**hydrops fetalis** the accumulation of fluid in fetal tissues or body cavities. This may take the form of a **\*cystic hygroma**. In its most severe form, excessive fluid collects in the peritoneal cavity (*see* **ASCITES**), the pleural and pericardial cavities, and the soft tissues (*see* **OEDEMA**). Hydrops may occur at any stage of gestation but is not usually seen until 16–18 weeks; the earlier it presents, the worse the prognosis. There are several causes of hydrops, one of which is severe anaemia associated with rhesus factor incompatibility (*see* **HAEMOLYTIC DISEASE OF THE NEWBORN**). Other (nonimmune) causes include congenital heart defects, fetal arrhythmias, chromosomal abnormalities, and fetal infection with human **\*parvovirus B19** (erythrovirus). Treatment before birth with intrauterine blood transfusions to the fetus may be undertaken in specialized fetal medicine units; without treatment the mortality is high. Prenatal ultrasound scanning enables early recognition of hydrops fetalis and has been enhanced with the introduction of MCA Doppler (*see* **DOPPLER ULTRASOUND**).

**hydrosalpinx** *n.* the accumulation of fluid in one of the **\*Fallopian tubes** due to inflammation and subsequent obstruction, usually as a result of pelvic infection.

**hydrotherapy** *n.* the use of water in the treatment of disorders, as by exercising in remedial swimming pools as part of the **\*rehabilitation** of

arthritic or partially paralysed patients.

**hydrothorax** *n.* fluid in the pleural cavity. *See also* **HYDROPNEUMOTHORAX**.

**hydrotubation** *n.* the introduction of a fluid (usually a dye) through the cervix (neck) of the uterus under pressure to allow visualization, by **\*laparoscopy**, of the passage of the dye through the Fallopian tubes. It is used to test whether or not the tubes are blocked in the investigation of infertility.

**hydroureter** *n.* an accumulation of urine in one of the tubes (ureters) leading from the kidneys to the bladder. The ureter becomes swollen and the condition usually results from obstruction of the ureter by a stone or a pelvic mass.

**hydroxocobalamin** *n.* a cobalt-containing drug used to treat conditions involving vitamin B<sub>12</sub> deficiency, such as pernicious anaemia, and cyanide poisoning.

**hydroxyapatite** *n.* **1.** a complex phosphate of calcium (Ca<sub>5</sub>(PO<sub>4</sub>)<sub>3</sub>OH) that occurs as a mineral and is the chief structural element of human bone and teeth. Hydroxyapatite crystals may also occur in joints in association with arthritis. **2.** a biocompatible ceramic material that is a synthetic form of natural hydroxyapatite. Some joint replacement prostheses are coated with synthetic hydroxyapatite, which encourages bone to grow on to the implant. The material is also used in some forms of middle-ear surgery.

**hydroxycarbamide (hydroxyurea)** *n.* a drug that prevents cell growth and is used mainly to treat chronic myeloid leukaemia but also to reduce the frequency of sickle-cell crises (*see* **SICKLE-CELL DISEASE**). Hydroxycarbamide may lower the white cell content of the blood due to its effects on the bone marrow.

**hydroxychloroquine** *n.* a drug similar to **\*chloroquine**, used mainly to treat lupus erythematosus and rheumatoid arthritis (*see* **DISEASE-MODIFYING ANTIRHEUMATIC DRUG**). Side-effects such as skin reactions, headache, and digestive upsets may occur and prolonged use can lead to eye damage.

**5-hydroxyindoleacetic acid (5-HIAA)** a metabolite of **\*serotonin**, the most common secretion product of **\*carcinoid** tumours. Measured over 24 hours in the urine, this is the most reliable screening test for such tumours.

**hydroxyproline** *n.* a compound, similar in structure to the **\*amino acids**, found only in **\*collagen**.

**5-hydroxytryptamine** *n.* *see* **SEROTONIN**.

**hydroxyurea** *n.* *see* **HYDROXYCARBAMIDE**.

**hydroxyzine** *n.* an **\*antihistamine** drug with sedative properties, used to treat pruritus (itching). It may cause drowsiness, headache, dry mouth, and gastrointestinal upsets.

**hygiene** *n.* the science of health and the study of ways of preserving it, particularly by promoting cleanliness.

**hygr- (hygro-)** *combining form denoting* moisture.

**hygroma (hydroma)** *n.* a type of cyst. It may develop from the liquified remains of a subdural **\*haematoma** (**subdural hygroma**). *See also* **CYSTIC HYGROMA**.

**hygrometer** *n.* an instrument for measuring the relative humidity of the atmosphere, i.e. the ratio of the moisture in the air to the moisture it would contain if it were saturated at the same temperature and pressure. In the **dew-point hygrometer** a polished surface is reduced in temperature until the water vapour from the atmosphere forms on it. The temperature of this dew point enables the relative humidity of the atmosphere to be calculated. In the **wet-and-dry bulb hygrometer**, there are two thermometers mounted side by side, the bulb of one being surrounded by moistened muslin. The thermometer with the wet bulb will register a lower temperature than that with the dry bulb owing to the cooling effect of the evaporating water. The temperature difference enables the relative humidity to be calculated.

**hymen** *n.* the membrane that covers the opening of the vagina at birth but usually perforates spontaneously before puberty. If the initial opening is small it may tear, with slight loss of blood, at the first occasion of sexual intercourse.

**Hymenolepis** *n.* a genus of small widely distributed parasitic tapeworms. The dwarf tapeworm, *H. nana*, only 40 mm in length, lives in the human intestine. Fleas can be important vectors of this species, and children in close contact with flea-infested dogs are particularly prone to infection. *H. diminuta* is a common parasite of rodents; humans occasionally become infected on swallowing stored cereals contaminated with insect pests – the intermediate hosts for this parasite. Symptoms of abdominal pain, diarrhoea, loss of appetite, and headache are obvious only in heavy infections of either species. Treatment involves a course of **\*anthelmintics**.

**hymenoplasty** *n.* see **FEMALE GENITAL COSMETIC SURGERY**.

**hymenotomy** *n.* incision of the hymen at the entrance to the vagina. This operation may be performed on a young girl if the membrane completely closes the vagina and thus impedes the flow of menstrual blood. It is also carried out to alleviate dyspareunia (painful intercourse).

**hyo-** *combining form denoting* the hyoid bone. Example: **hyoglossal** (relating to the hyoid bone and tongue).

**hyoglossus** *n.* a muscle that serves to depress the tongue. It has its origin in the hyoid bone.

**hyoid bone** a small isolated U-shaped bone in the neck, below and supporting the tongue. It is held in position by muscles and ligaments between it and the styloid process of the temporal bone.

**hyoscine (scopolamine)** *n.* an **\*antimuscarinic** drug that prevents muscle spasm. **Hyoscine butylbromide** is administered in the treatment of spasm in the digestive system and difficult or painful menstruation. **Hyoscine hydrobromide** is used for preoperative medication and to treat motion sickness. Side-effects of both drugs are rare but can include dry mouth, blurred vision, difficulty in urination, and increased heart rate.

**hyp- (hypo-)** *prefix denoting* **1.** deficiency, lack, or small size. Example: **hypognathous** (having a small lower jaw). **2.** (in anatomy) below; beneath. Example: **hypoglossal** (under the tongue).

**hypalgesia** *n.* an abnormally low sensitivity to pain.

**hyper-** *prefix denoting* **1.** excessive; abnormally increased. **2.** (in anatomy) above.

**hyperacusis** *n.* a form of reduced sound tolerance characterized by uncomfortable or even painful sensitivity to all sounds above a certain level. *See* MISOPHONIA; PHONOPHOBIA.

**hyperadrenalism** *n.* overactivity of the adrenal glands. *See* CUSHING'S SYNDROME.

**hyperaemia** *n.* the presence of excess blood in the vessels supplying a part of the body. In **active hyperaemia** (**arterial hyperaemia**) the arterioles are relaxed and there is an increased blood flow. In **passive hyperaemia** the blood flow from the affected part is obstructed.

**hyperaesthesia** *n.* excessive sensibility, especially of the skin.

**hyperaldosteronism** *n.* *see* ALDOSTERONISM.

**hyperalgesia** *n.* an abnormal state of increased sensitivity to painful stimuli.

**hyperandrogenism** *n.* excessive secretion of androgen in women. It is associated with **\*hirsutism**, acne, sparse or infrequent menstruation (oligomenorrhoea), absent or infrequent ovulation, infertility, endometrial **\*hyperplasia**, **\*hyperlipidaemia**, **\*hyperglycaemia**, and hypertension; all these conditions may be the result of mutations in specific genes. *See also* VIRILIZATION.

**hyperbaric** *adj.* at a pressure greater than atmospheric pressure.

**hyperbaric oxygenation** a technique for exposing a patient to oxygen at a pressure of greater than 1 atmosphere in a compression chamber. It is used to treat carbon monoxide poisoning, gas gangrene, compressed air illness, and acute breathing difficulties. It is also used in some cases during heart surgery. In dental extractions and implant treatment it may reduce the incidence of osteonecrosis in patients who have received radiation to the head and neck region (osteoradionecrosis).

**hyperbilirubinaemia** *n.* an excess of the **\*bile** pigment bilirubin in the blood leading to the development of jaundice. Transient mild hyperbilirubinaemia

may occur in the absence of significant liver disease (see [GILBERT'S SYNDROME](#)).

**hypercalcaemia** *n.* the presence in the blood of an abnormally high concentration of calcium. There are many causes, including excessive ingestion of vitamin D, overactivity of the [\\*parathyroid glands](#), and malignant disease. Malignant hypercalcaemia results from the secretion by the tumour of substances (most commonly [\\*parathyroid hormone-related protein](#)) that stimulate bone resorption or from bone metastases causing localized destruction and release of calcium into the bloodstream. Hypercalcaemia may also occur as an inherited congenital condition, for example **familial benign** (or **hypocalciuric**) **hypercalcaemia** or [\\*Williams syndrome](#). Compare [HYPOCALCAEMIA](#).

**hypercalcaemic nephropathy** defects of kidney function related to a high serum calcium, irrespective of cause. Impaired urine-concentrating ability and reduction in glomerular filtration rate are common features. Histologically, calcific deposits in the kidneys ([\\*nephrocalcinosis](#)) may be seen in cases of long-standing hypercalcaemia.

**hypercalcinuria (hypercalcuria)** *n.* the presence in the urine of an abnormally high concentration of calcium.

**hypercapnia (hypercarbia)** *n.* the presence in the blood of an abnormally high concentration of carbon dioxide.

**hyperchloraemia** *n.* the presence in the blood of an abnormally high concentration of chloride.

**hyperchlorhydria** *n.* excess secretion of hydrochloric acid in the stomach, usually associated with [\\*peptic ulcer](#). Extremely high levels of acid secretion are found in the [\\*Zollinger-Ellison syndrome](#).

**hypercholesterolaemia** *n.* the presence of elevated concentrations of [\\*cholesterol](#) in the blood (see also [HYPERLIPIDAEMIA](#)), which predisposes to atheromatous disease (see [ATHEROMA](#)). **Familial hypercholesterolaemia** is an autosomal [\\*dominant](#) condition in which raised levels of [\\*low-density lipoprotein](#) (LDL) result from a mutation in the LDL receptor gene, producing a deficiency of LDL receptors, which normally remove cholesterol from the

circulation. The **\*heterozygous** state, with LDL levels of 5–10 mmol/l, may not be detected until adulthood; usual signs are tendon **\*xanthomas** on the backs of the hands and a **\*corneal arcus**. The **\*homozygous** state is much more serious as cardiovascular complications can occur in childhood, due to massively increased total cholesterol levels (>12 mmol/l).

**hyperchromatism** *n.* the property of the nuclei of certain cells (for example, those of tumours) to stain more deeply than normal. —**hyperchromatic** *adj.*

**hyperdactylysm (polydactylysm)** *n.* the condition of having more than the normal number of fingers or toes. The extra digits are commonly undersized (rudimentary) and are usually removed surgically shortly after birth.

**hyperdontia** *n.* the condition of having **\*supernumerary** teeth. *Compare* **HYPODONTIA**.

**hyperdynamia** *n.* excessive activity of muscles.

**hyperechoic** *adj.* (in ultrasound imaging) describing a brighter area, which is usually caused by any structure (e.g. a stone) that reflects the sound waves (echoes) more than the adjacent structure. *Compare* **HYPOECHOIC**.

**hyperemesis gravidarum** persistent vomiting during pregnancy, which results in weight loss greater than 5%, dehydration, ketosis, and electrolyte imbalance. Management requires rehydration, antiemetics, and vitamin supplementation. In severe cases, if inadequately or inappropriately treated, it may cause liver damage and Wernicke's encephalopathy; in such cases it may be necessary to terminate the pregnancy.

**hyperextension** *n.* extension of a joint or limb beyond its normal limit.

**hyperglycaemia** *n.* an excess of glucose in the bloodstream. It may occur in a variety of diseases, most notably in **\*diabetes mellitus**, due to insufficient insulin in the blood and excessive intake of carbohydrates. Untreated it may progress to diabetic coma.

**hyperhidrosis (hyperidrosis)** *n.* excessive sweating, which may occur in certain diseases, such as thyrotoxicosis or fevers, or following the use of certain drugs. More commonly, however, there is no underlying cause for this condition. There are many successful treatments, including topical preparations, antimuscarinic drugs, and injections of **\*botulinum toxin**.

**hyper-IgM syndrome** an inherited immunodeficiency syndrome characterized by normal or high IgM levels with absence of IgA, IgG, and IgE (see [IMMUNOGLOBULIN](#)). Patients are susceptible to bacterial and opportunistic infections. Some cases are due to a mutation in the gene encoding the CD40 ligand, which is synthesized by *\*helper T cells* and is involved in activation of B cells to produce circulating antibodies.

**hyperinsulinism** *n.* **1.** excessive secretion of the hormone insulin by the islet cells of the pancreas. **2.** metabolic disturbance due to administration of too much insulin.

**hyperintense** *adj.* (in CT scanning) describing a structure that is denser than surrounding structures (allows fewer X-rays to pass through) and therefore appears brighter on CT; for example, bones and calcifications. *Compare* [HYPOINTENSE](#).

**hyperkalaemia** *n.* the presence in the blood of an abnormally high concentration of *\*potassium*, usually due to failure of the kidneys to excrete it. *See also* [ELECTROLYTE](#).

**hyperkeratosis** *n.* thickening of the outer horny layer of the skin. It may occur as an inherited disorder, affecting the palms and soles. — **hyperkeratotic** *adj.*

**hyperkinesia** *n.* a state of overactive restlessness in children. — **hyperkinetic** *adj.*

**hyperkinetic disorder** *see* [ATTENTION-DEFICIT/HYPERACTIVITY DISORDER](#).

**hyperlipidaemia (hyperlipaemia)** *n.* the presence in the blood of an abnormally high concentration of cholesterol (*see* [HYPERCHOLESTEROLAEMIA](#)) and/or triglycerides (*see* [HYPERTRIGLYCERIDAEMIA](#)) in the form of lipoproteins, which predisposes to *\*atherosclerosis* and coronary heart disease. **Familial mixed hyperlipidaemia** is an autosomal *\*dominant* condition that occurs in 1 in 200 people and in up to 20% of those with early-onset cardiovascular disease. It is marked by elevation of triglycerides, *\*low-density lipoprotein*, and/or

**\*very low-density lipoprotein** coupled with a reduction in **\*high-density lipoprotein**.

**hyperlipoproteinaemia** *n.* the presence in the blood of abnormally high concentrations of **\*lipoproteins**.

**hypermetropia (long-sightedness)** *n.* the condition in which parallel light rays are brought to a focus behind the retina when the **\*accommodation** is relaxed (see illustration). Moderate degrees of hypermetropia may not cause blurred vision in children and young adults because of their ability to accommodate, but for older people and those with greater degrees of hypermetropia near vision is more blurred than distance vision. Normal vision can be restored by wearing spectacles with convex lenses. *Compare* **EMMETROPIA**; **MYOPIA**.

**Hypermetropia (long-sightedness).**

**hypermobility (joint hypermobility)** a common condition in which joints can be moved beyond the normal range of motion. Most people with hypermobility have no other symptoms. However, those with **joint hypermobility syndrome** may suffer many difficulties due to laxity of the ligaments as the joints may sprain or dislocate. This can lead to weakened joints, muscle fatigue, and chronic pain. Joint hypermobility syndrome may

be symptomatic of a more serious underlying medical condition, such as [\\*Ehlers-Danlos syndrome](#).

**hypermotility** *n.* excessive movement or activity, especially of the stomach or intestine.

**hypernatraemia** *n.* the presence in the blood of an abnormally high concentration of [\\*sodium](#). *See also* [ELECTROLYTE](#).

**hypernephroma** *n.* *see* [RENAL CELL CARCINOMA](#).

**hyperopia** *n.* the usual US term for [\\*hypermetropia](#).

**hyperosmia** *n.* an abnormally acute sense of smell.

**hyperosmolar hyperglycaemic state (HHS)** a state of extreme hyperglycaemia seen in type 2 diabetes accompanied by dehydration that can be severe, typically triggered by illness in a patient with type 2 diabetes or a patient with previously unknown type 2 diabetes. It was previously known as **hyperosmolar non-ketotic hyperglycaemia (HONK)**. Emergency hospital treatment is required to control blood glucose levels and to treat the dehydration and the underlying precipitating cause. There is a significant mortality, especially in the elderly and patients with other disorders (e.g. vascular disease). While insulin is required as part of the initial emergency treatment, the patient often does not need insulin in the longer term, when well.

**hyperostosis** *n.* excessive enlargement of the outer layer of a bone. The condition is harmless and is usually recognized as an incidental finding on X-ray. It commonly affects the frontal bone of the skull (**hyperostosis frontalis**). **Infantile cortical hyperostosis** (or **Caffey's disease**) affects infants under six months. There is periodic swelling of the long bones, jaw, and shoulder blade, with pain and a fever. The condition settles spontaneously.

**hyperparathyroidism** *n.* excessive secretion of [\\*parathyroid hormone](#), usually due to a small tumour in one of the parathyroid glands. It results in [\\*hypercalcaemia](#). *See also* [VON RECKLINGHAUSEN'S DISEASE](#).

**hyperphagia** *n.* pathological overeating due to a loss of the normal regulatory processes.

**hyperpiesia** *n.* *see* **HYPERTENSION**.

**hyperplasia** *n.* the increased production and growth of normal cells in a tissue or organ without an increase in the size of the cells. The affected part becomes larger but retains its normal form. Hyperplasia can be physiological, as in the breasts during pregnancy, or pathological, as in benign prostatic hyperplasia (*see* **PROSTATE GLAND**). *See also* **ENDOMETRIAL HYPERPLASIA**. *Compare* **HYPERTROPHY**; **NEOPLASIA**.

**hyperpnoea** *n.* an increase in the rate of breathing that is proportional to an increase in metabolism; for example, on exercise. *Compare* **HYPERVENTILATION**.

**hyperpraxia** *n.* excessive motor activity, such as is seen in **\*mania** and **\*attention-deficit/hyperactivity disorder**.

**hyperprolactinaemia** *n.* *see* **PROLACTIN**.

**hyperpyrexia** *n.* a rise in body temperature above 106°F (41.1°C). *See* **FEVER**.

**hypersensitive** *adj.* prone to respond abnormally to the presence of a particular antigen, which may cause a variety of tissue reactions ranging from **\*serum sickness** to an allergy (such as hay fever) or, at the severest, to anaphylactic shock (*see* **ANAPHYLAXIS**). It is thought that when the normal antigen-antibody defence reaction is followed by tissue damage this may be due to an abnormality in the working of the **\*complement** system. *See also* **ALLERGY**; **IMMUNITY**. —**hypersensitivity** *n.*

**hypersomnia** *n.* sleep lasting for exceptionally long periods, as occurs in some cases of brain inflammation.

**hypersplenism** *n.* a decrease in the numbers of red cells, white cells, and platelets in the blood resulting from destruction or pooling of these cells by an enlarged spleen. Hypersplenism may occur in any condition in which there is enlargement of the spleen (*see* **SPLENOMEGALY**).

**hypersthenia** *n.* an abnormally high degree of strength or physical tension in all or part of the body.

**hypertelorism** *n.* an abnormally increased distance between two organs or parts, commonly referring to widely spaced eyes (**ocular hypertelorism**). See **CROUZON SYNDROME**; **SOTOS SYNDROME**.

**hypertension** *n.* high **\*blood pressure**, i.e. elevation of the arterial blood pressure above the normal range expected in a particular age group. Hypertension may be of unknown cause (**essential hypertension** or **hyperpiesia**). It may also result from kidney disease, including narrowing (stenosis) of the renal artery (**\*renovascular hypertension**), endocrine diseases (such as Cushing's disease or phaeochromocytoma) or disease of the arteries (such as coarctation of the aorta), when it is known as **secondary** or **symptomatic hypertension**.

Complications that may arise from hypertension include atherosclerosis, heart failure, cerebral haemorrhage, and kidney failure, but treatment may prevent their development. Hypertension is symptomless until the symptoms of its complications develop. Some cases of hypertension may be cured by eradicating the cause. Most cases, however, depend upon long-term drug therapy to lower the blood pressure and maintain it within the normal range. The drugs used include thiazide **\*diuretics**, **\*ACE inhibitors**, **\*calcium-channel blockers**, **\*beta blockers**, and **\*alpha blockers**. Combinations of drugs may be needed to obtain optimum control. See also **PORTAL HYPERTENSION**; **PULMONARY HYPERTENSION**.

**hyperthermia (hyperthermy)** *n.* **1.** exceptionally high body temperature (about 41°C or above). See **FEVER**. **2.** treatment of disease by inducing fever. Compare **HYPOTHERMIA**.

**hyperthyroidism** *n.* overactivity of the thyroid gland, either due to a tumour, overgrowth of the gland, or **\*Graves' disease**. See **THYROTOXICOSIS**.

**hypertonia (hypertonicity)** *n.* exceptionally high tension in muscles.

**hypertonic** *adj.* **1.** describing a solution that has a greater osmotic pressure than another solution. See **OSMOSIS**. **2.** describing muscles that demonstrate an abnormal increase in **\*tonicity**.

**hypertrichosis** *n.* excessive growth of hair (*see* [HIRSUTISM](#)).

**hypertriglyceridaemia** *n.* an excess of [\\*triglyceride](#) lipids in the serum, which can be caused by a genetic predisposition with or without a high-fat diet (*see also* [LIPOPROTEIN LIPASE](#)), excessive alcohol intake, or poorly controlled diabetes mellitus. The condition can predispose to cardiovascular disease and, in its extreme form, to acute pancreatitis. Lipid-lowering drugs, including [\\*fibrates](#), are used in treatment.

**hypertrophic cardiomyopathy** a familial condition affecting the heart, characterized by unexplained thickening (hypertrophy) of the wall of the left ventricle. In many cases this is an incidental finding and patients have a good outcome. However, more severely affected patients may suffer chest pain, tachyarrhythmia (*see* [ARRHYTHMIA](#)), heart failure, and sudden death. In some cases there is focal thickening of muscle around the left ventricular outflow tract (**asymmetric septal hypertrophy**, ASH), and this can result in restriction of blood flow to the body (**hypertrophic obstructive cardiomyopathy**, HOCM). The diagnosis is made by electrocardiography, echocardiography, and cardiac [\\*magnetic resonance imaging](#). Usually drug treatment is sufficient to control symptoms, but some patients require cardiac [\\*catheterization](#) or surgical treatment. Those deemed at highest risk of sudden death may require an [\\*implantable cardioverter defibrillator](#).

**hypertrophy (hypertrophia)** *n.* increase in the size of a tissue or organ brought about by the enlargement of its cells rather than by cell multiplication (as during normal growth and tumour formation). Hypertrophy can be a physiological response to normal stimuli, as in the enlargement of skeletal muscles in response to increased work. Pathological hypertrophy occurs in response to abnormal stimuli, as in cardiac muscle as a result of hypertension or aortic valve stenosis (*see also* [HYPERTROPHIC CARDIOMYOPATHY](#)). *Compare* [HYPERPLASIA](#). —**hypertrophic** *adj.*

**hypertropia** *n.* *see* [STRABISMUS](#).

**hyperuricaemia (lithaemia)** *n.* the presence in the blood of an abnormally high concentration of uric acid. *See* [GOUT](#).

**hyperuricuria (lithuria)** *n.* the presence in the urine of an abnormally high concentration of uric acid.

**hyperventilation** *n.* breathing at an abnormally rapid rate at rest. This causes a reduction of the carbon dioxide concentration of arterial blood, leading to dizziness, tingling (paraesthesiae) in the lips and limbs, tetanic cramps in the hands, and tightness across the chest. If continued, hyperventilation may cause loss of consciousness. This sequence of events occurs in the **hyperventilation syndrome (HVS)**, which has been estimated to contribute to 10% of out-patient referrals to hospital.

**hyperviscosity syndrome** a collection of symptoms resulting from an increase in the viscosity of blood. These symptoms include epistaxis (nosebleed), blurred vision, dizziness, headaches, drowsiness, confusion, and breathlessness. Hyperviscosity of the blood occurs in conditions such as polycythaemia, plasma-cell myeloma, leukaemia, and Waldenström's macroglobulinaemia.

**hypervitaminosis** *n.* the condition resulting from excessive consumption of vitamins. This is not usually serious in the case of water-soluble vitamins, when any intake in excess of requirements is excreted in the urine. However, the fat-soluble vitamins A and D are toxic if taken in excessive amounts.

**hypervolaemia** *n.* an increase in the volume of circulating blood.

**hyphaema** *n.* a collection of blood in the anterior chamber (in front of the iris) of the eye.

**hyphedonia** *n.* a lower than normal capacity for achieving enjoyment.

**hypn- (hypno-)** *combining form denoting* **1.** sleep. **2.** hypnosis.

**hypnagogic** *adj.* *see* **HALLUCINATION**.

**hypnopompic** *adj.* *see* **HALLUCINATION**.

**hypnosis** *n.* a sleeplike state, artificially induced in a person by a **hypnotist**, in which the mind is more than usually receptive to suggestion and memories of past events – apparently forgotten – may be elicited by questioning. Hypnotic suggestion may be used for a variety of therapeutic purposes; as a form of psychotherapy it is known as **hypnotherapy**.

**hypnotic (soporific)** *n.* a drug that produces sleep by depressing brain function. Hypnotics include benzodiazepines (such as **\*loprazolam**, **\*nitrazepam**, and **\*temazepam**) and drugs that act at benzodiazepine receptor sites, such as **zaleplon**, **zolpidem**, and **zopiclone**. Hypnotics are used for the short-term treatment of insomnia and sleep disturbances. Some of them (e.g. nitrazepam, **\*flurazepam**) may cause hangover effects in the morning.

**hypnotism** *n.* the induction of **\*hypnosis**.

**hypo-** *prefix.* *see* **HYP-**.

**hypoadrenalism** *n.* subnormal activity of the **\*adrenal glands**, which can be due to disease of the adrenal glands themselves (e.g. **\*Addison's disease**) or to a lack of stimulation from the pituitary hormone **\*ACTH** as part of any condition causing **\*hypopituitarism**.

**hypoaesthesia** *n.* a condition in which the sense of touch is diminished; uncommonly this may be extended to include other forms of sensation.

**hypobaric** *adj.* at a pressure lower than that of the atmosphere.

**hypocalcaemia** *n.* the presence in the blood of an abnormally low concentration of calcium. *See* **TETANY**. *Compare* **HYPERCALCAEMIA**.

**hypocapnia** *n.* *see* **ACAPNIA**.

**hypochloraemia** *n.* the presence in the blood of an abnormally low concentration of chloride.

**hypochlorhydria** *n.* reduced secretion of hydrochloric acid in the stomach. *See* **ACHLORHYDRIA**.

**hypochondriasis** *n.* preoccupation with the physical functioning of the body and with imagined ill health. In the most severe form there are delusions of ill health, sometimes associated with underlying illness, such as **\*depression**. When symptoms reach the level sufficient to be classified as a disorder, it is called **illness anxiety disorder** (in **\*DSM-5**; formerly hypochondriasis) or **hypochondriacal disorder** (in ICD-10). Treatment with reassurance, **\*antidepressant** drugs, and/or psychotherapy is common, but the condition is often chronic. —**hypochondriac** *adj., n.*

**hypochondrium** *n.* the upper lateral portion of the **\*abdomen**, situated beneath the lower ribs. — **hypochondriac** *adj.*

**hypocretin** *n.* a recently discovered neuropeptide that originates in the hypothalamus. Low levels of hypocretin in the cerebrospinal fluid are found in most patients with **\*narcolepsy** and may also be found in patients who have suffered with stroke, brain tumours, head injuries, and infections of the nervous system.

**Hypoderma** *n.* a genus of non-bloodsucking beelike insects – the warble flies – widely distributed in Europe, North America, and Asia. Cattle are the usual hosts for the parasitic maggots, but rare and accidental infections of humans have occurred (*see* **MYIASIS**), especially in farm workers. The maggots migrate beneath the skin surface, producing an inflamed linear lesion similar to that of **\*creeping eruption**.

**hypodermic** *adj.* beneath the skin: usually applied to subcutaneous **\*injections**. The term is also applied to the syringe used for such injections, and sometimes – loosely – to any injection.

**hypodipsia** *n.* pathological failure to drink enough to maintain the body's normal plasma osmolality. Like its most extreme form, **adipsia**, it is most commonly due to lesions of the thirst centre in the anterior hypothalamus.

**hypodontia** *n.* congenital absence of one or more teeth (not including the third molars, whose absence is considered a normal variation). Forms of hypodontia include **\*oligodontia** and **\*anodontia**.

**hypoechoic** *adj.* (in ultrasound imaging) describing a darker area, which is usually caused by any structure (e.g. a cyst) that allows the sound waves to pass through and therefore reflects echoes to a lesser degree than the adjacent structure. *Compare* **HYPERECHOIC**.

**hypofibrinogenaemia (fibrinogenopenia)** *n.* a deficiency of the clotting factor **\*fibrinogen** in the blood, which results in an increased tendency to bleed. It may occur as an inherited disorder in which either production of fibrinogen is impaired or the fibrinogen produced does not function in the normal way (**dysfibrinogenaemia**). Alternatively, it may be acquired. For example, it is the commonest cause of blood coagulation failure during pregnancy, when the blood fibrinogen level falls below the normal pregnancy

level of 4–6 g/l as a result of **\*disseminated intravascular coagulation** (DIC). This usually occurs as a complication of severe **\*abruptio placentae**, prolonged retention of a dead fetus, or amniotic fluid embolism.

**hypogammaglobulinaemia** *n.* a deficiency of the protein **\*gammaglobulin** in the blood. It may occur in a variety of inherited disorders or as an acquired defect, as in chronic lymphocytic **\*leukaemia** (CLL). Since gammaglobulin consists mainly of antibodies (**\*immunoglobulins**), hypogammaglobulinaemia results in an increased susceptibility to infections.

**hypogastrium** *n.* that part of the central **\*abdomen** situated below the region of the stomach. —**hypogastric** *adj.*

**hypogeusia** *n.* a condition in which the sense of taste is abnormally weak. *See also* **HYPOAESTHESIA**.

**hypoglossal nerve** the twelfth **\*cranial nerve** (XII), which supplies the muscles of the tongue and is therefore responsible for the movements of talking and swallowing.

**hypoglycaemia** *n.* a deficiency of glucose in the bloodstream, causing muscular weakness and incoordination, mental confusion, and sweating. If severe it may lead to **hypoglycaemic coma**. Hypoglycaemia most commonly occurs in **\*diabetes mellitus**, as a result of insulin overdosage and insufficient intake of carbohydrates. It is treated by administration of glucose: by injection if the patient is in a coma, by mouth otherwise. *See also* **REACTIVE HYPOGLYCAEMIA**. —**hypoglycaemic** *adj.*

**hypoglycaemic unawareness** a serious condition in which a person with diabetes loses the earliest warning signs of an approaching hypoglycaemic episode. Such people may suffer a severe attack of hypoglycaemia, with confusion, seizures, or even coma and death, because they fail to take the necessary measures to abort the episode. The condition is more common in longstanding diabetes and in those who experience frequent hypoglycaemic episodes. People with hypoglycaemic unawareness should not drive. Some awareness of hypoglycaemia may be restored by careful avoidance of more episodes, ensuring that the blood glucose level never falls below 4 mmol/l.

**hypogonadism** *n.* impaired function of the gonads (testes or ovaries), causing absence or inadequate development of the **\*secondary sexual characteristics**.

This may be due to a disorder of the gonads or to lack of secretion of the pituitary **\*gonadotrophins** (**hypogonadotrophic hypogonadism**).

**hypohidrosis** *n.* *see* **ANHIDROSIS**.

**hypoinsulinism** *n.* a deficiency of insulin due either to inadequate secretion of the hormone by the pancreas or to inadequate treatment of diabetes mellitus.

**hypointense** *adj.* (in CT scanning) describing a structure or substance (e.g. gas) that is less dense than surrounding structures (allows more X-rays to pass through) and therefore appears darker on CT. *Compare* **HYPERINTENSE**.

**hypokalaemia** *n.* the presence of abnormally low levels of potassium in the blood: occurs in dehydration. *See* **ELECTROLYTE**.

**hypokalaemic nephropathy** abnormalities seen with chronic hypokalaemia (usually  $K^+ < 3.0$  mmol/l) and manifest by impaired urine-concentrating ability and reduced capacity to excrete sodium. Histological changes include cytoplasmic vacuolation of the renal tubules and medullary fibrosis.

**hypomania** *n.* a mild degree of **\*mania**. Elated mood leads to faulty judgment; behaviour lacks the usual social restraints and the sexual drive is increased; there is a reduced need for sleep; speech is rapid and pressured; the individual is energetic but not persistent and tends to be irritable or possibly aggressive. The abnormality is not as great as in mania (*see* **ELATION**; **EUPHORIA**). Treatment follows the same principles as for mania, and it may be difficult to prevent an individual from damaging his or her own interests with extravagant behaviour; hospitalization would indicate that the severity of mania had been reached. —**hypomaniac** *adj.*

**hyponatraemia** *n.* the presence in the blood of an abnormally low concentration of **\*sodium**: occurs in dehydration. *See* **ELECTROLYTE**.

**hypoparathyroidism** *n.* subnormal activity of the parathyroid glands, causing a fall in the blood concentration of calcium and muscular spasms (*see* **TETANY**).

**hypopharynx (laryngopharynx)** *n.* the part of the pharynx that lies below the level of the hyoid bone.

**hypophysectomy** *n.* the surgical removal or destruction of the pituitary gland (hypophysis) in the brain. The operation may be conducted by opening the skull or by the insertion of special needles that produce a very low temperature (*see* **CRYOSURGERY**). Radiotherapy (e.g. by insertion of needles of **\*yttrium-90**) can also be used to destroy parts of the pituitary.

**hypophysis** *n.* *see* **PITUITARY GLAND**.

**hypophysitis** *n.* a rare condition of inflammation of the **\*pituitary gland** (hypophysis). The main cause is an infiltration by lymphocytes, most commonly during or just after pregnancy. This usually presents as a mass lesion of the pituitary with visual-field loss and headache or with anterior **\*hypopituitarism**, which may be total or just involve particular hormone systems. Around 50% of cases are associated with other autoimmune endocrine diseases, and antipituitary antibodies have been identified.

**hypopiesis** *n.* abnormally reduced blood pressure in the absence of organic disease (*see* **HYPOTENSION**).

**hypopituitarism** *n.* subnormal activity of the pituitary gland, causing **\*dwarfism** in childhood and a syndrome of impaired sexual function, pallor, and premature ageing in adult life (*see* **SIMMONDS DISEASE**).

**hypoplasia** *n.* the underdevelopment of an organ or tissue. **Dental hypoplasia** is the defective formation of parts of a tooth, for example systemic upset while the tooth is being formed can lead to **hypoplastic enamel**. **Pulmonary hypoplasia** is deficient lung development in a fetus or newborn infant for gestational age, with a decrease in lung size or volume. —**hypoplastic** *adj.*

**hypoplastic left heart** a congenital heart disorder in which the left side of the heart, particularly the left ventricle, is underdeveloped. The first part of the aorta may also be abnormal. Affected babies usually develop severe heart failure within the first few days of life. Diagnosis can be confirmed on **\*echocardiography**. Prognosis is generally very poor – most babies die within the first few weeks – but milder cases may be amenable to surgery. It is the commonest cause of death in the neonatal period due to heart disease.

**hypoplastic leukaemia** a stage of **\*leukaemia** in which there is a decrease in the number of white cells, red cells, and platelets in the blood and reduced **\*haemopoiesis** in the bone marrow.

**hypopnoea** *n.* an episode during sleep in which there is a reduction in the nasal airflow to less than 50% of normal, but more than 30% (*see* **APNOEA**), for more than 10 seconds. *See also* **OBSTRUCTIVE SLEEP APNOEA**.

**hypoproteinaemia** *n.* a decrease in the quantity of protein in the blood. It may result from malnutrition, impaired protein production (as in liver disease), or increased loss of protein from the body (as in the **\*nephrotic syndrome**). It results in swelling (**\*oedema**), because of the accumulation of fluid in the tissues, and increased susceptibility to infections. *See also* **HYPOGAMMAGLOBULINAEMIA**.

**hypoprothrombinaemia** *n.* a deficiency of the clotting factor **\*prothrombin** in the blood, which results in an increased tendency to bleed. It may occur as an inherited defect or as the result of liver disease, vitamin K deficiency, or anticoagulant treatment.

**hypopyon** *n.* pus in the anterior chamber (in front of the iris) of the eye. Seen in severe cases of **\*uveitis** or other ocular infections, it can be a sign of endophthalmitis following intraocular surgery.

**hyposensitive** *adj.* less than normally responsive to the presence of antigenic material. *Compare* **HYPERSENSITIVE**. —**hyposensitivity** *n.*

**hyposensitization** *n.* *see* **DESENSITIZATION**.

**hyposmia** *n.* reduction in the sense of smell. *See* **ANOSMIA**.

**hypospadias** *n.* a congenital abnormality in which the opening of the **\*urethra** is on the underside of the penis: either on the glans penis (**glandular hypospadias**), at the junction of the glans with the shaft (**coronal hypospadias**), on the shaft itself (**penile hypospadias**), or in the perineum (**perineal hypospadias**). All varieties can be treated surgically, and neither micturition nor sexual function need be impaired. *See* **MAGPI OPERATION**.

**hypostasis** *n.* accumulation of fluid or blood in a dependent part of the body, under the influence of gravity, in cases of poor circulation. Hypostatic

congestion of the lung bases may be seen in debilitated patients who are confined to bed. It predisposes to pneumonia (hypostatic pneumonia) but it may be prevented by careful nursing and physiotherapy. A similar condition (**lividity**) occurs after death when blood pools in the dependent parts of the body after the circulation has ceased. —**hypostatic** *adj.*

**hyposthenia** *n.* a state of physical weakness or abnormally low muscular tension.

**hyposthenuria** *n.* the secretion of urine of low specific gravity. The inability to concentrate the urine occurs in patients at the final stage of chronic renal failure.

**hypotension** *n.* a condition in which the arterial **\*blood pressure** is abnormally low, which is most commonly experienced when rising from a sitting or lying position (**postural** or **orthostatic hypotension**). Severe cases may manifest as **\*shock**.

**hypothalamus** *n.* the region of the forebrain in the floor of the third ventricle, linked with the thalamus above and the **\*pituitary gland** below (see **BRAIN**). It contains several important centres controlling body temperature, thirst, hunger, and eating, water balance, and sexual function. It is also closely connected with emotional activity and sleep and functions as a centre for the integration of hormonal and autonomic nervous activity through its control of the pituitary secretions (see **NEUROENDOCRINE SYSTEM**; **PITUITARY GLAND**). —**hypothalamic** *adj.*

**hypothenar** *adj.* describing or relating to the fleshy prominent part of the palm of the hand below the little finger. *Compare* **THENAR**.

**hypothermia** *n.* **1.** accidental reduction of body temperature below the normal range in the absence of protective reflex actions, such as shivering. Often insidious in onset, it is particularly liable to occur in babies and the elderly if they are living in poorly heated homes and have inadequate clothing. **2.** deliberate lowering of body temperature for therapeutic purposes. This may be done during surgery, in order to reduce the patient's requirement for oxygen.

**hypothetical imperative** *see* **IMPERATIVE**.

**hypothyroidism** *n.* subnormal activity of the thyroid gland. If present at birth and untreated it leads to **\*cretinism**. When acquired in later life it causes mental and physical slowing, undue sensitivity to cold, slowing of the pulse, weight gain, and coarsening of the skin (**myxoedema**). Treatment is by thyroid hormone replacement therapy, usually in the form of **\*thyroxine**. **Primary hypothyroidism** is due to intrinsic underactivity of the thyroid gland; **secondary hypothyroidism** is reduced stimulation of the gland caused by a deficiency of **\*thyroid-stimulating hormone** due to disease of the pituitary gland.

**hypotonia** *n.* a state of reduced tension in muscle.

**hypotonic** *adj.* **1.** describing a solution that has a lower osmotic pressure than another solution. *See* **OSMOSIS**. **2.** describing muscles that demonstrate diminished **\*tonicity**.

**hypotony** *n.* a very low intraocular pressure, usually as a result of trauma or surgery to the eye.

**hypotrichosis** *n.* a condition in which less hair develops than normal.

**hypotropia** *n.* *see* **STRABISMUS**.

**hypoventilation** *n.* breathing at an abnormally shallow and slow rate, which results in an increased concentration of carbon dioxide in the blood. **Alveolar hypoventilation** may be primary, which is very rare, or secondary, which can be due to destructive lesions of the brain or to an acquired blunting of respiratory drive arising from failure of the respiratory pump.

**hypovitaminosis** *n.* a deficiency of a vitamin caused either through lack of the vitamin in the diet or from an inability to absorb or utilize it.

**hypovolaemia (oligaemia)** *n.* a decrease in the volume of circulating blood. *See* **SHOCK**.

**hypoxaemia** *n.* reduction of the oxygen concentration in the arterial blood, recognized clinically by the presence of central and peripheral **\*cyanosis**. When the partial pressure of oxygen ( $pO_2$ ) falls below 8.0 kPa (60 mmHg), the condition is defined as respiratory failure.

**hypoxia** *n.* a deficiency of oxygen in the tissues. *See also* **ANOXIA**; **HYPOXAEMIA**.

**hypoxic-ischaemic encephalopathy (HIE, birth asphyxia, perinatal asphyxia)** brain damage in a newborn infant as a result of the brain receiving inadequate oxygen. HIE may cause seizures and, if severe, death within minutes of oxygen deprivation. If the infant survives there can be significant long-term consequences, such as developmental delay, learning disabilities, or cerebral palsy.

**hypsarhythmia** *n.* a severe abnormality on an EEG (*see* **ELECTROENCEPHALOGRAPHY**) that demonstrates a chaotic pattern of brain activity. It is usually characteristic of **\*infantile spasms**.

**hyster- (hystero-)** *combining form denoting* **1.** the uterus. **2.** hysteria.

**hysterectomy** *n.* the surgical removal of the entire uterus through an incision in the abdominal wall (**total abdominal hysterectomy, TAH**), or through the vagina (**vaginal hysterectomy**), or by minimal access (**laparoscopic abdominal hysterectomy, LAH**). **Subtotal hysterectomy** (rarely performed now unless as a laparoscopic procedure) involves removing the body of the uterus but leaving the neck (cervix). Hysterectomy is performed for cancerous conditions affecting the uterus and for nonmalignant conditions (e.g. fibroids) in which there is excessive menstrual bleeding. Abdominal hysterectomy carries a higher risk of morbidity than vaginal hysterectomy; the latter is therefore the preferred route unless contraindicated. Laparoscopic hysterectomy is the recommended operation for **\*endometrial cancer**.

**hysteria** *n.* a now obsolete name for a **\*neurosis** characterized by emotional instability, repression, dissociation, some physical symptoms (*see* **HYSTERICAL**), and vulnerability to suggestion. Two types were recognized: **conversion hysteria**, now known as **\*conversion disorder**; and **dissociative hysteria**, comprising a group of conditions now generally regarded as **\*dissociative disorders**.

**hysterical** *adj.* formerly, describing a symptom that is not due to organic disease, is produced unconsciously, and from which the individual derives some gain. What were known as hysterical symptoms are characteristic of **\*conversion disorder**.

**hysterosalpingography** *n.* radiological examination of the uterus and Fallopian tubes. A radiopaque contrast material is injected through a catheter placed in the uterine cavity and the flow is then observed with X-rays. The technique is used to look for patency of the Fallopian tubes in cases of infertility, or for any uterine anomalies or mass. *See also* SONOHYSTEROGRAPHY.

**hysterosalpingography** *n.* X-ray imaging of the uterus and Fallopian tubes following injection of water or a soluble *\*contrast medium*.

**hysterosalpingosonography** *n.* *see* HYCOSY.

**hysteroscopy** *n.* visualization of the interior of the uterus using a **hysteroscope** (a type of *\*endoscope*). It can also be used for therapeutic procedures, such as polypectomy. —**hysteroscopic** *adj.*

**hysterotomy** *n.* an operation for removal of the fetus by incision of the uterus through the abdomen before the 24th week of gestation; after this time the operation is called *\*Caesarean section*. Hysterotomy is now rarely performed owing to improvements in the efficiency of drugs now available for inducing abortion, e.g. *\*mifepristone*.

**-iasis** *combining form denoting a diseased condition. Example: leishmaniasis (disease caused by *Leishmania* species).*

**iatro-** *combining form denoting 1. medicine. 2. doctors.*

**iatrogenic** *adj. describing a condition or disease that has resulted from treatment and/or the actions of health-care professionals, for example an unforeseen or inevitable side-effect, hospital-acquired infection, or post-operative complication.*

**IBD** *see INFLAMMATORY BOWEL DISEASE.*

**IBS** *see IRRITABLE BOWEL SYNDROME.*

**ibuprofen** *n. an anti-inflammatory drug (see NSAID), used in the treatment of arthritic conditions and for pain relief (as in dysmenorrhoea and migraine). It sometimes causes skin rashes and digestive upsets.*

**ICD 1.** *see INTERNATIONAL CLASSIFICATION OF DISEASES. The version in current use is ICD-10. 2. see IMPLANTABLE CARDIOVERTOR DEFIBRILLATOR.*

**ICF** *International Classification of Functioning, Disabilities and Health. See INTERNATIONAL CLASSIFICATION OF DISEASES.*

**ICG angiography** *indocyanine green \*angiography.*

**ichor** *n. a watery material oozing from wounds or ulcers.*

**ichthyosis** *n. a genetically determined skin disorder (see GENODERMATOSIS) in which there is abnormal scaling of the skin (the scaly*

condition of the skin is reflected in the name of this disorder, which is derived from the Greek word for fish). Ichthyosis may be caused by a variety of genetic defects in skin shedding; the pattern of scaling varies according to the underlying defect. The commonest form, **ichthyosis vulgaris**, is inherited as an autosomal **\*dominant** and occurs in 1 in 300 of the population. **Lamellar ichthyosis** is a very rare condition in which the skin, particularly on the palms and soles, is thickened and lizard-like. Treatment of ichthyosis is mainly by the regular use of emollients. *See also* **XERODERMA**.

**icodextrin** *n.* a glucose polymer solution produced by the hydrolysis of cornstarch and containing a spectrum of polymer molecules with an average molecular weight of 16,200 Da. It is used in the dialysate treatment of renal failure by **\*peritoneal dialysis**. It exerts a strong osmotic effect, allowing removal of fluid without exposing the peritoneum to high levels of glucose. It is of most use when the dialysate is required to remain within the body for a long period, for instance overnight during chronic ambulatory peritoneal dialysis or during the day with automated peritoneal dialysis.

**ICSH (interstitial-cell-stimulating hormone)** *see* **LUTEINIZING HORMONE**.

**ICSI (intracytoplasmic sperm injection)** a technique of assisted conception that has revolutionized the treatment of severe male infertility. Spermatozoa are aspirated or extracted from the testis or epididymis (*see* **MESA**; **PESA**) and a single sperm is injected into the cytoplasm of a secondary **\*oocyte** in vitro. The fertilized ovum is then implanted into the uterus.

**icterus** *n.* *see* **JAUNDICE**.

**ictus** *n.* a stroke or any sudden attack, such as a subarachnoid haemorrhage. The term is often used for an epileptic seizure, stressing the suddenness of its onset (*see also* **AURA**; **POSTICTAL PHASE**).

**id** *n.* (in psychoanalysis) a part of the unconscious mind governed by the instinctive forces of **\*libido** and the death instinct (governing aggression, etc.). These violent forces seek immediate release in action or in symbolic form. The id is therefore said to be governed by the pleasure principle and not by the demands of reality or of logic. In the course of individual development some of the functions of the id are taken over by the **\*ego**.

**-id** *suffix denoting relationship or resemblance to.* Example: **spermatid** (a stage of sperm formation).

**idea of reference** *see* **DELUSION OF REFERENCE**.

**ideation** *n.* the process of thinking or of having **\*imagery** or ideas. The presence or absence of **suicidal ideation** is tested as part of every **\*mental state examination** and risk assessment.

**identical twins** *see* **TWINS**.

**ideo-** *combining form denoting* **1.** the mind or mental activity. **2.** ideas.

**idio-** *combining form denoting peculiarity to the individual.*

**idiopathic** *adj.* denoting a disease or condition the cause of which is not known or that arises spontaneously. —**idiopathy** *n.*

**idiopathic intracranial hypertension (benign intracranial hypertension, pseudotumour cerebri)** a syndrome of raised pressure within the skull in the absence of a clear structural cause, such as a tumour. Although the cause is not certain, proposed mechanisms include impaired reabsorption of cerebrospinal fluid or venous outflow from the brain. The symptoms include headache, vomiting, double vision, and **\*papilloedema**. The diagnosis is made by finding a high opening pressure at **\*lumbar** puncture in the absence of a causative structural abnormality on brain imaging. It can improve spontaneously but drug therapy or neurosurgical treatment may be required to protect the patient's vision.

**idiopathic pulmonary fibrosis (IPF)** a serious interstitial lung disease, formerly called **cryptogenic fibrosing alveolitis** (*see* **ALVEOLITIS**). It is characterized by progressive fibrous scarring of the lung and increased numbers of inflammatory cells in the alveoli and surrounding tissues. The disease is usually diagnosed on clinical grounds on a basis of worsening breathlessness, inspiratory crackles at the lung bases on auscultation, clubbing of the fingers or toes, bilateral radiographic shadowing predominantly in the lower zones of the chest X-ray, subpleural **\*honeycomb** change on CT scanning of the chest, and restrictive lung function on spirometry. It is also called **usual interstitial pneumonia** (UIP; *see* **INTERSTITIAL PNEUMONIA**), a term used by lung pathologists for the most

common cellular pattern seen on biopsy. Treatment includes *\*pirfenidone*, corticosteroids, and immunosuppressants.

**idiopathic thrombocytopenic purpura (ITP)** an *\*autoimmune disease* in which platelets are destroyed, leading to spontaneous bruising (*see PURPURA*). Acute ITP is a relatively mild disease of children, who usually recover without treatment. A chronic form of the disease, typically affecting adults, is more serious, requiring treatment with corticosteroids or, if there is no response, with splenectomy. If both fail, immunosuppressant drugs may be effective. Platelet concentrates are used for life-threatening bleeding.

**idiosyncrasy** *n.* an unusual and unexpected sensitivity exhibited by an individual to a particular drug or food. Drug idiosyncrasy commonly takes the form of undue susceptibility or hypersensitivity, so that the standard dose causes an excessive effect; the normal effect is produced by a small fraction of the standard dose. —**idiosyncratic** *adj.*

**idiotype** *n.* the antigen-binding site of an antibody, which confers antigenicity.

**idioventricular** *adj.* affecting or peculiar to the ventricles of the heart. The term is most often used to describe the very slow beat of the heart's ventricles under the influence of their own natural subsidiary pacemaker (**idioventricular rhythm**). An accelerated idioventricular rhythm of 80–120 beats per minute is often seen in patients a few hours after being admitted with a heart attack (*see MYOCARDIAL INFARCTION*). Its presence is a good sign since it usually indicates restoration of blood flow down the occluded coronary artery.

**IFG impaired fasting glucose** (*see GLUCOSE TOLERANCE TEST*).

**ifosfamide** *n.* a *\*cytotoxic drug* (an *\*alkylating agent*) used in the treatment of malignant disease, particularly sarcomas, testicular tumours, and lymphomas. Side-effects include nausea, vomiting, alopecia, and haemorrhagic cystitis; concomitant administration of *\*mesna* is recommended to prevent cystitis.

**Ig** *see IMMUNOGLOBULIN*.

**IgA nephropathy** *see BERGER'S NEPHROPATHY*.

**IGF** insulin-like growth factor, which includes IGF-I and IGF-II. *See* **GROWTH FACTOR**; **SOMATOMEDIN**.

**IGRT** *see* **IMAGE-GUIDED RADIOTHERAPY**.

**IGT** impaired glucose tolerance (*see* **GLUCOSE TOLERANCE TEST**).

**IL-2** *n. see* **INTERLEUKIN**.

**ile- (ileo-)** *combining form denoting the ileum*. Examples: **ileocaecal** (relating to the ileum and caecum); **ileocolic** (relating to the ileum and colon).

**ileal conduit** a segment of small intestine (ileum) used to convey urine from the ureters to the exterior into an appliance (*see also* **URINARY DIVERSION**). The ureters are implanted into an isolated segment of bowel, usually ileum but sometimes sigmoid colon, one end of which is brought through the abdominal wall to the skin surface. This end forms a spout, or **stoma**, which projects into a suitable urinary appliance. The ureters themselves cannot be used for this purpose as they tend to narrow and retract if brought through the skin. The operation is performed if the bladder has to be removed or bypassed; for example, because of cancer.

**ileal pouch (perineal pouch)** a reservoir made from loops of ileum to replace a surgically removed rectum, avoiding the need for a permanent **\*ileostomy**. This is commonly constructed in patients who have had their colon surgically removed for various disorders (e.g. ulcerative colitis or familial adenomatous polyposis).

**ileectomy** *n.* surgical removal of the ileum (small intestine) or part of the ileum.

**ileitis** *n.* inflammation of the ileum (small intestine). It may be caused by **\*Crohn's disease**, tuberculosis, the bacterium **\*Yersinia enterocolitica**, or typhoid or it may occur in association with **\*ulcerative colitis** (when it is known as **backwash ileitis**).

**ileocaecal valve** a valve at the junction of the small and large intestines consisting of two membranous folds that close to prevent the backflow of food from the colon and caecum to the ileum.

**ileocolitis** *n.* inflammation of the ileum and the colon (small and large intestines). The most likely cause is **\*Crohn's disease**.

**ileocolostomy** *n.* a surgical operation in which the ileum is joined to part of the colon. It is usually performed when the right side of the colon has been removed or if it is desired to bypass either the terminal part of the ileum or right side of the colon.

**ileocystoplasty** *n.* *see* **CYSTOPLASTY**.

**ileorectal anastomosis (ileoproctostomy)** a surgical operation in which the ileum is joined to the rectum, usually after surgical removal of the colon (*see* **COLECTOMY**).

**ileostomy** *n.* a surgical operation in which the ileum is brought through the abdominal wall to create an artificial opening (**stoma**) through which the intestinal contents can discharge, thus bypassing the colon. Various types of bag may be worn to collect the effluent. The operation is usually performed in association with a **\*colectomy**; or to allow the colon to rest and heal in refractory cases of colitis; or following injury or surgery to the colon.

**ileum** *n.* the lowest of the three portions of the small **\*intestine**. It runs from the jejunum to the **\*ileocaecal valve**. —**ileal, ileac** *adj.*

**ileus** *n.* intestinal obstruction, usually obstruction of the small intestine (ileum). Clinical symptoms include abdominal pain and distension, vomiting, and absolute constipation. **Paralytic** or **adynamic ileus** is functional obstruction of the ileum due to loss of intestinal movement (peristalsis), which may be caused by abdominal surgery (*see* **LAPAROTOMY**); spinal injuries; electrolyte abnormalities, particularly of potassium (hypokalaemia); peritonitis; or ischaemia. Treatment consists of intravenous administration of fluid and removal of excess stomach secretions by nasogastric tube until peristalsis returns (the 'drip and suck' approach). If possible, the underlying condition is treated. **Mechanical ileus** may be caused by gallstones entering the bowel through a fistula or widened bile duct (**gallstone ileus**); tumour; **\*intussusception**; intestinal **\*volvulus**; foreign bodies; thickened **\*meconium** in newborn babies (**meconium ileus**); or parasitic infestation, for example with the threadworm *Enterobius vermicularis* (**verminous ileus**).

**ili-** (**ilio-**) *combining form denoting the ilium.*

**iliac arteries** the arteries that supply most of the blood to the lower limbs and pelvic region. The right and left **common iliac arteries** form the terminal branches of the abdominal aorta. Each branches into the **external iliac artery** and the smaller **internal iliac artery**.

**iliacus** *n.* a flat triangular muscle situated in the area of the groin. This muscle acts in conjunction with the **\*psoas** muscle to flex the thigh.

**iliac veins** the veins draining most of the blood from the lower limbs and pelvic region. The right and left **common iliac veins** unite to form the inferior vena cava. They are each formed by the union of the **internal** and **external iliac veins**.

**iliopsoas** *n.* a composite muscle made up of the **\*iliacus** and **\*psoas** muscles, which have a common tendon.

**ilium** *n.* the haunch bone: a wide bone forming the upper part of each side of the **\*hip bone** (*see also* **PELVIS**). There is a concave depression (**iliac fossa**) on the inside of the pelvis; the right iliac fossa provides space for the vermiform appendix. —**iliac** *adj.*

**illness** *n.* *see* **DISEASE**.

**illness anxiety disorder** *see* **HYPOCHONDRIA**.

**illusion** *n.* a false perception due to misinterpretation of the stimuli arising from an object. For example, a patient may misinterpret a curtain cord as a snake. Illusions can occur in normal people, but they are usually spontaneously corrected. They may also occur in almost any psychiatric syndrome. *Compare* **HALLUCINATION**.

**image-guided radiotherapy (IGRT)** the process of imaging during a course of radiation treatment to verify the internal position of the target in comparison to the initial planning scan. This enables adjustment of **\*treatment fields** to improve coverage and allows the use of smaller treatment volumes. The possible methods for IGRT include **cone beam CT**, **\*tomotherapy**, **\*cyberknife**, and ultrasound and kilovoltage X-rays of implanted fiducial markers.

**image-guided surgery** *see* [COMPUTER-ASSISTED SURGERY](#).

**image intensifier** an electronic device that provides a TV image from an X-ray source. The X-rays strike a fluorescent screen after passing through the patient, giving off electrons, which are accelerated using an electron lens before striking a second fluorescent screen, which is usually attached to a video camera. The acceleration of the electrons amplifies the signal from the original image, giving a brighter picture, so that the radiation dose can be reduced. Images can be taken from the camera to be observed in real time on a video monitor or, using a brief higher-dose exposure, to provide a more detailed static image (*see* [DIGITAL SPOT IMAGING](#)).

**imagery** *n.* the production of vivid mental representations by the normal processes of thought. **Eidetic imagery**, more common in children than adults, is the production of images of exceptional clarity, which may be recalled long after being first experienced.

**imaging** *n.* (in radiology) the production of images of organs or tissues by a range of techniques. These images are used by physicians in diagnosis and in monitoring the effects of treatment. They can also be used to guide [\\*interventional radiology](#) techniques. *See also* [COMPUTERIZED TOMOGRAPHY](#); [MAGNETIC RESONANCE IMAGING](#); [ULTRASONOGRAPHY](#).

**imago** *n.* (in psychoanalysis) the internal unconscious representation of an important person in the individual's life, particularly a parent.

**imatinib** *n.* a [\\*cytotoxic drug](#) that works by inhibiting tyrosine kinases, enzymes that are active in some cancer cells (*see* [TYROSINE KINASE INHIBITOR](#)). Imatinib is used in the treatment of chronic myeloid leukaemia in which the [\\*Philadelphia chromosome](#) is present, [\\*myeloproliferative disorders](#) associated with abnormalities of the platelet-derived growth factor receptor gene, [\\*gastrointestinal stromal tumours](#) (GIST), and acute lymphoblastic leukaemia. The commonest side-effects are intestinal upset, fluid retention, and muscle pain and cramps.

**imidazole** *n.* one of a group of chemically related antifungal drugs that are also effective against a wide range of bacteria; some (e.g. [\\*tiabendazole](#) and

*\*mebendazole*) are also used as anthelmintics. The group includes *\*econazole*, *\*clotrimazole*, *\*ketoconazole*, and *\*miconazole*.

**imipramine** *n.* a drug administered by mouth to treat depression (*see* **ANTIDEPRESSANT**) and, in children, bedwetting. Common side-effects include dry mouth, blurred vision, constipation, sweating, and rapid heartbeat.

**imiquimod** *n.* a drug used for treating anogenital warts, superficial basal cell carcinoma, and actinic *\*keratosis*.

**imitation** *n.* acting in the same way as another person, either temporarily or permanently. It can be used in therapy (*see* **MODELLING**).

**immersion foot** *see* **TRENCH FOOT**.

**immobilization** *n.* the procedure of making a normally movable part of the body, such as a joint, immovable. This helps infected, diseased, or injured tissue (bone, joint, or muscle) to heal. Immobilization may be temporary (for example, by means of a plaster of Paris cast on a limb) or it may be permanent. Permanent immobilization of a joint is achieved by means of *\*arthrodesis*.

**immune** *adj.* protected against a particular infection by the presence of specific antibodies against the organisms concerned. *See* **IMMUNITY**.

**immune response** the response of the *\*immune system* to antigens. There are two types of immune response produced by two populations of *\*lymphocytes*. B lymphocytes (or B cells) are responsible for **humoral immunity**, producing free antibodies that circulate in the bloodstream; and T lymphocytes (or T cells) are responsible for **cell-mediated immunity** (*see* **HELPER T CELL**; **CYTOTOXIC T CELL**; **SUPPRESSOR T CELL**).

**immune system** the organs responsible for *\*immunity*. The primary *\*lymphoid* organs are the thymus and the bone marrow; the secondary lymphoid organs are the lymph nodes and lymphoid aggregates (spleen, tonsils, gastrointestinal lymph tissue, and Peyer's patches).

**immunity** *n.* the body's ability to resist infection, afforded by the presence of circulating *\*antibodies* and white blood cells. Healthy individuals protect

themselves by means of physical barriers, phagocytic cells, *\*natural killer cells*, and various blood-borne molecules. All of these mechanisms are present prior to exposure to infectious agents and are part of **natural** (or **innate**) **immunity**. Antibodies are manufactured specifically to deal with the antigens associated with different diseases as they are encountered. **Active immunity** arises when the body's own cells produce, and remain able to produce, appropriate antibodies following an attack of a disease or deliberate stimulation (*see* **IMMUNIZATION**). **Passive immunity**, which is only short-lived, is provided by injecting ready-made antibodies in *\*antiserum* taken from another person or an animal already immune. Babies have passive immunity, conferred by antibodies from the maternal blood and *\*colostrum*, to common diseases for several weeks after birth. *See also* **IMMUNE RESPONSE**.

**immunization** *n.* the production of *\*immunity* by artificial means. Passive immunity, which is temporary, may be conferred by the injection of an *\*antiserum*, but the production of active immunity calls for the use of treated antigens, to stimulate the body to produce its own antibodies: this is the procedure of *\*vaccination* (also called **inoculation**). The material used for immunization (the *\*vaccine*) may consist of live bacteria or viruses so treated that they are harmless while remaining antigenic or completely dead organisms or their products (e.g. toxins) chemically or physically altered to produce the same effect.

Childhood immunization schedule	
Age	Vaccine
2 months	DTaP/IPV/Hib/HepB pneumococcal vaccine, rotavirus (oral route)
3 months	DTaP/IPV/Hib/HepB, MenC, rotavirus (oral route)
4 months	DTaP/IPV/Hib/HepB, pneumococcal vaccine, MenB2
12–13 months	Hib/MenC, MMR, pneumococcal vaccine, MenB booster
2–4 years	influenza vaccine
3 years 4 months	DTaP/IPV, MMR
Girls aged 12–13 years	HPV (two doses)
14 years	Td/IPV, MenCAWY

**immuno-** *combining form denoting* immunity or immunological response.

**immunoassay** *n.* any of various techniques for determining the levels of antigen and antibody in a tissue. *See* **IMMUNOELECTROPHORESIS**;

IMMUNOFLUORESCENCE; RADIOIMMUNOASSAY.

**immunocompromised** *adj.* describing patients in whom the immune response is reduced or defective due to **\*immunosuppression**. Such patients are vulnerable to opportunistic infections.

**immunodeficiency** *n.* deficiency in the **\*immune response**. This can be acquired, as in **\*AIDS**, but there are many varieties of primary immunodeficiency occurring as inherited disorders characterized by **\*hypogammaglobulinaemia** or defects in T-cell function, or both.

**immunoelectrophoresis** *n.* a technique for identifying antigenic fractions in a serum. The components of the serum are separated by **\*electrophoresis** and allowed to diffuse through agar gel towards a particular antiserum. Where the antibody meets its antigen, a band of precipitation occurs. *See also* **PRECIPITIN**.

**immunofluorescence** *n.* a technique for observing the amount and/or distribution of antibody or antigen in a tissue section. The antibodies are labelled (directly or indirectly) with a fluorescent dye (e.g. fluorescein) and applied to the tissue, which is observed through an ultraviolet microscope. In **direct immunofluorescence** the antibody is labelled before being applied to the tissue. In **indirect immunofluorescence** the antibody is labelled after it has bound to the antigen, by means of fluorescein-labelled anti-immunoglobulin serum. — **immunofluorescent** *adj.*

**immunogenicity** *n.* the property that enables a substance to provoke an immune response, including foreignness (*see* **ANTIGEN**), size, route of entry into the body, dose, number and length of exposures to the antigen, and host genetic make-up.

**immunoglobulin (Ig)** *n.* one of a group of structurally related proteins (**\*gammaglobulins**) that act as antibodies. Several classes of Ig with different functions are distinguished – IgA, IgD, IgE, IgG, and IgM. They can be separated by **\*immunoelectrophoresis**. *See* **ANTIBODY**.

**immunological tolerance** a failure of the body to distinguish between materials that are ‘self’, and therefore to be tolerated, and those that are ‘not self’, against which it mounts an **\*immune response**. Tolerance results from

the interaction of antigens with lymphocytes under conditions in which the lymphocytes are not activated but rendered unresponsive.

**immunology** *n.* the study of **\*immunity** and all of the phenomena connected with the defence mechanisms of the body. — **immunological** *adj.*

**immunosuppressant** *n.* a drug, such as **\*azathioprine** or **\*cyclophosphamide**, that reduces the body's resistance to infection and other foreign bodies by suppressing the immune system. Immunosuppressants are used to maintain the survival of organ and tissue transplants and to treat various **\*autoimmune diseases**, including rheumatoid arthritis (*see* **DISEASE-MODIFYING ANTIRHEUMATIC DRUG**). **\*Ciclosporin** is the immunosuppressant usually used in organ transplant recipients. Because immunity is lowered during treatment with immunosuppressants, there is an increased susceptibility to infection and certain types of cancer.

**immunosuppression** *n.* suppression of the **\*immune response**, usually by disease (e.g. AIDS) or by drugs (e.g. steroids, azathioprine, ciclosporin).

**immunotherapy** *n.* the prevention or treatment of disease using agents that may modify the immune response. It is a largely experimental approach, studied most widely in the treatment of leukaemias (especially hairy-cell leukaemia), melanoma, and renal cell carcinoma. *See* **BIOLOGICAL RESPONSE MODIFIER**.

**immunotoxin** *n.* one of a class of compounds being studied for the treatment of certain cancers. Therapeutic immunotoxins combine **\*monoclonal antibodies**, which can specifically target cancerous cells, with a highly toxic compound (such as **\*ricin**) that inactivates the cells' **\*ribosomes** and thus inhibits protein synthesis. Because the toxin does not attack the whole cell only tiny amounts are required.

**immunotransfusion** *n.* the transfusion of an **\*antiserum** to treat or give temporary protection against a disease.

**impacted** *adj.* firmly wedged. An **impacted tooth** (usually a wisdom tooth) is one that cannot erupt into a normal position because it is obstructed by other tissues. **Impacted faeces** are so hard and desiccated that they cannot pass spontaneously through the anus without medical (or surgical)

intervention (*see* [CONSTIPATION](#)). An **impacted fracture** is one in which the bone ends are driven into each other. —**impaction** *n*.

**impaired fasting glucose (IFG)** *see* [GLUCOSE TOLERANCE TEST](#).

**impaired glucose tolerance (IGT)** *see* [GLUCOSE TOLERANCE TEST](#).

**impairment** *n*. any loss or abnormality of body or mind sufficient to prevent or reduce normal functioning. *See* [DISABILITY](#).

**impalpable** *adj*. describing a structure within the body that cannot be detected (or that can be detected only with difficulty) by feeling with the hand.

**imperative** *n*. in ethics, a rule, principle, or law used to direct or guide one's actions. \*[Kantian ethics](#) distinguishes between **categorical** and **hypothetical imperatives**. Whereas the latter are merely prudent or expedient and will vary with circumstances, the former are binding moral \*[duties](#) and it is rational that they are applicable to all situations and people. *See also* [DEONTOLOGY](#).

**imperforate** *adj*. lacking an opening. Occasionally girls at puberty are found to have an **imperforate hymen** (a fold of membrane close to the vaginal orifice), which impedes the flow of menstrual blood.

**imperforate anus (proctatresia)** partial or complete obstruction of the anus: a congenital malformation in which the anal canal fails to develop correctly and the rectum ends blindly above the muscles of the perineum. Many types exist, including **developmental anal stenosis**, **persistent anal membrane**, and **covered anus** (due to fused genital folds). Most mild cases of imperforate anus can be treated by a simple operation. If the defect is extensive a temporary opening is made in the colon (*see* [COLOSTOMY](#)), with later surgical reconstruction of the rectum and anus.

**impetigo** *n*. a superficial bacterial infection of the skin. **Nonbullous impetigo** is caused by *Staphylococcus aureus*, *Streptococcus* species, or both organisms; it mainly affects young children and is highly contagious, with yellowish-brown crusting. **Bullous impetigo** is caused by *Staph. aureus*; it is characterized by blisters, is less contagious than the nonbullous form, and

occurs at any age. Treatment of impetigo is with topical or systemic antibiotics.

**implant** *n.* **1.** a drug (such as a subcutaneous hormone implant), a prosthesis (such as an artificial hip, an **intraocular lens implant** (*see* CATARACT), a *\*breast implant*, a *\*cochlear implant*, or an artificial heart implant: *see* VENTRICULAR ASSIST DEVICE), or a radioactive source (such as radium needles) that is put into the body. **2.** (in dentistry) a rigid structure that is embedded in bone or under its periosteum to provide support for replacement teeth on a *\*denture*, *\*crown*, or *\*bridge*. Recent types (**osseointegrated implants**) consist of a number of special titanium alloy inserts (fixtures), placed in the jawbone, onto which abutments are fitted after the bone has healed and fused with the fixture. Later an artificial-tooth superstructure is bolted onto the abutments. Osseointegrated implants are also used to retain facial *\*prostheses*. *See also* OSSEOINTEGRATION.

**implantable cardioverter defibrillator (ICD)** a self-contained device, similar to a *\*pacemaker*, that monitors heart rhythm and delivers an electric shock to correct life-threatening arrhythmia. *See also* DEFIBRILLATOR.

**implantable hearing aid** a form of hearing aid in which a small electrical vibrator is surgically attached to the auditory *\*ossicles*. An external device with a microphone and an electronic processing unit passes information to the implanted device using radio-frequency waves. The external part is located behind the pinna and is powered by batteries.

**implantable loop recorder (ILR)** a device, inserted beneath the skin of the chest, to record the heart rhythm for up to two years. It is usually used for the investigation of patients presenting with infrequent syncope (fainting) in whom arrhythmia is the suspected cause. When syncope occurs, the device can be examined using wireless technology to reveal the heart rhythm at the time of the episode.

**implantation** *n.* **1. (nidation)** the attachment of the early embryo to the lining of the uterus, which occurs at the *\*blastocyst* stage of development, six to eight days after ovulation. The site of implantation determines the position of the placenta. **2.** the placing of a substance (e.g. a drug) or an object (e.g. an

artificial pacemaker) within a tissue. **3.** the surgical replacement of damaged tissue with healthy tissue (*see* [TRANSPLANTATION](#)).

**impotence** *n.* inability of a man to have sexual intercourse (*\*coitus*). *See* [ERECTILE DYSFUNCTION](#).

**impression** *n.* (in dentistry) a negative imprint (mould) of the teeth and surrounding soft tissues or of a toothless jaw. A soft impression material (e.g. silicone or alginate) is placed over the teeth or jaw and sets within several minutes, producing an elastic mould. Impressions may also be taken with hard-setting materials (e.g. plaster or zinc oxide–eugenol cement). From the impression, a positive reproduction (cast or model) can be made out of plaster or stone. On these are constructed *\*restorations* of teeth, *\*dentures*, or *\*orthodontic appliances*.

**imprinting** *n.* **1.** (in animal behaviour) a rapid and irreversible form of learning that takes place in some animals during the first hours of life. Animals attach themselves in this way to members of their own species, but if they are exposed to creatures of a different species during this short period, they become attached to this species instead. **2.** (in genetics) a phenomenon whereby gene expression depends on whether the chromosome is maternal or paternal in origin. For example, both *\*Prader-Willi syndrome* and *\*Angelman syndrome* are caused by a *\*deletion* of the same part of chromosome 15. When the deletion involves the chromosome 15 that came from the father, the child has Prader-Willi syndrome; inheritance of the same deletion from the mother results in Angelman syndrome.

**impulse** *n.* (in neurology) *see* [NERVE IMPULSE](#).

**IMRT** *see* [INTENSITY-MODULATED RADIOTHERAPY](#).

**in- (im-)** *prefix denoting* **1.** not. **2.** in; within; into.

**inanition** *n.* a condition of exhaustion caused by lack of nutrients in the blood. This may arise through starvation, malnutrition, or intestinal disease.

**inappetence** *n.* lack of desire, usually for food.

**in articulo mortis** Latin: at the moment of death.

**inborn error of metabolism** any one of a group of inherited conditions in which there is a disturbance in either the structure, synthesis, function, or transport of protein molecules. There are over 1500 inborn errors of metabolism; examples are *\*phenylketonuria*, *\*homocystinuria*, and *\*hypogammaglobulinaemia*.

**inbreeding** *n.* the production of offspring by parents who are closely related; for example, who are first cousins or siblings. The amount of inbreeding in a population is largely controlled by culture and tradition. *Compare* **OUTBREEDING**.

**incarcerated** *adj.* confined or constricted so as to be immovable: applied particularly to a type of *\*hernia*.

**incidence rate** a measure of morbidity based on the number of new episodes of illness arising in a population over a period of time. It can be expressed in terms of affected persons or episodes per 1000 individuals at risk. *Compare* **PREVALENCE**.

**incidentaloma** *n.* a growth found incidentally on (usually) an adrenal gland (**adrenal incidentaloma**) during CT or MRI scanning of the abdomen or thorax for other clinical reasons. These growths are rarely significant, particularly if small, but they may be pathological if the patient has symptoms (e.g. hypertension, flushing) that could be attributable to an adrenal tumour.

**incision** *n.* the surgical cutting of soft tissues, such as skin or muscle, with a knife or scalpel. The site and type of incision depends on the area needed to be accessed during the procedure and lines of skin tension (Langer's lines). *See* diagram.

### Incisions.

**incisional hernia** a hernia that occurs through a defect at the site of a previous surgical incision.

**incisor** *n.* any of the four front teeth in each jaw, two on each side of the midline. They are normally spade-shaped and narrow-edged for cutting. *See also* **DENTITION**.

**incisure** *n.* (in anatomy) a notch, small hollow, or depression.

**inclusion bodies** particles occurring in the nucleus and cytoplasm of cells usually as a result of virus infection. Their presence can sometimes be used to diagnose such an infection.

**inclusion conjunctivitis** a sexually transmitted disease caused by *Chlamydia trachomatis*. It can be transmitted to infants at birth, with the disease clinically apparent 5–13 days after birth. Diagnosis is by cell culture. Treatment in the newborn is with topical erythromycin; adults require oral tetracycline or doxycycline for three weeks.

**income support** an income-related benefit payable to those whose income and savings do not exceed a specified maximum level and who do not work full-time. It is currently being replaced by **\*universal credit**.

**incompatibility** *n.* *see* **COMPATIBILITY**.

**incompetence** *n.* **1.** impaired function of the valves of the heart or veins, which allows backward leakage of blood. *See* **AORTIC REGURGITATION**;

**MITRAL REGURGITATION; VARICOSE VEINS.** **2. (incapacity)** impairment of mental functioning such that a person is unable to understand, retain, and weigh up information so as to communicate a choice or preference. **3.** inability to fulfil the responsibilities and meet the standards of care expected of individuals working in a professional role in health care.

**incontinence** *n.* **1. (urinary incontinence)** the inappropriate involuntary passage of urine, resulting in wetting. **Stress incontinence** is the loss of urine on exertion (e.g. coughing and straining). It is common in women in whom the muscles of the pelvic floor are weakened after childbirth. **Urodynamic stress incontinence** (formerly called **genuine stress incontinence**) in women is due to a simultaneous rise in bladder and abdominal pressure that exceeds urethral pressure without a contraction of the detrusor muscle of the bladder. **Overflow incontinence** is leakage from a full bladder, which occurs most commonly in elderly men with bladder outlet obstruction or in patients with neurological conditions affecting bladder control. **Urge incontinence** is leakage of urine that accompanies an intense desire to pass water with failure of restraint. It is frequently caused by **\*detrusor** instability. *See also* **ENURESIS.** **2. (faecal incontinence, anal incontinence)** inability to control bowel movements, causing involuntary loss of faeces or flatus.

<https://www.bladderandbowel.org/>

- Website of the Bladder and Bowel Foundation

**incoordination** *n.* (in neurology) an impairment in the performance of precise movements. These are dependent upon the normal function of the whole nervous system, and incoordination may result from a disorder in any part of it, especially the **\*cerebellum**. *See* **APRAXIA; ATAXIA; DYSMETRIA.**

**incretin** *n.* any one of a group of gastrointestinal hormones that cause a decrease in blood glucose levels by stimulating an enhanced release of insulin from the pancreatic beta cells after eating. Thus they help to regulate the rise in blood glucose levels after eating and they have some additional actions that can enhance satiety – through effects on the brain and through gastrointestinal effects, such as delayed gastric emptying. Incretin-based

drugs mimic the effects of the incretin *\*glucagon-like peptide-1* (GLP-1). They include *\*GLP-1 receptor agonists* and *\*DPP-IV inhibitors*.

**incubation** *n.* **1.** the process of development of an egg or a culture of bacteria. **2.** the care of a premature baby in an *\*incubator*.

**incubation period (latent period)** **1.** the interval between exposure to an infection and the appearance of the first symptoms. **2.** (in bacteriology) the period of development of a bacterial culture.

**incubator** *n.* a transparent container for keeping premature babies in controlled conditions and protecting them from infection. Other forms of incubator are used for cultivating bacteria in Petri dishes and for hatching eggs.

**incus** *n.* a small anvil-shaped bone in the middle *\*ear* that articulates with the malleus and the stapes. *See* **OSSICLE**.

**independent contractors** (in Britain) *\*general practitioners*, *\*dentists*, and others who are not employees of the *\*National Health Service* but who receive payment to provide an agreed level of service.

**Independent Mental Capacity Advocate (IMCA)** a person who must, by virtue of the *\*Mental Capacity Act 2005*, be contacted to represent the *\*best interests* of a patient who lacks *\*capacity* and has no family or friends while acting as a proxy in medical decision-making. IMCAs are available via the local **Independent Mental Capacity Advocacy Service**.

**Inderal-LA** *n. see* **PROPRANOLOL**.

**indican** *n.* a compound excreted in the urine as a detoxification product of *\*indoxyl*. Indican is formed by the conjugation of indoxyl with sulphuric acid and potassium on the decomposition of tryptophan.

**indicanuria** *n.* the presence in the urine of an abnormally high concentration of *\*indican*. This may be a sign that the intestine is obstructed.

**indication** *n.* (in medicine) **1.** a strong reason for believing that a particular course of action is desirable. In a wounded patient, the loss of blood, which would lead to circulatory collapse, is an indication for blood transfusion. **2.**

any of the conditions for which a particular drug treatment may be prescribed, as defined by its *\*licence*. Compare CONTRAINDICATION.

**indigestion** *n.* see DYSPEPSIA.

**indinavir** *n.* see PROTEASE INHIBITOR.

**indocyanine green angiography** see ANGIOGRAPHY.

**indole** *n.* a derivative of the amino acid tryptophan, excreted in the urine and faeces. Abnormal patterns of urinary indole excretion are found in some mentally retarded patients.

**indolent** *adj.* describing a disease process that is failing to heal or has persisted. The term is applied particularly to ulcers of skin or mucous membrane.

**indometacin (indomethacin)** *n.* an anti-inflammatory drug (see NSAID), used mainly for the relief of pain and severe inflammation in the treatment of rheumatic disease and similar disorders. Common side-effects are headache, dizziness, and digestive upsets. It is also used in the treatment of patent *\*ductus arteriosus*.

**indoramin** *n.* an *\*alpha blocker* drug used to treat high blood pressure and to relieve urinary retention due to benign enlargement of the *\*prostate gland*. Possible side-effects can include drowsiness, nasal congestion, dry mouth, and failure of ejaculation.

**indoxyl** *n.* an alcohol derived from *\*indole* by bacterial action. It is excreted in the urine as *\*indican*.

**induced abortion** see ABORTION.

**inducer** *n.* see DELUSION BY PROXY; DOUBLE DELUSION; FOLIE À DEUX.

**induction** *n.* **1.** (in obstetrics) the starting of labour by artificial means. It is carried out using such drugs as *\*prostaglandins* to prime the cervix and/or *\*amniotomy* prior to synthetic *\*oxytocin* (Syntocinon), which stimulate uterine contractions. Induction of labour is carried out if the wellbeing or life of mother or child is threatened by continuance of the pregnancy. **2.** (in

anaesthesia) initiation of *\*anaesthesia*. General anaesthesia is usually induced by the intravenous injection of short-acting *\*anaesthetics*, e.g. thiopental.

**induction loop system (loop system)** a device for helping people with some types of *\*hearing aid* or *\*cochlear implant* to hear more effectively in certain situations. Electrical signals from a television, sound system, or microphone are passed through an amplifier to a wire that is positioned in a loop encompassing the desired listening area. This creates an electromagnetic field that can be picked up by a coil within the hearing aid or cochlear implant. Induction loops are installed in such places as public buildings, lecture theatres, classrooms, and churches. *See also* **ASSISTIVE LISTENING DEVICE**.

**induration** *n.* abnormal hardening of a tissue or organ. *See also* **SCLEROSIS**.

**indusium** *n.* a thin layer of grey matter covering the upper surface of the *\*corpus callosum* between the two cerebral hemispheres.

**industrial disease** *see* **OCCUPATIONAL DISEASE**.

**industrial injuries disablement benefit** a state benefit payable to a person disabled by injury or a prescribed industrial disease sustained or contracted in the course of employment (*see* **OCCUPATIONAL DISEASE**; **PRESCRIBED DISEASE**). The benefit is payable as a weekly amount. The amount of the benefit depends on the degree of disablement as determined following assessment by a specialist. To be entitled to benefit, the disablement must be assessed as being at least 20% of total disability (1% in the case of pneumoconiosis, byssinosis, and diffuse mesothelioma). The benefit is payable if the claimant is still suffering disability two months or more after the date of the accident or onset of the disease. It is payable for a period assessed as the time for which the claimant is likely to suffer the disability. The assessment can be reviewed if the claimant's condition deteriorates or if he or she is still disabled at the end of the period of assessment.

**inertia** *n.* (in physiology) sluggishness or absence of activity in certain smooth muscles. In **uterine inertia** the muscular wall of the uterus fails to contract adequately during labour, making the process excessively long. This inertia may be present from the start of labour or it may develop because of

exhaustion following strong contractions and can lead to increased risk of atonic *\*postpartum haemorrhage*. *See also* **SHOULDER DYSTOCIA**.

**in extremis** Latin: at the point of death.

**infant** *n.* a child incapable of any form of independence from its mother: the term is usually used to refer to a child under one year of age, especially a premature or newborn child. In legal use the term denotes a child up to the age of seven years.

**infanticide** *n.* (in England and Wales) under the terms of the Infanticide Act 1938, the killing of an infant by the natural mother within 12 months of birth. Where it can be shown that the woman's balance of mind was disturbed due to childbirth and/or lactation she would not normally be charged with murder but with infanticide, which carries a much lighter sentence. As a result, it is uncommon for a mother who kills her infant child to receive a custodial sentence. Following a report from the Law Commission in 2006, there have been repeated calls for the law to be reformed so that a defence of diminished responsibility is automatically available in such cases.

**infantile** *adj.* **1.** denoting conditions occurring in adults that are recognizable in childhood, e.g. poliomyelitis (**infantile paralysis**) and **infantile scurvy**. **2.** of, relating to, or affecting infants.

**infantile spasms (salaam attacks)** a rare but serious form of epilepsy that usually begins between three and eight months of age. The spasms are involuntary flexing movements of the arms, legs, neck, and trunk; each spasm lasts 1–3 seconds and is associated with flushing of the face, and runs of spasms occur over a period of several minutes. They may occur many times in one day. The baby fails to respond to human contact and development is usually profoundly slowed. An EEG pattern of *\*hypsarrhythmia* is usual and diagnostic. Diagnosis may be delayed as spasms are sometimes confused with colic. Immediate recognition and treatment with antiepileptic medication, corticosteroids, or ACTH offers a chance of arresting the disease, but outcome depends primarily on the nature of the underlying brain abnormality.

**infantilism** *n.* persistence of childlike physical or psychological characteristics into adult life.

**infant mortality rate (IMR)** the number of deaths of children under one year of age per 1000 live births in a given year. Included in the IMR are the **neonatal mortality rate** (calculated from deaths occurring in the first four weeks of life) and **postneonatal mortality rate** (from deaths occurring from four weeks). Neonatal deaths are further subdivided into **early** (first week) and **late** (second, third, and fourth weeks). In prosperous countries neonatal deaths account for about two-thirds of infant mortalities, the majority being in the first week (in the UK the major cause is prematurity and related problems). The IMR is usually regarded more as a measure of social affluence than a measure of the quality of antenatal and/or obstetric care; the latter is more truly reflected in the **\*perinatal mortality rate**.

**infarct** *n.* see **INFARCTION**.

**infarction** *n.* the death of part or the whole of an organ that occurs when the artery carrying its blood supply is obstructed by a blood clot (thrombus) or an **\*embolus**. For example, **\*myocardial infarction**, affecting the muscle of the heart, follows coronary thrombosis. A small localized area of dead tissue produced as a result of an inadequate blood supply is known as an **infarct**. Infarcts also arise when venous outflow from an organ or tissue is obstructed, as occurs when the ovary or testis twist on their vascular pedicles (stalks), or when the sigmoid colon twists in **\*volvulus**.

**infection** *n.* invasion of the body by harmful organisms (pathogens), such as bacteria, fungi, protozoa, rickettsiae, or viruses. The infective agent may be transmitted by a patient or **\*carrier** in airborne droplets expelled during coughing and sneezing or by direct contact, such as kissing or sexual intercourse (see **SEXUALLY TRANSMITTED DISEASE**); by animal or insect **\*vectors**; by ingestion of contaminated food or drink; or from an infected mother to the fetus during pregnancy or birth. Pathogenic organisms present in soil, organisms from animal intermediate hosts, or those living as **\*commensals** on the body can also cause infections. Organisms may invade via a wound or bite or through mucous membranes. After an **\*incubation period** symptoms appear, usually consisting of either localized inflammation and pain or more remote effects. Treatment with antibiotics is usually effective against most infections, but there are few specific treatments for many of the common viral infections, including the common cold (see **ANTIVIRAL DRUG**; **INTERFERON**).

**infectious disease** *see* COMMUNICABLE DISEASE.

**infectious mononucleosis** *see* GLANDULAR FEVER.

**inferior** *adj.* (in anatomy) lower in the body in relation to another structure or surface.

**inferior dental block (inferior alveolar nerve block)** a type of injection to anaesthetize the inferior \***dental nerve**. Inferior dental block is routinely performed to allow dental procedures to be carried out on the lower teeth on one side of the mouth.

**inferior dental canal** a bony canal in the \***mandible** on each side. It carries the inferior \***dental nerve** and vessels and for part of its length its outline is visible on a radiograph.

**inferiority complex** **1.** an unconscious and extreme exaggeration of feelings of insignificance or inferiority, which may be shown by behaviour that is defensive or compensatory (such as aggression). **2.** (in Freudian psychoanalysis) a \***complex** said to result from the conflict between Oedipal wishes (*see* OEDIPUS COMPLEX) and the reality of the child's lack of power. This gives rise to repressed feelings of personal inferiority if not worked through.

**infertility** *n.* inability in a woman to conceive or in a man to induce conception after regular unprotected sexual intercourse for two years. Female infertility may be due to failure to ovulate, to obstruction of the \***Fallopian tubes**, or to disease of the lining of the uterus (endometrium). Possible treatments (depending on the cause) include administration of drugs (such as \***clomifene** or \***gonadorelin analogues**), surgery (*see* SALPINGOGRAPHY; SALPINGOSTOMY; SALPINGOLYSIS) to restore patency of the Fallopian tubes, \***gamete intrafallopian transfer** (GIFT), and \***in vitro fertilization**. Causes of male infertility include decreased numbers or motility of spermatozoa (*see* OLIGOSPERMIA) and total absence of sperm (*see* AZOOSPERMIA). *See also* ANDROLOGY; STERILITY.

**infestation** *n.* the presence of animal parasites either on the skin (for example ticks) or inside the body (for example tapeworms).

**infibulation** *n.* *see* FEMALE GENITAL MUTILATION.

**infiltration** *n.* **1.** the abnormal entry of a substance (**infiltrate**) into a cell, tissue, or organ. Examples of infiltrates are blood cells, cancer cells, fat, starch, or calcium and magnesium salts. Infiltration can occur when a vein is damaged and the fluid being infused continues to leak out and accumulate in the surrounding tissue (also known as ‘tissuing’). This can result in inflammation. **2.** the injection of a local anaesthetic solution into the tissues to cause local *\*anaesthesia*. Infiltration anaesthesia is routinely used to anaesthetize upper teeth to allow dental procedures to be carried out.

**inflammation** *n.* the body’s response to injury, which may be acute or chronic. **Acute inflammation** is the immediate defensive reaction of tissue to any injury, which may be caused by infection, chemicals, or physical agents. It involves pain, heat, redness, swelling, and loss of function of the affected part. Blood vessels near the site of injury are dilated, so that blood flow is locally increased. White blood cells enter the tissue and begin to engulf bacteria and other foreign particles. Similar cells from the tissues (*see* **MACROPHAGE**) remove and consume the dead cells, sometimes with the production of pus, enabling the process of healing to commence. In certain circumstances healing does not occur and **chronic inflammation** ensues.

**inflammatory bowel disease (IBD)** a group of inflammatory disorders of the gastrointestinal tract characterized by relapsing and remitting inflammation. The most common types are *\*ulcerative colitis* and *\*Crohn’s disease*.

**infliximab** *n.* a *\*monoclonal antibody* that inhibits the activity of *\*tumour necrosis factor* (TNF- $\alpha$ ; *see* **CYTOKINE INHIBITOR**). It is used to treat severe Crohn’s disease and ulcerative colitis, and rheumatoid arthritis, ankylosing spondylitis, and psoriatic arthritis that have failed to respond to treatment with corticosteroids or immunosuppressants and antirheumatic drugs, respectively. Side-effects include intestinal upset, flushing, and allergic reactions.

**influenza** *n.* a highly contagious virus infection that affects the respiratory system. Types A and B are the forms that most commonly cause outbreaks in humans. The viruses are transmitted by coughing and sneezing. Symptoms commence after an incubation period of 1–4 days and include headache, fever, loss of appetite, weakness, and general aches and pains. They may

continue for about a week. With bed rest and aspirin most patients recover, but a few may go on to develop pneumonia, either a primary influenzal viral pneumonia or a secondary bacterial pneumonia. Either of these may lead to death from haemorrhage within the lungs. The main bacterial organisms responsible for secondary infection are *Streptococcus pneumoniae*, *Haemophilus influenzae*, and *Staphylococcus aureus*, against which appropriate antibiotic therapy must be given.

An influenzal infection provides later protection only against the specific strain of virus concerned; the same holds true for immunization. Strains are classified according to the presence of different subtypes of two glycoproteins (antigens) on the viral surface: *\*haemagglutinin* (H) and *\*neuraminidase* (N). Small changes in the structure of these antigens, which occur frequently in influenza A and B viruses, require the continual development of new vaccines to protect against annual outbreaks of the disease. Major changes in antigenic structure occur much more rarely, when there is genetic recombination between strains that can infect more than one species (most strains of the virus are highly species-specific). However, when it does occur, it could result in the development of hybrid strains causing new forms of influenza that are difficult to contain; the pandemic of 1918–19 is thought to have arisen in this way (*see also* [AVIAN INFLUENZA](#); [SWINE INFLUENZA](#)).

**Information Commissioner** the person in charge of the independent public agency set up to regulate the use and storage of personal data under the Data Protection Act 1998 (*see* [DATA PROTECTION](#)). The office of the Information Commissioner both regulates the use of data under the Act and takes any enforcement action required as a result of noncompliance with the principles of the statute. The Information Commissioner's office also promotes public access to official information under the Freedom of Information Act 2000.

**informed consent** the principle that requires clinicians to provide sufficient information to patients or potential research participants in order to render their *\*consent* lawful. How much information and of what kind is regarded as sufficient depends on the seriousness of what is proposed and on the understanding of those from whom consent is required.

**infra-** *prefix denoting below.*

**infracolic omentectomy** *see* OMENECTOMY.

**infrared radiation** the band of electromagnetic radiation that is longer in wavelength than the red of the visible spectrum. Infrared radiation is responsible for the transmission of radiant heat. It may be used in physiotherapy to warm tissues, reduce pain, and improve circulation, but is not as effective as *\*diathermy* for deep structures. Special photographic film, which is sensitive to infrared radiation, is used in *\*thermography*.

**infundibulum** *n.* any funnel-shaped channel or passage, particularly the hollow conical stalk that extends downwards from the hypothalamus and is continuous with the posterior lobe of the pituitary gland.

**infusion** *n.* **1.** the slow injection of a substance, usually into a vein (**intravenous (IV) infusion**). This is a common method for replacing water, electrolytes, and blood products and is also used for the continuous administration of drugs (e.g. antibiotics, painkillers) or *\*nutrition*. *See also* DRIP. **2.** the process whereby the active principles are extracted from plant material by steeping it in water that has been heated to boiling point (as in the making of tea). **3.** the solution produced by this process.

**ingesta** *pl. n.* food and drink that is introduced into the alimentary canal through the mouth.

**ingestion** *n.* **1.** the process by which food is taken into the alimentary canal. It involves chewing and swallowing. **2.** the process by which a phagocytic cell takes in solid material, such as bacteria.

**ingravescent** *adj.* gradually increasing in severity.

**ingrowing toenail** downward curving of the sides of a toenail, which causes chafing of the skin alongside the nail resulting in inflammation around the base of the nail.

**inguinal** *adj.* relating to or affecting the region of the groin (ingen).

**inguinal canal** either of a pair of openings that connect the abdominal cavity with the scrotum in the male fetus. The inguinal canals provide a route for the descent of the testes into the scrotum, after which they normally become obliterated.

**inguinal hernia** *see* [HERNIA](#).

**inguinal ligament (Poupart's ligament)** a ligament in the groin that extends from the anterior superior iliac spine to the pubic tubercle. It is part of the *\*aponeurosis* of the external oblique muscle of the abdomen.

**INH** *see* [ISONIAZID](#).

**inhalation** *n.* **1. (inspiration)** the act of breathing air into the lungs through the mouth and nose. *See* [BREATHING](#). **2.** a gas, vapour, or aerosol breathed in for the treatment of conditions of the respiratory tract. —**inhaler** *n.*

**inherited thrombophilias** *see* [THROMBOPHILIA](#).

**inhibin** *n.* *see* [ACTIVIN](#).

**inhibition** *n.* **1.** (in physiology) the prevention or reduction of the functioning of an organ, muscle, etc., by the action of certain nerve impulses. **2.** (in psychoanalysis) an inner command that prevents one from doing something forbidden. Some inhibitions are essential for social adjustment, but excessive inhibitions can severely restrict one's life.

**inhibitor** *n.* a substance that prevents the occurrence of a given process or reaction. *See also* [MAO INHIBITOR](#).

**inion** *n.* the projection of the occipital bone that can be felt at the base of the skull.

**initiation** *n.* (in oncology) the first step in the development of cancer (*see* [CARCINOGENESIS](#)).

**initiator** (in oncogenesis) *n.* a substance that induces an irreversible change in a cell's DNA that can result in a cancer. An example is dimethylbenzanthracene. *Compare* [PROMOTER](#).

**injection** *n.* introduction into the body of drugs or other fluids by means of a syringe, usually drugs that would be destroyed by the digestive processes if taken by mouth. Common routes for injection are into the skin (**intracutaneous** or **intradermal**); below the skin (**subcutaneous**), e.g. for insulin; into a muscle (**intramuscular**), for drugs that are slowly absorbed;

and into a vein (**intravenous, IV**), for drugs to be rapidly absorbed. **\*Enemas** are also regarded as injections.

**injury scoring system (injury severity scale, ISS)** a system used, particularly in **\*triage**, for grading the severity of an injury. *See also* **ABBREVIATED INJURY SCALE**.

**inlay** *n.* **1.** a substance or piece of tissue placed within a tissue, generally to replace a defect. For example, a bone graft may be inlaid into an area of missing or damaged bone, or an aortic prosthesis placed using an inlay technique within an aneurysm. **2.** (in dentistry) a rigid restoration inserted into a tapered cavity in a tooth. It is held in place with a cement **\*lute**. While cast gold has been the most widely used material, porcelain and composite resin are also used.

**inlet** *n.* an aperture providing the entrance to a cavity, such as that of the pelvis.

**innate** *adj.* describing a condition or characteristic that is present in an individual at birth and is inherited from his parents. *See also* **CONGENITAL**.

**inner ear** *see* **LABYRINTH**.

**innervation** *n.* the nerve supply to an area or organ of the body, which can carry either motor impulses to the structure or sensory impulses away from it towards the brain.

**innominate artery (brachiocephalic artery)** a short artery originating as the first large branch of the **\*aortic arch**, passing upwards to the right, and ending at the lower neck near the right sternoclavicular joint. Here it divides into the right common carotid and the right subclavian arteries.

**innominate bone** *see* **HIP BONE**.

**innominate vein (brachiocephalic vein)** either of two veins, one on each side of the neck, formed by the junction of the external jugular and subclavian veins. The two veins join to form the superior vena cava.

**INO** internuclear ophthalmoplegia (*see* **OPHTHALMOPLÉGIA**).

**ino-** *combining form denoting* **1.** fibrous tissue. **2.** muscle.

**inoculation** *n.* the introduction of a small quantity of material, such as a vaccine, in the process of **\*immunization**: a more general name for **\*vaccination**.

**inoculum** *n.* any material that is used for inoculation.

**inosine pranobex** a **\*antiviral drug** that is administered by mouth to treat herpes simplex infections (cold sores and genital herpes) and genital warts.

**inositol** *n.* a compound, similar to a hexose sugar, that is a constituent of some cell phospholipids. Inositol is present in many foods, in particular in the bran of cereal grain. It is sometimes classified as a vitamin but it can be synthesized by most animals and there is no evidence that it is an essential nutrient in humans.

**inositol triphosphate (IP<sub>3</sub>)** a short-lived biochemical **\*second messenger** formed from **\*phospholipid** in the cell membrane when a chemical messenger (e.g. a hormone or serotonin) binds to receptors on the cell surface. Inositol triphosphate triggers the rapid release of calcium into the cell fluid, which initiates various cellular processes, such as smooth muscle contraction and the release of glucose, histamine, etc. Inositol triphosphate exists for only a few seconds before being converted to inositol by the action of a sequence of enzymes.

**inotropic** *adj.* affecting the contraction of heart muscle. Drugs such as **\*dobutamine**, **\*dopamine**, and **\*enoximone** have positive inotropic action, stimulating heart muscle contractions and causing the heart rate to increase. **\*Beta-blocker** drugs, such as **\*propranolol**, have negative inotropic action, reducing heart muscle contractions and causing the heart rate to decrease.

**Inoue balloon** *see* **MITRAL STENOSIS; VALVULOPLASTY**.

**in-patient** *n.* a patient who is admitted to a bed in a hospital ward and remains there for a period of time for treatment, examination, or observation. *Compare* **OUT-PATIENT**.

**inquest** *n.* an official judicial enquiry into the cause of a person's death: carried out when the death is sudden or takes place under suspicious circumstances. The results of medical and legal investigations that have been

carried out are considered by a **\*coroner**, sitting with or without a jury, and made publicly known. *See also* **AUTOPSY**.

**INR** International Normalized Ratio: the ratio of a patient's **\*prothrombin time** (PT; i.e. the time taken for the patient's blood to clot) to a standardized 'normal' PT. It is used to monitor anticoagulant (usually warfarin) dosage. A normal INR is up to 1.2. Treatment usually aims to keep the ratio 2.0–3.0.

**insanity** *n.* a degree of mental illness such that the affected individual is not responsible for his actions or is not capable of entering into a legal contract. The term is a legal rather than a medical one.

**insect** *n.* a member of a large group of mainly land-dwelling **\*arthropods**. The body of the adult is divided into a head, thorax, and abdomen. The head bears a single pair of sensory antennae; the thorax bears three pairs of legs and, in most insects, wings (these are absent in some parasitic groups, such as lice and fleas). Some insects are of medical importance. Various bloodsucking insects transmit tropical diseases, for example the female *Anopheles* mosquito transmits malaria and the tsetse fly transmits sleeping sickness. The bites of lice can cause intense irritation and, secondarily, bacterial infection. The organisms causing diarrhoea and dysentery can be conveyed to food on the bodies of flies. *See also* **MYIASIS**.

**insecticide** *n.* a preparation used to kill insects. Ideally, an insecticide should have no toxic effects when ingested by human beings or animals, but modern powerful compounds have inherent dangers and have caused fatalities. Some insect powders contain organic phosphorus compounds and fluorides; when ingested accidentally they may cause damage to the nervous system. The use of such compounds is generally under strict control. *See also* **DDT**; **DIELDRIN**.

**insemination** *n.* introduction of semen into the vagina. *See also* **ARTIFICIAL INSEMINATION**; **INTRAUTERINE INSEMINATION**.

**insertion** *n.* (in anatomy) the point of attachment of a muscle (e.g. to a bone) that is relatively movable when the muscle contracts. *Compare* **ORIGIN**.

**insight** *n.* one's level of awareness of one's illness. Insight can be fully or partially intact or absent. Full insight requires an understanding that one has

an illness, seeks help, and complies with treatment. Insight can be impaired temporarily through drug intoxication or through medical or mental illness or permanently after brain damage or in some cases of *\*dementia*. The term is also applied in psychology to the patient's accuracy of understanding the development of his or her personality and problems; in this sense insight can be enhanced by psychotherapy.

**insolation** *n.* exposure to the sun's rays. *See also* **HEATSTROKE**.

**insomnia** *n.* inability to fall asleep or to remain asleep for an adequate length of time. Insomnia may be associated with physical disease, particularly if there are painful symptoms, or psychiatric illnesses, such as depression, anxiety, or mania.

**inspiration** *n.* *see* **INHALATION**.

**inspissated** *adj.* (of secretions, etc.) thickened or dried by evaporation or dehydration.

**instillation** *n.* **1.** the application of liquid medication drop by drop, as into the eye. **2.** the medication, such as eye drops, applied in this way.

**instinct** *n.* **1.** a complex pattern of behaviour innately determined, which is characteristic of all individuals of the same species. The behaviour is released and modified by environmental stimuli, but its pattern is relatively uniform and predetermined. **2.** an innate drive that urges the individual towards a particular goal (for example, *\*libido* in psychoanalytic psychology).

**institutionalization** *n.* a condition produced by long-term residence in an impersonal institution (such as some residential care homes and orphanages) where stimulation is lacking. The individual adapts to the behaviour characteristic of the institution to such an extent that he or she finds it difficult to function in other environments. The features often include apathy, dependence, social withdrawal or awkwardness, and a lack of personal responsibility. The effects of institutionalization on mental health can be significant and informed the move towards more care in the community.

**insufficiency** *n.* inability of an organ or part, such as the heart or kidney, to carry out its normal function.

**insufflation** *n.* the act of blowing gas or a powder, such as a medication, into a body cavity.

**insula** *n.* an area of the **\*cerebral cortex** that is overlapped by the sides of the deep lateral sulcus (cleft) in each hemisphere.

**insulin** *n.* a protein hormone, produced in the pancreas by the beta cells of the **\*islets of Langerhans**, that is crucial in regulating the amount of sugar (glucose) in the blood. Insulin secretion is stimulated by a high concentration of blood sugar. Lack of this hormone gives rise to **\*diabetes mellitus**, in which large amounts of sugar are present in the blood and urine. This condition may be treated successfully by insulin injections (see **INSULIN ANALOGUES**; **INSULIN PEN**; **ISOPHANE INSULINS**). See also **CONTINUOUS SUBCUTANEOUS INSULIN INFUSION**.

**insulin analogues** a group of synthetic human insulins with specific alterations in their amino-acid sequences designed to modify their rate of absorption from the subcutaneous injection site. Some are absorbed more rapidly and have a shorter duration of action than conventional short-acting human insulin; others are absorbed more slowly at a more consistent rate than conventional medium-acting **\*isophane insulin** to give a more sustained control of fasting and premeal blood glucose levels and therefore a reduced risk of **\*hypoglycaemia**. These analogues include the short-acting **insulin aspart**, **insulin glulisine**, and **insulin lispro**; the long-acting **insulin detemir** and **insulin glargine**; and the ultra-long-acting **insulin degludec**.

**insulinase** *n.* an enzyme, found in such tissues as the liver and kidney, that is responsible for the normal breakdown of insulin in the body.

**insulinoma** *n.* an insulin-producing and usually benign tumour of the beta cells in the **\*islets of Langerhans** of the pancreas. Symptoms can include sweating, faintness, episodic loss of consciousness, and other features of **\*hypoglycaemia** (see **WHIPPLE'S TRIAD**). Single tumours can be removed surgically. Multiple very small tumours scattered throughout the pancreas cannot be treated by surgery but do respond to drugs that poison the beta cells, including **\*diazoxide**.

**insulin pen** a user-friendly penlike device designed to inject a measured dose of insulin, typically containing 3 ml insulin (300 units in total) in a cartridge

chamber. For each injection a new disposable needle is applied to the device. The insulin dose is then 'dialled up' and safely injected subcutaneously. The pen can be capped off and easily stored in a pocket or small bag; some types are disposable when the cartridge is empty, while others can be refilled with a new cartridge.

**insulin resistance** diminution in the response of the body's tissues to insulin, so that higher concentrations of serum insulin are required to maintain normal circulating glucose levels. Eventually the islet cells can no longer produce adequate amounts of insulin for effective glucose lowering, resulting in hyperglycaemia. Insulin resistance is one of the risk factors for cardiovascular disease. *See also* [DIABETES MELLITUS](#); [METABOLIC SYNDROME](#).

**insulin shock** a condition of severe [\\*hypoglycaemia](#). If not treated with glucose or glucagon, coma and death can occur.

**insulin stress test** an important but potentially dangerous test of anterior pituitary function involving the deliberate induction of a hypoglycaemic episode with injected insulin and the subsequent measurement of plasma cortisol and growth hormone at regular intervals over the next three hours. The stress of the hypoglycaemia should induce a rise in the levels of these hormones unless the anterior pituitary or the adrenal glands are diseased. The test can induce epileptic seizures or angina in those with a predisposition and should not be performed in susceptible individuals. It is often combined with the thyrotrophin-releasing hormone (TRH) test and the gonadotrophin-releasing hormone (GnRH) test in what is known as the **triple test** (or dynamic pituitary function test).

**insult** *n.* an injury or physical trauma.

**Intal** *n.* *see* [CROMOGLICATE](#).

**integrated care pathway** a multidisciplinary plan for delivering health and social care to patients with a specific condition or set of symptoms. Such plans are often used for the management of common conditions and are intended to improve patient care by reducing unnecessary deviation from best practice. *See* [CLINICAL GOVERNANCE](#).

**integrated governance** *see* CLINICAL GOVERNANCE.

**integration** *n.* the blending together of the **\*nerve impulses** that arrive through the thousands of synapses at a nerve cell body. Impulses from some synapses cause **\*excitation**, and from others **\*inhibition**; the overall pattern decides whether an individual nerve cell is activated to transmit a message or not.

**integrity** *n.* moral honesty, consistency, and truthfulness: one of the requirements of **\*professionalism**. Integrity is particularly important in health care, where patients are vulnerable in all sorts of ways; it implies that someone can be trusted to behave well beyond their particular role.

**integument** *n.* **1.** the skin. **2.** a membrane or layer of tissue covering any organ of the body.

**intelligence quotient (IQ)** an index of intellectual development. In childhood and adult life it represents intellectual ability relative to the rest of the population; in children it can also represent rate of development (**\*mental age** as a percentage of chronological age). The population's IQ follows almost a normal distribution curve. Most **\*intelligence tests** are constructed so that the resulting intelligence quotients in the general population have a **\*mean** of about 100 and a **\*standard deviation** of about 15. An IQ of below 80 is considered to be indicative of **\*learning disability**.

**intelligence test** a standardized assessment procedure for the determination of intellectual ability. The score produced is usually expressed as an **\*intelligence quotient**. Most tests present a series of different kinds of problems to be solved. The best known are the Wechsler Adult Intelligence Scale (WAIS), the Wechsler Intelligence Scale for Children (WISC), and the Stanford Binet Intelligence Scale. Scores on intelligence tests are used for such purposes as the diagnosis of **\*learning disability** and the assessment of intellectual deterioration.

**intensity-modulated radiotherapy (IMRT)** radiotherapy using multiple beams with variable intensity across each field, resulting in dose distributions that can fit to concave shapes and thus reduce dose to surrounding healthy tissues and organs. It can be used to treat a wide range of cancers and can enable safe delivery of higher doses to tumours.

**intensive therapy unit (ITU, intensive care unit)** a hospital unit designed to give intensive care, provided by specialist multidisciplinary staff, to a selected group of seriously ill patients or to those in need of special postoperative techniques (e.g. those patients undergoing complex heart or lung procedures).

**intention** *n.* **1.** a process of healing. Healing by **first intention** is the natural healing of a wound or surgical incision when the edges are brought together under aseptic conditions and *\*granulation* tissue forms. In healing by **second intention** the wound edges are separated and the cavity is filled with granulation tissue over which epithelial tissue grows from the wound edges. In healing by **third intention** the wound ulcerates, granulations are slow to form, and a scar forms at the wound site. **2.** evaluation of a person's aims or purpose in undergoing an action, which is important for the assessment and attribution of responsibility in ethicolegal questions and defined legally for the purposes of criminal law. *See also* **DOCTRINE OF DOUBLE EFFECT**.

**intention to treat analysis** a research process in which results are reported according to the treatment arm to which a research subject was assigned, rather than the treatment eventually received. Intention to treat analysis is very widely used in clinical research as a method of avoiding *\*bias* resulting from nonrandom withdrawal from the trial or crossover between treatment arms.

**intention tremor** *see* **TREMOR**.

**inter-** *prefix denoting between.* Examples: **intercostal** (between the ribs); **intertrochanteric** (between the trochanters).

**intercalated** *adj.* describing structures, tissues, etc., that are inserted or situated between other structures.

**intercellular** *adj.* situated or occurring between cells.

**intercostal muscles** muscles that occupy the spaces between the ribs and are responsible for controlling some of the movements of the ribs. The superficial **external intercostals** lift the ribs during inspiration; the deep **internal intercostals** draw the ribs together during expiration.

**intercurrent** *adj.* going on at the same time: applied to an infection contracted by a patient who is already suffering from an infection or other disease.

**interferon** *n.* a substance that is produced by cells infected with a virus and has the ability to inhibit viral growth (*see* **CYTOKINES**). Interferon is active against many different viruses, but particular interferons are effective only in the species that produces them. There are three types of human interferon: **alpha** (from white blood cells), **beta** (from fibroblasts), and **gamma** (from lymphocytes).

Human interferon can be produced in bacterial host cells by **\*genetic engineering** for clinical use. **Interferon alfa** is used in treating hepatitis B and C and certain lymphomas and other cancers, **peginterferon alfa** is used for hepatitis B and C, and **interferon beta** for multiple sclerosis. Side-effects, including flulike symptoms, lethargy, and depression, may be severe.

**interkinesis** *n.* **1.** the resting stage between the two divisions of **\*meiosis**. **2.** *see* **INTERPHASE**.

**interleukin** *n.* any of a family of proteins that control some aspects of haemopoiesis and the immune response (*see* **CYTOKINES**). Many interleukins are currently characterized. **Interleukin 1 (IL-1)** is an inflammatory mediator. **Interleukin 2 (IL-2)** stimulates T lymphocytes to become **\*natural killer cells**, active against cancer cells, and is being investigated for the treatment of cancer: recombinant interleukin 2 (**aldesleukin**, Proleukin), administered by subcutaneous injection, can be of benefit in the treatment of renal cell carcinoma.

**intermediate care** a health and social care service that aims to facilitate earlier discharge from hospital or prevent admission to hospital by providing support at a level between **\*primary care** and **\*secondary care**. Intermediate care is provided on a short-term basis, usually no longer than six weeks.

**intermenstrual bleeding** bleeding arising from the genital tract in a woman with a regular menstrual cycle, not occurring at menstruation or following sexual intercourse.

**intermittency** *n.* a **\*lower urinary tract symptom** in which the flow of urine is not continuous but stops and starts.

**intermittent auscultation** a method of fetal monitoring in *\*labour*, with *\*auscultation* of the fetal heart for one minute through a uterine contraction every 15 minutes during the first stage, and after every other contraction, or every 5 minutes, in the second stage of labour.

**intermittent claudication** *see* CLAUDICATION.

**intermittent fever** a fever that rises, subsides, then returns again. *See* MALARIA.

**intermittent pneumatic compression** a technique to prevent thrombosis in bedridden patients. It uses an inflatable device that squeezes the calf when it inflates, preventing pools of blood forming behind the valves in the veins, thus mimicking the effects of walking.

**intermittent self-catheterization (clean intermittent self-catheterization, ISC, CISC)** a procedure in which the patient periodically passes a disposable catheter through the urethra into the bladder for the purpose of emptying it of urine. It is increasingly used in the management of patients of both sexes (including children) with chronic *\*retention* and large residual urine volumes, often due to *\*neuropathic bladder*. ISC may prevent back pressure and dilatation of the upper urinary tract with consequent infection and incontinence.

**intern** *n.* in the USA and some other countries, a trainee doctor, serving in a hospital, who does not yet have a full licence to practise (*compare* RESIDENT). The UK equivalent is the so-called **foundation doctor**, a postgraduate who has embarked on the two-year *\*Foundation Programme* of training (*see* DOCTOR).

**internal medicine** general adult medicine, with a focus on acute, chronic, and complex conditions. A doctor who specializes in this area in a hospital setting is sometimes called an **internist**. From August 2019 all entrants to the British medical profession must undergo a three-year programme of Internal Medicine Training after completion of the *\*Foundation Programme* (*see* Appendix 9).

**International Classification of Diseases (ICD)** a list of all known diseases and syndromes, including mental and behavioural disorders, published by the

\***World Health Organization** every ten years (approximately). Over the years the classification has moved from being disease-orientated to include a wider framework of illness and other health problems. The version in current use, **ICD-10**, was published in 1992 and employs alphanumeric coding. It is used in many countries as the principal means of classifying both mortality and morbidity experience and allows comparison of morbidity and mortality rates nationally and internationally. The clinical utility of the ICD is a matter of some controversy, especially in the field of psychiatry. ICD-11 was published in June 2018 and is intended to come into use from 2022. It includes about 55,000 codes for injuries, diseases, and causes of death, which is three times more than its predecessor. It also differs substantially from **ICD-10** as each disease entry includes descriptions and guidance as to what is covered by the term, rather than the term alone. For the first time it includes specific sections on sexual health and traditional medicine. A parallel list, the **International Classification of Functioning, Disabilities and Health (ICF)**, has also been compiled and is being used alongside the ICD. *See also* **HANDICAP**.

<https://icd.who.int/>

- The standard international classification for statistical, administrative, and epidemiological purposes, as supplied by the World Health Organization

<https://www.who.int/classifications/icf/en/>

- The WHO framework for measuring health and disability in individuals and populations

**International Normalized Ratio** *see* **INR**.

**International Prostate Symptom Score (IPSS)** a self-administered questionnaire, completed by men with \***lower urinary tract symptoms**, which consists of seven questions based on the extent of symptoms and a single quality-of-life question. It gives a numerical score, on a scale of 0 to 35, to indicate the severity of the patient's symptoms. A score of 0–7 indicates mild

symptoms, 8–19 moderate symptoms, and 20–35 severe symptoms. The quality-of-life question is scored from 0–6.

**interneuron** *n.* a neuron in the central nervous system that acts as a link between the different neurons in a **\*reflex arc**. It usually possesses numerous branching processes (dendrites) that make possible extensive and complex circuits and pathways within the brain and spinal cord.

**internode** *n.* the length of **\*axon** covered with a myelin sheath. Internodes are separated by nodes of Ranvier, where the sheath is absent.

**internuclear ophthalmoplegia (INO)** *see* **OPHTHALMOPLEGIA**.

**interobserver error** (in statistical surveys) *see* **VALIDITY**.

**interoceptor** *n.* any **\*receptor** organ composed of sensory nerve cells that respond to and monitor changes within the body, such as the stretching of muscles or the acidity of the blood.

**interparietal bone (inca bone, incarial bone)** the bone lying between the **\*parietal bones**, at the back of the skull.

**interpeduncular** *adj.* situated between the peduncles of the cerebrum or cerebellum.

**interphase (interkinesis)** *n.* the period when a cell is not undergoing division (mitosis), during which activities such as DNA synthesis occur.

**intersex** *n.* the condition of a person born with physical characteristics that do not conform clearly to those of either sex. An intersex person may have ambiguous genitals, or some sort of mismatch between their genitals and/or secondary sexual characteristics on the one hand and their chromosomes and/or internal reproductive system on the other. The term covers some 30 or 40 rare conditions officially classified as **disorders of sex development (DSDs)**, although the phrase **differences of sex development** is now sometimes preferred. The extent to which medical intervention is appropriate is a matter of ongoing debate. As a purely physical condition, intersex should not be confused with **\*gender dysphoria**.

**interstice** *n.* a small space in a tissue or between parts of the body. — **interstitial** *adj.*

**interstitial cells** cells that form part of the connective tissue (**interstitium**) between other tissues, especially the cells interspersed between the seminiferous tubules of the **\*testis** (also called **Leydig cells**). They secrete **\*androgens** in response to stimulation by **\*luteinizing hormone** from the anterior pituitary gland.

**interstitial-cell-stimulating hormone** *see* **LUTEINIZING HORMONE**.

**interstitial cystitis** a chronic nonbacterial inflammation of the bladder accompanied by an urgent desire to pass urine frequently and bladder pain; it is sometimes associated with an ulcer in the bladder wall (**Hunner's ulcer**). The cause is unknown and **\*contracture** of the bladder eventually occurs. Treatment is by distension of the bladder under spinal or epidural anaesthetic, instillation of anti-inflammatory solutions into the bladder, and administration of steroids or **\*NSAIDs**. Bladder enhancement or augmentation (*see* **CYSTOPLASTY**) may be required for a contracted bladder.

**interstitial nephritis** disease of the **\*tubulointerstitium** of the kidney. Acute interstitial nephritis (AIN) represents in many cases an allergic reaction to drugs (especially ampicillin, cephalexin, NSAIDs, allopurinol, and frusemide). AIN can also be associated with acute infections and autoimmune disease. Thirst and polyuria may be prominent, and renal function severely affected. In allergic cases, the use of steroids hastens recovery after the allergen has been removed. Chronic interstitial nephritis (CIN) is associated with progressive scarring of the tubulointerstitium, often with lymphocyte infiltration. Primary causes of CIN include gout, radiation nephropathy, sarcoidosis, **\*analgesic nephropathy**, reflux nephropathy, chronic hypokalaemia and hypercalcaemia, and **\*Aristolochia**-associated nephropathies. Management of CIN involves removal of the precipitating cause, where identified, and control of hypertension.

**interstitial pneumonia (interstitial pneumonitis)** an alternative name for **\*idiopathic** pulmonary fibrosis used by lung pathologists to classify the different cellular types of the disease. The most common cellular pattern is **usual interstitial pneumonia (UIP)**. A differing cellular pattern is seen in patients with **nonspecific interstitial pneumonia (NSIP)**, who have a better prognosis than those with UIP. There are two variants of NSIP: cellular and fibrosing. The former has chronic inflammatory cells with minimal collagen

deposition, while the latter consists of diffuse interstitial fibrosis with fewer inflammatory cells. It is believed that corticosteroid therapy can slow the progression of cellular to fibrosing NSIP.

**intertrigo** *n.* superficial inflammation of two skin surfaces that are in contact, such as between the thighs or under the breasts, particularly in obese people. It is caused by friction and sweat and is often aggravated by infection, especially with *Candida*.

**interventional cardiology** a subspecialty of cardiology concerned with the treatment of heart conditions using cardiac **\*catheterization** techniques under local anaesthetic and X-ray control, including **\*percutaneous coronary intervention** and percutaneous balloon mitral **\*valvuloplasty**.

**interventional radiology** a branch of radiology in which complex procedures are performed using imaging guidance, which avoids patients having to undergo invasive surgery to achieve the same results. This is often termed 'pinhole surgery'. Guidance is commonly by X-ray fluoroscopy, ultrasound, or computerized tomography, and recently also by magnetic resonance imaging. Procedures commonly performed include angioplasty and stenting of vascular structures, drainage of fluid collections or abscesses, stenting of obstructions to the gastrointestinal tract, embolization, cryotherapy, and radiofrequency ablation.

**intervention study** a comparison of the outcome between two or more groups of patients that are deliberately subjected to different regimes to test a hypothesis, usually of treatment (in a **clinical trial**). Wherever possible those entering the trial should be allocated to their respective groups by means of random numbers, and one such group (the **control group**) should have no active treatment (**randomized controlled trial**). Ideally neither the patient nor the person assessing the outcome should be aware of which group each patient is allocated to. In a **blind trial**, the patients are not aware of their group; in a **double-blind trial**, neither the patients nor the doctor or observer are aware of the therapy group. The groups may exchange treatment after a prearranged period (**cross-over trial**). Randomized controlled trials are increasingly used to assess new treatments against current standards; for example, to compare new chemotherapeutic agents to established treatment (the control group). To be ethically sound, there must not be evidence at the

time of the study to show conclusively which arm of the trial is the best (*see* [EQUIPOISE](#)).

**intervertebral disc** the flexible plate of fibrocartilage that connects any two adjacent vertebrae in the backbone. At birth the central part of the disc – the **nucleus pulposus** – consists of a gelatinous substance, which gradually becomes replaced by cartilage with age. The intervertebral discs account for one quarter of the total length of the backbone; they act as shock absorbers, protecting the brain and spinal cord from the impact produced by running and other movements. A tear in the outer fibrous portion of the disc results in displacement of the nucleus pulposus to varying degrees: protrusion, prolapse (*see* [PROLAPSED INTERVERTEBRAL DISC](#)), extrusion, or sequestration.

**intestinal flora** bacteria normally present in the intestinal tract. Some are responsible for the synthesis of *\*vitamin K*. By producing a highly acidic environment in the intestine they may also prevent infection by pathogenic bacteria that cannot tolerate such conditions.

**intestinal juice** *see* [SUCCUS ENTERICUS](#).

**intestinal obstruction** partial or complete blockage of the bowel producing symptoms of vomiting, distension, and abdominal pain due to failure to pass intestinal contents. Causes may be mechanical or nonmechanical (*see* [ILEUS](#)). Acute obstruction may be due to incarcerated hernias, adhesions, or malignancy; chronic obstruction may be secondary to tumours, strictures, anatomical abnormality, or neurological disease. Conservative management is by intravenous fluid replacement and nasogastric decompression ('drip and suck'). Most cases of mechanical obstruction require surgical intervention.

**intestine (bowel, gut)** *n.* the part of the *\*alimentary canal* that extends from the stomach to the anus. It is divided into two main parts – the small intestine and the large intestine. The **small intestine** is divided into the *\*duodenum*, *\*jejunum*, and *\*ileum*. It is here that most of the processes of digestion and absorption of food take place. The surface area of the inside of the small intestine is increased by the presence of finger-like projections called **villi** (*see* illustration). Glands in the mucous layer of the intestine secrete

digestive enzymes and mucus. The **large intestine** consists of the *\*caecum*, vermiform *\*appendix*, *\*colon*, and *\*rectum*. It is largely concerned with the absorption of water from the material passed from the small intestine. The contents of the intestines are propelled forwards by means of rhythmic muscular contractions (*see* **PERISTALSIS**). —**intestinal** *adj.*

**Intestine.** Longitudinal section through the ileum.

**intima (tunica intima)** *n.* **1.** the inner layer of the wall of an *\*artery* or *\*vein*. It is composed of a lining of endothelial cells and an elastic membrane. **2.** the inner layer of various other organs or parts.

**in-toe gait (in-toeing, pigeon toe)** a common foot deformity, noted at birth, in which the forefoot points inward (*see* **TIBIAL TORSION**). Most cases are self-correcting during childhood, but in severe cases surgery may be indicated. Medical names: **metatarsus adductus**, **metatarsus varus**.

**intolerance** *n.* the inability of a patient to tolerate a particular drug, manifested by various adverse reactions.

**intoxication** *n.* the symptoms of poisoning due to ingestion of any toxic material, including alcohol and heavy metals.

**intra-** *prefix denoting* inside; within. Examples: **intralobular** (within a lobule); **intraosseous** (within the bone marrow); **intrauterine** (within the uterus).

**intra-articular** *adj.* within a joint. The term is commonly used to specify a fracture pattern, the location of a soft-tissue injury, or the route of injection of a drug. *See also* **EXTRA-ARTICULAR**; **PERIARTICULAR**.

**intracameral** *adj.* within a chamber, such as the anterior or posterior chamber of the eye. In **intracameral anaesthesia** an anaesthetic agent is injected into the anterior chamber of the eye, usually during surgery.

**intracellular** *adj.* situated or occurring inside a cell or cells.

**intracorneal** *adj.* within the cornea.

**intracranial** *adj.* within the skull.

**intracranial hypotension headache** an increasingly recognized type of persistent headache in a patient with no history of headaches. Features include headache that is worse on standing and resolves on lying flat. It may be associated with other symptoms, such as dizziness, tinnitus, and (rarely) **\*diplopia**. The commonest cause is a complication of lumbar puncture, but it may occur spontaneously (**spontaneous intracranial hypotension**) after a dural tear resulting in a leak of cerebrospinal fluid. Treatment is with bed rest and increased intake of fluids; caffeine orally or intravenously is also used. In cases that do not resolve, an epidural blood patch procedure is performed, in which a small quantity of the patient's blood is slowly injected into the **\*epidural** space to seal the leak.

**intracytoplasmic sperm injection** *see* **ICSI**.

**intradermal** *adj.* within the skin. An **intradermal injection** is made into the skin.

**intramural** *adj.* within the walls. An **intramural haematoma** occurs within the wall of a blood vessel.

**intramuscular** *adj.* within a muscle. An **intramuscular injection** is made into a muscle.

**intraobserver error** (in statistical surveys) *see* **VALIDITY**.

**intraocular** *adj.* of or relating to the area within the eyeball. An **intraocular lens implant** is a plastic lens placed inside the eye after **\*cataract extraction** to replace the natural lens.

**intraosseous needle** a wide-bore needle for insertion directly into the bone marrow of (usually) the tibia in children, used only in emergencies when no other means of intravenous access can be gained. Intraosseous needles enable fluids and drugs to be given rapidly. They are only for use with unconscious patients and must be removed when alternative access is obtained.

**intrapartum** *adj.* occurring during labour or childbirth.

**intrastromal** *adj.* (in ophthalmology) within the **\*stroma** of the cornea.

**intrastromal keratomileusis** an operation to correct severe degrees of myopia (short-sightedness). A disc of corneal tissue (from the **\*stroma** of the cornea) is removed, frozen, and remodelled on a lathe, then replaced into the cornea to alter its curvature and thus reduce the myopia. **\*Excimer laser** treatment, which is easier to perform, has now replaced this (*see* **LASIK**).

**intrathecal** *adj.* **1.** within the **\*meninges** of the spinal cord. An **intrathecal injection** is made into the meninges. **2.** within a sheath, e.g. a nerve sheath.

**intratympanic** *adj.* within the middle ear cavity (*see* **EAR**), usually referring to drugs injected through the eardrum to treat conditions of the inner ear. *See also* **TRANSTYMPANIC**.

**intrauterine contraceptive device** *see* **IUCD**.

**intrauterine fetal death** death of a fetus in the uterus after 24 weeks of gestation. *See* **STILLBIRTH**.

**intrauterine growth restriction (IUGR, fetal growth restriction)** failure of a fetus to achieve its growth potential, resulting in the birth of a baby whose birth weight is abnormally low in relation to its gestational age (*see* **SMALL**

FOR GESTATIONAL AGE). Causes include *\*uteroplacental insufficiency*, maternal disease (e.g. infection, malnutrition, high blood pressure, smoking, and alcoholism), poor socioeconomic conditions, multiple pregnancy (e.g. twins), and fetal disease or chromosomal abnormalities. It may be associated with *\*preterm birth*.

**intrauterine insemination (IUI)** a procedure for assisting conception in which carefully washed spermatozoa are injected into the uterus through the vagina at the time of ovulation, which is induced and monitored (using ultrasound) to determine the day of insemination. This procedure is used in cases of male infertility due to inability of the sperm to penetrate the cervical mucus or the barriers surrounding the ovum, in which case the sperm may be treated in vitro to improve their motility and *\*acrosome* reaction. IUI is also used for donor insemination.

**intrauterine system** *see* IUS.

**intravascular ultrasound (IVUS)** a technique in which a micro *\*ultrasound* transducer is mounted on a catheter, which is then advanced over a guidewire into a blood vessel. IVUS is used to accurately assess the diameter of the blood vessels before any treatment, to assess any internal abnormality within the blood vessels, or to help mark the blood vessel branches during any stent placement.

**Intravascular ultrasound.**

**intravenous** *adj.* into or within a vein. *See* INFUSION; INJECTION.

**intravenous feeding** *see* ARTIFICIAL NUTRITION AND HYDRATION; NUTRITION.

**intravenous pyelography (IVP)** *see* PYELOGRAPHY.

**intravenous urography (IVU)** X-ray imaging of the urinary tract following the injection into a vein of a radiopaque **\*contrast medium**. This material is concentrated and excreted by the kidneys, and the IVU reveals the ureters and bladder. An IVU provides information about kidney function and may reveal the presence of stones, tumours, obstructions, or anatomical abnormalities in the urinary tract. *See also* PYELOGRAPHY.

**intraventricular haemorrhage (IVH)** *see* PERIVENTRICULAR HAEMORRHAGE.

**intraversion** *n. see* INTROVERSION.

**intra vitam** Latin: during life.

**intravitreal** *adj.* within the vitreous humour of the eye.

**intrinsic factor** a glycoprotein secreted in the stomach. The secretion of intrinsic factor is necessary for the absorption of **\*vitamin B<sub>12</sub>**; a failure of secretion of intrinsic factor leads to a deficiency of the vitamin and the condition of **\*pernicious anaemia**.

**intrinsic muscle** a muscle that is contained entirely within the organ or part it acts on. For example, there are intrinsic muscles of the tongue, whose contractions change the shape of the tongue.

**intro-** *prefix denoting* in; into.

**introitus** *n.* (in anatomy) an entrance into a hollow organ or cavity.

**introjection** *n.* (in psychoanalysis) the process of adopting, or of believing that one possesses, the qualities of another person. This can be a form of **\*defence mechanism**.

**intromission** *n.* the introduction of one organ or part into another, e.g. the penis into the vagina.

**introversion** *n.* **1. (intraversion)** an enduring personality trait characterized by interest in the self rather than the outside world. People high in introversion (**introverts**), as measured by questionnaires and psychological tests, tend to have a small circle of friends, like to persist in activities once they have started, and are highly susceptible to permanent *\*conditioning*. Introversion was first described by Carl Jung as a tendency to distancing oneself from others, to philosophical interests, and to reserved defensive reactions. *Compare* **EXTROVERSION**. **2.** a turning inwards of a hollow organ (such as the uterus) on itself.

**intubation** *n.* the introduction of a tube into part of the body for the purpose of diagnosis or treatment. Thus **gastric intubation** may be performed to keep the stomach empty during and after abdominal surgery and to provide feeding and drugs when the patient is unable to swallow. In **endotracheal intubation** an endotracheal tube is inserted through the mouth into the trachea to maintain an airway in an unconscious or anaesthetized patient. It requires expert knowledge for insertion, using a laryngoscope, and has a small cuff at the far end for inflation inside the trachea. It affords the best level of protection of the airway from vomitus.

**intumescence** *n.* a swelling or an increase in the volume of an organ.

**intussusception** *n.* the telescoping (**invagination**) of one part of the bowel into another: most common in young children under the age of four. As the contents of the intestine are pushed onwards by muscular contraction more and more intestine is dragged into the invaginating portion, resulting in obstruction. Symptoms include intermittent screaming and pallor, vomiting, and the passing of bloody mucus ('redcurrant jelly') with the stools; if the condition does not receive prompt surgical treatment, shock from gangrene of the bowel may result. A barium or Gastrografin enema may confirm the diagnosis and in many cases may relieve the intussusception.

**inulin** *n.* a carbohydrate with a high molecular weight, used in a test of kidney function called **inulin clearance**. Inulin is filtered from the bloodstream by the kidneys. By injecting it into the blood and measuring the amount that appears in the urine over a given period, it is possible to calculate how much filtrate the kidneys are producing in a given time.

**inunction** *n.* the rubbing in with the fingers of an ointment or liniment.

**invagination** *n.* **1.** the infolding of the wall of a solid structure to form a cavity. This occurs in some stages of the development of embryos. **2.** *see* [INTUSSUSCEPTION](#).

**invasion** *n.* the spread of [\\*cancer](#) into neighbouring normal structures; it is one of the cardinal features of malignancy.

**inverse care law** an ironic ‘law’ stating that where good health care is most needed, it is usually least available. It was first stated by the Welsh GP Tudor Hart to underline the great difficulty in bringing areas of health-care poverty up to acceptable levels. *See* [HEALTH INEQUALITIES](#); [JUSTICE](#); [NEED](#); [RATIONING](#).

**inversion** *n.* **1.** the turning inwards or inside-out of a part or organ: commonly applied to the state of the uterus after childbirth when its upper part is pulled through the cervical canal. **2.** a chromosome mutation in which a block of genes within a chromosome are in reverse order, due to that section of the chromosome becoming inverted. The centromere may be included in the inverted segment (**pericentric inversion**) or not (**paracentric inversion**).

**invertebrate** **1.** *n.* an animal without a backbone. The following are invertebrate groups of medical importance: [\\*insects](#), [\\*ticks](#), [\\*nematodes](#), [\\*flukes](#), and [\\*tapeworms](#). **2.** *adj.* not possessing a backbone.

**in vitro** Latin: describing biological phenomena that are made to occur outside the living body (traditionally in a test-tube).

**in vitro fertilization (IVF)** fertilization of an ovum outside the body, the resultant [\\*zygote](#) being incubated to the [\\*blastocyst](#) stage and then implanted in the uterus. The technique, pioneered in Britain, resulted in 1978 in the birth of the first **test-tube baby**. IVF may be undertaken when a woman has blocked Fallopian tubes, unexplained infertility, endometriosis, or ovulation disorders; it is also carried out for purposes of surrogacy and egg donation. The mother-to-be is given hormone therapy causing a number of ova to mature at the same time (*see* [SUPEROVULATION](#)). Several of them are then removed from the ovary through a laparoscope. The ova are mixed with spermatozoa and incubated in a culture medium until the blastocyst is formed. The blastocyst is then implanted in the mother’s uterus and the pregnancy

proceeds normally. IVF is regulated by the [\\*Human Fertilisation and Embryology Act 1990](#) via the Human Fertilisation and Embryology Authority.

**in vivo** Latin: describing biological phenomena that occur or are observed occurring within the bodies of living organisms.

**involucrum** *n.* a growth of new bone, formed from the [\\*periosteum](#), that sometimes surrounds a mass of infected and dead bone in osteomyelitis.

**involuntary muscle** muscle that is not under conscious control, such as the muscle of the gut, stomach, blood vessels, and heart. *See also* [CARDIAC MUSCLE](#); [SMOOTH MUSCLE](#).

**involution** *n.* **1.** the shrinking of the uterus to its normal size after childbirth. **2.** atrophy of the corpus luteum, which occurs after pregnancy or if implantation of the embryo does not occur. **3.** atrophy of an organ in old age.

**iodine** *n.* an element required in small amounts for healthy growth and development. An adult body contains about 30 mg of iodine, mostly concentrated in the thyroid gland: this gland requires iodine to synthesize [\\*thyroid hormones](#). A deficiency of iodine in adults leads to [\\*goitre](#) and in a fetus leads to [\\*cretinism](#). The RNI (*see* [DIETARY REFERENCE VALUES](#)) is 140 µg/day; dietary sources include seafood, vegetables grown in soil containing iodide, and iodized table salt. Iodine is used in the diagnosis and treatment of diseases of the thyroid gland (*see* [LUGOL'S SOLUTION](#); [RADIOACTIVE IODINE THERAPY](#)) and also as an antiseptic and skin disinfectant (in the form of **povidone-iodine**). Water-soluble contrast media used in X-ray examinations are organic chemicals containing iodine, which is radiopaque due to its high atomic weight. Symbol: I.

**iodism** *n.* iodine poisoning. The main features are a characteristic staining of the mouth and odour on the breath. Vomited material may be yellowish or bluish. There is pain and burning in the throat, intense thirst, and diarrhoea, with dizziness, weakness, and convulsions. Emergency treatment includes administration of starch or flour in water and lavage with sodium thiosulphate solution.

**IOL** intraocular lens implant. *See* [CATARACT](#).

**ion** *n.* an atom or group of atoms that has lost one or more electrons, making it electrically charged and therefore more chemically active. *See* [ANION](#); [CATION](#); [ELECTROLYTE](#); [IONIZATION](#).

**ion channel** a protein that spans a cell membrane to form a water-filled pore through which ions (e.g. calcium [Ca<sup>2+</sup>], sodium [Na<sup>+</sup>], potassium [K<sup>+</sup>]) can pass into or out of the cell.

**ionization** *n.* the process of producing *\*ions*. Some molecules ionize in solution (*see* [ELECTROLYTE](#)). Ions can also be produced when **ionizing radiation** dislodges one or more electrons from an atom or molecule. This can be harmful to DNA in cells, resulting in tumours or genetic defects.

**iontophoresis** *n.* the technique of introducing through the skin, by means of an electric current, charged particles of a drug, so that it reaches a deep site. The method has been used to transfer salicylate ions through the skin in the treatment of deep rheumatic pain. *See also* [CATAPHORESIS](#).

**IOUS** intraoperative ultrasound examination (*see* [ULTRASONOGRAPHY](#)).

**ipecacuanha** *n.* a plant extract used in small doses, usually in the form of tinctures and syrups, as an *\*expectorant* to relieve coughing and to induce vomiting. Ipecacuanha irritates the digestive system, and high doses may cause severe digestive upsets.

**IPF** *see* [IDIOPATHIC PULMONARY FIBROSIS](#).

**ipilimumab** *n.* a *\*monoclonal antibody* that activates the immune system by blocking the normal inhibition of *\*cytotoxic T cells*, which recognize and destroy cancer cells. It is used for the treatment of advanced melanoma. Side-effects include colitis, rash, and liver disorders.

**ipratropium** *n.* an *\*antimuscarinic* drug used as a bronchodilator in the treatment of chronic reversible airways obstruction (*see* [BRONCHOSPASM](#)) and to relieve rhinorrhoea resulting from *\*rhinitis*. Side-effects include dry mouth and nasal dryness.

**ipsilateral (ipselateral, homolateral)** *adj.* on or affecting the same side of the body: applied particularly to paralysis (or other symptoms) occurring on

the same side of the body as the brain lesion that caused them. *Compare* CONTRALATERAL.

**IPSS** *see* INTERNATIONAL PROSTATE SYMPTOM SCORE.

**IQ** *see* INTELLIGENCE QUOTIENT.

**irbesartan** *n. see* ANGIOTENSIN II ANTAGONIST.

**irid-** (**irido-**) *combining form denoting* the iris.

**iridectomy** *n.* an operation on the eye in which a part of the iris is removed.

**iridencleisis** *n.* an operation for *\*glaucoma*, now rarely performed, in which a small incision is made beneath the *\*conjunctiva* close to the cornea and part of the iris is drawn into it. The iris acts like a wick and keeps the incision open for the drainage of fluid from the anterior chamber of the eye to the tissue beneath the conjunctiva.

**iridium-192** *n.* a radioactive isotope of the metallic element iridium. It is the most common source used for intracavitary *\*brachytherapy*. Symbol: Ir-192.

**iridocyclitis** *n.* inflammation of the iris and ciliary body of the eye. *See* UVEITIS.

**iridodialysis** *n.* a tear, caused by injury to the eye, in the attachment of the iris to the ciliary body. Usually a dark crescentic gap is seen at the edge of the iris where the tear has occurred, and the pupil pulls away from the site of the tear.

**iridodonesis** *n.* tremulousness of the iris seen when the eye is moved. It is due to absence of support from the lens, against which the iris normally lies, and occurs when the lens is absent or dislocated from its normal position.

**iridoplegia** *n.* paralysis of the iris, which is usually associated with *\*cycloplegia* and results from injury, inflammation, or the use of pupil-dilating eye drops. In the case of injury, the pupil is usually larger than normal and moves little, if at all, in response to light and drugs.

**iridotomy** *n.* an operation on the eye in which a hole is made in the iris using a knife or a *\*YAG laser*.

**irinotecan** *n.* *see* [TOPOISOMERASE INHIBITOR](#).

**iris** *n.* the part of the eye that regulates the amount of light that enters. It forms a coloured muscular diaphragm across the front of the lens; light enters through a central opening, the **pupil**. A ring of muscle round the margin contracts in bright light, causing the pupil to become smaller (*see* [PUPILLARY REFLEX](#)). In dim light a set of radiating muscles contract and the constricting muscles relax, increasing the size of the pupil. The outer margin of the iris is attached to the **\*ciliary body**.

**iris bombé** an abnormal condition of the eye in which the iris bulges forward towards the cornea. It is due to pressure from the aqueous humour behind the iris when its passage through the pupil to the anterior chamber of the eye is blocked (**pupil-block glaucoma**).

**Irish Sign Language (ISL)** *see* [SIGN LANGUAGE](#).

**irisin** *n.* a hormone that is released into the bloodstream from muscle during physical activity and that activates fat cells to increase energy turnover. It was discovered in 2002.

**iritis** *n.* inflammation of the iris. *See* [UVEITIS](#).

**IRMER** Ionising Radiation (Medical Exposures) Regulations 2000. *See* [RADIATION PROTECTION](#).

**iron** *n.* an element essential to life. The body of an adult contains on average 4 g of iron, over half of which is contained in **\*haemoglobin** in the red blood cells, the rest being distributed between **\*myoglobin** in muscles, **\*cytochromes** and iron stores in the form of **\*ferritin** and **\*haemosiderin**. Iron is an essential component in the transfer of oxygen in the body, as well as a component of enzymes involved in the immune function. The absorption and loss of iron is very finely controlled. A good dietary source is meat, particularly liver. The RNI (*see* [DIETARY REFERENCE VALUES](#)) is 10 mg per day for men and 12 mg per day for women during their reproductive life. A deficiency of iron may lead to **\*anaemia**. Symbol: Fe.

Many preparations of iron are used to treat iron-deficiency anaemia. These include preparations taken by mouth, such as **\*ferrous sulphate**, and those administered by injection, such as **\*iron dextran**.

**iron dextran** a drug containing *\*iron* and *\*dextran*, administered to treat iron-deficiency anaemia. Side-effects can include pain at the site of injection, rapid beating of the heart, and allergic reactions.

**iron lung** *see* VENTILATOR.

**iron-storage disease** *see* HAEMOCHROMATOSIS.

**irradiation** *n.* **1.** exposure of the body to ionizing radiation (*see* IONIZATION). For humans the source may be background radiation, diagnostic X-rays, radiotherapy, or nuclear accidents. **2.** exposure of a substance or object to ionizing radiation. Irradiation of food with gamma rays, which kill bacteria, is a technique used in food preservation.

**irreducible** *adj.* unable to be replaced in a normal position: applied particularly to a type of *\*hernia*.

**irrigation** *n.* the process of washing out a wound or hollow organ with a continuous flow of water or medicated solution. Techniques are available for washing out the entire intestinal tract (**whole-gut irrigation**) as a prelude to surgery on the lower intestine.

**irritability** *n.* **1.** (in physiology) the property of certain kinds of tissue that enables them to respond in a specific way to outside stimuli. Irritability is shown by nerve cells, which can generate and transmit electrical impulses when stimulated appropriately, and by muscle cells, which contract when stimulated by nerve impulses. **2.** impatience and lack of *\*empathy*. This has been found to be a major factor in patients' dissatisfaction with their medical advisors.

**irritable bowel syndrome (IBS)** a common functional bowel disorder characterized by recurrent abdominal pain, altered stool consistency, and variable frequency of defecation. The symptoms, which may differ from individual to individual, may be caused by abnormal contractions of the colon, heightened sensitivity to such stimuli as stretching or distension, stress, and changes in diet. A minority of people may develop symptoms following an episode of gastroenteritis (**postinfectious irritable bowel syndrome**). Tests may be needed to rule out organic disease. Treatment includes reassurance, dietary manipulation (*see* FODMAPS), the use of

antispasmodics, antidiarrhoeal drugs or laxatives, and drugs that reduce the sensitivity of the bowel (such as low-dose amitriptyline).

**irritable hip (transient synovitis of the hip)** a self-limiting condition, affecting children between 3 and 10 years of age, due to inflammation of the synovium of the hip joint capsule. It is a common cause of sudden hip pain and limping in young children. Treatment is with NSAIDs and by limiting weight bearing. It usually resolves in 7–10 days, although in some cases symptoms may persist for several weeks.

**irritant** *n.* any material that causes irritation of a tissue, ranging from nettles (causing pain and swelling) to tear gas (causing watering of the eyes). Chronic irritation by various chemicals can give rise to *\*dermatitis*.

**isch- (ischio-)** *combining form denoting suppression or deficiency.*

**ischaemia** *n.* an inadequate flow of blood to a part of the body, caused by constriction or blockage of the blood vessels supplying it. Ischaemia of heart muscle produces *\*angina pectoris*. Ischaemia of the calf muscles of the legs on exercise (causing intermittent *\*claudication*) or at rest (producing *\*rest pain*) is common in elderly subjects with atherosclerosis of the vessels at or distal to the point where the aorta divides into the iliac arteries. —**ischaemic** *adj.*

**ischi- (ischio-)** *combining form denoting the ischium.*

**ischiorectal abscess** an abscess in the space between the sheet of muscle that assists in control of the rectum (levator ani) and the pelvic bone. It may occur spontaneously, but is often secondary to an anal fissure, thrombosed *\*haemorrhoids*, or other disease of the anus (such as Crohn's disease). Symptoms are severe throbbing pain near the anus with swelling and fever; it may cause an anal *\*fistula*. Pus is drained from the abscess by surgical incision.

**ischium** *n.* a bone forming the lower part of each side of the *\*hip bone* (see also **PELVIS**). —**ischiac, ischial** *adj.*

**island** *n.* (in anatomy) an area of tissue or group of cells clearly differentiated from surrounding tissues.

**islet** *n.* (in anatomy) a small group of cells that is structurally distinct from the cells surrounding it.

**islet cell antibodies** a group of autoantibodies directed against components of the insulin-secreting beta cells of the pancreas. They are usually detectable in the blood of people presenting with type 1 diabetes. Antibodies against **\*glutamic acid** decarboxylase (GAD) in the beta cells have become a more specific test for islet cell antibodies, to help confirm a diagnosis of type 1 diabetes.

**islet cell transplantation** a new technique still under evaluation for curing type 1 **\*diabetes mellitus**, which involves the injection of donated cells from the pancreatic **\*islets of Langerhans** into the liver, where it is hoped they will seed and survive. The transplanted cells then take over insulin production from the recipient's diseased pancreas.

**islet cell tumour** any tumour arising in a cell of the pancreatic **\*islets of Langerhans**. These tumours, which include **\*insulinomas**, **\*glucagonomas**, and **\*somatostatinomas**, form one of the two major subclasses of gastrointestinal neuroendocrine tumours, the other being the **\*carcinoid** tumours.

**islets of Langerhans** small groups of endocrine cells scattered through the material of the **\*pancreas**. There are three main histological types: alpha ( $\alpha$ ) cells, which secrete **\*glucagon**; beta ( $\beta$ ) cells, which produce **\*insulin**; and D cells, which release **\*somatostatin** and **\*pancreatic polypeptide**. [P. Langerhans (1847–88), German physician and anatomist]

**iso-** *combining form denoting equality, uniformity, or similarity.*

**isoagglutinin (isohaemagglutinin)** *n.* one of the antibodies occurring naturally in the plasma that cause **\*agglutination** of red blood cells of a different group.

**isoagglutininogen** *n.* one of the **\*antigens** naturally occurring on the surface of red blood cells that is attacked by an isoagglutinin in blood plasma of a different group, so causing **\*agglutination**.

**isoantibody** (alloantibody) *n.* an **\*antibody** that occurs only in some individuals of a species against the components of foreign tissues from an individual of the same species.

**isoantigen (alloantigen)** *n.* an antigenic substance that occurs only in some individuals of a species. Thus the antigens of the **\*HLA system** are isoantigens, as are the agglutinogens of the different **\*blood groups**.

**isodactylism** *n.* a congenital defect in which all the fingers are the same length.

**isoechoic** *adj.* (in ultrasound imaging) describing a structure that reflects sound waves (echoes) of the same magnitude as the adjacent structure. Therefore, no contrast between the structures is seen separately, when received by the ultrasound crystal.

**isoenzyme (isozyme)** *n.* a physically distinct form of a given enzyme. Isoenzymes catalyse the same type of reaction but have slight physical and immunological differences. Isoenzymes of dehydrogenases, oxidases, transaminases, phosphatases, and proteolytic enzymes are known to exist.

**isohaemagglutinin** *n.* *see* **ISOAGGLUTININ**.

**isoimmunization** *n.* the development of antibodies (**isoantibodies**) within an individual against antigens from another individual of the same species.

**isointense** *adj.* (in CT scanning) describing a structure that is of similar density to surrounding structures (allows a similar amount of X-rays to pass through). Therefore, no contrast between the structures is seen separately.

**isolation** *n.* **1.** the separation of a person with an infectious disease from noninfected people. *See also* **QUARANTINE**. **2.** (in surgery) the separation of a structure from surrounding structures by the use of instruments.

**isoleucine** *n.* an **\*essential amino acid**. *See also* **AMINO ACID**.

**isomerase** *n.* any one of a group of enzymes that catalyse the conversion of one isomer of a compound into another.

**isometheptene** *n.* a **\*sympathomimetic** drug used in the treatment of migraine attacks, in combination with paracetamol. Possible side-effects include dizziness.

**isometric exercises (isometrics)** a system of exercises based on the principle of **isometric contraction** of muscles. This occurs when the fibres

are called upon to contract and do work, but despite an increase in tension do not shorten in length. It can be induced in muscles that are used when a limb is made to pull or push against something that does not move. The exercises increase fitness and build muscle.

**isometropia** *n.* an equal power of **\*refraction** in both eyes.

**isomorphism** *n.* the condition of two or more objects being alike in shape or structure. It can exist at any structural level, from molecules to whole organisms. —**isomorphic, isomorphous** *adj.*

**isoniazid (isonicotinic acid hydrazide, INH)** *n.* a drug used in the treatment of **\*tuberculosis**, usually taken by mouth. Because tuberculosis bacteria soon become resistant to isoniazid, it is given in conjunction with other antibiotics. Side-effects include peripheral neuropathy, especially in patients with diabetes or alcohol dependence, which can be countered by including pyridoxine (vitamin B<sub>6</sub>) in the preparation.

**isophane insulins** a group of insulins in which the insulin molecules are combined with **\*protamine** molecules to slow down their rate of absorption from the injection site. The insulin is released steadily from the skin into the bloodstream to stabilize blood sugar over a longer period. Mixtures of isophane and fast-acting insulins are also available (**biphasic insulin aspart, biphasic insulin lispro, biphasic isophane insulin**).

**isosorbide dinitrate** a drug used for the prevention and treatment of angina; it acts by relaxing the smooth muscle of both arteries and veins, thus causing dilatation (*see* **VASODILATOR**). Side-effects include headache, flushing, dizziness, and hypotension.

Isosorbide dinitrate is converted in the body to the active form of the drug, **isosorbide mononitrate**, which is available as a preventative oral treatment for angina.

**isosthenuria** *n.* inability of the kidneys to produce either a concentrated or a dilute urine. This occurs in the final stages of renal failure.

**isotonic** *adj.* **1.** describing solutions that have the same osmotic pressure. *See* **OSMOSIS**. **2.** describing muscles that have equal **\*tonicity**.

**isotonic exercises** *see* **EXERCISE**.

**isotope** *n.* any one of the different forms of an element, possessing the same number of protons (positively charged particles) in the nucleus, and thus the same atomic number, but different numbers of neutrons. Isotopes therefore have different atomic weights. Radioactive isotopes decay into other isotopes or elements, emitting alpha, beta, or gamma radiation. Some radioactive isotopes may be produced artificially by bombarding elements with neutrons. These are known as **nuclides** and are used extensively in **\*radiotherapy** for the treatment of cancer.

**isotretinoin** *n.* a drug related to vitamin A (*see* **RETINOID**) that is administered orally in the treatment of severe acne that has failed to respond to other treatment and topically for mild to moderate acne. Possible side-effects include dry skin, nose bleeds, eyelid and lip inflammation, muscle, joint, and abdominal pains, fetal abnormalities (it should not be taken during pregnancy), diarrhoea, and some disturbances of vision.

**isotropic** *adj.* (in computerized tomography or magnetic resonance imaging) denoting the acquisition of data when the slice thickness is similar in size to that of an individual **\*pixel** in all planes, i.e. the **\*voxel** is a cube. Computerized reconstruction in any plane will not suffer any loss of detail. The concept is particularly applicable for **\*multidetector computerized tomography**, in which slice thickness of less than 1 mm is used.

**isozyme** *n.* *see* **ISOENZYME**.

**ispaghula husk** a bulking agent (*see* **LAXATIVE**) used to treat constipation, **\*diverticular disease**, **\*irritable bowel syndrome**, and other conditions of disturbed bowel habit.

**ISS** *see* **INJURY SCORING SYSTEM**.

**isthmus** *n.* a constricted or narrowed part of an organ or tissue, such as the band of thyroid tissue connecting the two lobes of the thyroid gland.

**itch** *n.* discomfort or irritation of the skin, prompting the sufferer to scratch or rub the affected area. It is an important symptom of skin disease. *See* **PRURITUS**.

**-itis** *combining form denoting* inflammation of an organ, tissue, etc. Examples: **arthritis** (of a joint); **peritonitis** (of the peritoneum).

**itraconazole** *n.* an antifungal drug that is administered by mouth or intravenous infusion to treat a wide variety of fungal infections, including candidiasis and ringworm. Side-effects include nausea and abdominal pain, and there is a risk of liver damage and heart failure.

**ITU** *see* **INTENSIVE THERAPY UNIT**.

**IUCD (intrauterine contraceptive device)** a plastic or metal coil, spiral, or other shape, about 25 mm long, that is inserted into the cavity of the uterus to prevent conception. Its exact mode of action is unknown but it is thought to interfere with implantation of the embryo. Early IUCDs (such as the Lippes loop) were made of plastic; later variants (such as the Gravigard) are covered with copper, which slowly dissolves and augments the contraceptive action. About one-third of women fitted with an IUCD find the side-effects (heavy menstrual bleeding or back pain) unacceptable, but most have no complaints. The unwanted pregnancy rate is about 2 per 100 woman-years. If pregnancy should occur there is normally no need to remove the device (it may, however, be shed spontaneously). *See also* **IUS**; **POSTCOITAL CONTRACEPTION**.

**IUGR** *see* **INTRAUTERINE GROWTH RESTRICTION**.

**IUI** *see* **INTRAUTERINE INSEMINATION**.

**IUS (intrauterine system)** a hormonal contraceptive device consisting of a plastic T-shaped frame that is inserted into the uterus. It carries a progestogen (**\*levonorgestrel**) in a sleeve around its stem and has two fine threads attached to its base, by which it can be removed. It provides a long-term method of contraception that is also reversible. The IUS is also used in the treatment of menorrhagia and benign **\*endometrial hyperplasia** as it acts by thinning the endometrium. A newer version delivers a smaller amount of levonorgestrel and is suitable for young women who have not been pregnant; it is not licensed for menorrhagia or for use after the menopause.

**IV** intravenous. *See* **INFUSION**; **INJECTION**.

**ivermectin** *n.* a drug used in the treatment of **\*onchocerciasis**. It acts by killing the immature forms (**\*microfilariae**) of the parasite. Ivermectin is also

used to treat creeping eruption, strongyloidiasis, and scabies. Side-effects, which are mild, include itching and swollen lymph nodes.

**IVF** *see* **IN VITRO FERTILIZATION**.

**IVU** *see* **INTRAVENOUS UROGRAPHY**.

**IVUS** *see* **INTRAVASCULAR ULTRASOUND**.

**Ixodes** *n.* a genus of widely distributed parasitic ticks. Several species are responsible for transmitting **\*Lyme disease**, **\*tularaemia**, Queensland tick typhus, and **\*Russian spring-summer encephalitis**. The bite of a few species can give rise to a serious paralysis, caused by a toxin in the tick's saliva.

**ixodiasis** *n.* any disease caused by the presence of **\*ticks**.

**Ixodidae** *n.* a family of **\*ticks**.

**Jacksonian march** *see* **EPILEPSY**. [J. H. Jackson (1835–1911), British neurologist]

**Jacquemier's sign** a bluish or purplish coloration of the vagina: a possible indication of pregnancy. [J. M. Jacquemier (1806–79), French obstetrician]

**jactitation** *n.* restless tossing and turning of a person suffering from a severe disease, frequently one with a high fever.

**Jaeger test types** a card with text printed in type of different sizes, used for testing acuity of near vision. [E. R. Jaeger von Jastthal (1818–84), Austrian ophthalmologist]

**jamais vu** one of the manifestations of temporal lobe **\*epilepsy**, in which there is a sudden feeling of unfamiliarity with everyday surroundings.

**Janeway lesions** red spots on the palm of the hands caused by a bacterial infection of the heart (*see* **ENDOCARDITIS**). [E. G. Janeway (1841–1911), US physician]

**Jarisch–Herxheimer reaction (Herxheimer reaction)** exacerbation of the symptoms of syphilis that may occur on starting antibiotic therapy for the disease. The effect is transient and requires no treatment. [A. Jarisch (1850–1902), Austrian dermatologist; K. Herxheimer (1861–1944), German dermatologist]

**jaundice** *n.* a yellow discoloration of the skin or whites of the eyes, indicating excess bilirubin (a bile pigment) in the blood. Jaundice is classified into three types. **Obstructive jaundice** occurs when bile made in the liver fails to reach the intestine due to obstruction of the **\*bile ducts** (e.g. by gallstones or a tumour) or to **\*cholestasis**. The urine becomes dark in

colour and the stools become pale. **Hepatocellular jaundice** is due to disease of the liver cells, such as *\*hepatitis*, when the liver is unable to utilize the bilirubin, which accumulates in the blood. The urine may be dark but the faeces retain their colour. **Haemolytic jaundice** occurs when there is excessive destruction of red cells in the blood (*see HAEMOLYSIS*). Urine and faeces retain their normal colour. Medical name: **icterus**.

**jaw** *n.* either the *\*maxilla* (upper jaw) or the *\*mandible* (lower jaw). The jaws form the framework of the mouth and provide attachment for the teeth.

**jaw-jerk reflex** an abnormal reflex elicited by lightly placing the index finger across the chin of the patient and tapping it with a tendon hammer while the jaw hangs loosely open. A brisk upward movement of the jaw indicates an upper *\*motor neuron* disorder above the brainstem.

**jaw thrust** a manoeuvre for opening the airway of an unconscious patient. The flats of the hands are placed on the cheeks with the fingers hooked under the angles of the jaw so that the jaw can be pulled upwards to separate the tongue from the back of the pharynx. The tongue often falls onto the back of the pharynx in unconsciousness, causing obstruction to the airway. This method is particularly useful when spinal injury is suspected and movement of the neck is undesirable. This is an alternative to the *\*head tilt, chin lift* manoeuvre.

**jaw wiring** a radical but reversible approach to obtain weight loss in which the jaws are wired together surgically to restrict food intake to simple fluids. Success can be dramatic but weight is often regained once the restriction is removed and normal eating habits are resumed. *See also BARIATRIC SURGERY*.

**JE** *see JUNCTIONAL EPITHELIUM*.

**Jehovah's Witnesses** a religious movement important in medicine because of its biblical prohibition on using blood or blood products, even to save a life. Individual witnesses who undergo transfusion (even against their will or unknowingly) risk being seen by their community as defiled and damned for eternity. Physicians therefore may have to respond in critical circumstances to a competent adult's decision to refuse treatment: there may be alternative nonbiological methods of treatment. An accident and emergency department

should have a discussed and agreed policy, with senior staff available to help and counsel junior staff.

**jejun-** (**jejuno-**) combining form denoting the jejunum.

**jejunal biopsy** sampling of the mucosa in the jejunum. This is performed endoscopically using an **\*enteroscope**, although a surgical approach may be considered. Jejunal biopsies are examined microscopically to assist in the diagnosis of suspected disease in the small intestine, including **\*coeliac disease**, **\*Crohn's disease**, **\*Whipple's disease**, or intestinal infection.

**jejunal ulcer** *see* **PEPTIC ULCER**; **ZOLLINGER-ELLISON SYNDROME**.

**jejunectomy** *n.* surgical removal of part or the entirety of the jejunum.

**jejunioileostomy** *n.* an operation in which part of the jejunum is joined to the distal ileum following the removal or bypass of diseased segments of small bowel. It was formerly used for the treatment of obesity but has been abandoned because of deleterious side-effects.

**jejunostomy** *n.* a surgical operation in which the jejunum is brought through the abdominal wall as a **\*stoma**. It may enable the insertion of a jejunal catheter for short-term infusion of nutrients or other substances. A **feeding jejunostomy** is a tube inserted into the jejunum using endoscopic or surgical techniques to allow the introduction of nutrients. This may be required when disease, previous surgery, or refractory vomiting prevents the placement of a **\*gastrostomy** (PEG) tube. A **percutaneous endoscopic gastrojejunostomy (PEG-J)** is a jejunal extension that is applied to an existing PEG tube.

**jejunotomy** *n.* surgical incision of the jejunum.

**jejunum** *n.* part of the small **\*intestine**. It comprises about two-fifths of the whole small intestine and connects the duodenum to the ileum. —**jejunal** *adj.*

**jerk** *n.* the sudden contraction of a muscle in response to a nerve impulse. Examples are the **\*ankle jerk** and the **knee jerk** (*see* **PATELLAR REFLEX**). Eliciting these and other jerks is a means of testing the nerve pathways, via the spinal cord, which are involved in **\*reflexes**.

**JGA** *see* **JUXTAGLOMERULAR APPARATUS**.

**JIA** *see* JUVENILE IDIOPATHIC ARTHRITIS.

**jigger** *n. see* TUNGA.

**Jod–Basedow phenomenon** a collection of symptoms that includes skin rash, conjunctivitis, salivary gland inflammation, and hyperthyroidism due to the intake of high doses of iodine (German *Jod*, hence the name). [K. A. von Basedow (1799–1854), German physician]

**joint** *n.* the point at which two or more bones are connected. The opposing surfaces of the two bones are lined with cartilaginous, fibrous, or soft (synovial) tissue. The three main classes of joint are **\*diarthrosis** (freely movable), **\*amphiarthrosis** (slightly movable), and **\*synarthrosis** (immovable).

**joule** *n.* the **\*SI unit** of work or energy, equal to the work done when the point of application of a force of 1 newton is displaced through a distance of 1 metre in the direction of the force. In electrical terms the joule is the work done per second when a current of 1 ampere flows through a resistance of 1 ohm. Symbol: J. *See also* CALORIE.

**judgment** *n.* the opinion of a clinician in the context of medical care. In spite of technical advances, few decisions in medicine are automatic. This is particularly true where there are critical differences of data interpretation, potential conflicts between individuals or family members, or moral and procedural dilemmas.

**jugular** *adj.* relating to or supplying the neck or throat.

**jugular vein** any one of several veins in the neck. The **internal jugular** is a very large paired vein running vertically down the side of the neck and draining blood from the brain, face, and neck. It ends behind the sternoclavicular joint, where it joins the subclavian vein. The **external jugular** is a smaller paired vein running superficially down the neck to the subclavian vein and draining blood from the face, scalp, and neck. Its tributary, the **anterior jugular**, runs down the front of the neck.

**jugular venous pressure (JVP)** the pressure in the internal jugular vein, which is an indirect measurement of **\*central venous pressure** (CVP) in the

right atrium. In clinical practice the JVP is estimated by visual inspection at the bedside with the patient reclining at 45 degrees.

**jugum** *n.* (in anatomy) a ridge or furrow that connects two parts of a bone.

**jumper's knee (patellar tendinitis)** a form of **\*tendinitis** that is common in athletes and dancers. Repeated sudden contracture of the quadriceps muscle at take-off causes inflammation of the attachment of the patellar tendon to the lower end of the patella. Treatment includes rest, physiotherapy, and anti-inflammatory medication.

**junction** *n.* (in anatomy) the point at which two different tissues or structures are in contact. *See also* **NEUROMUSCULAR JUNCTION**.

**junctional epithelium (JE)** (in dentistry) the stratified squamous **\*epithelium** that is directly attached to the surface of a tooth; it has a protective function against periodontal diseases.

**justice** *n.* the moral requirement to treat people fairly and impartially and with a proper regard for their entitlements and deserts – although the ways in which ethicists and philosophers define fairness, entitlements, and deserts varies considerably. Justice is common to many theories of ethics and is one of the **\*four principles** of medical ethics. Issues of justice are mainly, but not exclusively, concerned with the fair allocation of medical resources when these are limited, and can be encapsulated in theories of distributive justice (*see* **DESERT**; **EQUALITY**; **NEED**; **RATIONING**).

**juvenile idiopathic arthritis (JIA, Still's disease)** any one of a group of conditions characterized by inflammation of the joints lasting longer than 6 weeks and occurring before the age of 16. The causes are unknown but immunological and infective mechanisms are suspected. JIA can affect either four or fewer joints (**pauciarticular JIA**) or more than four (**polyarticular JIA**). There are two recognized types of pauciarticular JIA: type 1, which generally affects girls below the age of four; and type 2 (**juvenile-onset spondylarthropathy**), which generally affects boys over the age of nine. There are also two types of polyarticular JIA, depending on the presence or absence of a particular antibody in the blood. There is a great range of severity of these diseases. Treatment consists of pain management and prevention of subsequent deformity or limitation of movement (e.g.

contractures). Long-term joint damage is prevented by use of medications similar to those used in rheumatoid arthritis.

**juvenile-onset spondylarthropathy** *see* **JUVENILE IDIOPATHIC ARTHRITIS**.

**juvenile plantar dermatosis** *see* **DERMATOSIS**.

**juvenile polyp** *see* **POLYP**.

**juxta-** combining form denoting proximity to. Example: **juxta-articular** (near a joint).

**juxtaglomerular apparatus (JGA)** a microscopic structure within the kidney that is important in regulating blood pressure, body fluid, and electrolytes. It is situated in each nephron, between the afferent arteriole of the glomerulus and the returning distal convoluted tubule of the same nephron. The JGA consists of specialized cells within the distal tubule (the **macula densa**), which detect the amount of sodium chloride passing through the tubule and can secrete locally acting vasoconstrictor substances that act on the associated afferent arteriole to induce a reduction in filtration pressure (tubuloglomerular feedback). Modified cells within the afferent arterioles secrete **\*renin** in response to a fall in perfusion pressure or feedback from the macula densa and form a central role in the renin-**\*angiotensin**-aldosterone axis. **Mesangial cells** support and connect the macula densa and the specialized cells in the afferent arteriole and have sympathetic innervation, facilitating the renin response to sympathetic nervous stimulation.

**JVP** *see* **JUGULAR VENOUS PRESSURE**.

**Kahn reaction** a test for syphilis, in which antibodies specific to the disease are detected in a sample of the patient's blood by means of a *\*precipitin* reaction. This test is not as reliable as some. [R. L. Kahn (20th century), US bacteriologist]

**kala-azar (visceral leishmaniasis, Dumdum fever)** *n.* a tropical disease caused by the parasitic protozoan *\*Leishmania donovani*. The parasite, which is transmitted to humans by *\*sandflies*, invades the cells of the lymphatic system, spleen, and bone marrow. Symptoms include enlargement and subsequent lesions of the liver and spleen; anaemia; a low *\*leucocyte* count; weight loss; and irregular fevers. The disease occurs in Asia, South America, the Mediterranean area, and Africa. Drugs containing antimony, with supplementary pentamidine, are used in the treatment of this potentially fatal disease.

**kallidin** *n.* a naturally occurring polypeptide consisting of ten amino acids. Kallidin is a powerful vasodilator and causes contraction of smooth muscle; it is formed in the blood under certain conditions. *See* KININ.

**kallikrein** *n.* one of a group of enzymes found in the blood and body fluids that act on certain plasma globulins to produce bradykinin and kallidin. *See* KININ.

**Kallmann's syndrome** a familial condition that is the most common form of isolated *\*gonadotrophin* deficiency; it is combined with underdevelopment of the olfactory lobes, causing *\*anosmia*. The syndrome is caused by a gene *\*deletion* on the short arm of the X chromosome. Patients often present with delayed puberty. There is an association with *\*ichthyosis*, learning disabilities, obesity, renal and skeletal abnormalities, and undescended

testes, but these features are very variable. [F. J. Kallmann (1897–1965), US geneticist]

**Kantian ethics** approaches to moral questions based on the thought of the German philosopher Immanuel Kant (1724–1804). These seek to discover what is morally right by asking what basic rules all rational people (*see* **AUTONOMY**) could adopt for themselves and then act on as an *\*imperative* matter of *\*duty*, regardless of their personal desires or of the possible consequences (*see* **DEONTOLOGY**; **CONSEQUENTIALISM**). The Kantian tradition has been influential in medical ethics, especially in its insistence that every human life must be treated as an end in itself and not simply as a means.

**kaolin** *n.* a white clay that contains aluminium and silicon and is purified and powdered for use as an adsorbent. It may be used to treat chronic diarrhoea and is also used in dusting powders and poultices.

**Kaposi's sarcoma** a malignant tumour arising from blood vessels in the skin and appearing as purple to dark brown plaques or nodules. It is common in Africa and is sometimes seen in those of Mediterranean extraction, but more commonly occurs in patients with *\*AIDS*. The tumour evolves slowly; radiotherapy is the treatment of choice for localized lesions but chemotherapy may be of value in metastatic disease. Highly active antiretroviral therapy (*see* **ANTIRETROVIRAL DRUG**) should be started in those with HIV infection as a first-line treatment. [M. Kaposi (1837–1902), Hungarian dermatologist]

**Kartagener's syndrome** a hereditary condition in which the heart and other internal organs lie on the opposite side of the body to the norm (i.e. the heart lies on the right; *see* **DEXTROCARDIA**); it is associated with chronic sinusitis and bronchiectasis. [M. Kartagener (1897–1975), German physician]

**kary-** (**karyo-**) *combining form denoting a cell nucleus.*

**karyokinesis** *n.* division of the nucleus of a cell, which occurs during cell division before division of the cytoplasm (**cytokinesis**). *See* **MITOSIS**.

**karyolysis** *n.* the breakdown of a cell nucleus, which occurs during cell *\*necrosis* and is preceded by fragmentation of the nucleus (**karyorrhexis**).

**karyoplasm** *n.* see **NUCLEOPLASM**.

**karyosome** *n.* the dense mass of **\*chromatin** found in the cell nucleus, which is composed mainly of chromosomes.

**karyotype** **1.** *n.* the **\*chromosome** set of an individual or species described in terms of both the number and structure of the chromosomes. **2.** *n.* the representation of the chromosome set in a diagram. **3.** *vb.* to determine the karyotype of a cell, as by microscopic examination.

**katathermometer** *n.* a thermometer used to measure the cooling power of the air surrounding it, having its bulb covered with water-moistened material. The instrument is brought to a steady temperature of 100°F and then exposed to the air. The time taken for the temperature recorded by the thermometer to fall to 95°F gives an index of the air's cooling power.

**Kawasaki disease (Kawasaki syndrome, mucocutaneous lymph node syndrome)** a condition of unknown cause affecting young children, usually less than five years old and most commonly of Japanese or Korean descent, and characterized by fever, conjunctivitis, a sore throat, and a generalized rash and reddening of the palms and soles. This is followed by peeling of the fingers and toes. The fever usually persists for 1–2 weeks. In approximately one-fifth of children there is involvement of the coronary arteries and heart muscle (myocardium), resulting in **\*myocarditis** and **\*aneurysms** of the coronary arteries. About 2% of cases are fatal. The aneurysms will usually resolve spontaneously but slowly. Treatment involves aspirin therapy, and **\*gammaglobulin** reduces the risk of coronary artery disease. [T. Kawasaki (20th century), Japanese physician]

**Kayser–Fleischer ring** a brownish-yellow ring in the outer rim of the cornea of the eye. It is a deposit of copper granules and is diagnostic of **\*Wilson's disease**. When well developed it can be seen by unaided observation, but faint Kayser-Fleischer rings may only be detected by specialized **\*slit-lamp** ophthalmological examination. [B. Kayser (1869–1954), German ophthalmologist; B. Fleischer (1848–1904), German physician]

**Kegel exercises (pelvic-floor muscle training, pelvic-floor exercises)** active rehabilitation of the pelvic-floor muscles by conscious contractions,

which leads to a cure in 50–80% of patients with stress incontinence. [A. H. Kegel (20th century), US gynaecologist]

**Kehr's sign** pain in the left shoulder caused by irritation of the undersurface of the diaphragm by blood leaking from a ruptured spleen. The pain impulses are referred along the *\*phrenic nerve*. [H. Kehr (1862–1913), German surgeon]

**Kell antigens** a group of antigens that may or may not be present on the surface of red blood cells, forming the basis of a *\*blood group*. This group is important in blood transfusion reactions. [Mrs Kell (20th century), patient in whom they were first demonstrated]

**Keller's operation** an operation for *\*hallux valgus* (*see also* BUNION) or *\*hallux rigidus* that involves an excision *\*arthroplasty* of the metatarsophalangeal joint, at the base of the big toe. The toe will be slightly shorter and floppy, but usually this improves alignment and range of movement. [W. L. Keller (1874–1959), US surgeon]

**keloid** *n.* an overgrowth of fibrous scar tissue following trauma to the skin. It does not resolve spontaneously but may be flattened by silicone gels, applied pressure, injections of potent corticosteroids, or intralesional excision (or combinations of these). Keloid formation is particularly common at certain sites, such as the breastbone or ear lobe; surgical excision of benign (nonmalignant) lesions from such sites is therefore best avoided. *See also* SCAR.

**kelvin** *n.* the *\*SI unit* of temperature, formally defined as the fraction 1/273.16 of the temperature of the triple point of water. A temperature in kelvins is equal to a Celsius temperature plus 273.15°C. Symbol: K.

**Kemp echoes** *see* OTOACOUSTIC EMISSIONS.

**kerat-** (**kerato-**) *combining form denoting* **1.** the cornea. Example: **keratopathy** (disease of). **2.** horny tissue, especially of the skin.

**keratalgia** *n.* pain arising from the cornea.

**keratectasia** *n.* bulging of the cornea at the site of scar tissue (which is thinner than normal corneal tissue).

**keratectomy** *n.* an operation in which a part of the cornea is removed, usually a superficial layer. This procedure is now frequently done by an **\*excimer laser**, either to correct refractive errors (myopia, hypermetropia), by reshaping the surface of the cornea (**photorefractive keratectomy**; PRK), or to remove diseased corneal tissue (**phototherapeutic keratectomy**). *See also* **AUTOMATED LAMELLAR KERATECTOMY**.

**keratin** *n.* one of a family of proteins that are the major constituents of the nails, hair, and the outermost layers of the skin. The cytoplasm of epithelial cells, including **\*keratinocytes**, contains a network of keratin filaments.

**keratinization (cornification)** *n.* the process by which cells become horny due to the deposition of **\*keratin** within them. It occurs in the **\*epidermis** of the skin and associated structures (hair, nails, etc.), where the cells become flattened, lose their nuclei, and are filled with keratin as they approach the surface.

**keratinocyte** *n.* a type of cell that makes up 95% of the cells of the epidermis. Keratinocytes migrate from the deeper layers of the epidermis and are finally shed from the surface of the skin.

**keratitis** *n.* inflammation of the **\*cornea** of the eye. It may be due to physical or chemical agents (abrasions, exposure to dust, chemicals, ultraviolet light, etc.) or result from infection. The eye waters and is very painful, and vision is blurred. In **disciform keratitis** a disc-shaped patch of oedema and inflammation develops in the cornea, usually as an immune response to viral infection, commonly herpes simplex. **Filamentary keratitis** is associated with small mucoid deposits of epithelial filaments on the surface of the cornea, which come off to leave small corneal erosions that cause severe pain until they heal.

**keratoacanthoma** *n.* a firm nodule that appears singly on the skin, grows to 1–2 cm across in about 6 weeks, and usually disappears gradually during the next few months. Men are affected more often than women, commonly between the ages of 50 and 70. Keratoacanthomas occur mainly on the face; the cause is not known. Spontaneous healing may leave an unsightly scar; therefore treatment by curettage and cautery, or excision, may be required. The precise relationship of keratoacanthoma to **\*squamous cell carcinoma** is controversial.

**keratocele (descemetocele)** *n.* outward bulging of the base of a deep ulcer of the cornea. The deep layer of the cornea (Descemet's membrane) is elastic and relatively resistant to perforation; it therefore bulges when the overlying cornea has been destroyed.

**keratoconjunctivitis** *n.* combined inflammation of the cornea and conjunctiva of the eye. **Keratoconjunctivitis sicca** is dryness of the cornea and conjunctiva due to deficient production of tears. It may be associated with systemic disorders, such as **\*Sjögren's syndrome**, systemic lupus, systemic sclerosis, and sarcoidosis.

**keratoconus** *n.* conical cornea: a slowly progressive abnormality in the cornea, which changes from its normal gradual curve to a more conical shape, causing distortion of vision.

**keratocyte (fibroblast)** *n.* a cell, derived from **\*mesenchyme**, of the corneal **\*stroma**. Such cells are normally quiescent but can readily respond to injury and change into repair types.

**keratoglobus (megalocornea)** *n.* a congenital disorder of the eye in which the whole cornea bulges forward in a regular curve. *Compare* **KERATOCONUS**.

**keratomalacia** *n.* a progressive nutritional disease of the eye due to **\*vitamin A** deficiency. The cornea softens and may even perforate. This condition is very serious and blindness is usually inevitable. *See also* **XEROPHTHALMIA**.

**keratome** *n.* any instrument designed for cutting the cornea. The simplest type has a flat triangular blade attached at its base to a handle, the other two sides being very sharp and tapering to a point. Power-driven keratomes have oscillating or rotating blades. An automated keratome is used in **\*automated lamellar keratectomy**. *See also* **MICROKERATOME**.

**keratometer (ophthalmometer)** *n.* an instrument for measuring the radius of curvature of the cornea. Usually the vertical and horizontal curvatures are measured. All keratometers work on the principle that the size of the image of an object reflected from a convex mirror (in this case, the cornea) depends on the curvature of the mirror. The steeper the curve, the smaller the image.

The keratometer is used for assessing the degree of curvature of the cornea in different meridians. —**keratometry** *n.*

**keratomileusis** *n.* *see* INTRASTROMAL KERATOMILEUSIS; LASIK.

**keratopathy** *n.* any disorder relating to the cornea. *See* BAND KERATOPATHY; BULLOUS KERATOPATHY.

**keratoplasty (corneal graft)** *n.* an eye operation in which any diseased part of the cornea is replaced by clear corneal tissue from a donor. In **penetrating keratoplasty** all layers of the cornea are replaced, in **lamellar keratoplasty** only the superficial layers are replaced, and in **Descemet's stripping endothelial keratoplasty (DSEK)** the endothelium only is replaced.

**keratoprosthesis** *n.* an optically clear prosthesis that is implanted into the cornea to replace an area that has become opaque. Due to its poor success rate, it is used only as a last resort in an attempt to restore some sight to patients with severe disease where corneal transplantation (*see* KERATOPLASTY) is unlikely to succeed.

**keratoscope (Placido's disc)** *n.* an instrument for detecting abnormal curvature of the cornea. It consists of a black disc, about 20 cm in diameter, marked with concentric white rings. The examiner looks through a small lens in the centre at the reflection of the rings in the patient's cornea. A normal cornea will reflect regular concentric images of the rings; a cornea that is abnormally curved (for example in **\*keratoconus**) or scarred reflects distorted rings. Modern keratoscopes can print out a contour map of the corneal surface.

**keratosis** *n.* a horny overgrowth of the skin. **Actinic (or solar) keratoses** are red spots with a scaly surface, found in older fair-skinned people who have been chronically overexposed to the sun. They may occasionally become a **\*squamous cell carcinoma**. **Seborrhoeic keratoses** (also known as **seborrhoeic warts**) never become malignant. They are superficial yellowish or brown spots, crusty or greasy-looking, occurring especially on the trunk in middle age, that become warty over the years.

**keratosis obturans** an abnormal build-up of **\*keratin** and dead skin cells within the ear canal that can block the canal, cause conductive hearing loss (see **DEAFNESS**), and erode the bone of the ear canal. It is associated with **\*bronchiectasis** and chronic sinusitis.

**keratosis pilaris (follicular keratosis, lichen pilaris)** a very common autosomal **\*dominant** condition characterized by rough horny plugs in the hair follicles, usually on the skin of the lateral and posterior aspects of the arms. They may be skin-coloured, red, or brown. The condition typically appears during teenage years and persists into adulthood; it is completely harmless.

**keratotomy** *n.* an incision into the cornea. See **ARCULATE KERATOTOMY**; **RADIAL KERATOTOMY**.

**keratouveitis** *n.* inflammation involving both the cornea (see **KERATITIS**) and the uvea (see **UVEITIS**).

**kerion** *n.* an uncommon and severe form of **\*ringworm** of the scalp consisting of a painful inflamed mass. It is caused by a type of fungus (e.g. *Trichophyton tonsurans*).

**Kerley B lines** fine horizontal lines seen in the angle between the diaphragm and the chest wall on a chest X-ray. It is a sign of pulmonary **\*oedema** and therefore heart failure. [P. J. Kerley (20th century), British radiologist]

**kernicterus** *n.* staining and subsequent damage of the brain by bile pigment (bilirubin), which may occur in severe cases of **\*haemolytic disease of the newborn**. Immature brain cells in the **\*basal ganglia** are affected, and as brain development proceeds a pattern of **\*cerebral palsy** emerges at about six months, with uncoordinated movements, deafness, disturbed vision, and feeding and speech difficulties.

**Kernig's sign** a symptom of **\*meningitis** in which the hamstring muscles in the legs are so stiff that the patient is unable to extend his legs at the knee when the thighs are held at a right angle to the body. [V. Kernig (1840–1917), Russian physician]

**Kernohan's phenomenon (Kernohan's syndrome)** **\*hemiplegia** that is **\*ipsilateral** to the brain lesion that caused it, due to pressure of the lesion (which is often a haematoma) on surrounding structures in the brain. It is

unusual because normally a lesion of the brain causes dysfunction in the **\*contralateral** limbs. [J. W. K. Kernohan (20th century), US pathologist]

**ketoacidosis** *n.* a condition in which **\*acidosis** is accompanied by **\*ketosis**, such as occurs in diabetes mellitus (see **DIABETIC KETOACIDOSIS**). Symptoms include nausea and vomiting, abdominal tenderness, confusion or coma, extreme thirst, and weight loss.

**ketoconazole** *n.* an antifungal drug (see **IMIDAZOLE**) applied topically to treat fungal infections of the skin and anogenital region.

**ketogenesis** *n.* the production of **\*ketone** bodies. These are normal products of lipid metabolism and can be used to provide energy. The condition of **\*ketosis** can occur when excess ketone bodies are produced.

**ketogenic diet** a diet that promotes the formation of **\*ketone** bodies in the tissues. A ketogenic diet is one in which the principal energy source is fat rather than carbohydrate. Its adoption can help control epileptic seizures.

**ketonaemia** *n.* the presence in the blood of **\*ketone** bodies.

**ketone** *n.* any member of a group of organic compounds consisting of a carbonyl group (=CO) flanked by two alkyl groups. The ketones acetoacetic acid, acetone, and  $\beta$ -hydroxybutyrate (known as **ketone** (or **acetone**) **bodies**) are produced during the metabolism of fats. *See also* **KETOSIS**.

**ketonuria (acetonuria)** *n.* the presence in the urine of **\*ketone** (acetone) bodies. This may occur in diabetes mellitus, starvation, or after persistent vomiting and results from the partial oxidation of fats. Ketone bodies may be detected by adding a few drops of 5% sodium nitroprusside solution and a solution of ammonia to the urine; the gradual development of a purplish-red colour indicates their presence.

**ketoprofen** *n.* an anti-inflammatory drug (see **NSAID**) used to treat various arthritic and rheumatic diseases and to relieve pain. Gastric bleeding and ulceration may occur.

**ketose** *n.* a simple sugar that terminates with a keto group ( $-C=O$ ); for example, **\*fructose**.

**ketosis** *n.* raised levels of **\*ketone** bodies in the body tissues. Ketone bodies are normal products of fat metabolism and can be oxidized to produce energy. Elevated levels arise when there is an imbalance in fat metabolism, such as occurs in diabetes mellitus or starvation. Ketosis may result in severe **\*acidosis**. *See also* **KETONURIA**.

**keV** *symbol for* kiloelectronvolt. *See* **ELECTRONVOLT**.

**keyhole surgery** *see* **MINIMALLY INVASIVE SURGERY**.

**khat (qat, kat)** *n.* the leaves of the shrub *Catha edulis*, which contain a stimulant. In Yemen these leaves are wrapped around betel nuts and chewed: this habit is associated with the development of oral **\*leukoplakia**. In 2014 khat became a class-C drug in the UK owing to its increasing use. Possession of the drug can result in up to two years in prison and an unlimited fine.

**kidney** *n.* either of the pair of organs responsible for the excretion of nitrogenous wastes, principally urea, from the blood (see illustrations). The kidneys are situated at the back of the abdomen, below the diaphragm, one on each side of the spine; they are supplied with blood by the renal arteries. Each kidney is enclosed in a fibrous capsule and is composed of an outer **cortex** and an inner **medulla**. The active units of the kidney are the **\*nephrons**, within the cortex and medulla, which filter the blood under pressure and then reabsorb water and selected substances back into the blood. The **\*urine** thus formed is conducted from the nephrons via the renal tubules into the **renal pelvis** and from here to the ureter, which leads to the bladder. *See also* **HAEMODIALYSIS**; **HORSESHOE KIDNEY**; **RENAL FUNCTION TESTS**.

**Position of the kidneys.**

**Section through a kidney.**

<http://www.kidney.org.uk/>

- Website of the National Kidney Federation: includes basic information on the kidneys and a guide to kidney diseases, their symptoms, and treatment

**Kielland's forceps** obstetric forceps used to rotate a baby whose head is presenting in the occipitoposterior or occipitotransverse position (*see OCCIPUT*). Potentially dangerous, when carefully used under regional

anaesthesia they can achieve a controlled atraumatic delivery. [C. Kielland (20th century), Norwegian obstetrician]

**Kienböck's disease** necrosis of the *\*lunate bone* of the wrist caused by interruption of its blood supply (*see* **OSTEOCHONDritis**; **OSTEONECROSIS**). It usually follows chronic stress or injury to the wrist and presents with pain and stiffness, with reduced grip strength. Initially, X-rays may show no abnormality; if the disease is suspected, a bone scan or MRI is indicated. Treatment is with rest, splintage, and *\*NSAIDs*, but some cases require surgical shortening of the radius or *\*arthrodesis* of the wrist. [R. Kienböck (1871–1953), Austrian radiologist]

**Kiesselbach's plexus** a collection of capillaries in the mucosa at the anterior part of the nasal septum. Nosebleeds frequently have their origin from this plexus. *See* **EPISTAXIS**; **LITTLE'S AREA**. [W. Kiesselbach (1839–1902), German laryngologist]

**kilo-** *prefix denoting a thousand.*

**kilocalorie** *n.* one thousand calories. *See* **CALORIE**.

**kilogram** *n.* the *\*SI unit* of mass equal to 1000 grams and previously defined in terms of the international prototype kept at Sèvres, near Paris; from 20 May 2019 it is defined in terms of the Planck constant. Symbol: kg.

**kilovolt** *n.* one thousand *\*volts* (symbol: kV). In radiography, the kilovoltage of the X-ray machine determines the maximum energy of the X-rays produced. The setting is important in controlling the exposure of the film and is generally higher when more penetration is required, depending on the thickness of the body part being imaged. *See also* **MILLIAMPERE**.

**Kimmelstiel–Wilson lesion** *n.* a nodular form of glomerulosclerosis associated with diabetic nephropathy. *See also* **DIABETIC GLOMERULOSCLEROSIS**. [P. Kimmelstiel and C. Wilson (20th century), US physicians]

**kin- (kine-)** *combining form denoting movement.*

**kinaesthesia** *n.* the sense that enables the brain to be constantly aware of the position and movement of muscles in different parts of the body. This is

achieved by means of **\*proprioceptors**, which send impulses from muscles, joints, and tendons. Without this sense, coordinated movement would be impossible with the eyes closed.

**kinaesthesiometer** *n.* an instrument for measuring a patient's awareness of the muscular and joint movements of his own body: used during the investigation of nervous and muscular disorders and certain forms of brain damage.

**kinanaesthesia** *n.* inability to sense the positions and movements of parts of the body, with consequent disordered physical activity.

**kinase** *n.* **1.** an agent that can convert the inactive form of an enzyme (*see* **PROENZYME**) to the active form. **2.** an enzyme that catalyses the transfer of phosphate groups. An example is **\*phosphofructokinase**.

**kinematics** *n.* the study of motion and the forces required to produce it. This includes the different forces at work during the movement of a single part of the body, and more complex movements such as running and climbing.

**kineplasty** *n.* a method of amputation in which the muscles and tendons of the affected limb are arranged so that they can be integrated with a specially made artificial replacement. This enables direct movement of the artificial hand or limb by the muscles.

**-kinesis** *combining form denoting movement.*

**kinetochore** *n.* *see* **CENTROMERE**.

**King–Kopetzky syndrome** *see* **OBSCURE AUDITORY DYSFUNCTION**.

**kinin** *n.* one of a group of naturally occurring polypeptides that are powerful **\*vasodilators**, which lower blood pressure, and cause contraction of smooth muscle. The kinins **bradykinin** and **kallidin** are formed in the blood by the action of proteolytic enzymes (**kallikreins**) on certain plasma globulins (**kininogens**). Kinins are not normally present in the blood, but are formed under certain conditions; for example when tissue is damaged or when there are changes in the pH and temperature of the blood. They are thought to play a role in inflammatory response.

**KIRs** killer cell immunoglobulin-like receptors, which are present on the surface of *\*natural killer cells*.

**kiss of life** *see* MOUTH-TO-MOUTH RESUSCITATION.

**kisspeptin** *n.* a protein that appears to have an important role in initiating secretion of gonadotrophin-releasing hormone (GnRH) at puberty.

**Klatskin tumour** *see* CHOLANGIOCARCINOMA. [G. Klatskin (20th century), US physician]

**Klebsiella** *n.* a genus of Gram-negative rodlike nonmotile bacteria, mostly lactose-fermenting, found in the respiratory, intestinal, and urinogenital tracts of animals and humans. The species *K. oxytoca* is associated with human urinary infections; *K. pneumoniae* is associated with pneumonia and other respiratory infections. The species *K. rhinoscleromatis* causes *\*rhinoscleroma*, a chronic infection of the nose and pharynx.

**Klebs–Loeffler bacillus** *see* CORYNEBACTERIUM. [T. Klebs (1834–1913) and F. A. J. Loeffler (1852–1915), German bacteriologists]

**Kleihauer–Betke test** a test to detect and measure fetal red blood cells in the maternal circulation of Rh-negative women who have *\*antepartum haemorrhage* or have previously had a Rh-positive baby. It is used to calculate the correct dose of *\*anti-D immunoglobulin* that will prevent *\*haemolytic disease of the newborn*.

**Kleine–Levin syndrome** a rare episodic disorder characterized by periods (usually of a few days or weeks), in which sufferers eat enormously, sleep for most of the day and night, and may become more dependent or aggressive than normal. Between episodes they are usually quite unaffected. The disorder almost always resolves spontaneously. [W. Kleine (20th century), German neuropsychiatrist; M. Levin (20th century), US neurologist]

**klepto-** *combining form denoting stealing.*

**kleptomania** *n.* a pathologically strong impulse to steal, often in the absence of any desire for the stolen object(s).

**Klinefelter's syndrome** a genetic disorder in which there are three sex chromosomes, XXY, rather than the normal XX or XY. Affected individuals

are apparently male, but are tall and thin, with small testes, failure of normal sperm production (azoospermia), enlargement of the breasts (gynaecomastia), and absence of facial and body hair. [H. F. Klinefelter (1912–90), US physician]

**Klumpke's paralysis** a partial paralysis of the arm caused by injury to a baby's **\*brachial plexus** during birth. This may result from an obstetric manoeuvre in which the arm is raised at the shoulder to an extreme degree, which damages the lower cervical (neck) and upper thoracic (chest) nerve roots of the spinal cord. It results in weakness and wasting of the muscles of the hand. [A. Klumpke (1859–1927), French neurologist]

**K-nail** *n.* *see* **KÜNTSCHER NAIL**.

**kneading** *n.* *see* **PETRISSAGE**.

**knee** *n.* the hinge joint (*see* **GINGLYMUS**) between the end of the femur, the top of the tibia, and the back of the **\*patella** (kneecap). It is commonly involved in **\*sports injuries** (such as a torn meniscus or ligament) and is a common site of osteoarthritis and rheumatoid arthritis; it can be replaced by an artificial joint (*see also* **ARTHROPLASTY**).

**knee-elbow position** the buttocks-up position assumed by patients undergoing anorectal examinations, now commonly performed in the left lateral position. It is useful for helping patients dispel excess flatus following colonoscopy.

**knee jerk** *see* **PATELLAR REFLEX**.

**knight's-move thinking** a form of **\*formal thought disorder**, common in psychosis, in which connections between sentences or parts of sentences are without a coherent train of thought.

**knock-knee** *n.* abnormal in-curving of the legs, resulting in a gap between the ankles when the knees are in contact. In severe cases there is stress on the knee, ankle, and foot joints, resulting eventually in degenerative arthritis. The condition may be corrected by **\*osteotomy**. Medical name: **genu valgum**.

**Kobberling–Dunnigan syndrome** *see* **LIPODYSTROPHY**.

**Kocher manoeuvre** a method for \*reduction of an anteriorly dislocated shoulder by manipulation. Longitudinal traction is applied to the elbow, pulling down the shoulder, then the forearm, bent at the elbow, is externally rotated to 90°. [E. T. Kocher (1841–1917), Swiss surgeon]

**Kocher's incision** an oblique \*incision made in the right upper quadrant of the abdomen just below and parallel to the costal margin. It is classically used for open \*cholecystectomy. [E. T. Kocher]

**Koch's bacillus** *see* MYCOBACTERIUM. [R. Koch (1843–1910), German bacteriologist]

**Koebner phenomenon (isomorphic response)** a phenomenon that occurs in skin diseases, especially psoriasis and lichen planus, in which the characteristic lesions of the disease appear in linear form in response to such trauma as cuts, burns, or scratches. [H. Koebner (1834–1904), German dermatologist]

**Koeppé nodule** a type of nodule occurring in the iris at the pupil margin in both granulomatous and nongranulomatous \*uveitis. [L. Koeppé (20th century), German ophthalmologist]

**Köhler's disease** OSTEONECROSIS of the \*navicular bone of the foot (*see* OSTEOCHONDritis). It occurs in children aged 3–7 years, causing pain and limping, and is treated by strapping the foot, rest, and anti-inflammatory drugs. [A. Köhler (1874–1947), German physician]

**koilonychia** *n.* the development of thin (brittle) concave (spoon-shaped) nails, a common disorder that can occur with anaemia due to iron deficiency, though the cause is not known. Any underlying disease should be treated.

**Koplik's spots** small red spots with bluish-white centres that often appear on the mucous membranes of the mouth in \*measles. [H. Koplik (1858–1927), US physician]

**koro** *n.* a state of acute anxiety, seen especially in certain cultures (such as that of the Chinese of SE Asia), characterized by a sudden belief that the penis is shrinking into the abdomen and will disappear: the sufferer is often convinced that disappearance of the penis means death. Occasionally women

have a similar belief that their breasts are disappearing into their body. It is usually treated with tranquillizing drugs and reassurance.

**Korsakoff's syndrome** an organic disorder affecting the brain that results in a memory defect in which new information fails to be learnt although events from the past are still recalled; **\*disorientation** in time and place; and a tendency to unintentionally invent material to fill memory blanks (*see* **CONFABULATION**). The commonest cause of the condition is untreated **\*Wernicke's encephalopathy** in the context of alcoholism. Large doses of thiamine are given as treatment. The condition often becomes chronic. [S. S. Korsakoff (1854–1900), Russian neurologist]

**Kostmann's syndrome (severe congenital neutropenia)** a hereditary (autosomal **\*recessive**) disorder characterized by severe **\*neutropenia**. This results in frequent bacterial infections, and death often occurs before the age of six months.

**KRAS** *n.* an important **\*oncogene** for the causation of human lung and colorectal cancer.

**kraurosis** *n.* shrinking of a body part, usually the vulva in elderly women (**kraurosis vulvae**).

**Krebs cycle (citric acid cycle)** a complex cycle of enzyme-catalysed reactions, occurring within the cells of all living animals, in which acetate, in the presence of oxygen, is broken down to produce energy in the form of **\*ATP** (via the **\*electron transport chain**) and carbon dioxide. The cycle is the final step in the oxidation of carbohydrates, fats, and proteins; some of the intermediary products of the cycle are used in the synthesis of amino acids. [Sir H. A. Krebs (1900–81), British biochemist]

**Krukenberg's spindle** a vertical linear deposit of brown pigment on the inner surface of the cornea (corneal endothelium), appearing in cases of pigment dispersion syndrome. [F. E. Krukenberg (1871–1946), German pathologist]

**Krukenberg tumour** a rapidly developing malignant growth in one or (more often) both ovaries. It is caused by the **\*transcoelomic spread** of a primary growth in the stomach or intestine, typically an adenocarcinoma. [F. E. Krukenberg]

**krypton-81m** *n.* a radioactive gas that is the shortest-lived isotope in medical use (half-life 13 seconds). It can be used to investigate the *\*ventilation* of the lungs. The patient breathes a small quantity of the gas, the arrival of which in different parts of the lungs is recorded by means of a *\*gamma camera*. This is often performed as part of *\*ventilation-perfusion scanning* to look for pulmonary emboli (clots in the lungs). *See also* RUBIDIUM-81.

**KUB X-ray** an abdominal plain X-ray film that is longer than normal to enable it to include the *kidneys*, *ureters*, and the entire *bladder*.

**Kugelberg–Wellander disease (juvenile spinal muscular atrophy)** *see* SPINAL MUSCULAR ATROPHY. [E. Kugelberg and L. Wellander (20th century), Swedish neurologists]

**Küntscher nail (K-nail)** a metal rod that is inserted down the middle of the femur (thigh bone) to stabilize a transverse fracture of the shaft. [G. Küntscher (1902–72), German orthopaedic surgeon]

**Kupffer cells** phagocytic cells that line the sinusoids of the *\*liver* (*see* MACROPHAGE). They are particularly concerned with the formation of *\*bile* and are often seen to contain fragments of red blood cells and pigment granules that are derived from the breakdown of haemoglobin. [K. W. von Kupffer (1829–1902), German anatomist]

**kuru (trembling disease)** *n.* a disease that involves a progressive degeneration of the nerve cells of the central nervous system, particularly in the region of the brain that controls movement. Muscular control becomes defective and shiver-like tremors occur in the trunk, limbs, and head. Death usually occurs within 9–12 months. Thought to be caused by a *\*prion* and transmitted by cannibalism, kuru was largely limited to the Fore tribe of New Guinea and mainly affected women and children, reaching high levels in the mid-20th century. It has died out since cannibalism is no longer practised. *See also* SPONGIFORM ENCEPHALOPATHY.

**Kussmaul breathing** the slow deep respiration associated with acidosis. [A. Kussmaul (1822–1902), German physician]

**kV** *symbol for* *\*kilovolt*.

**Kveim test** a test used for the diagnosis of *\*sarcoidosis*. Tissue from a lymph node of a person suffering from the disease is injected intradermally; the development of a granuloma at the injection site indicates that the subject has sarcoidosis. [M. A. Kveim (20th century), Norwegian physician]

**kwashiorkor** *n.* a form of malnutrition due to a diet deficient in protein and energy-producing foods, common among certain African tribes. Kwashiorkor develops when, after prolonged breast feeding, the child is weaned onto an inadequate traditional family diet. The diet is such that it is physically impossible for the child to consume the required quantity in order to obtain sufficient protein and energy. Kwashiorkor is most common in children between the ages of one and three years. The symptoms are *\*oedema*, loss of appetite, diarrhoea, general discomfort, and apathy; the child fails to thrive and there is usually associated gastrointestinal infection.

**Kyasanur Forest disease** a tropical disease, common in southern India, caused by a virus transmitted to humans through the bite of the forest-dwelling tick *Haemaphysalis spinigera*. Symptoms include fever, headache, muscular pains, vomiting, conjunctivitis, exhaustion, bleeding of nose and gums and, subsequently, internal bleeding and the *\*necrosis* of various tissues. General therapy, in the absence of specific treatment, involves relief of dehydration and loss of blood; analgesics are given to alleviate pain.

**kymograph** *n.* an instrument for recording the flow and varying pressure of the blood within the blood vessels. —**kymography** *n.*

**kypho-** *combining form denoting a hump.*

**kyphoplasty** *n.* (in interventional radiology) a technique in which a collapsed high-tensile balloon is inserted into a fractured vertebra (a compression fracture) through a large-bore needle and inflated to restore the height of the vertebra. The balloon is then removed and the space is filled with bone cement.

**kyphos** *n.* a sharp posterior angulation of the spine due to localized collapse or wedging of one or more vertebrae. It results in the appearance of a hump on the back (a hunchback deformity). The cause may be a congenital defect, a fracture (which may or may not be pathological), or spinal tuberculosis.

**kyphoscoliosis** *n.* abnormal posterior and sideways curvature of the spine, i.e. **\*kyphosis** combined with **\*scoliosis**. The deformity may occur during growth for no apparent reason (**idiopathic kyphoscoliosis**) or may result from any of several diseases involving the vertebrae and spinal muscles. Special braces can reduce the extent of the deformity if this is mild. Severe deformity may require surgical correction by **\*fusion** of the spine.

**kyphosis** *n.* outward curvature of the spine, which if excessive causes hunching of the back. A **mobile kyphosis** may be caused by bad posture or muscle weakness or may develop to compensate for another condition, such as hip deformity; it can be corrected by backward bending. A **fixed kyphosis** may be congenital; it may arise in adolescence (see **SCHEUERMANN'S DISEASE**); or it may result from collapse of the vertebrae, as in **\*osteoporosis**, ankylosing **\*spondylitis**, infections, or tumours. Treatment depends on the cause and may include physiotherapy, bracing, and surgery (spinal **\*osteotomy** and fusion may be required in severe cases). *See also* **KYPHOS**; **KYPHOSCOLIOSIS**.

**labelling index** the proportion of cells in a sample of tissue that are producing DNA. Cells that are synthesizing DNA take up tritiated thymidine, which shows up on an autoradiograph (*see* [AUTORADIOGRAPHY](#)) of the sample.

**labetalol** *n.* a combined alpha- and beta-blocking drug, sometimes found to be more effective in the treatment of high blood pressure than beta blockers. Possible side-effects include faintness on standing up, scalp tingling, and difficulty with urination and ejaculation.

**labia** *pl. n. see* [LABIUM](#).

**labial** *adj.* **1.** relating to the lips or to a labium. **2.** designating the surface of a tooth adjacent to the lips.

**labio-** *combining form denoting* the lip(s).

**labiomancy** *n.* lip-reading.

**labioplasty (cheiloplasty)** *n.* surgical repair of injury or deformity of the lips (*\*cleft lip*).

**labium** *n.* (*pl.* **labia**) a lip-shaped structure, especially either of the two pairs of skin folds that enclose the *\*vulva*. The larger outer pair are known as the **labia majora** and the smaller inner pair the **labia minora**.

**labour** *n.* the sequence of actions by which a baby and the afterbirth (placenta) are expelled from the uterus at childbirth. The process usually starts spontaneously about 280 days after conception, but it may be started by artificial means (*see* [INDUCTION](#)). In the first stage the muscular wall of the uterus begins contracting while the muscle fibres of the cervix relax so that

the cervix expands. A portion of the membranous sac (amnion) surrounding the baby is pushed into the opening and ruptures under the pressure, releasing *\*amniotic fluid* to the exterior. In the second stage the baby's head appears at the cervix and the contractions of the uterus strengthen. The passage of the infant through the vagina is assisted by contractions of the abdominal muscles and conscious pushing by the mother. When the top of the baby's head appears at the vaginal opening the whole infant is eased clear of the vagina, and the umbilical cord is cut. If the emergence of the head is impeded an incision may be made in the surrounding tissue (*see EPISIOTOMY*). In the final stage the placenta and membranes are pushed out by the continuing contraction of the uterus, which eventually returns to its unexpanded state. The average duration of labour is about 12 hours in first pregnancies and about 8 hours in subsequent pregnancies. The pain of labour may be reduced with effective birth preparation, continuous midwifery support in labour, and by the use of drugs (e.g. morphine, epidural anaesthesia). *See also CAESAREAN SECTION.*

**labrum** *n.* (*pl. labra*) a lip or liplike structure; occurring, for example, around the margins of the articulating socket (acetabulum) of the hip bone.

**labyrinth (inner ear)** *n.* a convoluted system of cavities and ducts comprising the organs of hearing and balance. The **membranous labyrinth** is a series of interconnected membranous canals and chambers consisting of the *\*semicircular canals*, *\*utricle*, and *\*sacculle* (concerned with balance) and the central cavity of the *\*cochlea* (concerned with hearing). (See illustration.) It is filled with a fluid, **endolymph**. The **bony labyrinth** is the system of the bony canals and chambers that surround the membranous labyrinth. It is embedded in the petrous part of the *\*temporal bone* and is filled with fluid (**perilymph**).

**Labyrinth.** Membranous labyrinth of the right ear.

**labyrinthectomy** *n.* a surgical procedure to ablate (*see* **ABLATION**) the structures of the **\*labyrinth**, usually performed for cases of severe Ménière's disease.

**labyrinthitis (otitis interna)** *n.* inflammation of the inner ear (labyrinth) resulting in dizziness, vertigo, and hearing loss (*compare* **VESTIBULAR NEURONITIS**). A form of **\*otitis**, it may be caused by bacterial or viral infections but often the cause is unknown.

**laceration** *n.* a tear in the flesh caused by a blunt object producing a wound with irregular edges. A **\*gunshot wound** is an example of a laceration caused by a high-velocity blunt object.

**lacertus** *n.* a band of fibres or a tendon-like structure.

**lacrimal apparatus** the structures that produce and drain away fluid from the eye (*see* illustration). The **lacrimal gland** secretes **\*tears**, which drain away through small openings (**puncta**) at the inner corner of the eye into two **lacrimal canaliculi**. From there the tears pass into the nasal cavity via the **lacrimal sac** and the **\*nasolacrimal duct**.

**The lacrimal apparatus of the left eye.**

**lacrimal bone** the smallest bone of the face: either of a pair of rectangular bones that contribute to the orbits. *See* [SKULL](#).

**lacrimal nerve** a branch of the *\*ophthalmic nerve* that supplies the lacrimal gland (*see* [LACRIMAL APPARATUS](#)) and conjunctiva.

**lacrimation** *n.* the production of excess tears; crying. *See also* [LACRIMAL APPARATUS](#).

**lacrimator** *n.* an agent that irritates the eyes, causing excessive secretion of tears.

**lact-** (**lacti-**, **lacto-**) *combining form denoting* **1.** milk. **2.** lactic acid.

**lactalbumin** *n.* a milk protein present in milk at a lower concentration than *\*casein*. Unlike casein, it is not precipitated from milk under acid conditions; it is therefore a constituent of cheese made from whey rather than curd.

**lactase** *n.* an enzyme, secreted by the glands of the small intestine, that converts lactose (milk sugar) into glucose and galactose during digestion.

**lactation** *n.* the secretion of milk by the *\*mammary glands* of the breasts, which begins normally at the end of pregnancy or may be pathological (*see* [GALACTORRHOEA](#)). A fluid called *\*colostrum* is secreted before the milk is produced; both secretions are released in response to the sucking action of the infant on the nipple. Lactation is controlled by hormones (*see*

**PROLACTIN**; **OXYTOCIN**); it stops when the baby is no longer fed at the breast.

**lacteal** *n.* a blind-ended lymphatic vessel that extends into a villus of the small **\*intestine**. Digested fats are absorbed into the lacteals.

**lactic acid** a compound that forms in the cells as the end-product of glucose metabolism in the absence of oxygen (*see* **GLYCOLYSIS**). During strenuous exercise pyruvic acid is reduced to lactic acid, which may accumulate in the muscles and cause cramp. Lactic acid (owing to its low pH) is an important food preservative. The lactic acid produced by the fermentation of milk is responsible for the preservation and flavour of cheese, yoghurt, and other fermented milk products.

**lactic acidosis** excessive plasma acidity due to an accumulation of lactic acid. This may be caused by a variety of illnesses, including heart failure or severe dehydration. It can also be caused by the accumulation of **\*biguanide** drugs used for treating type 2 **\*diabetes mellitus**, particularly when kidney failure is present. Biguanides (*see* **METFORMIN**) should therefore not be used to treat patients who have established kidney disease or heart failure or who are dehydrated.

**lactiferous** *adj.* transporting or secreting milk, as the **lactiferous ducts** of the breast.

**lactifuge** *n.* a drug that reduces the secretion of milk. Some oestrogenic drugs have this effect and are used to suppress milk production in mothers not breastfeeding.

**Lactobacillus** *n.* a genus of Gram-positive nonmotile rodlike bacteria capable of growth in acid media and of producing lactic acid from the fermentation of carbohydrates. They are found in fermenting animal and plant products, especially dairy products, and in the alimentary tract and vagina. They are responsible for the souring of milk. The species *L. acidophilus* is found in milk and is associated with dental caries. It occurs in very high numbers in the faeces of breast- or bottle-fed infants.

**lactogenic hormone** *see* **PROLACTIN**.

**lactose** *n.* a sugar, consisting of one molecule of glucose and one of galactose, found only in milk. Lactose is split into its constituent sugars by the enzyme **\*lactase**, which is secreted in the small intestine. This enzyme is missing or is of low activity in certain people of some Eastern and African races. This leads to the inability to absorb lactose, known as **lactose intolerance**.

**lactosuria** *n.* the presence of milk sugar (**\*lactose**) in the urine. This often occurs during pregnancy and breastfeeding or if the milk flow is suppressed.

**lactulose** *n.* a disaccharide sugar that acts as a gentle but effective osmotic **\*laxative**. It is administered by mouth but is not absorbed or broken down, remaining intact until it reaches the colon. There it is split by bacteria into simpler sugars that help to retain water, thereby softening the stools. Lactulose is also used as a bowel cleanser for treating **\*hepatic encephalopathy**.

**lacuna** *n.* (*pl.* **lacunae**) **1.** (in anatomy) a small cavity or depression; for example, one of the spaces in compact bone in which a bone cell lies. **2.** (in ethics) a crucial gap, for instance in laying out the arguments for or against a controversial approach or treatment, that may invalidate the whole approach.

**laetrile** *n.* a cyanide-containing compound extracted from peach stones. It has been used in **\*complementary medicine** in the treatment of various forms of cancer.

**laevo-** *combining form.* see **LEVO-**.

**laevocardia** *n.* the normal position of the heart, in which its apex is directed towards the left. *Compare* **DEXTROCARDIA**.

**lagaena (lagenae)** *n.* the closed end of the spiral **\*cochlea**. This term is more commonly used to describe the structure homologous to the cochlea in primitive vertebrates.

**lagophthalmos** *n.* any condition in which the eye does not close completely. It may lead to corneal damage from undue exposure.

**laking** *n.* the physical or chemical treatment of blood to abolish the structure of the red cells and thus form a homogeneous solution. Laking is an important

preliminary step in the analysis of haemoglobin or enzymes present in red cells.

**-lalia** *combining form denoting a condition involving speech.*

**lambda** *n.* the point on the skull at which the lambdoidal and sagittal **\*sutures** meet.

**lambda sign (twin-peak sign)** an ultrasound diagnosis of dichorionicity at 10–14 weeks gestation: a peak of placental tissue protrudes into the base of the intertwin membrane. *See* **CHORIONICITY**.

**lambdoidal suture** *see* **SUTURE**.

**lambliasis** *n.* *See* **GIARDIASIS**.

**lamella** *n.* (*pl.* **lamellae**) **1.** a thin layer, membrane, scale, or plate-like tissue or part. In **\*bone** tissue, lamellae are thin bands of calcified matrix arranged concentrically around a Haversian canal. **2.** a thin gelatinous medicated disc used to apply drugs to the eye. The disc is placed on the eyeball; the gelatinous material dissolves and the drug is absorbed. —**lamellar** *adj.*

**lamellar bone** mature **\*bone**, in which the collagen fibres are arranged parallel to each other to form multiple layers (**\*lamellae**) with the osteocytes lying between the lamellae. It exists in two structurally different forms: cortical (compact) and cancellous (spongy) bone. *See also* **WOVEN BONE**.

**lamina** *n.* (*pl.* **laminae**) **1.** a thin membrane or layer of tissue. **2.** the section of the posterior arch of a **\*vertebra** located between the central spinous process and the transverse process on each side.

**lamina cribrosa** a meshlike structure through which nerve fibres forming the optic nerve exit the eye posteriorly through a hole in the sclera.

**laminaria** *n.* an osmotic dilator applied to the cervix before surgically induced abortion in the second trimester (15–23 weeks of pregnancy). Pretreatment with prostaglandins can also be used, but laminaria is preferred after 18 weeks gestation in order to avoid trauma to the cervix and uterus.

**laminectomy** *n.* surgical cutting into the backbone to obtain access to the vertebral (spinal) canal. The surgeon excises the rear part (the posterior

arch) of one or more vertebrae. The operation is performed to remove tumours, to treat injuries to the spine, such as prolapsed intervertebral (slipped) disc (in which the affected disc is removed), or to relieve pressure on the spinal cord or roots.

**laminotomy** *n.* the surgical creation of a window-like opening in the posterior arch of a vertebra by removing a small piece of *\*lamina* and adjacent *\*ligamentum flavum*.

**lamivudine** *n.* a reverse transcriptase inhibitor (*see* **REVERSE TRANSCRIPTASE**).

**lamotrigine** *n.* an antiepileptic drug used in the control of partial seizures and tonic–clonic seizures. Possible side-effects include nausea, headache, double vision, dizziness, *\*ataxia*, and serious skin rashes.

**Lancefield classification** a classification of the *\*Streptococcus* bacteria based on the presence or absence of antigenic carbohydrate on the cell surface. Species are classified into the groups A–S. Most species causing disease in humans belong to groups A, B, and D. [R. C. Lancefield (1895–1981), US bacteriologist]

**lancet** *n.* a broad two-edged surgical knife with a sharp point.

**lancinating** *adj.* describing a sharp stabbing or cutting pain.

**Landau reflex** a reflex seen in normal babies from three months until one year, when it disappears. If the baby is held horizontally, face down, it will straighten its legs and back and try to lift up its head. The presence of this reflex beyond one year may be suggestive of a developmental disorder.

**Langerhans cell histiocytosis** overgrowth of cells of the *\*reticuloendothelial system*. This includes disorders previously called **histiocytosis X**, including **eosinophilic granuloma**, **Hand–Schüller–Christian disease**, and **Letterer–Siwe disease**. [P. Langerhans (1847–88), German physician and anatomist]

**Langer's lines** normal permanent skin creases. Incisions parallel to Langer's lines heal well and are less visible. [C. R. von E. Langer (1819–87), Austrian anatomist]

**lanreotide** *n.* a somatostatin analogue (*see* [SOMATOSTATIN](#)).

**lansoprazole** *n.* *see* [PROTON-PUMP INHIBITOR](#).

**lanugo** *n.* fine hair covering the body and limbs of the human fetus. It is most profuse at about the 28th week of gestation and is shed around 40 weeks. Lanugo is often found in teratomas.

**laparo-** *combining form denoting the loins or abdomen.*

**laparoscope (peritoneoscope)** *n.* a surgical instrument (a type of [\\*endoscope](#)) comprising an illuminated viewing tube generally connected to a camera, with the image viewed on a video screen. It is inserted through the abdominal wall to enable the surgeon to view the abdominal organs (*see* [LAPAROSCOPY](#)). It can be used as a means to allow surgical procedures to be carried out with special instruments, through several small skin incisions. *See also* [MINIMALLY INVASIVE SURGERY](#).

**laparoscopic myolysis** *see* [FIBROID](#).

**laparoscopy (peritoneoscopy)** *n.* examination of the abdominal structures (which are contained within the peritoneum) by means of a [\\*laparoscope](#). This is passed through a small incision in the wall of the abdomen after insufflating carbon dioxide into the abdominal cavity (creating a [\\*pneumoperitoneum](#)). Laparoscopy enables visual assessment of abdominal organs, harvesting of biopsies, and cancer staging. Therapeutic uses include aspiration of cysts, division of adhesions, and surgery that would previously have required [\\*laparotomy](#). Examples include [\\*hysterectomy](#), [\\*cholecystectomy](#), [\\*fundoplication](#), [\\*prostatectomy](#), [\\*colectomy](#), [\\*nephrectomy](#), [\\*oophorectomy](#), Fallopian tube ligation, and ova collection for [\\*in vitro fertilization](#). *See also* [MINIMALLY INVASIVE SURGERY](#). — **laparoscopic** *adj.*

**laparotomy** *n.* an incision to allow access to the abdominal cavity. All of the abdominal organs are examined in order to make a diagnosis and then proceed to treatment. An **exploratory laparotomy** may be performed in abdominal trauma or in the investigation of patients with emergency intra-abdominal conditions.

**lardaceous** *adj.* resembling lard: often applied to tissue infiltrated with the starchlike substance amyloid (*see* [AMYLOIDOSIS](#)).

**Lariam** *n.* *see* [MEFLOQUINE](#).

**larva** *n.* (*pl.* **larvae**) the preadult or immature stage hatching from the egg of some animal groups, e.g. insects and nematodes, which may be markedly different from the sexually mature adult and have a totally different way of life. For example, the larvae of some flies are parasites of animals and cause disease whereas the adults are free-living. —**larval** *adj.*

**larva migrans** *see* [CREEPING ERUPTION](#).

**laryng-** (**laryngo-**) *combining form denoting* the larynx.

**laryngeal mask** an airway tube with an elliptical inflatable cuff at one end for insertion into the mouth of a patient requiring artificial ventilation. It is designed to fit snugly in the patient's throat over the top of the laryngeal opening. While it is relatively easy to insert and allows delivery of effective artificial ventilation, it does not provide the absolute protection of the airway from vomitus afforded by an endotracheal tube (*see* [INTUBATION](#)).

**laryngeal reflex** a cough produced by irritating the larynx.

**laryngeal stroboscopy** a method of studying the movements of the *\*vocal folds* of the *\*larynx* by using stroboscopic light (controlled intermittent flashes) to slow or freeze the movement.

**laryngectomy** *n.* surgical removal of the larynx in the treatment of laryngeal carcinoma. Postoperatively the patient breathes through a *\*tracheostomy*. Speech is lost following the operation but can be restored by teaching the patient to swallow air and then belch it in a controlled fashion. Alternatively, a battery-powered vibrating device can be held in the mouth or underneath the chin to produce speech (*see* [ELECTROLARYNX](#)). Speech can also be facilitated by a one-way valve surgically implanted between the tracheostomy and the upper oesophagus, allowing the patient to divert air into the throat. **Partial laryngectomy** conserves part of the larynx and allows patients to breathe and speak normally. However, it is only suitable for a few patients with small tumours.

**laryngismus** *n.* closure of the vocal folds by sudden contraction of the laryngeal muscles, followed by a noisy indrawing of breath. It occurs in young children and was in the past associated with low-calcium rickets. Now it occurs when the larynx has been irritated following administration of anaesthetic, when a foreign body has lodged in the larynx, or in **\*croup**.

**laryngitis** *n.* inflammation of the larynx and vocal folds, due to infection by bacteria or viruses or irritation by gases, chemicals, etc. The folds lose their vibrance (owing to swelling) and the voice becomes husky or is lost completely; breathing is harsh and difficult (*see* **STRIDOR**); and the cough is painful and honking. Obstruction of the airways may occasionally be serious, especially in children (*see* **CROUP**). The patient should rest his voice and remain in a warm moisture-laden atmosphere; steam inhalations for 15–20 minutes every 2–3 hours are traditionally beneficial.

**laryngocele** *n.* a condition in which an air sac communicates with the larynx. The sac forms a swelling in the neck that dilates on coughing or straining. The condition is probably congenital but is also noted in such people as glassblowers, who have chronically raised intralaryngeal pressure.

**laryngofissure** *n.* a surgical operation to open the larynx, enabling access for further procedures.

**laryngology** *n.* the study of diseases of the larynx and vocal folds.

**laryngomalacia** *n.* a condition characterized by paroxysmal attacks of breathing difficulty and **\*stridor**. It occurs in small children and is caused by flaccidity of the structure of the larynx. It usually resolves spontaneously by the age of two years.

**laryngopharynx** *n.* *see* **HYPOPHARYNX**.

**laryngoscope** *n.* a device used to inspect the larynx. This can be for diagnostic purposes, to facilitate surgery on the laryngeal structures, or to aid insertion of an endotracheal tube (*see* **INTUBATION**). Diagnostic laryngoscopes for use on awake patients are generally fiberoptic devices that are introduced through the mouth or nose. Surgical laryngoscopes are hollow tubes that are passed through the mouth and pharynx and are often used in conjunction with an **\*operating microscope**. Intubating or anaesthetic

laryngoscopes consist of a handle and a curved blade, fitted with a light, for moving the tongue and epiglottis aside.

**laryngoscopy** *n.* examination of the larynx. This may be done indirectly using a small mirror or directly using a **\*laryngoscope**.

**laryngospasm** *n.* involuntary closure of the larynx, obstructing the flow of air to the lungs.

**laryngotomy** *n.* surgical incision of the larynx. *See* **CRICOTHYROIDOTOMY**.

**laryngotracheobronchitis** *n.* a severe and almost exclusively viral infection of the respiratory tract, especially of young children, in whom there may be a dangerous degree of obstruction either at the larynx (*see* **CROUP**) or main air passages (bronchi) due to the thickness and stickiness of the fluid (exudate) produced by the inflamed tissues. Symptoms normally start at night. Treatment is supportive until the condition resolves naturally. In mild and moderate cases the child may benefit from being kept in a humid atmosphere (e.g. a steamy room). Nebulized medications and oxygen can help in more severe cases. In extreme cases endotracheal **\*intubation** may be necessary. The condition may recur.

**laryngotracheoplasty** *n.* a surgical procedure to enlarge the airway within the larynx and upper trachea. It is most commonly used in children with narrowing of the larynx below the vocal folds (subglottic stenosis).

**larynx** *n.* the organ responsible for the production of vocal sounds, also serving as an air passage conveying air from the pharynx to the lungs. It is situated in the front of the neck, above the trachea. It is made up of a framework of nine cartilages (see illustration) – the epiglottis, thyroid, cricoid, arytenoid (two), corniculate (two), and cuneiform (two) – bound together by ligaments and muscles and lined with mucous membrane. Within are a pair of **\*vocal folds**, which function in the production of voice. — **laryngeal** *adj.*

### The larynx.

**LASEK** *laser in situ epithelial keratomileusis*: a technique of laser refractive eye surgery used to correct both short sight (myopia) and long sight (hypermetropia). A flap of corneal epithelium is raised, the surface of the cornea is reshaped using an **\*excimer laser**, and the epithelium is then replaced.

**laser** *n.* light amplification by stimulated emission of radiation: a laser is a device that emits light through such a process; it can be used to operate on small areas of abnormality without damaging the delicate surrounding tissues. For example, lasers are used to unblock coronary arteries narrowed by atheroma and to remove certain types of birthmark (see **NAEVUS**). In ophthalmology different types of laser are used for operations on the cornea (see **EXCIMER LASER**), lens (see **FEMTOSECOND LASER**), lens capsule (see **YAG LASER**), and retina (see **ARGON LASER**; **DIODE LASER**) and for glaucoma (see **TRABECULOPLASTY**). Lasers are also used in the treatment of **\*endometrial ablation** and large fibroids (the **Nd:YAG laser**), **\*cervical intraepithelial neoplasia**, and varicose veins (**\*endovenous laser treatment**).

**laser-assisted uvulopalatoplasty (LAUP)** laser surgery to the palate, which is used in the treatment of **\*obstructive sleep apnoea**.

**laser Doppler flowmeter** a non-invasive instrument for measuring blood flow through tissue (e.g. skin) utilizing a laser beam.

**LASIK** *laser in situ keratomileusis*: laser refractive eye surgery used to correct both **\*myopia** (short sight) and **\*hypermetropia** (long sight). A thin corneal flap (epithelium and stroma) is raised using a keratome, the cornea is reshaped using an **\*excimer laser**, and the flap is then replaced. *Compare* INTRASTROMAL KERATOMILEUSIS.

**Lasix** *n. see* FUROSEMIDE.

**Lassa fever** a serious virus disease confined to Central West Africa. After an incubation period of 3–21 days, headache, high fever, and severe muscular pains develop; difficulty in swallowing often arises. Death from kidney or heart failure occurs in over 50% of cases. Treatment with plasma from recovered patients is the best therapy, and the causative virus is susceptible to ribavirin.

**latah** *n.* a pattern of behaviour seen especially in certain cultures, such as that of Malaysia. After a psychological shock the affected individual becomes very anxious and very suggestible and shows excessive obedience and pathological imitation of the actions of another person (echopraxia).

**latanoprost** *n.* a **\*prostaglandin** drug (an analogue of PGF<sub>2</sub>) that both increases the drainage of aqueous humour from the eye and reduces the production of aqueous humour. It is used as a treatment for open-angle **\*glaucoma**.

**late neonatal death** death of a baby between 7 and 27 completed days of life.

**latent period** (in neurology) the pause of a few milliseconds between the time that a nerve impulse reaches a muscle fibre and the time that the fibre starts to contract.

**late-onset schizophrenia** a mental disorder characterized by systematic **\*delusions** and commonly auditory **\*hallucinations**, but without any other marked symptoms of **\*mental illness**; it was formerly known as **paraphrenia**. The only loss of contact with reality is in areas affected by the delusions and hallucinations. It is typically seen in the elderly and can also occur in people

with severe hearing impediments. Some people develop other symptoms of *\*schizophrenia* over time but in many the personality remains intact over years. *\*Antipsychotic* medication is often useful in treating the illness.

**lateral** *adj.* **1.** situated at or relating to the side of an organ or organism. **2.** (in anatomy) relating to the region or parts of the body that are furthest from the *\*median* plane. *See* ANATOMICAL POSITION. **3.** (in radiology) in the *\*sagittal* plane.

**lateral parapharyngeal space** *see* PARAPHARYNGEAL SPACE.

**lathyrism** *n.* a disease, characterized by muscular weakness and paralysis, found among people whose staple diet consists mostly of large quantities of *Lathyrus sativus*, a kind of chick pea, and/or vetches and pulses related to it. Except in mild cases complete recovery does not occur, despite administration of an adequate diet and physiotherapy.

**laudanum** *n.* a hydroalcoholic solution containing 1% morphine, prepared from macerated raw opium. It was formerly widely used as an opioid analgesic.

**laughing gas** *see* NITROUS OXIDE.

**LAUP** *see* LASER-ASSISTED UVULOPALATOPLASTY.

**Laurence–Moon–Biedl syndrome** an autosomal *\*recessive* condition characterized by obesity, short stature, learning disabilities, *\*retinitis pigmentosa*, *\*hypogonadism*, and delayed puberty. [J. Z. Laurence (1830–74), British ophthalmologist; R. C. Moon (1844–1914), US ophthalmologist; A. Biedl (1869–1933), Austrian physician]

**lavage** *n.* washing out a body cavity, such as the colon or stomach, with water or a medicated solution. In cases of bowel obstruction the washing out can be done during the operation (**on-table lavage**). *See also* DIAGNOSTIC PERITONEAL LAVAGE.

**laxative** *n.* a drug used to stimulate or increase the frequency of bowel evacuation (also called a **cathartic** or **purgative**), or to encourage the passage of a softer or bulkier stool. The common laxatives are the stimulants (e.g. *\*bisacodyl*, *\*senna* and its derivatives); osmotic laxatives (e.g.

magnesium salts, *\*lactulose*); and *\*methylcellulose*, *\*ispaghula husk*, and other bulking agents.

**lazy eye** *see* **AMBLYOPIA**.

**LBC** *see* **LIQUID-BASED CYTOLOGY**.

**LD<sub>50</sub>** the dose of a toxic compound that causes death in 50% of a group of experimental animals to which it is administered: used as a measure of the toxicity of drugs.

**LD flap (latissimus dorsi flap)** a technique used in breast surgery to reconstruct the breast following a mastectomy. The latissimus dorsi muscle is freed up from its position in the back and moved around to be placed over the pectoralis major while still attached to its blood supply.

**LDL** *see* **LOW-DENSITY LIPOPROTEIN**.

**L-dopa** *n. see* **LEVODOPA**.

**lead<sup>1</sup>** *n.* a soft bluish-grey metallic element that forms several poisonous compounds. Acute lead poisoning, which may follow inhalation of lead fumes or dust, causes abdominal pains, vomiting, and diarrhoea, with paralysis and convulsions and sometimes *\*encephalitis*. In chronic poisoning a characteristic bluish marking of the gums ('lead line') is seen and the peripheral nerves are affected; there is also anaemia. Treatment is with *\*edetate*. The use of lead in paints is now strictly controlled. Symbol: Pb.

**lead<sup>2</sup>** *n.* **1.** a portion of an electrocardiographic record that is obtained from a single electrode or a combination of electrodes placed on a particular part of the body (*see* **ELECTROCARDIOGRAM**; **ELECTROCARDIOGRAPHY**). In the conventional ECG, 12 leads are recorded. Each lead represents the electrical activity of the heart as 'viewed' from a different position on the body surface and may help to localize myocardial damage. **2.** a flexible steerable insulated wire introduced into the heart under X-ray control to allow electrical stimulation of the heart for the purpose of pacing (*see* **PACEMAKER**).

**learning disability (learning difficulty)** delayed or incomplete intellectual development combined with some form of social malfunction, such as

educational or occupational failure or inability of individuals to look after themselves. The disability may be classified according to the **\*intelligence quotient** (IQ) as mild (IQ 50–70), moderate to severe (IQ 20–50), and profound (IQ less than 20). Mildly disabled people often make a good adjustment to life after special help with education. The moderately and severely disabled usually need much more help and most are permanently dependent on other people, while the profoundly disabled usually need constant attention. There are very many causes of learning disability, including **\*Down's syndrome**, **\*autism**, inherited metabolic disorders, brain injury, and gross psychological deprivation; some are preventable or treatable. Individuals with learning disability are at greater risk of developing mental illnesses, such as schizophrenia and dementia. Good education alters the course of the disability, and a specialty of psychiatry provides treatment for patients who have a learning disability as well as a mental illness.

<https://www.mencap.org.uk/>

- Website of Mencap, the UK's leading charity for those with learning disabilities

**leather-bottle stomach** *see* **LINITIS PLASTICA**.

**Leber's congenital amaurosis** a hereditary condition (inherited as an autosomal **\*recessive**) causing severe visual loss in infants. The **\*fundus** usually appears to be normal when examined with an **\*ophthalmoscope**, but marked abnormalities are found on the ERG (*see* **ELECTRORETINOGRAPHY**), usually with extinguished wave pattern. [T. Leber (1840–1917), German ophthalmologist]

**Leber's optic atrophy** a rare hereditary disorder, usually affecting young males, that is characterized by loss of central vision due to neuroretinal

degeneration. Visual loss in one eye is rapid and usually followed by loss in the second eye. [T. Leber]

**lecithin** *n.* one of a group of **\*phospholipids** that are important constituents of cell membranes and are involved in the metabolism of fat by the liver. An example is **phosphatidylcholine**. Lecithins are present in the **\*surfactant** that occurs in fetal lung tissue. The **lecithin-sphingomyelin ratio (LS ratio)** is used as a measure of fetal lung maturity; an LS ratio below 2 indicates a higher risk of **\*respiratory distress syndrome** (RDS). In such cases cortisone may be given to stimulate fetal lung maturity and hence reduce the risk of RDS in the newborn.

**lecithinase** *n.* an enzyme from the small intestine that breaks **\*lecithin** down into glycerol, fatty acids, phosphoric acid, and choline.

**leech** *n.* a type of worm that possesses suckers at both ends of its body. Leeches occur in tropical forests and grasslands and in water. Certain parasitic species suck blood from animals and humans, and their bites cause irritation and, in some cases, infection. A leech can be detached from its host by applying salt. Formerly widely used for letting blood, the medicinal leech (*Hirudo medicinalis*) may now be used following microsurgery (e.g. to replace a severed finger) to restore patency to blocked or collapsed blood vessels and thus encourage the growth of new capillaries. The anticoagulants in the saliva of this and other species are now used for the treatment and prevention of thrombosis (*see* **HIRUDIN**).

**leflunomide** *n.* an **\*immunosuppressant** drug used to treat rheumatoid and psoriatic arthritis that have not responded to methotrexate or other **\*disease-modifying antirheumatic drugs**. Side-effects, including blood disorders caused by impairment of bone-marrow function, may be severe.

**Le Fort classification** a classification of fractures involving the **\*maxilla** (upper jaw) and **\*orbit**. Type I involves the maxilla only, type II the anterior orbit, and type III the posterior orbit. [R. Le Fort (19th century), French surgeon]

**left ventricular failure** *see* **HEART FAILURE**.

**Legg–Calvé–Perthes disease (Perthes disease, pseudocoxalgia)** necrosis of the head of the femur (thigh bone) due to interruption of its blood supply

(see [OSTEOCHONDRITIS](#)). Of unknown cause, it occurs most commonly in boys between the ages of 5 and 10 and causes aching and a limp. The head of the femur can collapse and become deformed, resulting in a short leg and restricted hip movement. Affected boys are kept under observation and their activities are restricted; surgery may be required in more severe cases. [A. T. Legg (1874–1939), US surgeon; J. Calvé (1875–1954), French orthopaedist; G. C. Perthes (1869–1927), German surgeon]

**legionnaires' disease** an infection of the lungs caused by the bacterium *Legionella pneumophila*, named after an outbreak at the American Legion convention in Pennsylvania in 1976. *Legionella* organisms are widely found in water; outbreaks of the disease have been associated with defective central heating, air conditioning, and other ventilating systems. Symptoms appear after an incubation period of 2–10 days: malaise and muscle pain are succeeded by a fever, dry cough, chest pain, and breathlessness. X-ray of the lungs shows patchy consolidation. Erythromycin provides the most effective therapy.

**Leigh syndrome** a rare metabolic disorder that affects movement and development. Affected children are initially normal but lose coordination and balance as the disease progresses. There is no known cure at present. *See also* [MITOCHONDRIAL DISORDERS](#). [D. Leigh (1915–98), British psychiatrist]

**leio-** *combining form denoting* smoothness. Example: **leioderma** (abnormal smoothness of the skin).

**leiomyoma** *n.* a benign tumour of smooth muscle. Such tumours occur most commonly in the uterus (see [FIBROID](#)) but can also arise in the digestive tract, walls of blood vessels, etc. They may undergo malignant change (see [LEIOMYOSARCOMA](#)).

**leiomyosarcoma** *n.* a malignant tumour of smooth muscle, most commonly found in the uterus (it may arise in fibroids), stomach, small bowel, and at the base of the bladder. It is the second most common *\*sarcoma* of soft tissues. This tumour is rare in children, occurring most commonly in the bladder, prostate, and stomach. Treatment is with surgery; these tumours are poorly responsive to chemotherapy and radiotherapy.

**Leishman–Donovan body** *see* **LEISHMANIA**. [Sir W. B. Leishman (1865–1926), British surgeon; C. Donovan (1863–1951), Irish physician]

**Leishmania** *n.* a genus of parasitic flagellate protozoans, several species of which cause disease in humans (*see* **LEISHMANIASIS**). The parasite assumes a different form in each of its two hosts. In humans, especially in **\*kala-azar** patients, it is a small rounded structure, with no flagellum, called a **Leishman–Donovan body**, which is found within the cells of the lymphatic system, spleen, and bone marrow. In the insect carrier it is long and flagellated.

**leishmaniasis** *n.* a disease, common in the tropics and subtropics, caused by parasitic protozoans of the genus **\*Leishmania**, which are transmitted by the bite of sandflies. There are two principal forms of the disease: **visceral leishmaniasis**, in which the cells of various internal organs are affected (*see* **KALA-AZAR**); and **cutaneous leishmaniasis**, which affects the tissues of the skin. Cutaneous leishmaniasis itself has several different forms, depending on the region in which it occurs and the species of *Leishmania* involved. In Asia it is common in the form of **\*oriental sore**. In America there are several forms of leishmaniasis (*see* **CHICLERO’S ULCER**; **ESPUNDIA**). Leishmaniasis is treated with drugs containing antimony.

**lemniscus** *n.* a ribbon-like tract of nerve tissue conveying information from the spinal cord and brainstem upwards through the midbrain to the higher centres. On each side a **medial lemniscus** acts as a pathway from the spinal cord, while an outer **lateral lemniscus** commences higher up and is mainly concerned with hearing.

**lemon sign** *see* **BANANA AND LEMON SIGNS**.

**lenalidomide** *n.* a drug, related to **\*thalidomide**, that affects the immune response and has activity against tumour cell formation and **\*angiogenesis**. It is used to treat multiple myeloma and certain types of **\*myelodysplastic syndromes**. The most serious side-effects are deep vein thrombosis and neutropenia, and there is a risk of **\*teratogenesis** (women capable of bearing children must practise contraception during treatment and for a month before and after it).

**lens** *n.* **1.** (in anatomy) the transparent crystalline structure situated behind the pupil of the eye and enclosed in a thin transparent **capsule**. It helps to refract incoming light and focus it onto the *\*retina*. *See also* **ACCOMMODATION**. **2.** (in optics) a piece of glass shaped to refract rays of light in a particular direction. **Convex lenses** converge the light, and **concave lenses** diverge it; they are worn to correct faulty eyesight. *See also* **BIFOCAL LENS**; **CONTACT LENSES**; **TRIFOCAL LENSES**.

**lensectomy** *n.* a surgical procedure in which the crystalline lens of the eye is removed.

**lens implant** *see* **CATARACT**.

**lensmeter** *n.* an instrument used to measure the refractive properties of an artificial lens, such as a spectacle lens.

**lenticonus** *n.* a condition in which the anterior surface (**anterior lenticonus**) or the posterior surface (**posterior lenticonus**) of the lens of the eye has a much steeper curvature than normal and bulges as a blunted cone. It is usually congenital.

**lenticular nucleus (lentiform nucleus)** *see* **BASAL GANGLIA**.

**lentigo** *n.* (*pl.* **lentigines**) a flat dark brown spot found mainly in the elderly on skin exposed to light. Lentigines have increased numbers of *\*melanocytes* in the basal layer of the epidermis (freckles, by contrast, do not show an increase in these cells). **Lentigo maligna** (preinvasive or in-situ melanoma) occurs on the cheeks of the elderly and has variable pigmentation.

**leontiasis** *n.* a bilateral symmetrical hypertrophy of the bones of the face and cranium, said to resemble the appearance of a lion's head. It is a rare feature of untreated *\*Paget's disease*; the cause is unknown. Medical name: **leontiasis ossea**.

**lepra reaction** an aggravation of lumps on the skin caused by *\*leprosy*, accompanied by fever and malaise.

**leproma** *n.* a lump on the skin characteristic of *\*leprosy*.

**lepromin** *n.* a chemical prepared from lumps on the skin caused by lepromatous \*leprosy.

**leprosy (Hansen's disease)** *n.* a chronic disease, caused by the bacterium *Mycobacterium leprae*, that affects the skin, mucous membranes, and nerves. It is confined mainly to the tropics and is transmitted by direct contact. After an incubation period of 1–30 years, symptoms develop gradually and mainly involve the skin and nerves. **Lepromatous (multibacillary) leprosy** is a contagious steadily progressive form of the disease characterized by the development of widely distributed lumps on the skin, thickening of the skin and nerves, and in serious cases by severe numbness of the skin, muscle weakness, and paralysis, which leads to disfigurement and deformity. Tuberculosis is a common complication. **Tuberculoid leprosy** is a benign, often self-limiting, form of leprosy causing discoloration and disfiguration of patches of skin (sparsely distributed) associated with localized numbness. **Indeterminate leprosy** is a form of the disease in which skin manifestations represent a combination of the two main types; tuberculoid and indeterminate leprosy are known as **paucibacillary leprosy**.

Like tuberculosis, leprosy should be treated with a combination of antibacterial drugs, to overcome the problem of resistance developing to a single drug; the WHO advocates a combination of rifampicin and dapsone for six months to treat paucibacillary leprosy and these drugs with the addition of clofazimine for multibacillary leprosy, this **multidrug therapy** (MDT) to be continued for two years. Reconstructive surgery can repair some of the damage caused by the disease. A vaccine is being developed and tested.

**lept- (lepto-)** *combining form denoting* **1.** slender; thin. **2.** small. **3.** mild; slight.

**leptin** *n.* a protein that is produced and secreted by adipose tissue (especially white fat) and has a role in the regulation of eating (leptin receptors are concentrated in the hypothalamus). Increased amounts of adipose tissue result in higher concentrations of leptin and a reduction in appetite. A deficiency of leptin is responsible for a few cases of obesity.

**leptocyte** *n.* a red blood cell (\*erythrocyte) that is wafer-thin, generally large in diameter, and displays a thin rim of haemoglobin at the periphery

with a large area of central pallor. Leptocytes are seen in certain types of anaemia.

**leptomeninges** *pl. n.* the inner two **\*meninges**: the arachnoid and pia mater.

**leptomeningitis** *n.* inflammation of the inner membranes (the **\*pia** mater and **\*arachnoid**) of the brain and spinal cord. *See also* **MENINGITIS**.

**leptophonia** *n.* weakness of the voice.

**Leptospira** *n.* a genus of spirochaete bacteria, commonly bearing hooked ends. They are not visible with ordinary light microscopy and are best seen using dark-ground microscopy. The parasitic species *L. icterohaemorrhagiae* is the main causative agent of Weil's disease (*see* **LEPTOSPIROSIS**), but many closely related species cause similar symptoms.

**leptospirosis (Weil's disease)** *n.* an infectious disease, caused by bacteria of the genus *Leptospira* (especially *L. icterohaemorrhagiae*), that occurs in rodents, dogs, and other mammals and may be transmitted to people whose work brings them into contact with these animals. The disease begins with a high fever and headache and may affect the liver (causing jaundice) or kidneys (resulting in renal failure); in some cases patients may go on to develop meningitis.

**leptotene** *n.* the first stage in the first prophase of **\*meiosis**, in which the chromosomes become visible as single long threads.

**Leriche's syndrome** a condition in males characterized by absence of penile erection combined with absence of pulses in the femoral arteries and wasting of the buttock muscles. It is caused by occlusion of the abdominal aorta and iliac arteries. [R. Leriche (1879–1956), French surgeon]

**Lesch–Nyhan disease** a **\*sex-linked** hereditary disease caused by an enzyme deficiency resulting in overproduction of uric acid. Affected boys have learning disabilities and suffer from **\*spasticity** and gouty arthritis. They also have a compulsion for self-mutilation. [M. Lesch (1939–2008) and W. L. Nyhan Jr. (1926– ), US physicians]

**lesion** *n.* a zone of tissue with impaired function as a result of damage by disease or wounding. Apart from direct physical injury, examples of primary

lesions include abscesses, ulcers, and tumours; secondary lesions (such as crusts and scars) are derived from primary ones.

**lethal gene** a gene that, under certain conditions, causes the death of the individual carrying it. Lethal genes are usually *\*recessive*: an individual will die only if he or she receives the gene from both parents.

**lethargy** *n.* mental and physical sluggishness: a degree of inactivity and unresponsiveness approaching or verging on the unconscious. The condition results from disease (such as sleeping sickness) or hypnosis.

**letrozole** *n.* *see* AROMATASE INHIBITOR.

**Letterer–Siwe disease** *see* LANGERHANS CELL HISTIOCYTOSIS. [E. Letterer (20th century) and S. A. Siwe (1897–1966), German physicians]

**leuc-** (**leuco-**, **leuk-**, **leuko-**) *combining form denoting* **1.** lack of colour; white. **2.** leucocytes.

**leucapheresis** *n.* a procedure for removing a quantity of white cells from the blood. Blood is withdrawn from the patient through a vein and passed through a machine (a cell separator). White cells are removed and the rest of the blood is returned to the patient through another vein. This method can be used to collect peripheral blood *\*stem cells* from a patient.

**leucine** *n.* an *\*essential amino acid*. *See also* AMINO ACID.

**leucocyte (white blood cell)** *n.* any blood cell that contains a nucleus. In health there are three major subdivisions: *\*granulocytes*, *\*lymphocytes* and *\*monocytes*, which are part of the immune system, being involved in protecting the body against foreign substances and in antibody production. In disease, a variety of other types may appear in the blood, most notably immature forms of the normal red or white blood cells.

**leucocytosis** *n.* an increase in the number of white blood cells (leucocytes) in the blood. *see* BASOPHILIA; EOSINOPHILIA; LYMPHOCYTOSIS; MONOCYTOSIS.

**leucocytospermia** *n.* the presence of excess white blood cells (leucocytes) in the semen (more than 1 million/ml). It has an adverse effect on fertility.

**leucoderma** *n.* loss of pigment in areas of the skin, resulting in the appearance of white patches or bands and due to a variety of different causes.

**leucolysin** *n.* *see* **LYSIN**.

**leucoma** *n.* a white opacity occurring in the cornea. Most leucomas result from scarring after corneal inflammation or ulceration. Congenital types may be associated with other abnormalities of the eye.

**leuconychia** *n.* white discoloration of the nails, which may be total or partial. There are many causes.

**leucopenia** *n.* a reduction in the number of white blood cells (leucocytes) in the blood. *See* **EOSINOPENIA**; **LYMPHOPENIA**; **NEUTROPENIA**.

**leucoplakia** *n.* *see* **LEUKOPLAKIA**.

**leucopoiesis** *n.* the process of the production of white blood cells (leucocytes), which normally occurs in the blood-forming tissue of the **\*bone marrow**. *See also* **GRANULOPOIESIS**; **HAEMOPOIESIS**; **LYMPHOPOIESIS**; **MONOBLAST**.

**leucorrhoea** *n.* a whitish or yellowish discharge of mucus from the vaginal opening. It may occur normally, the quantity usually increasing before and after menstruation. An abnormally large discharge may indicate infection of the lower reproductive tract, e.g. **\*vaginitis**, **\*Chlamydia**, or **\*bacterial vaginosis**.

**leucostasis (leukostasis)** *n.* abnormal leucocyte aggregation and clumping associated with a very high white blood cell count, often seen in **\*leukaemia** patients. The brain and lungs are the two most commonly affected organs.

**leucotomy** *n.* the surgical operation of interrupting the pathways of white nerve fibres within the brain: it was formerly the most common procedure in **\*psychosurgery**. In the original form, **prefrontal leucotomy (lobotomy)**, the operation involved cutting through the nerve fibres connecting the **\*frontal lobe** with the **\*thalamus** and the association fibres of the frontal lobe. This was often successful in reducing severe emotional tension. However,

prefrontal leucotomy had serious side-effects and the procedure has now been abandoned.

Modern procedures use *\*stereotaxy* and make selective lesions in smaller areas of the brain. Side-effects are uncommon and the operation is very occasionally (only a few each year in the UK) used for intractable pain, severe depression, obsessive–compulsive disorder, and chronic anxiety, where very severe emotional tension has not been relieved by other treatments.

**leukaemia** *n.* any of a group of malignant diseases in which the bone marrow and other blood-forming organs produce increased numbers of certain types of white blood cells (*\*leucocytes*). Overproduction of these white cells, which are immature or abnormal forms, suppresses the production of normal white cells, red cells, and platelets. This leads to increased susceptibility to infection (due to *\*neutropenia*), *\*anaemia*, and bleeding (due to *\*thrombocytopenia*). Other symptoms include enlargement of the spleen, liver, and lymph nodes.

Leukaemias are classified into **acute** or **chronic** varieties depending on the rate of progression of the disease. They are also classified according to the type of white cell that is proliferating abnormally; for example **acute lymphoblastic leukaemia** (see **LYMPHOBLAST**), **chronic lymphocytic leukaemia** (see **LYMPHOCYTE**), **acute myeloblastic leukaemia** (see **MYELOBLAST**), **hairy-cell leukaemia** (see **HAIRY CELL**), and **monocytic leukaemia** (see **MONOCYTE**). (See also **MYELOID LEUKAEMIA**.) Leukaemias can be treated with *\*cytotoxic drugs* or *\*monoclonal antibodies*, which suppress the production of the abnormal cells, or occasionally with radiotherapy.

<https://www.leukaemiacancersociety.org/>

- Website of the Leukaemia Cancer Society

**leukocidin** *n.* a bacterial *\*exotoxin* that selectively destroys white blood cells (leucocytes).

**leukoplakia (leucoplakia)** *n.* a thickened white patch on a mucous membrane, such as the mouth lining or vulva, that cannot be rubbed off. It is

not a specific disease and is present in about 1% of the elderly. Occasionally leukoplakia can become malignant. **Hairy leukoplakia**, with a shaggy or hairy appearance, is a marker of AIDS. *See also* [KHAT](#).

**leukostasis** *n.* *see* [LEUCOSTASIS](#).

**leukotaxine** *n.* a chemical, present in inflammatory exudates, that attracts white blood cells (leucocytes) and increases the permeability of blood capillaries. It is probably produced by injured cells.

**leukotrichia** *n.* the condition of having white hair. This may be seen with other, underlying, conditions, such as [\\*vitiligo](#).

**leukotriene** *n.* one of a class of powerful chemical agents synthesized from arachidonic acid by mast cells, basophils, macrophages, and various other tissues. Leukotrienes are involved in inflammatory reactions and the immune response: they increase the permeability of small blood vessels, cause contraction of smooth muscle, and attract neutrophils to the site of an infection.

**leukotriene receptor antagonist** one of a class of drugs that prevent the action of [\\*leukotrienes](#) by blocking their receptors on cell membranes, such as those in the airways. These drugs are used in the management of asthma for their effects in relaxing the smooth muscle of the airways and in reducing inflammation in the bronchial linings. Examples are **montelukast** and **zafirlukast**; side-effects may include headache and abdominal pain or gastrointestinal upsets.

**leuprorelin** *n.* *see* [GONADORELIN ANALOGUE](#).

**levamisole** *n.* an [\\*anthelmintic](#) drug used to treat [\\*ascariasis](#). Possible side-effects include nausea and vomiting.

**levator** *n.* **1.** a surgical instrument used for levering up displaced bone fragments in a depressed fracture of the skull. **2.** any muscle that lifts the structure into which it is inserted; for example, the **levator scapulis** helps to lift the shoulder blade.

**Levitra** *n.* *see* [SILDENAFIL](#).

**levo- (laevo-)** *combining form denoting* **1.** the left side. **2.** (in chemistry) levorotation.

**levobunolol** *n.* a **\*beta blocker** used in the treatment of open-angle **\*glaucoma**; it reduces intraocular pressure, probably by reducing the rate of production of aqueous humour. Side-effects may include local stinging and burning.

**levodopa (L-dopa)** *n.* a naturally occurring amino acid (*see* **DOPA**) used in the treatment of **\*parkinsonism**. It is combined with benserazide in **co-beneldopa** or with carbidopa in **co-careldopa**. These drugs prevent the breakdown of levodopa to dopamine outside the brain, which reduces the severity of side-effects and enables lower doses of levodopa to be given. Side-effects may include nausea, vomiting, loss of appetite, faintness on standing up, and involuntary facial movements.

**levodopa test** a test of the ability of the pituitary to secrete growth hormone, in which levodopa is administered by mouth and plasma levels of growth hormone are subsequently measured (they should peak within the following hour). It is a safer alternative to the **\*insulin stress test** but does not give information on cortisol production, which is usually more clinically important to know.

**levomepromazine (methotrimeprazine)** *n.* a phenothiazine **\*antipsychotic** drug used in the treatment of schizophrenia and to relieve agitation, nausea and vomiting, and pain in terminally ill patients. Side-effects include drowsiness and weakness.

**levonorgestrel** *n.* a synthetic female sex hormone – a **\*progestogen** – used mainly in **\*oral contraceptives**, either in combination with an oestrogen or as a progestogen-only preparation. It is also used for emergency contraception (*see* **POSTCOITAL CONTRACEPTION**) and in the intrauterine system (*see* **IUS**).

**levothyroxine sodium** *see* **THYROXINE**.

**levulosuria** *n.* *see* **FRUCTOSURIA**.

**Lewy bodies** *see* **CORTICAL LEWY BODY DISEASE**. [F. H. Lewy (1885–1950), German neurologist]

**Leydig cells** *see* INTERSTITIAL CELLS. [F. von Leydig (1821–1908), German anatomist]

**Leydig tumour** a tumour of the *\*interstitial (Leydig) cells* of the testis. Such tumours often secrete testosterone, which in prepubertal boys causes *\*virilization* and precocious puberty.

**LH** *see* LUTEINIZING HORMONE.

**Lhermitte's sign** a tingling shocklike sensation passing down the arms or trunk when the neck is flexed. It is a nonspecific indication of disease in the cervical (neck) region of the spinal cord. Causes include multiple sclerosis, cervical *\*spondylosis*, and deficiency of vitamin B<sub>12</sub>. [J. Lhermitte (1877–1959), French neurologist]

**LHRH analogue** *see* GONADORELIN ANALOGUE.

**liaison psychiatry** the interface between medicine and psychiatry, recognized by the Royal College of Psychiatrists as a specialty of psychiatry. Liaison teams ideally consist of psychiatric nurses, psychiatrists, psychologists, pharmacists, health-care support workers, and social workers. They are usually located in general hospitals and see patients after *\*deliberate self-harm* or when a mental illness or *\*delirium* is suspected anywhere in the hospital, in order to diagnose and advise on treatment. They offer *\*psychosocial assessments*, treatment plans, medication advice, and advice regarding mental health and capacity legislation, and support ward staff with the management of challenging patients. They also help develop plans for earlier discharges, provide training, and support governance structures.

**libido** *n.* **1.** (in psychoanalytic theory) the life instinct or, specifically, the sexual instinct. The libido (like the death instinct) is said to be one of the fundamental sources of energy for all mental life. **2.** sexual desire. Reduced or low libido may be caused by psychological or physical factors, or by mental illnesses, such as depression.

**Librium** *n.* *see* CHLORDIAZEPOXIDE.

**lice** *pl. n.* *see* LOUSE; PEDICULOSIS.

**licence** *n.* **1.** (in pharmaceuticals) a document that allows a pharmaceutical company to market a particular drug. The company must apply for a licence to the regulatory body that issues them: in the UK this is the **\*Medicines and Healthcare products Regulatory Agency**. A drug is licensed only for defined uses (indications), which the health-care professional prescribing it should adhere to. **2. (licence to practice)** (in general practice) *see* **LICENSING**.

**licensing** *n.* a system in which the medical register shows whether a doctor is a licensed medical practitioner or holds registration only. It is the **licence to practise** rather than registration that signifies to patients and employers that a doctor has the legal authority to hold a post as a doctor, write prescriptions, sign death certificates, and exercise various other legal privileges. *See also* **REVALIDATION**.

**lichenification** *n.* thickening of the epidermis of the skin with exaggeration of the normal creases, thought to resemble tree bark. The cause is abnormal scratching or rubbing of the skin. It is one of the cardinal features of chronic eczema, together with erythema (flushing), pruritus (itching), and xerosis (dryness).

**lichenoid** *adj.* describing any skin disease that resembles **\*lichen planus**.

**lichen planus** an extremely itchy skin disease of unknown cause. Shiny flat-topped pink/purple spots may occur anywhere but are characteristically found on the inside of the wrists. It may take the form of a white lacy pattern in the mouth, which usually produces no symptoms. Trauma, such as a scratch, may induce a linear form of the disease (*see* **KOEBNER PHENOMENON**). Treatment with potent topical corticosteroids gives symptomatic relief. Tablet treatments may be necessary for generalized disease.

**lichen sclerosis** a chronic skin disease affecting the anogenital area (and rarely other sites), especially the vulva in women and foreskin in men. It is characterized by sheets of thin ivory-white skin and may be caused by chronic irritation by urine. There is a risk of **\*squamous cell carcinoma**. In women, the condition causes intense itching, and atrophy of the labia minora often occurs. Potent topical corticosteroids are helpful for women. In men, normal penile architecture is progressively lost and a constricting band

around the foreskin may appear (causing sexual dysfunction and sometimes **\*paraphimosis**) or sometimes narrowing of the urethral meatus may occur. This sometimes necessitates circumcision.

**lichen simplex chronicus (neurodermatitis)** thickened eczematous skin that develops at the site of constant rubbing in susceptible individuals. Common sites are the nape of the neck in women and the lower legs or scrotum in men. Stress may be a relevant factor.

**Liddle's syndrome** a rare autosomal **\*dominant** condition characterized by hypertension associated with hypokalaemia, metabolic alkalosis, and low levels of plasma **\*renin** and **\*aldosterone**. The hypertension often starts in infancy and is due to excess resorption of sodium and excretion of potassium by the renal tubules. The syndrome is caused by a single genetic mutation on chromosome 16, which results in dysregulation of a sodium channel in the distal convoluted tubule. Treatment is with a low salt diet and a potassium-sparing diuretic that directly blocks the sodium channel, such as amiloride or triamterene. [G. G. Liddle (1921–89), US endocrinologist]

**lidocaine (lignocaine)** *n.* a widely used local **\*anaesthetic** administered by injection for minor surgery and dental procedures. For the latter it is normally used in combination with adrenaline to achieve better and longer anaesthesia. Alone or in combination with other agents, it can also be applied directly to the eye, throat, and mouth, as it is absorbed through mucous membranes, and to the skin. Lidocaine is also injected intravenously to treat conditions involving abnormal heart rhythm (ventricular arrhythmias), particularly following myocardial infarction. When used as a local anaesthetic, side-effects are uncommon.

**lie** *n.* **1.** the long axis of the fetus in relation to that of the mother. It may be longitudinal, transverse, or oblique. **2.** (in ethics) an untruthful statement that is intended to deceive. *See also* **TRUTH-TELLING**.

**Lieberkühn's glands (crypts of Lieberkühn)** simple tubular glands in the mucous membrane of the **\*intestine**. In the small intestine they lie between the villi. They are lined with columnar **\*epithelium** in which various types of secretory cells are found. In the large intestine Lieberkühn's glands are longer and contain more mucus-secreting cells. [J. N. Lieberkühn (1711–56), German anatomist]

**lien** *n.* *see* SPLEEN.

**lien-** (**lieno-**) *combining form denoting the spleen.* Example: **lienopathy** (disease of).

**life expectancy** the number of years after which half of the babies born today will have died, assuming mortality rates throughout their lifetime remain the same as they are today. Life expectancy is commonly understood as the number of years that a person within a given population can expect, on average, to live.

**life table** an actuarial presentation of the ages at which a group of males and/or females are expected to die and from which mean life expectancy at any age can be estimated, based on the assumption that mortality patterns current at the time of preparation of the table will continue to apply.

**ligament** *n.* **1.** a tough band of white fibrous connective tissue that links two bones together at a joint. Ligaments are inelastic but flexible; they both strengthen the joint and limit its movements to certain directions. **2.** a sheet of peritoneum that supports or links together abdominal organs.

**ligamentum flavum** an important posterior ligament of the spine, which is thickened and yellowish in colour and joins the **\*laminae** of adjacent vertebrae.

**ligand** *n.* a molecule that binds to another molecule, as in antigen–antibody and hormone–receptor bondings.

**ligation** *n.* the application of a **\*ligature**. This can be used to stop bleeding from medium and larger blood vessels.

**ligature** *n.* any material – for example, nylon, vicryl, or wire – that is tied firmly round a blood vessel to stop it bleeding or around the base of a structure (such as the **\*pedicle** of a growth) to constrict it.

**light adaptation** reflex changes in the eye to enable vision either in normal light after being in darkness or in very bright light after being in normal light. The pupil contracts (*see* PUPILLARY REFLEX) and the pigment in the **\*rods** is bleached. *Compare* DARK ADAPTATION.

**lightening** *n.* the sensation experienced, usually after the 36th week of gestation, by many pregnant women, particularly those carrying their first child, as the presenting part of the fetus enters the pelvis. This reduces the pressure on the diaphragm and the woman notices that it is easier to breathe. Compare **ENGAGEMENT**.

**light reflex** *see* **PUPILLARY REFLEX**.

**lignocaine** *n. see* **LIDOCAINE**.

**likelihood ratio** the degree to which a test result will change the odds that a patient has a disease. The likelihood ratio for a positive test expresses the degree to which the odds that a patient has a disease increase following a positive test. The likelihood ratio for a negative test expresses the degree to which the odds that a patient has a disease decrease following a negative test. Likelihood ratios depend on the **\*sensitivity** and specificity of the test.

**limbic system** a complex system of nerve pathways and networks in the brain, involving several different nuclei, that is involved in the expression of instinct and mood in activities of the endocrine and motor systems of the body. Among the brain regions involved are the **\*amygdala**, **\*hippocampal formation**, and **\*hypothalamus**. The activities of the body that are governed are those concerned with self-preservation (e.g. searching for food, fighting) and preservation of the species (e.g. reproduction and the care of offspring), the expression of fear, rage, and pleasure, and the establishment of memory patterns. *See also* **RETICULAR ACTIVATING SYSTEM**.

**limb lengthening** an orthopaedic procedure for increasing the length of a limb (usually the leg). An **\*external fixator** is attached to the bone. This can be a circular frame surrounding the bone, which was invented by the Russian surgeon Ilizarov, or a bar down one side of the limb. The bone is divided, and the gap produced is slowly widened by moving the two ends of the frame apart; if a bar fixator is used, its body has a screw thread that is turned to increase the distance between the two ends. New bone is produced in the widening gap as the bone is stretched (*see* **CALLOTASIS**). Limb lengthening is undertaken when there is inequality in the length of the legs; for example, following trauma or resulting from paralysis in childhood. Both legs can be lengthened to increase the height of a person of excessively short stature.

**limbus** *n.* (in anatomy) an edge or border; for example, the **limbus sclerae** is the junction of the cornea and sclera of the eye.

**limen** *n.* (in anatomy) a border or boundary. The **limen nasi** is the boundary between the bony and cartilaginous parts of the nasal cavity.

**liminal** *adj.* (in physiology) relating to the threshold of perception.

**limosis** *n.* abnormal hunger or an excessive desire for food.

**linac** *n.* *see* **LINEAR ACCELERATOR**.

**linagliptin** *n.* *see* **DPP-IV INHIBITORS**.

**linctus** *n.* a syrupy liquid medicine, particularly one used in the treatment of irritating coughs.

**Lindau's tumour** *see* **HAEMANGIOBLASTOMA**. [A. Lindau (1892–1958), Swedish pathologist]

**linea** *n.* (*pl.* **lineae**) (in anatomy) a line, narrow streak, or stripe. The **linea alba** is a tendinous line, extending from the xiphoid process to the pubic symphysis, where the flat abdominal muscles are attached.

**linea nigra** a dark line down the centre of the abdomen caused by increased pigmentation in pregnancy.

**linear accelerator (linac)** a machine that accelerates particles to produce high-energy radiation, used in the treatment (radiotherapy) of malignant disease.

**linezolid** *n.* a member of a class of antibiotics – the **oxazolidinones** – that are active against Gram-positive bacteria, including **\*MRSA**. Linezolid is used to treat pneumonia and soft-tissue infections caused by these organisms when they have not responded to other antibacterials. The most common side-effects are headache, a metallic taste in the mouth, diarrhoea, and nausea.

**lingual** *adj.* relating to, situated close to, or resembling the tongue (lingua). The lingual surface of a tooth is the surface adjacent to the tongue.

**lingula** *n.* **1.** the thin forward-projecting portion of the anterior lobe of the cerebellum, in the midline. **2.** a small section of the upper lobe of the left

lung, extending downwards in front of the heart. **3.** a bony spur on the inside of the mandible, above the angle of the jaw. **4.** a small backward-pointing projection on each side of the sphenoid bone.

**liniment** *n.* a medicinal preparation that is rubbed onto the skin or applied on a surgical dressing. Liniments often contain camphor.

**lining** *n.* (in dentistry) a protective layer placed in a prepared tooth cavity before a **\*filling** is inserted.

**linitis plastica (leather-bottle stomach)** diffuse infiltration of the stomach submucosa with malignant tissue, producing rigidity, narrowing, and reduced luminal capacity. Endoscopic diagnosis may be difficult (typically the stomach does not distend during air insufflation at gastroscopy) but radiological changes are more marked.

**linkage** *n.* (in genetics) the situation in which two or more genes lie close to each other on a chromosome and are therefore very likely to be inherited together. The further two genes are apart the more likely they are to be separated by **\*crossing over** during meiosis.

**linogram** *n.* a radiological examination of any tube or line placed into any organ. A radiopaque contrast material is injected through the line and the flow is observed with X-rays, to look for any leakage or blockage of the tubing or the organ it is placed in.

**linoleic acid** *see* **ESSENTIAL FATTY ACID**.

**linolenic acid** *see* **ESSENTIAL FATTY ACID**.

**lint** *n.* a material used in surgical dressings, made of scraped linen or a cotton substitute. It is usually fluffy on one side and smooth on the other.

**liothyronine** *n.* a preparation of the hormone **\*triiodothyronine**, produced by the thyroid gland, that is used to treat conditions of severe thyroid deficiency.

**lip- (lipo-)** *combining form denoting* **1.** fat. **2.** lipid.

**lipaemia** *n.* the presence in the blood of an abnormally large amount of fat.

**lipase (steapsin)** *n.* an enzyme, produced by the pancreas and the glands of the small intestine, that breaks down fats into glycerol and fatty acids during

digestion.

**lipid** *n.* one of a group of naturally occurring compounds that are soluble in solvents such as chloroform or alcohol, but insoluble in water. Lipids are important dietary constituents, not only because of their high energy value but also because certain vitamins and *\*essential* fatty acids are associated with them. The group includes *\*fats*, *\*steroids*, *\*phospholipids*, and *\*glycolipids*.

**lipidosis (lipoidosis)** *n.* (*pl.* **lipidoses**) any disorder of lipid metabolism within the cells of the body. The **brain lipidoses** (*see* **GAUCHER'S DISEASE**; **HUNTER'S SYNDROME**; **HURLER'S SYNDROME**; **TAY-SACHS DISEASE**) are inborn defects causing the accumulation of lipids within the brain.

**lip lick**'s **dermatitis** an irritant contact *\*dermatitis* caused by saliva produced during habitual licking of the lips and the surrounding skin in an attempt to moisten dry chapped lips. The mainstay of treatment is regular frequent application of a moisturizing agent.

**lipoatrophy** *n.* an immune reaction to insulin injections close to the site of injection, resulting in localized hollowing of the fat tissue, which may be unsightly. Formerly common with bovine insulin, it is now very rarely seen with human insulins and insulin analogues.

**lipocondrodystrophy** *n.* multiple congenital defects affecting lipid (fat) metabolism, cartilage and bone, skin, and the major internal organs, leading to learning disabilities, dwarfism, and deformities of the bones.

**lipochrome** *n.* a pigment that is soluble in fat and therefore gives colour to fatty materials. An example is *\*carotene*, the pigment responsible for the colour of egg yolks and butter.

**lipodystrophy** *n.* any condition resulting in the loss and/or redistribution of fat tissue in part or all of the body. It may be congenital or acquired (for example, as an adverse effect of antiretroviral drug treatment). Congenital lipodystrophies include **Kobberling–Dunnigan syndrome**, an autosomal *\*dominant* condition more common in women, who lose fat tissue from their limbs and lower bodies and often also suffer with *\*polycystic ovary syndrome*; and **Seip–Berardinelli syndrome**, which is autosomal *\*recessive* and involves more generalized fat-tissue loss. Acquired forms usually follow an acute illness in childhood and may involve all or part of the body.

**lipodema** *n.* a chronic progressive condition involving abnormal fat-cell accumulation in the buttocks and lower limbs, which causes fluid retention, pain, reduced mobility, and psychological problems.

**lipofuscin** *n.* a brownish pigment staining with certain fat stains. It is most common in the cells of heart muscle, nerves, and liver and is normally contained within the **\*lysosomes**.

**lipogenesis** *n.* the process by which glucose and other substances, derived from carbohydrate in the diet, are converted to **\*fatty acids** in the body.

**lipogranulomatosis** *n.* an abnormality of lipid metabolism causing deposition of yellowish nodules in the skin.

**lipohypertrophy** *n.* a local build-up of fat tissue at the site of repeated insulin injections, which tends to alter the rate of absorption of further injections. It is caused by the local action of the insulin, which (among other things) promotes fat storage.

**lipoic acid** a sulphur-containing compound that can be readily interconverted to and from its reduced form, **dihydrolipoic acid**. Lipoic acid functions in carbohydrate metabolism as one of the **\*coenzymes** in the oxidative decarboxylation of pyruvate and other  $\alpha$ -keto acids.

**lipoidosis** *n.* see **LIPIDOSIS**.

**lipolysis** *n.* the process by which lipids, particularly triglycerides in fat, are broken down into their constituent fatty acids in the body by the enzyme **\*lipase**. —**lipolytic** *adj.*

**lipoma** *n.* (*pl.* **lipomas** or **lipomata**) a common benign tumour composed of well-differentiated fat cells.

**lipomatosis** *n.* **1.** the presence of an abnormally large amount of fat occurring in the tissues. **2.** the presence of multiple **\*lipomas**.

**lipopolysaccharide** *n.* a complex molecule containing both a lipid component and a polysaccharide component. Lipopolysaccharides are constituents of the cell walls of Gram-negative bacteria and are important in determining the antigenic properties of these bacteria.

**lipoprotein** *n.* one of a group of compounds, found in blood plasma and lymph, each consisting of a protein (*see* **APOLIPOPROTEIN**) combined with a lipid (which may be cholesterol, a triglyceride, or a phospholipid). Lipoproteins are important for the transport of lipids in the blood and lymph (*see also* **LIPOPROTEIN LIPASE**). *See* **CHYLOMICRON**; **HIGH-DENSITY LIPOPROTEIN**; **LOW-DENSITY LIPOPROTEIN**; **VERY LOW-DENSITY LIPOPROTEIN**. *See also* **HYPERLIPIDAEMIA**.

**lipoprotein lipase** an enzyme that catalyses the hydrolysis of triglycerides in **\*chylomicrons** and **\*very low-density lipoproteins** to free fatty acids, which are absorbed from the capillaries into local tissues. Deficiency of this enzyme results in severe **\*hypertriglyceridaemia**.

**liposarcoma** *n.* a rare malignant tumour of fat cells. It is most commonly found in the thigh and is rare under the age of 30 years. There are four main histological types: **well-differentiated**, **myxoid**, **pleomorphic**, and **round-cell liposarcomas**. Treatment is usually by surgery.

**liposome** *n.* a microscopic spherical membrane-enclosed vesicle or sac (20–30 nm in diameter) made artificially in the laboratory by the addition of an aqueous solution to a phospholipid gel. The membrane resembles a cell membrane and the whole vesicle is similar to a cell organelle. Liposomes can be incorporated into living cells and may be used to transport relatively toxic drugs into cancer cells, where they can exert their maximum effects. The cancerous organ is at a higher temperature than normal body temperature, so that when the liposome passes through its blood vessels the membrane melts and the drug (e.g. **\*doxorubicin**) is released. Liposomes are also undergoing clinical trials as vehicles in **\*gene therapy** for cystic fibrosis.

**liposuction** *n.* a technique for removing unwanted collections of subcutaneous fat by using a powerful suction tube passed through the skin at different locations.

**lipotrophin** *n.* a hormone-like substance from the anterior pituitary gland that stimulates the transfer of fat from the body stores to the bloodstream.

**lipotropic** *adj.* describing a substance that promotes the transport of fatty acids from the liver to the tissues or accelerates the utilization of fat in the

liver itself. An example of such a substance is the amino acid methionine.

**lipping** *n.* overgrowth of bone around a joint as seen on X-ray. This is a characteristic sign of degenerative joint disease and occurs most frequently and prominently in osteoarthritis. *See also* **OSTEOPHYTE**.

**Lipsitz score** a scoring system used for newborn babies who may be withdrawing from maternal opioids or other (usually nonprescription) drugs. *See* **NEONATAL ABSTINENCE SYNDROME**.

**lipuria** *n.* the presence of fat or oil droplets in the urine.

**liquid-based cytology (LBC)** a technique used for analysing **\*cervical** smears taken for **\*cervical screening**. The specimen is collected using a brush or spatula and then mixed with a liquid preservative fluid. In the laboratory, this fluid is spun and filtered to remove blood and other extraneous material, leaving a thin layer of cells that is spread on a microscope slide and examined. LBC yields specimens that are easier to screen and give more accurate results than those obtained by the traditional Pap test.

**liquor** *n.* **1.** (in pharmacy) any solution, usually an aqueous solution. **2.** the amniotic fluid surrounding a fetus.

**LI-RADS** Liver Imaging Reporting and Data System: *see* **BI-RADS**.

**liraglutide** *n.* *see* **GLP-1 RECEPTOR AGONISTS**.

**Lisch nodules** pigmented **\*hamartomas** of the iris of the eye seen in **\*neurofibromatosis** type I. [K. Lisch (1907–99), Austrian ophthalmologist]

**lissencephaly (smooth brain)** *n.* a condition in which the brain develops abnormally – it has no grooves on the outside, large ventricles, and generally is smaller than it should be. Lissencephaly causes severe learning disabilities and **\*failure to thrive**. *See also* **MILLER–DIEKER SYNDROME**.

**Listeria** *n.* a genus of Gram-positive aerobic motile rodlike bacteria that are parasites of warm-blooded animals. The single species, *L. monocytogenes*, infects many domestic and wild animals. If it is transmitted to humans, by eating infected animals or animal products, it may cause disease (**listeriosis**), especially in the frail, ranging from influenza-like symptoms to

meningoencephalitis. In pregnant women it may cause a miscarriage or damage the fetus.

**lith-** (**litho-**) *combining form denoting a calculus (stone).* Example: **lithogenesis** (formation of).

**-lith** *combining form denoting a calculus (stone).* Example: **faecalith** (a stony mass of faeces).

**lithaemia** *n. see* **HYPERURICAEMIA**.

**lithiasis** *n.* formation of stones (*see* **CALCULUS**) in an internal organ, such as the gall bladder (*see* **GALLSTONE**), urinary system, pancreas, or appendix.

**lithium** *n.* a metallic element used in the form of its salts (lithium carbonate and lithium citrate) to prevent and treat episodes of mania or depression in patients with **\*bipolar affective disorder**, and sometimes chronic or recurrent depression. Side-effects include tremor, weakness, nausea, thirst, and excessive urination. Thyroid function can be impaired after many years of use and regular thyroid function tests are compulsory. Reversible changes in the kidney as well as **\*diabetes** insipidus can appear after long-term lithium treatment. The therapeutic range of lithium is relatively small, therefore levels of lithium in the blood are regularly checked during long-term therapy.

**litholapaxy (lithotripsy)** *n.* the operation of crushing a stone in the bladder, using an instrument called a **lithotrite**. The small fragments of stone can then be removed by irrigation and suction.

**lithonephrotomy** *n.* surgical removal of a stone from the kidney. *See* **NEPHROLITHOTOMY**; **PYEOLITHOTOMY**.

**lithopaedion** *n.* a fetus that has died in the uterus or abdominal cavity and has become calcified.

**lithotomy** *n.* the surgical removal of a stone (calculus) from the urinary tract. *See* **NEPHROLITHOTOMY**; **PYEOLITHOTOMY**; **URETEROLITHOTOMY**.

**lithotomy position** an operating-table position that allows good access to the pelvis and perineum. The patient is placed supine so that the buttocks are at the edge of the table. The feet are placed in individual stirrups and the knees bent to allow the feet to be placed above or at the same level as the hips.

**lithotripsy** *n.* **1.** the process of breaking calculi (stones) into smaller fragments by the application of shock waves. This will enable the stones to pass naturally or be removed more easily. In **extracorporeal shock-wave lithotripsy** (ESWL), used for breaking calculi in the upper urinary tract, the shock waves are generated and transmitted by an external power source. The specialized machine (a **lithotripter**) consists of a sophisticated radiological system to localize the stone accurately by biplanar X-ray and a shock head or transducer to produce and focus the energy source. The prototype machines required the patient to be anaesthetized and immersed in a water bath for treatment, but modern machines require neither water bath nor general anaesthesia. In **electrohydraulic lithotripsy** (EHL), used for breaking urinary calculi, an electrically generated shock wave is transmitted to the stone by a contact probe delivered via a *\*nephroscope* or *\*ureterscope*. **Laser lithotripsy** has also been available since the 1980s. **2.** *see* LITHOLAPAXY.

**lithotrite** *n.* a surgical instrument used for crushing a stone in the bladder. *See* LITHOLAPAXY.

**lithotrophic** *adj.* *see* AUTOTROPHIC.

**lithuresis** *n.* the passage of small stones or *\*gravel* in the urine.

**lithuria** *n.* *see* HYPERURICURIA.

**litre** *n.* a unit of volume equal to the volume occupied by 1 kilogram of pure water at 4°C and 760 mmHg pressure. In *\*SI units* the litre is treated as a special name for the cubic decimetre, but is not used when a high degree of accuracy is required (1 litre = 1.0000028 dm<sup>3</sup>). For approximate purposes 1 litre is assumed to be equal to 1000 cubic centimetres (cm<sup>3</sup>), therefore 1 millilitre (ml) is often taken to be equal to 1 cm<sup>3</sup>. This practice is now deprecated.

**Little's area** the anterior region of the nasal septum (*see* NOSE). It has a rich capillary supply, called *\*Kiesselbach's plexus*, and is a common site from which nosebleeds arise. *See* EPISTAXIS. [J. L. Little (1836–85), US surgeon]

**Little's disease** a form of *\*cerebral palsy* involving both sides of the body and affecting the legs more severely than the arms. [W. J. Little (1810–94),

British surgeon]

**Littre's hernia** an unusual hernia containing a Meckel's *\*diverticulum*. [A. Littre (1658–1726), French anatomist]

**Litzmann's obliquity** *see* *ASYNCLITISM*. [K. C. T. Litzmann (1815–90), German obstetrician]

**livedo** *n.* a discoloured area or spot on the skin, often caused by local congestion of the circulation.

**liver** *n.* the largest gland of the body, weighing 1200–1600 g. Situated in the top right portion of the abdominal cavity, the liver is divided by fissures (*fossae*) into four lobes: the **right** (the largest lobe), **left**, **quadrate**, and **caudate lobes**. It is connected to the diaphragm and abdominal walls by five ligaments: the membranous **falciform** (which separates the right and left lobes), **coronary**, and **right** and **left triangular ligaments** and the fibrous **round ligament**, which is derived from the embryonic umbilical vein. Venous blood containing digested food is brought to the liver in the **hepatic portal vein** (*see* *PORTAL SYSTEM*). Branches of this vein pass in between the lobules and terminate in the **sinusoids** (*see* illustration).

Oxygenated blood is supplied in the **hepatic artery**. The blood leaves the liver via a central vein in each lobule, which drains into the *\*hepatic vein*. The liver is supplied by parasympathetic nerve fibres from the vagus nerve, and by sympathetic fibres from the solar plexus. The liver has a number of important functions. It synthesizes *\*bile*, which drains into the *\*gall bladder* before being released into the duodenum. The liver is an important site of metabolism of carbohydrates, proteins, and fats. It regulates the amount of blood sugar, converting excess glucose to *\*glycogen*; it removes excess amino acids by breaking them down into ammonia and finally *\*urea*; and it stores and metabolizes fats. The liver also synthesizes *\*fibrinogen* and *\*prothrombin* (essential blood-clotting substances) and *\*heparin*, an anticoagulant. It forms red blood cells in the fetus and is the site of production of plasma proteins. It has an important role in the detoxification of poisonous substances and it breaks down worn out red cells and other unwanted substances, such as excess oestrogen in the male (*see also* *KUPFFER CELLS*). The liver is also the site of *\*vitamin A* synthesis; this vitamin is stored in the liver, together with vitamins B<sub>12</sub>, D, and K.

The liver is the site of many important diseases, including \***hepatitis**, \***cirrhosis**, amoebic \***dysentery**, \***hydatid disease**, and \***hepatomas**.

**The liver (microscopic structure).**

<https://www.britishlivertrust.org.uk/>

- Website of the British Liver Trust: information on the liver, liver care, and liver conditions

**livid** *adj.* denoting a bluish colour of the skin, such as that produced locally by a bruise or of the general complexion in \***cyanosis**.

**lividity** *n.* *see* **HYPOSTASIS**.

**living will** *see* **ADVANCE DIRECTIVE, DECISION, OR STATEMENT**.

**lixisenatide** *n.* *see* **GLP-1 RECEPTOR AGONISTS**.

**LLETZ** large loop excision of the \***transformation zone**: a procedure for treating premalignant conditions of the cervix, including carcinoma in situ

(CIN 3; *see* [CERVICAL INTRAEPITHELIAL NEOPLASIA](#)), that is performed under colposcopic control (*see* [COLPOSCOPY](#)) after application of local anaesthetic to the cervix. The transformation zone is removed using a thin loop of wire heated by electric current (*see* [DIATHERMY](#)).

**LMC** *see* [LOCAL MEDICAL COMMITTEE](#).

**Loa** *n.* a genus of parasitic nematode worms (*see* [FILARIA](#)). The adult eye worm, *L. loa*, lives within the tissues beneath the skin, where it causes inflammation and swelling (*see* [LOIASIS](#)). The motile embryos, present in the blood during the day, may be taken up by bloodsucking *Chrysops* flies. Here they develop into infective larvae, ready for transmission to a new human host.

**lobe** *n.* a major division of an organ or part of an organ, especially one having a rounded form and often separated from other lobes by fissures or bands of connective tissue. For example, the brain, liver, and lung are divided into lobes. —**lobar** *adj.*

**lobectomy** *n.* the surgical removal of a lobe of an organ or gland, such as the lung, thyroid, or brain. Lobectomy of the lung may be performed for cancer or other disease of the lung; in some cases the operation can be done through an endoscope.

**lobotomy (prefrontal leucotomy)** *n.* *see* [LEUCOTOMY](#).

**lobular carcinoma** cancer that arises in the lobules (rather than the ducts) of the breast. Like ductal carcinoma, it may be confined to its site of origin but can invade other tissues; however, it has a greater tendency than ductal carcinoma to affect both breasts.

**lobule** *n.* a subdivision of a part or organ that can be distinguished from the whole by boundaries, such as septa, that are visible with or without a microscope. For example, the **lobule of the liver** is a structural and functional unit seen in cross-section under a microscope as a column of cells drained by a central vein and bounded by a branch of the portal vein. The **lung lobule** is a practical subdivision of the lung tissue seen macroscopically in lung slices as outlined by incomplete septa of fibrous tissue. It is made up of three to five lung *\*acini*.

**local education and training board (LETB)** a statutory committee of \*Health Education England responsible for identifying the education and training needs in the health-care and public health workforce and for commissioning postgraduate medical and dental training to meet these needs. There are four local education and training boards in England.

**local involvement networks (LINKs)** groups set up to help local people get involved in the development and delivery of health and social care services; they were replaced by local \*Healthwatch organizations in 2013.

**local medical committee (LMC)** a group of representatives of the general practitioners working in a defined geographical area. There are separate LMCs for each area, and the members speak on behalf of the local practitioners by whom they are elected. Similar arrangements and responsibilities apply for dentists, pharmacists, and optometrists practising in the NHS outside hospitals.

**lochia** *n.* the material eliminated from the uterus through the vagina after the completion of labour. The first discharge, **lochia rubra** (**lochia cruenta**), consists largely of blood. This is followed by **lochia serosa**, a brownish mixture of blood and mucus, and finally **lochia alba** (**lochia purulenta**), a yellowish or whitish discharge containing microorganisms and cell fragments. Each stage may last for several days. —**lochial** *adj.*

**locked-in syndrome** *see* VEGETATIVE STATE.

**lockjaw** *n. see* TETANUS.

**locomotor ataxia** *see* TABES DORSALIS.

**loculation** *n.* the compartmentalization of a fluid-filled cavity into smaller spaces (locules) by fibrous septa. Loculation may occur in patients with long-standing pleural effusions, ascites, and in some cysts.

**loculus** *n.* (in anatomy) a small space or cavity.

**locum tenens** a doctor who stands in temporarily for a colleague who is absent or ill and looks after the patients in his practice. Often shortened to **locum**.

**locus** *n.* **1.** (in anatomy) a region or site. The **locus caeruleus** is a small pigmented **\*nucleus** in the floor of the fourth ventricle of the brain. **2.** (in genetics) the region of a chromosome occupied by a particular gene.

**lofepramine** *n.* a tricyclic **\*antidepressant** that is less sedating than amitriptyline and has a lower incidence of **\*antimuscarinic** side-effects.

**Löfgren's syndrome** an acute form of **\*sarcoidosis** characterized by fever, **\*erythema** nodosum, enlarged lymph nodes near the inner border of the lungs, joint pain or inflammation, often involving the ankles, and **\*uveitis**. Symptoms may resolve spontaneously after a few weeks or may need therapy with NSAIDs or low-dose corticosteroids. Recurrence may occur in a minority of patients. [S. Löfgren (1910–78), Swedish clinician]

**log- (logo-)** *combining form denoting words; speech.*

**LogMAR chart** a chart for testing **\*visual acuity** in which the rows of letters (optotypes) vary in size in a logarithmic progression. The space between the letters in a row and the space between each row is identical to the size of the letters in that row. This neutralizes the effect of crowding on vision. There are five letters in each row and each letter has a score of 0.02 log unit (the name derives from *logarithm* of the *minimum angle of resolution*). This makes it more accurate than a **\*Snellen chart** and it is becoming increasingly used in testing vision. Most tests are done at a distance of 4 metres, allowing it to be used in smaller rooms. The acuity is scored as a number, with 1 being the same as 6/60 on the Snellen chart and 0 being equivalent to 6/6 (normal visual acuity). Vision better than 6/6 is scored as a negative, e.g. –0.18.

**logopaedics** *n.* the scientific study of defects and disabilities of speech and of the methods used to treat them. *See also* **SPEECH AND LANGUAGE THERAPY**.

**logorrhoea** *n.* a rapid flow of voluble speech, often with incoherence, such as is encountered in **\*mania**.

**-logy (-ology)** *combining form denoting field of study.* Example: **cytology** (study of cells).

**loiasis** *n.* a disease, occurring in West and Central Africa, caused by the eye worm **\*Loa loa**. The adult worms live and migrate within the skin tissues,

causing the appearance of transitory **calabar** swellings. These are probably an allergic reaction to the worms' waste products, and they sometimes lead to fever and itching. Worms often migrate across the eyeball just beneath the conjunctiva, where they cause irritation and congestion. Loiasis is treated with **\*diethylcarbamazine**, which kills both the adults and larval forms.

**loin** *n.* the region of the back and side of the body between the lowest rib and the pelvis.

**Lomotil** *n.* *see* **CO-PHENOTROPE**.

**longitudinal study** the collection and analysis of data about a group of participants over a period of time, often some years. *Compare* **CROSS-SECTIONAL STUDY**. *See also* **COHORT STUDY**.

**long QT syndrome** prolongation of the **\*Q–T interval** on the electrocardiogram. It indicates susceptibility to ventricular tachycardia (especially **\*torsades de pointes**), ventricular fibrillation, and sudden death. It may be familial or caused by certain drugs (e.g. sotalol, amiodarone, certain antipsychotic drugs).

**long-sightedness** *n.* *see* **HYPERMETROPIA**.

**long-stretch bandage** a bandage consisting of padding and/or crepe and material containing elastic fibres that can stretch to up 300% of their original length. It is used in the treatment of venous leg ulcers and may be applied dry or as a cohesive layer. The fibres provide constant pressure and should not be worn overnight or during extended periods of rest.

**loop** *n.* **1.** a bend in a tubular organ, e.g. **\*Henle's loop** in a kidney tubule. **2.** one of the patterns of dermal ridges in **\*fingerprints**.

**loop system** *see* **INDUCTION LOOP SYSTEM**.

**loosening of associations** (in psychiatry) a form of **\*formal thought disorder** in which the linkage of the person's train of thoughts gets lost or disrupted. This may be a sign of severe psychotic illness or mania.

**Looser zone** *see* **OSTEOMALACIA**. [E. Looser (1877–1936), Swiss surgeon]

**loperamide** *n.* a drug used in the treatment of diarrhoea, in conjunction with rehydration. It acts by reducing *\*peristalsis* of the digestive tract; side-effects are rare, but include abdominal distension, drowsiness, and skin rash.

**lopinavir** *n.* *see* **PROTEASE INHIBITOR**.

**loprazolam** *n.* a short-acting benzodiazepine drug administered for the short-term treatment of insomnia (*see* **HYPNOTIC**). Possible side-effects include drowsiness and confusion.

**loratidine** *n.* *see* **ANTI-HISTAMINE**.

**lorazepam** *n.* a *\*benzodiazepine* used to relieve moderate or severe anxiety and tension, including that associated with insomnia. It is also used for premedication and for treating status epilepticus. It may cause drowsiness, dizziness, blurred vision, and nausea.

**lordosis** *n.* inward curvature of the spine, which appears as a forward curvature when viewed from the side. A certain degree of lordosis is normal in the lumbar and cervical regions of the spine: loss of this may occur in ankylosing *\*spondylitis*. Exaggerated lordosis may occur through faulty posture or as a result of disorders of vertebral development and spinal muscles. *Compare* **KYPHOSIS**.

**losartan** *n.* *see* **ANGIOTENSIN II ANTAGONIST**.

**loss** *n.* no longer having some valued aspect of one's life, such as a relationship, a job, or a home, that one has previously enjoyed. This may have health consequences: shock, disbelief, and emotional numbness may be followed by anger, guilt, anxiety, or profound sadness. Such emotions may lead to behavioural changes or symptoms that bring people to health care. Encouraging the patient to talk about the loss will require *\*empathy*, sensitivity, and *\*judgment* from the professional, both to obtain the history of the events and to provide helpful advice and direction to assist in adjustment. *See also* **BEREAVEMENT**.

**lotion** *n.* a medicinal solution for washing or bathing the external parts of the body. Lotions usually have a cooling, soothing, or antiseptic action.

**Lou Gehrig's disease** amyotrophic lateral *\*sclerosis*. *See also* MOTOR NEURON DISEASE. [Lou Gehrig (1903–41), US baseball player who suffered from it]

**loupe** *n.* **1.** a small magnifying hand lens used for examining the front part of the eye, usually with a pocket torch to provide illumination. In modern practice a slit-lamp microscope is used. **2. (loupes)** a binocular telescope system of variable magnification range mounted on a spectacle frame or a headband and used in microsurgical procedures, such as nerve repair or anastomosis of fine vessels.

**louse** *n.* (*pl. lice*) a small wingless insect that is an external parasite of humans. Lice attach themselves to hair and clothing using their well-developed legs and claws. Their flattened leathery bodies are resistant to crushing and their mouthparts are adapted for sucking blood. Lice thrive in overcrowded and unhygienic conditions; they can infest humans (*see* PEDICULOSIS) and they may transmit disease. *See also* PEDICULUS; PHTHIRUS.

**Løvset's manoeuvre** rotation of the trunk of the fetus during a breech birth to facilitate delivery of the arms and the shoulders. This procedure is used when the fetal arms are extended due to previous inappropriate traction. [J. Løvset (20th century), Norwegian obstetrician]

**low-density lipoprotein (LDL)** a *\*lipoprotein* that is the principal form in which *\*cholesterol* is transported in the bloodstream: it accounts for approximately 70% of the circulating cholesterol in an individual. LDL is derived from *\*very low-density lipoprotein* and is eventually cleared from the circulation by the liver. LDL may be deposited within the lining of arteries, thus causing *\*atheroma*; the higher the circulating concentration of LDL, the higher the likelihood of atheroma developing (*see also* HYPERCHOLESTEROLAEMIA). *\*Statins* are effective in lowering circulating LDL levels.

**lower urinary tract symptoms (LUTS)** symptoms occurring during urine storage, voiding, or immediately after. These include *\*frequency*, *\*urgency*, *\*nocturia*, *\*incontinence*, *\*hesitation*, *\*intermittency*, *\*terminal dribble*, *\*dysuria*, and *\*postmicturition dribble*. These symptoms used to be known as

**prostatism.** Sometimes they are due to benign prostatic hyperplasia (*see* **PROSTATE GLAND**), but they may be due to **\*detrusor** overactivity, excessive drinking, diuresis due to poorly controlled diabetes, or a urethral stricture.

**lower uterine segment** the lower portion of uterus, lying below the loose fold of peritoneum that lies between the uterus and bladder. This does not form until later in pregnancy and is less contractile than the rest of the uterus. A **\*Caesarean section** is performed through the lower segment.

**Lowe's syndrome** *see* **DENT'S DISEASE**.

**low-molecular-weight heparin** a type of **\*heparin** that is more readily absorbed and requires less frequent administration than standard heparin preparations used as **\*parenteral** anticoagulant therapy to prevent and treat deep vein thrombosis following surgery or during kidney dialysis. Preparations in use include, **dalteparin sodium**, **enoxaparin sodium**, and **tinzaparin sodium**.

**lozenge** *n.* a medicated tablet containing sugar. Lozenges should dissolve slowly in the mouth so that the medication is applied to the mouth and throat.

**LSD** *see* **LYSERGIC ACID DIETHYLAMIDE**.

**lubb-dupp** *n.* a representation of the normal heart sounds as heard through the stethoscope. Lubb (the first heart sound) coincides with closure of the mitral and tricuspid valves; dupp (the second heart sound) is due to closure of the aortic and pulmonary valves.

**Lucentis** *n. see* **RANIBIZUMAB**.

**lucid interval** temporary recovery of consciousness after a blow to the head, before relapse into coma. It is a sign of intracranial arterial bleeding (extradural **\*haematoma**).

**Ludwig's angina** severe inflammation caused by infection of both sides of the floor of the mouth, resulting in massive swelling of the neck. If untreated, it may obstruct the airways, necessitating tracheostomy. [W. F. von Ludwig (1770–1865), German surgeon]

**lues** *n.* a serious infectious disease such as syphilis.

**Lugol's solution (aqueous iodine oral solution)** a solution of 5% iodine and 10% potassium iodide, used in the treatment of thyrotoxicosis in emergencies, such as *\*thyroid crisis*, or when surgery cannot wait for more conventional treatments. For its mode of action it utilizes the abnormal *\*Wolff–Chaikoff effect*, seen in cases of thyroiditis. [J. G. A. Lugol (1786–1851), French physician]

**lumbago** *n.* pain in the lumbar or loin region, of any cause or description. Severe lumbago, of sudden onset while bending or lifting, can be due either to a slipped disc or to a strained muscle or ligament. When associated with *\*sciatica* it is often due to a prolapsed intervertebral disc.

**lumbar** *adj.* relating to the loin.

**lumbar puncture** a procedure performed under local anaesthetic in which cerebrospinal fluid is withdrawn by means of a hollow needle inserted into the *\*subarachnoid space* in the region of the lower back (usually between the third and fourth lumbar vertebrae). The fluid obtained is examined for diagnosis of meningitis, multiple sclerosis, and various other disorders of the brain and spinal cord. Lumbar puncture may also be performed to inject agents into the subarachnoid space. The procedure is usually without risk to the patient, but in patients with raised intracranial pressure it may be hazardous. CT and MRI scanning prior to lumbar puncture have greatly reduced the risk of performing the test in patients with unsuspected raised intracranial pressure. The commonest side-effect of the procedure is a headache that is worse on standing and reduces on lying down (*\*intracranial hypotension headache*). *See also* QUECKENSTEDT TEST.

**lumbar triangle** a weak area in the abdomen bounded by the iliac crest (below), the external oblique muscle (in front), and the erector spinae muscle (behind). It can be the site of a **lumbar hernia**.

**lumbar vertebrae** the five bones of the *\*backbone* that are situated between the thoracic vertebrae and the sacrum, in the lower part of the back. They are the largest of the unfused vertebrae and have stout processes for attachment of the strong muscles of the lower back. *See also* VERTEBRA.

**lumbo-** *combining form* denoting the loin; lumbar region.

**lumbosacral** *adj.* relating to part of the spine composed of the lumbar vertebrae and the sacrum.

**lumen** *n.* **1.** the space within a tubular or sac-like part, such as a blood vessel, the intestine, or the stomach. **2.** the \*SI unit of luminous flux, equal to the amount of light emitted per second in unit solid angle of 1 steradian by a point source of 1 candela. Symbol: lm.

**luminescence** *n.* the emission of light from a substance. \*Fluorescence is a type of luminescence obtained after an object has been irradiated. This phenomenon is used in a \*fluoroscope, a \*gamma camera, an X-ray \*cassette, and some types of \*dosimeter.

**lumpectomy** *n.* an operation for \*breast cancer in which the tumour and surrounding breast tissue are removed: muscles, skin, and lymph nodes are left intact (*compare* MASTECTOMY). The procedure, usually followed by radiation, is indicated for patients with a tumour less than 2 cm in diameter and who have no metastases to local lymph nodes or to distant organs.

**lunate bone** a bone of the wrist (*see* CARPUS). It articulates with the capitate and hamate bones in front, with the radius behind, and with the triquetral and scaphoid at the sides.

**lung** *n.* one of the pair of organs of \*respiration, situated in the chest cavity on either side of the heart and enclosed by a serous membrane (*see* PLEURA). The lungs are fibrous elastic sacs that are expanded and compressed by movements of the rib cage and diaphragm during \*breathing. They communicate with the atmosphere through the \*trachea, which opens into the pharynx. The trachea divides into two bronchi (*see* BRONCHUS), which enter the lungs and branch into \*bronchioles. These divide further and terminate in minute air sacs (*see* ALVEOLUS), the sites of gaseous exchange. (See illustration.) Atmospheric oxygen is absorbed and carbon dioxide from the blood of the pulmonary capillaries is released into the lungs; in each case down a concentration gradient (*see* PULMONARY CIRCULATION). The total capacity of the lungs in an adult male is about 5.5 litres, but during normal breathing only about 500 ml of air is exchanged (*see also* RESIDUAL VOLUME). Other functions of the lung include water evaporation: an important factor in the fluid balance and heat regulation of the body.

**The lungs.** Showing the lobes and main air passages (left) with details of the alveoli (right).

<https://www.blf.org.uk/>

- British Lung Foundation: basic information on the lungs and some common lung conditions

**lung cancer** cancer arising in the epithelium of the air passages (**bronchial cancer**) or lung (*see also* **NON-SMALL-CELL LUNG CANCER**; **SMALL-CELL LUNG CANCER**). It is a very common form of cancer, particularly in Britain, and is strongly associated with cigarette smoking and exposure to industrial air pollutants (including asbestos). There are often no symptoms in the early stages of the disease, when diagnosis is made on X-ray examination. Treatment includes surgical removal of the affected lobe or lung (less than 20% of cases are suitable for surgery), radiotherapy, and chemotherapy.

**lunula** *n.* the whitish crescent-shaped area at the base of a **\*nail**.

**lupus** *n.* any of several chronic skin diseases. *See* **LUPUS ERYTHEMATOSUS**; **LUPUS VERRUCOSUS**; **LUPUS VULGARIS**.

**lupus anticoagulant** one of several autoantibodies that can cause **\*antiphospholipid antibody syndrome** (APS). Despite the name, the antibody behaves as a coagulant, increasing the risk of thrombosis. It can be found in 50% of patients with APS.

**lupus erythematosus (LE)** a chronic inflammatory autoimmune disease of connective tissue, affecting the skin and various internal organs (**systemic LE, SLE**). Typically, there is a red butterfly-shaped rash on the face, over the cheek and bridge of the nose (**butterfly rash**); arthritis; and progressive damage to the kidneys. Often the heart, lungs, and brain are also affected by progressive attacks of inflammation followed by the formation of scar tissue (fibrosis). In a milder form, known as **discoid LE (DLE)**, only the skin is affected. LE is an **\*autoimmune disease** and can be diagnosed by the presence of abnormal antibodies in the bloodstream. The disease is treated with corticosteroids or immunosuppressant drugs.

**lupus nephritis** a frequent and serious complication of systemic **\*lupus erythematosus** (SLE). The 2002 WHO/ISN/RPS classification of lupus nephritis recognizes six classes: class I is the presence of mesangial deposits (see **JUXTAGLOMERULAR APPARATUS**) seen on immunofluorescence and/or electron microscopy; class II is the presence of mesangial deposits and mesangial hypercellularity; class III is focal and segmental **\*glomerulonephritis**; class IV is diffuse segmental or global nephritis; class V is **\*membranous nephropathy**; and class VI is advanced sclerotic glomerulonephritis. Untreated, outcomes are poor in classes III and IV, but much improved with immunosuppressant treatment.

**lupus verrucosus** a rare tuberculous infection of the skin – commonly the arm or hand – typified by warty lesions. It occurs in those who have been reinfected with tuberculosis.

**lupus vulgaris** tuberculous infection of the skin, usually due to direct inoculation of the tuberculosis bacillus into the skin. It is no longer common in the developed world. This type of lupus often starts in childhood, with dark red patches on the nose or cheek. Unless treated, lupus vulgaris may spread, ulcerate, and cause extensive scarring. Treatment is with antituberculous drugs.

**lute** *n.* (in dentistry) a thin layer of cement inserted into the minute space between a prepared tooth and a crown or inlay to hold and seal it permanently in place.

**luteal cyst** *see* OVARIAN CYST.

**lutein** *n.* **1.** a yellow carotenoid pigment and potent **\*antioxidant** found in many vegetables. Like the related pigment **zeaxanthin** (*see also* MESOZEAXANTHIN), it occurs in high concentrations in the human eye. For this reason these pigments are thought to be crucial to healthy vision. **2.** the yellow pigment of the corpus luteum.

**luteinizing hormone (LH)** a hormone (*see* GONADOTROPHIN), synthesized and released by the anterior pituitary gland, that stimulates ovulation, **\*corpus luteum** formation, progesterone synthesis by the ovary (*see also* MENSTRUAL CYCLE), and androgen synthesis by the interstitial cells of the testes. Also called: **interstitial cell stimulating hormone (ICSH)**.

**luteo-** *combining form denoting* **1.** yellow. **2.** the corpus luteum.

**luteotrophic hormone (luteotrophin)** *see* PROLACTIN.

**LUTS** *see* LOWER URINARY TRACT SYMPTOMS.

**lux** *n.* the **\*SI unit** of intensity of illumination, equal to 1 lumen per square metre. This unit was formerly called the metre candle. Symbol: lx.

**luxation** *n.* **1.** *see* DISLOCATION. **2.** extrusion of a tooth from its socket by trauma or pathology.

**lyase** *n.* one of a group of enzymes that catalyse the linking of groups by double bonds.

**Lyell's syndrome** *see* TOXIC EPIDERMAL NECROLYSIS. [A. Lyell (20th century), British dermatologist]

**Lyme disease** a disease caused by a spirochaete, *Borrelia burgdorferi*, and transmitted by certain ticks of the genus *Ixodes*. Following a 3–32-day incubation period, a slowly extending red rash develops in approximately 75% of cases; intermittent systemic symptoms include fever, malaise, headache and neck stiffness, and muscle and joint pains. Later, 60% of

patients suffer intermittent attacks of arthritis, especially of the knees, each attack lasting months and recurring over several years. The spirochaete has been identified in synovium and synovial fluid. Neurological and cardiac involvement occurs in a smaller percentage of cases. Treatment is with doxycycline or a penicillin.

**lymph** *n.* the fluid present within the vessels of the **\*lymphatic system**. It consists of the fluid that bathes the tissues, which is derived from the blood and is drained by the lymphatic vessels. Lymph passes through a series of filters (**\*lymph nodes**) and is ultimately returned to the bloodstream via the **\*thoracic duct**. It is similar in composition to plasma, but contains less protein and some cells, mainly **\*lymphocytes**.

**lymphaden-** (**lymphadeno-**) *combining form denoting lymph node(s).*

**lymphadenectomy** *n.* surgical removal of lymph nodes, an operation commonly performed when a cancer has invaded nodes in the drainage area of an organ infiltrated by a malignant growth. The whole chain of lymph nodes draining the tumour is excised. This is performed for local control and also staging of the cancer, to plan further treatment and for prognosis.

**lymphadenitis** *n.* inflammation of lymph nodes, which become swollen, painful, and tender. Some cases may be chronic (e.g. tuberculous lymphadenitis) but most are acute and localized adjacent to an area of infection. The most commonly affected lymph nodes are those in the neck, in association with tonsillitis. The lymph nodes help to contain and combat the infection. Occasionally generalized lymphadenitis occurs as a result of virus infections. The treatment is that of the cause.

**lymphadenopathy** *n.* enlargement of the lymph nodes. This is usually due to infection (e.g. viral or bacterial), when the nodes are painful and tender, but may alternatively be caused by malignancy (e.g. leukaemias, lymphomas), autoimmune disease (e.g. systemic lupus erythematosus), or adverse drug reactions.

**lymphangi-** (**lymphangio-**) *combining form denoting a lymphatic vessel.*

**lymphangiectasis** *n.* dilatation of the lymphatic vessels, which is usually congenital and produces enlargement of various parts of the body (e.g. the leg

in Milroy's disease). It may also be caused by obstruction of the lymphatic vessels. See [LYMPHOEDEMA](#).

**lymphangiography (lymphography)** *n.* X-ray examination of the lymphatic vessels and lymph nodes after a contrast medium has been injected into them (see [ANGIOGRAPHY](#)). Lymphatic vessels in the upper part of the foot are dissected and cannulated after injecting methylene blue into the web space to identify them. Then a viscous contrast medium (Lipiodol) is injected into them at a very slow rate. Its main uses are in the investigation of the extent and spread of cancer of the lymphatic system, the investigation of lymphoedema, and postoperative collection from lymphatic damage. Newer techniques involve injection of contrast medium directly into the lymph nodes (**intranodal lymphangiography**). Alternatively, the lymphatic system can be imaged using a gamma camera following the injection of a radioactive tracer. This examination has now largely been replaced by other [\\*cross-sectional imaging](#) techniques.

**lymphangioma** *n.* a localized collection of distended lymphatic vessels, which may result in a large cyst in the neck or armpit. This can be removed surgically.

**lymphangiosarcoma** *n.* a rare malignant tumour of the lymphatic vessels. It is most commonly seen in the chronically swollen (oedematous) arms of women who have had a mastectomy for breast cancer and may be induced by radiation.

**lymphangitis** *n.* inflammation of the lymphatic vessels, which can be seen most commonly as red streaks in the skin adjacent to a focus of streptococcal infection. Occasionally a more chronic form results in [\\*lymphoedema](#). The infected part is rested and the infection can be eliminated by an antibiotic (e.g. penicillin).

**lymphatic** **1.** *n.* a lymphatic vessel. See [LYMPHATIC SYSTEM](#). **2.** *adj.* relating to or transporting lymph.

**lymphatic system** a network of vessels that conveys electrolytes, water, proteins, etc. – in the form of [\\*lymph](#) – from the tissue fluids to the bloodstream (see illustration). It consists of fine blind-ended lymphatic capillaries, which unite to form lymphatic vessels. At various points along

the lymphatic vessels are **\*lymph nodes**. Lymph drains into the capillaries and passes into the lymphatic vessels, which have valves to prevent backflow of lymph. The lymphatics lead to two large channels – the **thoracic duct** and the **right lymphatic duct** – which return the lymph to the bloodstream via the innominate veins.

### The lymphatic system.

**lymph node** one of a number of small swellings found at intervals along the lymphatic system. Groups of nodes are found in many parts of the body; for example, in the groin and armpit and behind the ear. They are composed of lymphoid tissue and act as filters for the lymph, preventing foreign particles from entering the bloodstream; they also produce lymphocytes.

**lympho-** *combining form denoting lymph or the lymphatic system.*

**lymphoblast** *n.* an abnormal cell present in the blood and the blood-forming organs in one type of leukaemia (**lymphoblastic leukaemia**). It has a large nucleus with very scanty cytoplasm and is thought to be the precursor of the lymphocyte. —**lymphoblastic** *adj.*

**lymphocele (lymphocoele)** *n.* a collection of lymph in the tissues, which follows injury to, or operations upon, lymph nodes or ducts.

**lymphocyte** *n.* a variety of white blood cell (leucocyte), present also in the lymph nodes, spleen, thymus gland, gut wall, and bone marrow. With **\*Romanowsky stains**, lymphocytes can be seen to have dense nuclei with clear pale-blue cytoplasm. Lymphocytes with scanty cytoplasm are **small lymphocytes**; those with abundant cytoplasm are **large lymphocytes**. There are normally  $1.5\text{--}4.0 \times 10^9$  lymphocytes per litre of blood. They are involved in **\*immunity** and can be subdivided into **B lymphocytes** (or **B cells**), which produce circulating antibodies, and **T lymphocytes** (or **T cells**), which are primarily responsible for cell-mediated immunity. T lymphocytes can differentiate into **\*helper T cells** or **\*cytotoxic T cells**. There is an increase in the number of lymphocytes in the blood and bone marrow in chronic lymphocytic **\*leukaemia**. —**lymphocytic** *adj.*

**lymphocytopenia** *n.* *see* LYMPHOPENIA.

**lymphocytosis** *n.* an increase in the number of **\*lymphocytes** in the blood. Lymphocytosis may occur in a wide variety of diseases, including chronic lymphocytic **\*leukaemia** and infections due to viruses.

**lymphoedema** *n.* an accumulation of lymph in the tissues, producing swelling; the legs are most often affected. It may be due to a congenital abnormality of the lymphatic vessels (as in **Milroy's disease**, congenital lymphoedema of the legs) or result from obstruction of the lymphatic vessels by a tumour, parasites, inflammation, or injury. Treatment consists of elastic support, by stockings or bandages, and diuretic drugs. A variety of surgical procedures has been devised but with little success.

**lymphogranuloma venereum** a sexually transmitted disease that is caused by **\*Chlamydia** and is most common in tropical regions. An initial lesion on

the genitals is followed by swelling and inflammation of the lymph nodes in the groin; the lymph vessels in the genital region may become blocked, causing thickening of the skin of that area. Early treatment with sulphonamides or tetracyclines is usually effective.

**lymphography** *n.* *see* **LYMPHANGIOGRAPHY**.

**lymphoid tissue** a tissue responsible for the production of lymphocytes and antibodies. It occurs as discrete organs, in the form of the lymph nodes, tonsils, thymus, and spleen, and also as diffuse groups of cells not separated from surrounding tissue. *See also* **IMMUNE SYSTEM**.

**lymphokine** *n.* a substance produced by lymphocytes that has effects on other cells involved in the immune system (*see* **CYTOKINES**). An example is **\*interleukin 2** (IL-2).

**lymphoma** *n.* cancer of the lymph nodes, including **\*Hodgkin's disease** and **non-Hodgkin's lymphomas**. There is a broad spectrum of malignancy, with prognosis ranging from a few months to many years. The patient usually shows evidence of multiple enlarged lymph nodes and may have constitutional symptoms such as weight loss, fever, and sweating (the so-called 'B symptoms'). Disease may be widespread, but in some cases is confined to a single area, which may be extranodal (such as the tonsil). Treatment is with drugs such as chlorambucil or combinations of cyclophosphamide, vincristine, and prednisolone, sometimes with the addition of doxorubicin and/or bleomycin; response to these drugs is often dramatic. New **\*targeted agents** are used depending on the expression of cell surface molecules, particularly **\*rituximab** against CD20 in diffuse B-cell lymphoma. Localized disease may be treated with radiotherapy followed by drugs. Patients with non-Hodgkin's lymphoma who do not respond to chemotherapy may be considered for a bone-marrow transplant.

**lymphopenia (lymphocytopenia)** *n.* a decrease in the number of **\*lymphocytes** in the blood, which may occur in a wide variety of diseases.

**lymphoplasmacytic lymphoma** *see* **WALDENSTROM'S MACROGLOBULINAEMIA**.

**lymphopoiesis** *n.* the process of the production of **\*lymphocytes**, which occurs in the **\*bone marrow** as well as in the lymph nodes, spleen, thymus gland, and gut wall. The precursor cell from which lymphocytes are derived has not yet been identified.

**lymphorrhagia** *n.* the escape of the lymph from lymphatic vessels that have been injured.

**lymphosarcoma** *n.* a former name for non-Hodgkin's **\*lymphoma**.

**lymphoscintigraphy** *n.* an imaging scan undertaken to identify the **\*sentinel lymph nodes**, which receive lymph drainage from a tumour and are the first to show evidence of metastasis, and to differentiate these from disease-free nodes; this is in order to plan treatment options, particularly for melanoma and breast cancer management.

**lymphotoxin** *n.* a **\*lymphokine** that lyses various cell types, including tumour cells.

**lymphovascular invasion** the spread of cancer cells into lymphatic or blood vessels noted on histopathological analysis of a specimen taken at biopsy or after surgical resection. It is associated with a higher risk of lymph node involvement and distant metastases.

**lymphuria** *n.* the presence in the urine of lymph.

**Lynch syndrome** *see* **HEREDITARY NONPOLYPOSIS COLORECTAL CANCER**.

**Lyon hypothesis** the hypothesis that gene dosage imbalance between males and females, because of the presence of two X chromosomes in females (XX) as opposed to only one in males (XY), is compensated for by random inactivation of one of the X chromosomes in the somatic cells of females. The inactivated X chromosome becomes the Barr body (*see* **SEX CHROMATIN**). [M. F. Lyon (1925–2014), British geneticist]

**lys-** (**lysi-**, **lyso-**) *combining form denoting* lysis; dissolution.

**lysergic acid diethylamide (LSD)** an illegal hallucinogenic drug that was formerly used to aid treatment of certain psychological disorders. Side-effects include digestive upsets, dizziness, tingling, anxiety, sweating, dilated

pupils, muscle incoordination and tremor. Alterations in sight, hearing, and other senses occur, psychotic effects, depression, and confusion are common, and tolerance to the drug develops rapidly. Because of these toxic effects, LSD is no longer used clinically. See [Appendix 12](#) for a list of street names for illicit drugs.

**lysin** *n.* a specific *\*complement*-fixing antibody that is capable of bringing about the destruction (lysis) of whole cells. Names are given to varieties of lysin with different targets; for example, **haemolysin** attacks red blood cells; **leucolysin** attacks white cells; and a **bacteriolysin** targets bacterial cells.

**lysine** *n.* an *\*essential amino acid*. See also [AMINO ACID](#).

**lysis** *n.* the destruction of cells through damage or rupture of the plasma membrane, allowing escape of the cell contents. See also [AUTOLYSIS](#); [LYSOZYME](#).

**-lysis** *combining form denoting* **1.** lysis; dissolution. **2.** remission of symptoms.

**lysogenic** *adj.* producing *\*lysis*.

**lysogeny** *n.* an interaction between a *\*bacteriophage* and its host in which a latent form of the phage (**prophage**) exists within the bacterial cell, which is not destroyed. Under certain conditions (e.g. irradiation of the bacterium) the phage can develop into an active form, which reproduces itself and eventually destroys the bacterial cell.

**lysosome** *n.* a particle in the cytoplasm of cells that contains enzymes responsible for breaking down substances in the cell and is bounded by a single membrane. Lysosomes are especially abundant in liver and kidney cells. Foreign particles (e.g. bacteria) taken into the cell are broken down by the enzymes of the lysosomes. When the cell dies, these enzymes are released to break down the cell's components.

**lysozyme** *n.* an enzyme found in tears and egg white. It catalyses the destruction of the cell walls of certain bacteria. Bacterial cells that are attacked by lysozyme are said to have been **lysed**.

**lytic** *adj.* of, relating to, or causing **\*lysis**. For example, bone metastases that involve lysis (destruction) of normal bone, typically seen in multiple **\*myeloma**, are described as lytic.

**mA** *symbol for* \*milliamp.

**MabThera** *n. see* RITUXIMAB.

**maceration** *n.* **1.** the softening of a solid by leaving it immersed in a liquid.  
**2.** (in obstetrics) the natural breakdown of a dead fetus within the uterus.

**machinery murmur** a continuous heart \*murmur that indicates patent \*ductus arteriosus or arteriovenous \*fistula.

**Macleod's syndrome (Swyer-James syndrome)** pulmonary \*emphysema affecting only one lung and beginning in childhood or in adolescence; it occurs secondarily to necrotizing bronchitis, probably caused by a virus. [W. M. Macleod (1911–77), British physician]

**macr-** (**macro-**) *combining form denoting* large size. Example: **macrencephaly** (abnormally enlarged brain).

**macrocephaly (megalcephaly)** *n.* abnormal largeness of the head in relation to the rest of the body. *Compare* MICROCEPHALY.

**macrocheilia** *n.* hypertrophy of the lips: a congenital condition in which the lips are abnormally large. *Compare* MICROCHEILIA.

**macrocyte (megalocyte)** *n.* an abnormally large red blood cell (\*erythrocyte), seen in certain anaemias. *See also* MACROCYTOSIS. — **macrocytic** *adj.*

**macrocytosis** *n.* the presence of abnormally large red cells (**macrocytes**) in the blood. Macrocytosis is a feature of certain anaemias (**macrocytic anaemias**), including those due to deficiency of vitamin B<sub>12</sub> or folate, and

also of anaemias in which there is an increase in the rate of red cell production.

**macroductyly** *n.* abnormally large size of one or more of the fingers or toes.

**macrodonia (megadonia, megalodonia)** *n.* a condition in which the teeth are unusually large. Macrodonia may be true generalized (all the teeth are larger than normal), relative generalized (all teeth appear larger than normal, usually because the jaw is abnormally small), or localized (affecting a single tooth or teeth in one part of the mouth).

**macrogamete** *n.* the nonmotile female sex cell of the malarial parasite (*Plasmodium*) and other protozoans. The macrogamete is similar to the ovum of animals and larger than the male sex cell (*see* MICROGAMETE).

**macrogametocyte** *n.* a cell that undergoes meiosis to form mature female sex cells (macrogametes) of the malarial parasite (*see* PLASMODIUM). Macrogametocytes are found in human blood but must be ingested by a mosquito before developing into macrogametes.

**macrogenitosoma** *n.* excessive bodily growth with marked enlargement of the genitalia. **Macrogenitosoma praecox** is a variant occurring in early childhood.

**macroglia** *n.* one of the two basic classes of \*glia (the non-nervous cells of the central nervous system), divided into \*astrocytes and \*oligodendrocytes. *Compare* MICROGLIA.

**macroglobulin** *n.* **1.** (immunoglobulin M, IgM) a protein of the globulin series that is present in the blood and functions as an antibody, forming an effective first-line defence against bacteria in the bloodstream. *See also* IMMUNOGLOBULIN. **2.** an abnormal form of IgM (*see* PARAPROTEIN) produced by \*lymphoma cells or in other plasma-cell disorders, such as multiple \*myeloma.

**macroglobulinaemia** *n.* the presence in the blood of excessive amounts of \*macroglobulin (IgM), produced by a malignant proliferation of the lymphocytes in certain \*lymphomas. *See* WALDENSTROM'S MACROGLOBULINAEMIA.

**macroglossia** *n.* the condition of having an abnormally large tongue. It can be associated with a variety of congenital disorders (including Down's syndrome) and may also be caused by trauma or disease. The condition can cause problems with eating, breathing, and sleeping.

**macrognathia** *n.* a condition in which one or both jaws are abnormally large. It can be associated with pituitary **\*gigantism**, tumours, and other disorders. It can often be corrected with surgery.

**macromelia** *n.* abnormally large size of the arms or legs. *Compare* **MICROMELIA**.

**macronormoblast** *n.* an abnormal form of any of the cells (**\*normoblasts**) that form a series of precursors of red blood cells. Macronormoblasts are unusually large but have normal nuclei (*compare* **MEGALOBLAST**); they are seen in certain anaemias in which red cell production is impaired.

**macrophage** *n.* a large scavenger cell (a **\*phagocyte**) present in connective tissue and many major organs and tissues, including the bone marrow, spleen, **\*lymph nodes**, liver (*see* **KUPFFER CELLS**), and the central nervous system (*see* **MICROGLIA**). They are closely related to **\*monocytes**. **Fixed macrophages (histiocytes)** are stationary within connective tissue; **free macrophages** wander between cells and aggregate at focal sites of infection, where they remove bacteria or other foreign bodies from blood or tissues. *See also* **RETICULOENDOTHELIAL SYSTEM**.

**macroprolactin** *n.* a physiologically inactive form of the hormone prolactin, bound to immunoglobulin G to create a much bigger molecule. It is found in a small proportion of people but is important because some laboratory assays will detect it as prolactin, leading to a falsely elevated prolactin level in the blood and a misdiagnosis of hyperprolactinaemia (*see* **PROLACTIN**).

**macropsia** *n.* a condition in which objects appear larger than they really are. It is usually due to disease of the retina affecting the **\*macula** but may also occur in spasm of **\*accommodation**.

**macroscopic** *adj.* visible to the naked eye. *Compare* **MICROSCOPIC**.

**macrosomia** *n.* abnormally large size. In **fetal macrosomia** the baby is large for its gestational age. This condition is associated with poorly controlled maternal diabetes, the increased size being due to excessive production of fetal insulin and thence to increased deposition of glycogen in the fetus, and maternal obesity.

**macrotia** *n.* a congenital deformity of the external ear in which the **\*pinna** is larger than normal.

**macula** *n.* (*pl.* **maculae**) a small anatomical area that is distinguishable from the surrounding tissue. The **macula lutea** is the yellow spot on the retina at the back of the eye, which surrounds the greatest concentration of cones (*see* **FOVEA**). Maculae occur in the saccule and utricle of the inner ear (*see* illustration). Tilting of the head causes the otoliths to bend the hair cells, which send impulses to the brain via the vestibular nerve. *See also* **LABYRINTH**.

**A macula of the inner ear.**

**macular degeneration** a group of conditions affecting the **\*macula** lutea of the eye, resulting in a reduction or loss of central vision. **Age-related macular degeneration (AMD, ARMD)** is the most common cause of poor vision in the elderly. Two types are commonly recognized. **Atrophic (or dry) AMD** results from chronic choroidal ischaemia: small blood vessels of the choroid, which lies beneath the retina, become constricted, reducing the blood supply to the macula. This gives rise to degenerative changes in the retinal pigment epithelium (RPE; *see* **RETINA**), clinically recognized by macular pigmentation and the deposition of **\*drusen**. **Wet AMD** is associated with the growth of abnormal new blood vessels underneath the retina,

derived from the choroid (*see* [NEOVASCULARIZATION](#)). These can leak fluid and blood beneath the retina, which further reduces the macular function. Nutritional supplements can delay the progression of AMD in some cases. Laser surgery (*see* [PHOTOCOAGULATION](#); [PHOTODYNAMIC THERAPY](#)) and anti-VEGF therapy (*see* [VASCULAR ENDOTHELIAL GROWTH FACTOR](#)) can delay progression in cases of wet AMD.

**macule** *n.* a flat (impalpable) circumscribed area of skin or an area of altered skin colour (e.g. a freckle). *Compare* [PAPULE](#).

**maculopapular** *adj.* describing a rash that consists of both [\\*macules](#) and [\\*papules](#).

**maculopathy** *n.* any abnormality of the [\\*macula](#) of the eye. For example, **bull's-eye maculopathy** describes the appearance of the macula in some toxic conditions (e.g. chloroquine toxicity) and in some hereditary disorders of the macula. *See also* [EPIRETINAL MEMBRANE](#).

**madarosis** *n.* **1.** a congenital deficiency of the eyelashes and eyebrows, which are sometimes absent altogether. **2.** a deficiency of the eyelashes alone, caused by chronic [\\*blepharitis](#).

**Maddox rod** a series of transparent cylinders that change a point source of light into a linear streak perpendicular to the axis of the rods, used in the assessment of binocular visual functions. [E. E. Maddox (1860–1933), British ophthalmologist]

**Madopar** *n.* *see* [LEVODOPA](#).

**Madura foot** an infection of the tissues and bones of the foot producing chronic inflammation (mycetoma), occurring in the tropics. It is caused by various filamentous fungi (including *Madurella*) and certain bacteria of the genera *Nocardia* and *Streptomyces*. Medical name: **maduromycosis**.

**Madurella** *n.* a genus of widely distributed fungi. The species *M. grisea* and *M. mycetomi* cause the tropical infection [\\*Madura foot](#).

**maduromycosis** *n.* *see* [MADURA FOOT](#).

**MAG3** mercaptoacetyltriglycine: a tracer used in nuclear medicine, during **\*renography**, when labelled with technetium-99m. This agent is cleared by glomerular filtration and tubular secretion by the kidneys. It can be used to measure effective renal plasma flow and to give anatomical information. Compared with a **\*DTPA** scan, it can be used in patients with impaired renal function.

**magenta** *n.* see **FUCHSIN**.

**maggot** *n.* the wormlike larva of a fly, which occasionally infests human tissues (see **MYIASIS**). Disinfected maggots may be used to assist in the cleaning and healing of serious wounds by feeding on dead tissue.

**magic bullet** a colloquial name for any drug treatment that is designed to target diseased tissue without adversely affecting healthy tissue. The term has been used especially in reference to new treatments for cancer.

**Magill's forceps** long angled forceps for use with a **\*laryngoscope** in removing foreign bodies from the mouth and throat of an unconscious patient. [Sir I. V. Magill (1888–1975), British anaesthetist]

**magnesium** *n.* a metallic element essential to life. The body of an average adult contains about 25 g of magnesium, concentrated mostly in the bones. Magnesium is necessary for the proper functioning of muscle and nervous tissue. It is required as a **\*cofactor** for approximately 90 enzymes. A good source of magnesium is green leafy vegetables. Symbol: Mg.

**magnesium carbonate** a weak **\*antacid** used to relieve indigestion. It is taken alone or combined with other compounds in mixtures, powders, and tablets.

**magnesium hydroxide** a magnesium salt used as an osmotic **\*laxative** to treat constipation. It is also combined with **\*aluminium hydroxide** in antacid preparations.

**magnesium sulphate** a magnesium salt used in the form of mixtures or powders as an osmotic **\*laxative** for rapid evacuation of the bowel. It is also administered intravenously to treat magnesium deficiency and serious **\*arrhythmias** and to prevent the recurrence of convulsions in **\*eclampsia**.

**magnesium trisilicate** a compound of magnesium with antacid and absorbent properties, used in the form of tablets or a mixture for the treatment of indigestion.

**magnetic imager** *see* 3-D MAGNETIC IMAGER.

**magnetic resonance imaging (MRI)** a diagnostic imaging technique based on the emission of electromagnetic waves from the body when the patient is placed in a strong magnetic field and exposed to radiofrequency radiation (*see* NUCLEAR MAGNETIC RESONANCE). The strength of the magnetic field is measured in \*teslas. Most images rely on the signal from hydrogen in water, which is particularly strong, although other elements with unpaired outer electrons can be used (*see* MAGNETIC RESONANCE SPECTROSCOPY). A major advantage over \*computerized tomography is the lack of X-rays, which reduces exposure to ionizing radiation. MRI is used for the noninvasive diagnosis and treatment planning of a wide range of diseases and also to guide interventional radiological procedures. *See also* FUNCTIONAL MAGNETIC RESONANCE IMAGING.

**magnetic resonance spectroscopy (MRS)** a diagnostic technique that utilizes the phenomenon of \*nuclear magnetic resonance to obtain a biochemical profile of tissues by exciting elements other than hydrogen in water and other body components. It is particularly useful for biochemical analysis of tissues in the living body. This technique is used clinically in the brain and prostate.

**MAGPI operation** *meatal advancement and glanuloplasty operation*: a simple surgical procedure designed to correct minor to moderate degrees of coronal or subcoronal \*hypospadias. This single-stage operation corrects any associated minor degrees of \*chordee and transfers the urethral opening to the glans, allowing normal urination.

**MAI complex** a group of bacteria comprising *Mycobacterium avium* and *M. intracellulare*, which are responsible for \*opportunistic infections of the lung. *See* MYCOBACTERIUM.

**main d'accoucheur (obstetrician's hand)** the appearance of the hand in a carpopedal \*spasm (*see also* TETANY). The wrist is flexed, the fingers are tightly adducted, and the thumb is apposed across the palm.

**major histocompatibility complex** *see* MHC.

**mal** *n.* illness or disease.

**mal-** *combining form denoting* disease, disorder, or abnormality.

**malabsorption** *n.* reduced or defective absorption of various nutrients in the small bowel. It commonly affects the absorption of fatty acids (causing **\*steatorrhoea**, **\*bloating**, and **\*flatulence**), fat-soluble vitamins (A, D, E, and K), water-soluble vitamins (B<sub>12</sub> and folate), **\*electrolytes** (such as calcium and potassium), iron, and amino acids. Symptoms include weight loss, diarrhoea, failure to thrive, weakness and lethargy (due to **\*anaemia**), **\*paraesthesia**, swelling (oedema), and a propensity to bleeding. The commonest causes are **\*coeliac disease**, **\*Crohn's disease**, **\*pancreatitis**, **\*cystic fibrosis**, **\*blind loop syndrome**, chronic infection (e.g. giardiasis), and previous surgery.

**malacia** *n.* abnormal softening of a part, organ, or tissue, such as bone (*see* OSTEOMALACIA).

**-malacia** *combining form denoting* abnormal softening of a tissue. Example: **keratomalacia** (of the cornea).

**maladie de Roger (Roger's disease)** a form of congenital heart disease in which there is a small **\*ventricular septal defect** that produces a loud heart **\*murmur**. It usually causes no symptoms. [H. L. Roger (1809–91), French physician]

**malaise** *n.* a general feeling of being unwell. The feeling may be accompanied by identifiable physical discomfort and may indicate the presence of disease.

**malakoplakia** *n.* a rare form of chronic inflammatory disorder due to the defective destruction of phagocytosed bacteria. It is characterized by the formation of soft yellow plaques and nodules composed of foamy macrophages containing basophilic cytoplasmic inclusions (**Michaelis–Gutmann bodies**). Malakoplakia occurs most commonly in the urinary tract but can also occur in the skin.

**malar bone** *see* ZYGOMATIC BONE.

**malaria** (ague, marsh fever, periodic fever, paludism) *n.* an infectious disease due to the presence of parasitic protozoa of the genus *\*Plasmodium* (*P. falciparum*, *P. malariae*, *P. ovale*, or *P. vivax*) within the red blood cells. The disease is transmitted by the *Anopheles* mosquito and is confined mainly to tropical and subtropical areas.

Parasites in the blood of an infected person are taken into the stomach of the mosquito as it feeds. Here they multiply and then invade the salivary glands. When the mosquito bites an individual, parasites are injected into the bloodstream and migrate to the liver and other organs, where they multiply. After an incubation period varying from 12 days (*P. falciparum*) to 10 months (some varieties of *P. vivax*), parasites return to the bloodstream and invade the red blood cells. Rapid multiplication of the parasites results in destruction of the red cells and the release of more parasites capable of infecting other red cells. This causes a short bout of shivering, fever, and sweating, and the loss of healthy red cells results in anaemia. When the next batch of parasites is released symptoms reappear. The interval between fever attacks varies in different types of malaria: in **quartan malaria** (or **fever**), caused by *P. malariae*, it is three days; in **tertian malaria** (*P. ovale* or *P. vivax*) it is two days (these two types are known as **benign malarías**). In **malignant** (or **falciparum**) **malaria** (caused by *P. falciparum*) – the most severe kind – the interval between attacks varies from a few hours to two days (*see also* **BLACKWATER FEVER**). Preventive and curative treatment includes such drugs as *\*chloroquine*, *\*proguanil*, *\*mefloquine*, and *\*pyrimethamine*.

**Malarone** *n.* *see* **PROGUANIL**.

**Malassezia (Pityrosporum)** *n.* a genus of yeasts producing superficial infections of the skin. The species *M. furfur* (including *P. orbiculare* and *P. ovale*) causes *\*pityriasis* versicolor.

**malathion** *n.* an organophosphorous insecticide used to treat head and pubic lice and scabies. Side-effects include skin irritation and allergic reactions.

**mal de débarquement syndrome (MdDS, disembarkment syndrome)** a form of *\*vertigo* in which sufferers experience a sensation of bobbing, rocking, or swaying after getting off a boat or other form of transport. The condition remains little understood.

**malformation** *n.* any variation from the normal physical structure, due either to congenital or developmental defects or to disease or injury.

**malignant** *adj.* **1.** describing a tumour that invades and destroys the tissue in which it originates and has the potential to spread to other sites in the body via the bloodstream and lymphatic system. *See* **CANCER**; **METASTASIS**. **2.** describing any disorder that becomes life-threatening if untreated (e.g. **\*malignant hypertension**). *Compare* **BENIGN**.

**malignant hypertension** dangerously high blood pressure (diastolic pressure >130 mmHg) associated with necrosis of small arteries and arterioles. Retinal haemorrhage and **\*papilloedema** are present. Untreated, malignant hypertension causes severe organ damage, targeting the central nervous and cardiovascular systems and the kidneys (malignant **\*nephrosclerosis**). Causes include complications of essential and secondary **\*hypertension** and pregnancy and the use of certain drugs (e.g. MAO inhibitors).

**malignant melanoma** *see* **MELANOMA**.

**malignant vasovagal syndrome** *see* **NEUROCARDIOGENIC SYNCOPE**.

**malinger** *n.* pretending to be ill, usually in order to avoid work or gain attention. It may be a sign of mental disorder (*see also* **MUNCHAUSEN'S SYNDROME**).

**malleolus** *n.* either of the two protuberances on each side of the ankle: the **lateral malleolus** at the lower end of the **\*fibula** or the **medial malleolus** at the lower end of the **\*tibia**.

**mallet finger** a condition in which a finger (usually the index finger) is bent downwards at the tip, due to **\*avulsion** of the long extensor tendon from the bone. Treatment is to hold the tip of the finger straight with a splint for at least six weeks.

**malleus** *n.* a hammer-shaped bone in the middle **\*ear** that articulates with the incus and is attached to the eardrum. *See* **OSSICLE**.

**Mallory bodies** large irregular masses abnormally located in the hepatocytes of the liver. They are found in patients with alcoholic hepatitis, alcoholic

cirrhosis, Wilson's disease, primary biliary cirrhosis, clinical obesity, and hepatoma. [F. B. Mallory (1862–1941), US pathologist]

**Mallory's triple stain** a histological stain consisting of water-soluble aniline blue or methyl blue, orange G, and oxalic acid. Before the stain is applied the tissue is mordanted, then treated with acid fuchsin and phosphomolybdic acid. Nuclei stain red, muscle red to orange, nervous tissue lilac, collagen dark blue, and mucus and connective tissue become blue. [F. B. Mallory]

**Mallory–Weiss syndrome** trauma of the mucosal lining at the junction of the oesophagus (gullet) and stomach following protracted vomiting and retching. It is associated with *\*haematemesis* and rarely perforation of the oesophagus. [G. K. Mallory (1926– ), US pathologist; S. Weiss (1899–1942), US physician]

**malnutrition** *n.* a condition in which there is an imbalance between the nutrients the body receives and the nutrients it requires. A deficiency (or undernutrition) results from a combination of a decreased dietary intake, a decreased uptake by the body (*\*malabsorption*), an increase in bodily losses, and an increase in the body's requirements. Overnutrition is the consequence of dietary excess and results in *\*obesity* and other metabolic abnormalities, such as *\*diabetes* and *\*hyperlipidaemia*.

**malnutrition universal screening tool** *see* **MUST**.

**malocclusion** *n.* a condition in which there is an abnormal arrangement of the teeth or discrepancy in the relationship of the jaws that results in a misalignment when the teeth meet. It is usually treated by orthodontics. If jaw discrepancy is severe, it may require *\*orthognathic surgery*.

**Malpighian body** the part of a *\*nephron* comprising the blood capillaries of the glomerulus and its surrounding Bowman's capsule. [M. Malpighi (1628–94), Italian anatomist]

**Malpighian layer** the stratum germinativum: one of the layers of the *\*epidermis*.

**malposition** *n.* (in obstetrics) an abnormal position of the fetal head when this is the presenting part in labour (*see* **PRESENTATION**). The head is in such a position that the diameter of the skull in relation to the pelvic opening is

greater than normal (e.g. occipital transverse, occipital posterior: *see* **OCCIPUT**). This is likely to result in a prolonged and complicated labour.

**malpractice** *n.* professional misconduct: treatment falling short of the standards of skill and care that can reasonably be expected from a qualified medical practitioner.

**malpresentation** *n.* the condition in which the presenting part of the fetus (*see* **PRESENTATION**) is other than the back of the head (e.g. the brow, face, shoulder, or buttocks). Malpresentation is likely to complicate labour and may necessitate delivery by *\*Caesarean section*. Placenta praevia, fibroids, ovarian cysts, fetal malformations, multiple pregnancy, and abnormal uterus should be excluded as a cause of the malpresentation.

**malt** *n.* a mixture of carbohydrates, predominantly maltose, produced by the breakdown of starch contained in barley or wheat grains. As well as its use in brewing and distilling, malt has been used as a source of nutrients in wasting diseases.

**MALT** mucosa-associated lymphoid tissue: an important part of the peripheral lymphoid system with special features of immune cell production. It is associated with the digestive tract and is concentrated in such areas as the *\*tonsils* and *\*Peyer's patches*.

**Malta fever** *see* **BRUCELLOSIS**.

**maltase** *n.* an enzyme, present in saliva and pancreatic juice, that converts maltose into glucose during digestion.

**maltoma (MALT lymphoma)** *n.* a mucosal associated lymphoid tissue tumour of low-grade malignancy, treated by chemotherapeutic agents.

**maltose** *n.* a sugar that consists of two molecules of glucose. Maltose is formed from the digestion of starch and glycogen and is found in germinating cereal seeds.

**malt-worker's lung** a form of extrinsic allergic *\*alveolitis* seen in people who work with barley.

**malunion** *n.* *\*union* of the fragments of a fracture in an unsatisfactory position. It occurs if fracture *\*reduction* is inadequate or the splintage is

inadequate to maintain the bone fragments in the correct position until healing occurs. Malunion may require surgical correction with **\*osteotomy**.

**mamilla** *n.* *see* **NIPPLE**.

**mamillary bodies** two paired rounded swellings in the floor of the **\*hypothalamus**, immediately behind the pituitary gland.

**mamma** *n.* *see* **BREAST**.

**mammary gland** the milk-producing gland of female mammals. *See* **BREAST**.

**mammography** *n.* the study of the breast by imaging techniques, most commonly X-rays. The breast is usually compressed between radiolucent plates before being exposed to relatively low-energy X-rays to emphasize differences in the soft tissues. Mammography is mainly concerned with the detection and diagnosis of breast cancer.

**mammoplasty** *n.* plastic surgery of the breasts, in order to alter their shape or increase or decrease their size. In the case of sagging breasts skin and glandular tissue are removed and the remaining breast tissue is fixed in the normal position. After a mastectomy, or when the breasts are too small, a prosthesis (*see* **BREAST IMPLANT**) may be inserted to improve the contour.

**mammothermography** *n.* the technique of examining the breasts for the presence of abnormalities by **\*thermography**.

**managed care** a US system that integrates the financing and delivery of medical care by means of contracts with physicians and with hospitals. The goal is to cut costs through economic incentives, cost sharing, controlling the length of inpatient admissions, and careful management of high-cost cases. Providers of managed care take several different forms, including **health maintenance organizations** and **preferred provider organizations**.

**mancinism** *n.* the condition of being left-handed.

**mandible** *n.* the lower jawbone. It consists of a horseshoe-shaped **body**, the upper surface of which bears the lower teeth (*see* **ALVEOLUS**), and two vertical parts (**rami**). Each ramus divides into a **condyle** and a **\*coronoid process**. The condyle articulates with the temporal bone of the cranium to

form the **temporomandibular joint** (a hinge joint). *See also* [MAXILLA](#); [SKULL](#). —**mandibular** *adj.*

**mandibular advancement splint (MAS)** an orthodontic device used to advance the mandible to improve the airway in the pharynx during sleep in the treatment of [\\*obstructive sleep apnoea](#).

**manganese** *n.* a greyish metallic element, the oxide of which, when inhaled by miners in underventilated mines, causes brain damage and symptoms very similar to those of [\\*parkinsonism](#). Minute quantities of the element are required by the body (*see* [TRACE ELEMENT](#)). Symbol: Mn.

**mania** *n.* a state of mind characterized by excessive cheerfulness and increased activity. The mood is euphoric and can change rapidly to irritability. Thought and speech are pressured and rapid to the point of incoherence and the connections between ideas may be impossible to follow to the point of [\\*loosening of associations](#). Behaviour is overactive, extravagant, overbearing, and sometimes aggressive. Excessive drug and alcohol use can complicate the picture. Judgment is impaired, with disinhibited behaviour, and therefore the patient may damage his or her own interests. There may be grandiose delusions. [\\*Mixed affective states](#) (such as low mood with pressured speech and irritability) are common. Treatment is usually with medication, such as lithium, [\\*benzodiazepines](#), or [\\*antipsychotics](#), and hospital admission is frequently necessary. *See also* [BIPOLAR AFFECTIVE DISORDER](#). —**manic** *adj.*

**-mania** *combining form denoting* obsession, compulsion, or exaggerated feeling for. Example: **pyromania** (for starting fires).

**manic depression** a former (but still quite commonly used) name for [\\*bipolar affective disorder](#).

**manikin** *n.* *see* [HOMUNCULUS](#).

**manipulation** *n.* the use of the hands to produce a desired movement or therapeutic effect in part of the body. Both physiotherapists and osteopaths use manipulation to restore normal working to stiff joints.

**mannitol** *n.* an osmotic [\\*diuretic](#) administered mainly to reduce intracranial pressure in brain injuries and also in the emergency treatment of glaucoma.

Side-effects include fever and chills. Mannitol powder is inhaled to treat cystic fibrosis.

**mannosidosis** *n.* a progressive autosomal **\*recessive** disorder causing deficiency of the enzyme mannosidase; this results in errors of carbohydrate metabolism and lysosomal function, leading to a spectrum of learning difficulties and muscle weakness.

**Mann–Whitney U test** *see* **SIGNIFICANCE**.

**manometer** *n.* a device for measuring pressure in a liquid or gas. A manometer often consists of a U-tube containing mercury, water, or other liquid, open at one end and exposed to the fluid under pressure at the other end. The pressure can be read directly from a graduated scale. *See also* **SPHYGMOMANOMETER**.

**manometry** *n.* measurement of pressures within organs of the body. The technique is used to record changes within fluid-filled chambers (e.g. cerebral ventricles) or to indicate muscular activity in motile tubes, such as the oesophagus, rectum, or bile duct.

**manslaughter** *n.* in law, the unlawful killing of a person that does not amount to murder owing to the absence of malicious intent. It comprehends both **voluntary manslaughter**, where the killing was a deliberate act but is held to have arisen from diminished responsibility (i.e. from an abnormality of mind that does not amount to **\*insanity**), and **involuntary manslaughter**, where the killing was an accident arising from recklessness or gross **\*negligence**. In rare cases, medical professionals have been convicted of the involuntary manslaughter of their patients.

**mantle** *adj.* (in radiotherapy) *see* **TREATMENT FIELD**.

**Mantoux test** *see* **TUBERCULIN**. [C. Mantoux (1877–1947), French physician]

**manual lymphatic drainage** a series of therapeutic movements, using massage, developed to enhance lymph drainage, alleviate swelling, and improve wound healing.

**manual vacuum aspiration (MVA)** *see* **VACUUM ASPIRATION**.

**manubrium** *n.* (*pl.* **manubria**) **1.** the upper section of the breastbone (*see* STERNUM). It articulates with the clavicles and the first costal cartilage; the second costal cartilage articulates at the junction between the manubrium and body of the sternum. **2.** the handle-like part of the \*malleus (an ear ossicle), attached to the eardrum. —**manubrial** *adj.*

**manuka honey** a honey, produced in Australia and New Zealand from nectar of the manuka (or tea) tree, that is reported to have antibacterial and antioxidant properties and is used to promote wound healing. The thickness of the honey acts as a moist protective barrier.

**MAO** *see* MONOAMINE OXIDASE.

**MAO inhibitor (MAOI)** a drug that prevents the activity of the enzyme \*monoamine oxidase (MAO). MAO inhibitors include **phenelzine**, **isocarboxazid**, and **tranylcypromine**. These drugs are irreversible inhibitors of monoamine oxidase A, whose use as antidepressants is now restricted because of the severity of their side-effects. These include interactions with other drugs (e.g. ephedrine, phenylephrine) and with foods or drinks containing \*tyramine (e.g. cheese or red wine) to produce a sudden and dangerous increase in blood pressure. \*Moclobemide is a reversible inhibitor of monoamine oxidase A (RIMA), with less severe side-effects. *See also* SELEGILINE.

**maple syrup urine disease (aminoacidopathy)** an inborn defect of amino acid metabolism causing an excess of valine, leucine, isoleucine, and alloisoleucine in the urine, which has an odour like maple syrup. Treatment is dietary; if untreated, the condition leads to learning disabilities and death in infancy.

**marasmus** *n.* mixed deficiency of both protein and calories, resulting in severe wasting in infants. Body weight is below 60% of that expected for age, the infant looks ‘old’, has thin sparse hair, is pallid and apathetic, lacks skin fat, and has subnormal temperature. The condition may be due to \*malabsorption, wrong feeding, metabolic disorders, repeated vomiting, diarrhoea, severe disease of the heart, lungs, kidneys, or urinary tract, or chronic bacterial or parasitic disease (especially in tropical climates). Maternal rejection of an infant may cause marasmus through underfeeding. Acute infection may precipitate death. Treatment depends on the underlying

cause, but initially very gentle nursing and the provision of nourishment and fluids by gradual steps is appropriate for all.

**maraviroc** *n.* an **\*antiretroviral drug** (ARV) used, in combination with other ARVs, for treating refractory HIV infection. It acts by binding to and antagonizing CCR5, a receptor for a class of **\*chemokines** on the host cell needed by some HIV viruses to enter the cell. Side-effects include gastrointestinal upsets, cough, and dizziness.

**marble-bone disease** *see* **OSTEOPETROSIS**.

**Marburg disease (green monkey disease)** a virus disease of vervet (green) monkeys transmitted to humans by contact (usually in laboratories) with blood or tissues from an infected animal. It was first described in Marburg, Germany. Symptoms include fever, malaise, severe headache, vomiting, diarrhoea and bleeding from mucous membranes in the mouth and elsewhere. Treatment with antiserum and measures to reduce the bleeding are sometimes effective.

**march fracture** a **\*stress fracture** occurring in the distal section of the second or third metatarsal bone, associated with excessive walking or marching.

**Marcus Gunn jaw-winking syndrome** a congenital condition characterized by drooping (**\*ptosis**) of one eyelid. On opening or moving the mouth, the droopy lid elevates momentarily, resembling a wink. It is believed to be due to an abnormal innervation of the levator muscle by the trigeminal nerve. [R. Marcus Gunn (1850–1909), British ophthalmologist]

**Marfan's syndrome** an inherited disorder of connective tissue characterized by excessive tallness, abnormally long and slender fingers and toes (**arachnodactyly**), heart defects, and partial dislocation of the lenses of the eyes (*see* **PHACODONESIS**). [B. J. A. Marfan (1858–1942), French physician]

**marijuana** *n.* *see* **CANNABIS**.

**Marion's disease** obstruction of the outlet of the bladder caused by enlargement of the muscle cells in the neck of the bladder. [J. B. C. G. Marion (1869–1960), French surgeon]

**Marjolin's ulcer** a carcinoma that develops at the edge of a chronic **\*ulcer** of the skin, usually a venous ulcer in the ankle region. [J. N. Marjolin (1780–1850), French surgeon]

**marrow** *n.* *see* **BONE MARROW**.

**marsupialization** *n.* an operative technique for curing a cyst. The cyst is opened, its contents removed, and the edges then stitched to the skin incision. The wound is kept open until it has healed by **\*granulation**. This technique is commonly used for treatment of vulval (Bartholin's) abscesses.

**MAS** *see* **MANDIBULAR ADVANCEMENT SPLINT**.

**masculinization** *n.* development of excess body and facial hair, deepening of the voice, and increase in muscle bulk (secondary male sexual characteristics) in a female due to a hormone disorder or to hormone therapy. *See also* **VIRILISM**; **VIRILIZATION**.

**massage** *n.* manipulation of the soft tissues of the body with the hands. Massage is used to improve circulation, reduce oedema where present, prevent **\*adhesions** in tissues after injury, reduce muscular spasm, and improve the tone of muscles. *See also* **EFFLEURAGE**; **PETRISSAGE**; **TAPOTEMENT**.

**masseter** *n.* a thick muscle in the cheek extending from the zygomatic arch to the outer corner of the mandible. It is important for mastication and acts by closing the jaws.

**mast-** (**masto-**) *combining form denoting the breast.*

**mastalgia** *n.* pain in the breast.

**mast cell** a large cell in **\*connective tissue** with many coarse cytoplasmic granules. These granules contain the chemicals **\*heparin**, **\*histamine**, and **\*serotonin**, which are released during inflammation and allergic responses.

**mastectomy** *n.* surgical removal of a breast. **Simple mastectomy**, performed for extensive but not necessarily invasive tumours, involves simple removal of the breast; the skin and if possible the nipple may be retained and a prosthesis (*see* **BREAST IMPLANT**) may be inserted under the

skin to give the appearance of normality. When breast cancer has spread to involve the lymph nodes, **radical mastectomy** may be performed. This classically involves removal of the breast with the skin and underlying pectoral muscles together with all the lymphatic tissue of the armpit. This treatment may be followed up with radiotherapy and/or chemotherapy. In modern surgical practice a modified radical mastectomy, preserving the pectoral muscles, is more usual than the classical technique. *See also* [LUMPECTOMY](#).

**mastication** *n.* the process of crushing, grinding, and chewing food.

**mastitis** *n.* inflammation of the breast, usually caused by bacterial infection via damaged nipples. It most often occurs as acute **puerperal mastitis**, which develops during the period of breast-feeding, about a month after childbirth, and sometimes involves the discharge of pus. Chronic **cystic mastitis** has a different cause and does not involve inflammation. The breast feels lumpy due to the presence of cysts, and the condition is thought to be caused by hormone imbalance.

**mastocytosis** *n.* a condition caused by [\\*mast cell](#) proliferation due to [KIT](#) [\\*proto-oncogene](#) mutations. It most commonly manifests in the skin but also affects other organs. Maculopapular variants were formerly known as **urticaria pigmentosa**. Systemic involvement is common in adult cases, with bone marrow examination essential for accurate diagnosis. It may be associated with haematological abnormalities, including leukaemias. Resolution is common in children with skin involvement only. Treatment includes antihistamines, mast-cell stabilizers (such as sodium [\\*cromoglicate](#)), and [\\*tyrosine kinase inhibitors](#).

**mastoid** *n.* the [\\*mastoid process](#) of the temporal bone. *See also* [MASTOIDITIS](#).

**mastoidectomy** *n.* an operation to remove some or all of the air cells in the bone behind the ear (the [\\*mastoid process](#) of the temporal bone) when they have become infected (*see* [MASTOIDITIS](#)) or invaded by [\\*cholesteatoma](#). *See also* [ATTICOTOMY](#).

**mastoiditis** *n.* inflammation of the [\\*mastoid process](#) behind the ear and of the air space (**mastoid antrum**) connecting it to the cavity of the middle ear. It is

usually caused by bacterial infection that spreads from the middle ear (*see* [OTITIS](#)). Usually the infection responds to antibiotics, but surgery (*see* [MASTOIDECTOMY](#)) may be required in severe cases.

**mastoid process** a nipple-shaped process on the [\\*temporal bone](#) that extends downward and forward behind the ear canal and is the point of attachment of several neck muscles. It contains many air spaces (**mastoid cells**), which communicate with the cavity of the middle ear via an air-filled channel, the **mastoid antrum**. This provides a possible route for the spread of infection from the middle ear (*see* [MASTOIDITIS](#)).

**masturbation** *n.* physical self-stimulation of the genitalia in order to produce sexual pleasure, often resulting in orgasm.

**matched pair study** *see* [CASE CONTROL STUDY](#).

**materia medica** the study of drugs used in medicine and dentistry, including [\\*pharmacognosy](#), [\\*pharmacy](#), [\\*pharmacology](#), and therapeutics.

**maternal death** deaths of women while pregnant or within 42 days of the end of the pregnancy from any cause related to, or aggravated by, the pregnancy or its management, but not from accidental or incidental causes. These deaths can be subdivided into four main categories: (1) direct deaths: directly related to pregnancy; (2) indirect deaths: due to pre-existing maternal disease aggravated by pregnancy; (3) coincidental: unrelated to pregnancy; (4) late deaths: occurring between six weeks and one year following delivery. *See also* [MATERNAL MORTALITY RATE](#).

**maternal mortality rate** the number of deaths due to complications of pregnancy, childbirth, and the puerperium per 100,000 live births (*see also* [STILLBIRTH](#)). In 1952 concern about maternal mortality resulted in Britain in the setting up of a triennial [\\*confidential enquiry](#) into every such death to identify any shortfall in resources or care. The first triennial report was published in 1985. Since 2014 reports have been produced annually by MBRRACE-UK (Mothers and Babies: Reducing Risk through Audits and Confidential Enquiries Across the UK). Levels of [\\*maternal deaths](#) are currently low: a report published in 2017 (covering 2013–15) counted 202 obstetric-related deaths (8.76 per 100,000 live births). Thromboembolism was the commonest direct cause of death (30 deaths, 1.13 per 100,000 live

births), while heart disease was the commonest indirect cause of death (54 deaths, 2.34 per 100,000 live births).

**matrix** *n.* **1.** (in histology) the substance of a tissue or organ in which more specialized structures are embedded; for example, the ground substance (**extracellular matrix**) of connective tissue. **2.** (in radiology) the division of an image into rows and columns with equally sized elements (**\*pixels**). The final image is completed by assigning a density to each of these elements. Increasing the number of pixels in the matrix improves the resolution of the final image. A typical value could be 256 rows × 256 columns.

**matrix band** a flexible metal or plastic strip that is placed round a tooth to restore a wall, thus aiding the insertion of a dental filling to restore anatomical form and function.

**matrix metalloproteinase (MMP)** any one of a group of zinc-containing proteases capable of digesting the extracellular tissue matrix. These enzymes play an important role in cell division, cell migration, inflammation, neoplastic invasion (**\*metastasis**), and **\*angiogenesis**.

**maturation** *n.* the process of attaining full development. The term is applied particularly to the development of mature germ cells (ova and sperm).

**maturity-onset diabetes of the young (MODY, monogenic diabetes)** a range of rare but important forms of type 2 **\*diabetes mellitus** caused by a single autosomal **\*dominant** genetic defect. The two commonest forms are mutations of the HNF-1 $\alpha$  gene (MODY 3), which often responds to treatment with **\*sulphonylurea** drugs, and mutations of the glucokinase gene (MODY 2), causing a mild elevation of blood glucose levels usually responsive to dietary management.

**Mauriceau–Smellie–Viet manoeuvre (MSV manoeuvre)** a technique used in breech delivery to promote flexion of, and safely deliver, the fetal head.

**maxilla** *n.* (*pl.* **maxillae**) loosely, the upper jaw, which bears the upper teeth. Strictly, the maxilla is one of a pair of bones that partly form the upper jaw, the outer walls of the maxillary sinus, and the floor of the orbit. *See also* **MANDIBLE**; **SKULL**. —**maxillary** *adj.*

**maxillary sinus (maxillary antrum)** *see* **PARANASAL SINUSES**.

**maxillofacial** *adj.* describing or relating to the region of the head, neck, face, jaws, and related structures.

**maximin principle** *see* VEIL OF IGNORANCE.

**maximum intensity projection (MIP)** a \*post-processing technique used in CT and MRI scanning. When projecting a volume, maximum brightness encountered along the viewing plane will be displayed. This is particularly useful in vascular imaging.

**maxwell** *n.* a unit of magnetic flux equal to a flux of 1 gauss per square centimetre.

**Maydl hernia** a rare hernia that contains two adjacent loops of intestine. The intra-abdominal section of intestine between the two loops within the hernia may become strangulated. [K. Maydl (1853-1903), Bohemian surgeon]

**Mayer–Rokitansky–Küster–Hauser syndrome (Rokitansky–Küster–Hauser syndrome, Müllerian agenesis)** congenital absence of the uterus and upper part of the vagina due to failure of development of the \*Müllerian duct. It may be associated with skeletal, renal, and auditory abnormalities, but usually presents with amenorrhoea in a patient with otherwise normal secondary sexual characteristics. There is a multidisciplinary approach to treatment, with psychological support, counselling, discussion of creation of a ‘neovagina’ with gradual use of vaginal dilators, and/or surgical vaginal reconstruction. Surrogacy is the only option for childbearing, although oocyte donation from the mother to a surrogate can be discussed. [K. W. Mayer (1795–1868), German gynaecologist; K. von Rokitansky (1804–78), Austrian pathologist; H. Küster and G. A. Hauser (20th century), German gynaecologists]

**Mayo operation** an overlapping repair of an umbilical hernia. [W. J. Mayo (1861–1939), US surgeon]

**MBRRACE-UK** *see* CONFIDENTIAL ENQUIRIES.

**McArdle’s disease** an \*inborn error of metabolism in which a deficiency of the enzyme myophosphorylase prevents the breakdown of glycogen to lactate in exercising muscle. This results in fatigue, pain, and cramps in exercising

muscles. The only treatment is avoidance of sustained or excessive exercise. [B. McArdle (20th century), British biochemist]

**McBurney's point** the point on the abdomen that overlies the anatomical position of the appendix and is the site of maximum tenderness in acute appendicitis. It lies one-third of the way along a line drawn from the anterior superior iliac spine (the projecting part of the hipbone) to the umbilicus. [C. McBurney (1845–1913), US surgeon]

**McCormick toy test** a hearing test used in preschool children in which the child must discriminate between similar speech sounds. The test consists of 14 toys that are paired because their names sound similar; for example, tree and key, plane and plate. Having first identified all the objects, the child is then asked in a quiet voice to indicate a particular toy (e.g. Can you find the key?).

**McCune–Albright syndrome** polyostotic \*fibrous dysplasia of long bones coupled with \*café au lait spots and precocious puberty, occurring in both males and females. [D. J. McCune (1902–76), US paediatrician; F. Albright (1900–69), US physician]

**MCI** *see* MILD COGNITIVE IMPAIRMENT.

**McRobert's manoeuvre** a manoeuvre that overcomes most cases of \*shoulder dystocia when the fetal shoulders are unable to pass through the mother's pelvis. The maternal hips are sharply flexed against her abdomen: this rotates the maternal pelvis to encourage delivery.

**MCS** *see* MINIMALLY CONSCIOUS STATE.

**MCU** micturating cystourethrogram. *See* URETHROGRAPHY.

**MDCT** *see* MULTIDETECTOR COMPUTERIZED TOMOGRAPHY.

**MdDS** *see* MAL DE DEBARQUEMENT SYNDROME.

**MDRD eGFR** *see* eGFR.

**MDS** *see* MYELOYDYSPLASTIC SYNDROMES.

**MDT** *see* MULTIDISCIPLINARY TEAM.

**ME** myalgic encephalomyelitis. *See* [CFS/ME/PVF](#).

**MEA** microwave [\\*endometrial ablation](#).

**meals on wheels** *see* [SOCIAL SERVICES](#).

**mean (arithmetic mean)** *n.* the average of a group of observations calculated by adding their values and dividing by the number in the group. When one or more observations are substantially different from the rest, which can influence the arithmetic mean unduly, it is preferable to use the **geometric mean** (a similar calculation based on the logarithmic values of the observations) or – more commonly – the **median** (the middle observation of the series arranged in ascending order). A further method of obtaining an average or summary value for a group is to identify the **mode** – the observation (or group of observations when these occur as a continuous quantitative [\\*variable](#)) that occurs most often in the series.

**measles** *n.* a highly infectious virus disease that tends to appear in epidemics every 2–3 years and mainly affects children. After an incubation period of 8–15 days, symptoms resembling those of a cold develop accompanied by a high fever. Small red spots with white centres (**Koplik's spots**) may appear on the inside of the cheeks. On the third to fifth day a blotchy slightly elevated pink rash develops, first behind the ears then on the face and elsewhere; it lasts 3–5 days. The patient is infectious throughout this period. In most cases the symptoms soon subside but patients are susceptible to pneumonia and middle ear infections. Complete recovery may take 2–4 weeks. Severe complications include encephalitis (one in 1000 cases) and [\\*subacute sclerosing panencephalitis](#). Measles is a common cause of childhood mortality in malnourished children, particularly in the developing world. Vaccination against measles provides effective immunity (*see* [MMR VACCINE](#)). Medical names: **rubeola**, **morbilli**.

**meat- (meato-)** *combining form denoting* a meatus. Example: **meatotomy** (incision into the urethral meatus).

**meatus** *n.* (in anatomy) a passage or opening. The **auditory meatus** is the passage leading from the pinna of the outer [\\*ear](#) to the eardrum. A **nasal meatus** is one of three groovelike parts of the nasal cavity beneath each of

the nasal conchae. The **urethral meatus** is the external opening of the urethra.

**mebendazole** *n.* an **\*anthelmintic** drug used to get rid of roundworms, hookworms, threadworms, and whipworms. Side-effects may include stomach upsets. *See also* **IMIDAZOLE**.

**mebeverine** *n.* *see* **ANTISPASMODIC**.

**mechanoreceptor** *n.* a group of cells that respond to mechanical distortion, such as that caused by stretching or compressing a tissue, by generating a nerve impulse in a sensory nerve (*see* **RECEPTOR**). Touch receptors, **\*proprioceptors**, and the receptors for hearing and balance all belong to this class.

**mechanotherapy** *n.* the use of mechanical equipment during physiotherapy to produce regularly repeated movements in part of the body. This is done to improve the functioning of muscles and joints.

**Meckel's cartilage** a cartilaginous bar in the fetus around which the **\*mandible** develops. Part of Meckel's cartilage develops into the malleus (an ear ossicle) in the adult. [J. F. Meckel, the Younger (1781–1833), German anatomist]

**Meckel's diverticulum** *see* **DIVERTICULUM**.

**meconism** *n.* poisoning from the effects of eating or smoking **\*opium** or the products derived from it, especially **\*morphine**.

**meconium** *n.* the first stools of a newborn baby, which are sticky and dark green and composed of cellular debris, mucus, and bile pigments. The presence of meconium in the amniotic fluid during labour indicates fetal distress. *See also* **ILEUS**; **PERITONITIS**.

**meconium aspiration** a condition occurring during childbirth in which the baby inhales meconium into the lungs during delivery. This can cause plugs in the airways and the baby may become short of oxygen (hypoxic). Treatment is to assist breathing if necessary, with physiotherapy and antibiotics.

**media (tunica media)** *n.* **1.** the middle layer of the wall of a *\*vein* or *\*artery*. It is the thickest of the three layers, being composed of elastic fibres and smooth muscle fibres in alternating layers. **2.** the middle layer of various other organs or parts.

**medial** *adj.* **1.** relating to or denoting the parts of the body that are closest to the *\*median* plane of the body. **2.** relating to or situated in the central region of an organ, tissue, or the body.

**median** *adj.* **1.** (in anatomy) situated in or denoting the **median plane**, which divides the body into right and left halves. See **ANATOMICAL POSITION**. **2.** (in statistics) see **MEAN**.

**median raphe** a ridge of skin extending from the anus through the perineum. In males it extends further up the scrotum and penis. It represents a fusion line from embryological development and may be the site of cysts and other harmless structures.

**mediastinitis** *n.* inflammation of the midline partition of the chest cavity (mediastinum), usually complicating a rupture of the oesophagus (gullet). **Sclerosing mediastinitis** often leads to *\*fibrosis*, which may cause compression of other structures in the thorax, such as the superior vena cava, the bronchial tree, or the oesophagus.

**mediastinoscopy** *n.* examination of the *\*mediastinum*, usually by means of an endoscope inserted through a small incision in the neck region. It can be used to assess the spread of intrathoracic tumours and for lymph node biopsy.

**mediastinum** *n.* the space in the thorax (chest cavity) between the two pleural sacs. The mediastinum contains the heart, aorta, trachea, oesophagus, and thymus gland and is divided into anterior, middle, posterior, and superior regions.

**Medicaid** in the USA, a programme of health-care services made available to low-income and other needy persons, regardless of age; eligibility criteria differ from state to state. Each state is responsible for its own Medicaid programme, and provides up to half the funding, depending on the state's per capita income. The programmes cover inpatient hospital services, outpatient hospital services, other laboratory and X-ray services, skilled nursing

services, physician services, family-planning services, medical and surgical dentistry, and screening for children under 21.

**medical** *adj.* **1.** of or relating to medicine, the diagnosis, treatment and prevention of disease. **2.** of or relating to conditions that require the attention of a physician rather than a surgeon. For example, a **medical ward** of a hospital accommodates patients with such conditions.

**medical assistant** **1.** a health service worker who is not a registered medical practitioner (often in the armed forces) working in association with a doctor to undertake minor treatments and preliminary assessments. In poorer countries, particularly in rural areas where qualified resources are short (e.g. China), agricultural workers receive limited training in health care and continue in a dual role as **barefoot doctors**; elsewhere, limited training concentrates more on environmental issues: the workers so trained are known as **sanitarians**. **2.** in the USA, a person – licensed or unlicensed, certified or uncertified – who provides administrative and/or clinical assistance in a physician's office or other health-care facility. Administrative duties typically include filling out insurance forms, billing, and bookkeeping, while clinical duties may include taking medical histories, preparing patients to be examined, and preparing blood and urine specimens.

**medical audit** *see* **CLINICAL AUDIT**.

**medical certificate** a certificate stating a doctor's diagnosis of a patient's medical condition, disability, or fitness to work (*see* **STATEMENT OF FITNESS FOR WORK**). It is known informally as a 'fit note' (formerly a 'sick note'). See **Appendix 8**.

**medical committee** *see* **LOCAL MEDICAL COMMITTEE**.

**medical emergency team (MET)** a team, usually consisting of a group of physicians, anaesthetists, and senior nurses, that can be summoned urgently to attend to patients with deteriorating medical conditions. The aim is to prevent further deterioration and to decide if enhanced levels of care are appropriate (e.g. on the high-dependency or intensive care units). The team will also assume the role of the **\*cardiac-arrest team**.

**medical ethics** the standards of conduct required of medical professionals and also the academic study of ethical issues arising from the practice of medicine. From the **\*Hippocratic oath** onwards, standards are designed to reassure that professionals subscribing to them will act in the **\*best interests** of, and will avoid harming, their patients. Today they lay greater emphasis on patient **\*autonomy**, while the contemporary study of medical ethics is concerned with a great variety of complex societal and social issues related to medical practice and research. Medical ethics is now taught in all medical schools in the UK as an essential part of a professional training, and the wider field of **\*bioethics** is becoming a recognized academic specialty. *See also* **CLINICAL ETHICS**; **FEMINIST ETHICS**; **PUBLIC HEALTH ETHICS**; **PUBLICATION ETHICS**; **VIRTUE ETHICS**.

<https://www.gmc-uk.org/ethical-guidance/ethical-guidance-for-doctors/good-medical-practice>

- Guidance on good medical practice from the website of the General Medical Council

**medical jurisprudence** the study or practice of the legal aspects of medicine. *See* **FORENSIC MEDICINE**.

**medically indigent patients** *see* **CHARITY PATIENTS**.

**medical negligence** *see* **NEGLIGENCE**.

**Medical Research Council (MRC)** a government-supported body that is an important source of funds for medical research.

<https://mrc.ukri.org/>

- MRC website

**medical tourism** travelling internationally to undergo surgery or otherwise be treated for an illness or condition. This may be done to save money, to avoid having to wait for treatment, or to receive a treatment not available in the home country.

**Medicare** in the USA, a national programme of health insurance for persons who are 65 and older or disabled or who have permanent kidney failure. The programme consists of three parts: **hospital insurance** provides coverage for inpatient hospital services, skilled nursing facilities, home health services, and hospice care; **medical insurance** helps pay for physician services, outpatient hospital services, medical equipment and supplies, and preventive services such as cancer screening tests; and **prescription drug plans** cover a range of medications depending on which plan is chosen. Medicare does not cover all expenses, and various supplemental insurance policies, *\*managed care* plans, and private fee-for-service plans are available that provide additional benefits.

**medicated** *adj.* containing a medicinal drug: applied to lotions, soaps, sweets, etc. Medicated dressings are applied to wounds to prevent infection and allow normal healing.

**medication** *n.* **1.** a substance administered by mouth, applied to the body, or introduced into the body for the purpose of treatment. *See also* **PREMEDICATION**. **2.** treatment of a patient using drugs.

**medicine** *n.* **1.** the science or practice of the diagnosis, treatment, and prevention of disease. **2.** the science or practice of nonsurgical methods of treating disease. **3.** any drug or preparation used for the treatment or prevention of disease, particularly a drug that is taken by mouth.

**Medicines and Healthcare products Regulatory Agency (MHRA)** a UK government agency that regulates the use of medicinal drugs and medical devices. The agency regulates and issues *\*licences* for the clinical trial, manufacture, and marketing of new products. It also applies the regulations governing the collection, storage, and use of human blood and blood products.

<https://www.gov.uk/government/organisations/medicines-and-healthcare-products-regulatory-agency/services-information>

- MHRA section of the Gov.uk website

**medicochirurgical** *adj.* of or describing matters that are related to both medicine and surgery. A medicochirurgical disorder is one that calls for treatment by both a physician and a surgeon.

**medicolegal** *adj.* relating to the legal aspects of the practice of medicine. There has been rapid expansion of the branch of the law relating to medicine due to the increasing number of court actions for accidents and injuries, many of them seeking compensation for negligence by doctors or hospitals.

**Mediterranean fever** **1.** *see* BRUCELLOSIS. **2.** *see* POLYSEROSITIS.

**medium** *n.* **1.** any substance, usually a broth, agar, or gelatin, used for the \*culture of microorganisms or tissue cells. An **assay medium** is used to determine the concentration of a growth factor or chemical by measuring the amount of growth it produces in a particular microorganism; all other nutrients are present in amounts adequate for growth. **2.** *see* CONTRAST MEDIUM.

**medroxyprogesterone** *n.* a synthetic female sex hormone (*see* PROGESTOGEN) used to treat menstrual disorders (including endometriosis) and certain cancers (especially breast and endometrial cancer) and in \*hormone replacement therapy. It is also used as a long-term contraceptive administered by \*depot injection.

**medulla** *n.* **1.** the inner region of any organ or tissue when it is distinguishable from the outer region (the cortex), particularly the inner part of the kidney, adrenal glands, or lymph nodes. **2.** *see* MEDULLA OBLONGATA. **3.** the \*myelin layer of certain nerve fibres. — **medullary** *adj.*

**medulla oblongata (myelencephalon)** the extension within the skull of the upper end of the spinal cord, forming the lowest part of the \*brainstem. Besides forming the major pathway for nerve impulses entering and leaving the skull, the medulla contains centres that are responsible for the regulation of the heart and blood vessels, respiration, salivation, and swallowing. \*Cranial nerves VI–XII leave the brain in this region.

**medullary carcinoma** a tumour whose consistency was thought to resemble that of bone marrow. **Medullary carcinoma of the thyroid** has associations with tumours of other organs (multiple endocrine neoplasia; *see* MENS) and

is often familial: it arises from the **\*C cells** of the thyroid and produces calcitonin, which can often be used as a **\*tumour marker**.

**medullated nerve fibre (myelinated nerve fibre)** *see* MYELIN.

**medulloblastoma** *n.* a malignant brain tumour (*see* CEREBRAL TUMOUR) that occurs during childhood. It is derived from cells that have the apparent potential to mature into neurons and develops in the cerebellum, the part of the brain that is predominantly involved in the control of balance. The flow of cerebrospinal fluid (CSF) may become obstructed, causing **\*hydrocephalus**. Symptoms include headaches, dizziness, and unsteadiness. Treatment involves surgery to remove most of the tumour and restore CSF flow, followed by radiotherapy directed using **\*stereotactic localization**. Medulloblastoma is the second most common form of cancer of childhood (after leukaemia); recent advances have improved the survival rate so that 40% of affected children live for more than five years.

**mefenamic acid** an anti-inflammatory drug (*see* NSAID) used to treat headache, toothache, rheumatic pain, and similar conditions. Side-effects include digestive upsets, drowsiness, and skin rashes.

**mefloquine** *n.* a drug used mainly in the prevention of malaria that is resistant to chloroquine. Side-effects can include dizziness, rash, gastrointestinal problems, and psychiatric disturbances (e.g. depression, psychosis), and the drug should not be taken during pregnancy, by psychiatric patients, or with beta blockers.

**mega-** *combining form denoting* **1.** large size, or abnormal enlargement or distension. Example: **megacaecum** (of the caecum). **2.** a million. Example: **megavolt** (a million volts).

**megacolon** *n.* pathological dilatation of the colon. It is caused by chronic obstruction of the colon (e.g. due to **\*Hirschsprung's disease**) or longstanding constipation, or it may occur as a complication of **\*ulcerative colitis (toxic megacolon)**.

**megadontia** *n. see* MACRODONTIA.

**megakaryoblast** *n.* a cell that gives rise to the platelet-forming cell **\*megakaryocyte**, found in the blood-forming tissue of the bone marrow. It is

derived from a **\*haemopoietic stem cell** and matures via an intermediate stage (**promegakaryocyte**) into a megakaryocyte.

**megakaryocyte** *n.* a cell in the bone marrow that produces **\*platelets**. It is large (35–160 µm in diameter), with an irregular multilobed nucleus, and with **\*Romanowsky stains** its abundant cytoplasm appears pale blue with fine reddish granules. *See also* **THROMBOPOIESIS**.

**megal-** (**megalo-**) *combining form denoting* abnormal enlargement. Example: **megalomelia** (of limbs).

**megaloblast** *n.* an abnormal form of any of the cells that are precursors of red blood cells (*see* **ERYTHROBLAST**). Megaloblasts are unusually large and their nuclei fail to mature in the normal way; they are seen in the bone marrow in certain anaemias (**megaloblastic anaemias**) due to deficiency of vitamin B<sub>12</sub> or folate. —**megaloblastic** *adj.*

**megalocephaly** *n.* **1.** *see* **MACROCEPHALY**. **2.** overgrowth and distortion of skull bones (*see* **LEONTIASIS**).

**megalocyte** *n.* *see* **MACROCYTE**.

**megalomania** *n.* an obsolete word for delusions of grandeur, such as being God, royalty, etc. It may be a feature of a schizophrenic or manic illness.

**-megaly** *combining form denoting* abnormal enlargement. Example: **splenomegaly** (of spleen).

**megaureter** *n.* gross dilatation of the **\*ureter**. This occurs above the site of a long-standing obstruction in the ureter, which blocks the free flow of urine from the kidney. A common cause of megaureter is reflux of urine from the bladder into the ureters (*see* **VESICoureteric REFLUX**), but some of the most striking examples are found in so-called **idiopathic megaureter**. In this condition, which may affect one or both ureters, there is a segment of normal ureter of varying length at the extreme lower end of the bladder, above which the ureter is enormously dilated. Both reflux and idiopathic megaureter can be complicated by urinary infection and/or renal impairment. Treatment of megaureter is by corrective surgery if functional obstruction can be demonstrated. Surgery for reflux is normally reserved for children with gross

reflux distending the renal pelvis and is usually carried out in the first few months of life.

**megestrol** *n.* a synthetic female sex hormone (*see* **PROGESTOGEN**) that is used mainly in the treatment of metastatic endometrial cancer.

**meglitinides** *pl. n.* a group of **\*oral hypoglycaemic drugs**, including **repaglinide** and **nateglinide**, used for treating type 2 **\*diabetes mellitus**. They act by stimulating insulin release from the pancreas and should be taken before each meal.

**megophthalmia** *n.* an abnormally large eyeball.

**meibomian cyst** *n. see* **CHALAZION**.

**meibomian glands (tarsal glands)** small sebaceous glands that lie under the conjunctiva of the eyelids.

**meibomianitis** *n.* inflammation of the **\*meibomian glands** of the eyelids.

**Meigs syndrome** the rare combination of a benign ovarian **\*fibroma** with **\*ascites** and a right-sided pleural effusion. [J. V. Meigs (1892–1963), US gynaecologist]

**meiosis (reduction division)** *n.* a type of cell division that produces four daughter cells, each having half the number of chromosomes of the original cell. It occurs before the formation of sperm and ova and the normal (**\*diploid**) number of chromosomes is restored after fertilization. Meiosis also produces genetic variation in the daughter cells, brought about by the process of **\*crossing over**. Meiosis consists of two successive divisions, each divided into four stages (*see* **PROPHASE**; **METAPHASE**; **ANAPHASE**; **TELOPHASE**). (See illustration.) *Compare* **MITOSIS**. —**meiotic** *adj.*

## Stages in meiosis.

**Meissner's plexus (submucous plexus)** a fine network of parasympathetic nerve fibres in the wall of the alimentary canal, supplying the muscles and mucous membrane. [G. Meissner (1829–1905), German physiologist]

**melaena** *n.* black tarry faeces discoloured by the presence of digested blood. Melaena usually reflects significant bleeding in the upper gastrointestinal tract, but may be due to disease in the small bowel or proximal large bowel (such as carcinoma or **\*angiodysplasia**). It may be associated with vomiting blood (**\*haematemesis**) or **\*coffee-ground vomit**. *See also* **HAEMORRHAGIC DISEASE OF THE NEWBORN**.

**melan- (melano-)** *combining form denoting* **1.** black coloration. **2.** melanin. Example: **melanaemia** (the presence in the blood of melanin).

**melancholia** *n.* an obsolete name for **\*depression** not triggered by any stressor. *See also* **ENDOGENOUS**.

**melanin** *n.* a dark-brown to black pigment occurring in the hair, the skin, and in the iris and choroid layer of the eyes. Melanin is contained within special cells (**chromatophores** or **melanophores**) and is produced by the metabolism of the amino acid tyrosine. Production of melanin by **melanocytes** in the epidermis of the skin is increased by the action of sunlight (producing tanning), which protects the underlying skin layers from the sun's radiation.

**melanism (melanosis)** *n.* an unusually pronounced darkening of body tissues caused by excessive production of the pigment **\*melanin**. For example, melanism may affect the hair, the skin (after sunburn, during pregnancy, or in **\*Addison's disease**), or the eye.

**melanocyte** *n.* any one of the cells, concentrated within the epidermis of skin, that produces the dark brown pigment **\*melanin**.

**melanocyte-stimulating hormone (MSH)** a peptide hormone produced and secreted by the anterior pituitary gland. In humans it stimulates production and dispersal of melanin in the melanocytes. **Alpha-melanocyte-stimulating**

**hormone** ( $\alpha$ -MSH), which is released by neurons in the hypothalamus, suppresses appetite and regulates energy balance. It also stimulates sexual activity and is involved in regulation of heart rate and blood pressure.

**melanoma (malignant melanoma)** *n.* a highly malignant tumour of melanin-forming cells, the *\*melanocytes*. Such tumours usually occur in the skin (pale skin, genetic predisposition, and excessive exposure to sunlight, particularly repeated sunburn, are the most important factors); it may arise from a pre-existing mole or naevus or from apparently normal skin. It can rarely occur at other sites than the skin. Melanomas are usually dark, but may also be free of pigment (**amelanotic melanomas**). Spread of this cancer to other parts of the body, especially to the lymph nodes and liver, is common if the original melanoma is thick. The prognosis is inversely related to the thickness of the tumour; almost all patients with tumours less than 0.76 mm survive following surgical excision. The mainstay of treatment is surgery, but melanoma can be responsive to *\*immunotherapy* and is currently the subject of investigational treatments using melanoma vaccines; the response rate to conventional chemotherapy is poor. Primary prevention programmes reducing episodes of sunburn are advanced in some parts of the world, such as Australia.

**melanonychia** *n.* blackening of the nails with the pigment *\*melanin*.

**melanophore** *n.* *see* MELANIN.

**melanoplakia** *n.* pigmented areas of *\*melanin* in the mucous membrane lining the inside of the cheeks.

**melanosis** *n.* **1.** *see* MELANISM. **2.** a disorder in the body's production of the pigment melanin. **3.** *\*cachexia* associated with the spread of the skin cancer *\*melanoma*. —**melanotic** *adj.*

**melanuria** *n.* the presence of dark pigment in the urine. This may be caused by the presence of melanin or its precursors, in some cases of *\*melanoma*; it may alternatively be caused by metabolic disease, such as *\*porphyria*.

**MELAS** mitochondrial encephalopathy lactic acidosis and stroke-like episodes: a rare metabolic disorder, usually inherited from the mother, that results in short stature and high levels of lactic acid in the blood (*see*

**LACTIC ACIDOSIS**). Affected individuals are usually diagnosed in late childhood and early adult life. *See also* **MITOCHONDRIAL DISORDERS**.

**melasma** *n.* *see* **CHLOASMA**.

**melatonin** *n.* a hormone produced by the **\*pineal gland** in darkness but not in bright light. Melatonin receptors in the brain, in a nucleus immediately above the **\*optic chiasm**, react to this hormone and synchronize the nucleus to the 24-hour day/night rhythm, thus informing the brain when it is day and when it is night. Melatonin is a derivative of **\*serotonin**, with which it works to regulate the sleep cycle, and is being used experimentally to treat jet lag, **\*SAD**, and insomnia in shift workers and the elderly.

**melioidosis** *n.* a disease of wild rodents caused by the bacterium *Pseudomonas pseudomallei*. It can be transmitted to humans, possibly by rat fleas, causing pneumonia, multiple abscesses, and septicaemia. It is often fatal.

**Melkersson–Rosenthal syndrome** a rare disorder characterized by the occurrence together of facial paralysis, enlargement of the glottis, and swollen lips, which is due to lymphatic **\*stasis** and the consequent build-up of protein in the facial tissues. [E. Melkersson (1898–1932), Swedish physician; C. Rosenthal (20th century), German neurologist]

**melomelus** *n.* a fetus with one or more pairs of supernumerary limbs.

**melphalan** *n.* a drug (an **\*alkylating agent**) used to treat various types of cancer, particularly myeloma. Side-effects include digestive upsets, mouth ulcers, and temporary hair loss.

**memantine hydrochloride** an **\*NMDA-receptor** antagonist drug indicated for treatment of moderate to severe Alzheimer's-type dementia. Its most common side-effects are dizziness, headache, and constipation.

**membrane** *n.* **1.** a thin layer of tissue surrounding the whole or part of an organ or tissue lining a cavity, or separating adjacent structures or cavities. *See also* **BASEMENT MEMBRANE**; **MUCOUS MEMBRANE**; **SEROUS MEMBRANE**. **2.** the lipoprotein envelope surrounding a cell (**plasma** or **cell membrane**). —**membranous** *adj.*

**membrane bone** a bone that develops in connective tissue by direct **\*ossification**, without cartilage being formed first. The bones of the face and skull are membrane bones.

**membranous labyrinth** *see* LABYRINTH.

**membranous nephropathy** a common cause of the **\*nephrotic syndrome** in adults. The diagnosis is established by renal biopsy, which shows diffuse global subepithelial deposits within the glomerulus. Most cases of membranous nephropathy are idiopathic, but there are associations with infection (e.g. hepatitis B), malignancy (especially lung cancer), autoimmune disease (e.g. SLE, Hashimoto's disease), and drugs (e.g. gold and penicillamine). Recent studies suggest that idiopathic membranous nephropathy is an autoimmune disease with antibodies directed against an antigen (PLA<sub>2</sub>R, a phospholipase A<sub>2</sub> receptor) on the **\*podocyte** cell membrane. Without treatment, outcome is very variable: some patients will make a full recovery, while others will progress to end-stage kidney failure. Immunosuppressant treatment is often tried when there is evidence of declining renal function.

**Memokath** *n.* trade name for a nickel-titanium alloy prostatic **\*stent** used as a minimally invasive treatment for men with **\*lower urinary tract symptoms** due to benign prostatic hyperplasia (*see* PROSTATE GLAND) who are unfit for surgery. The stent is placed in the prostatic section of the urethra and bladder neck using a flexible cystoscope. The stent expands when warm water is passed through it; cold water causes contraction and allows removal. Less commonly this stent can be used in the ureter in the management of ureteric strictures.

**memory cell** a long-lived lymphocyte that is formed following primary infection. It enables a faster and more robust immune response following a second exposure to the antigen.

**MEN** multiple endocrine neoplasia. *See* MENS.

**men- (meno-)** *combining form denoting* menstruation.

**MenACWY vaccine** a vaccine that provides protection against four different strains (A, C, W, and Y) of the bacterium *Neisseria meningitidis* (the meningococcus) that causes **\*meningitis** and septicaemia. It also prevents the

carriage of the bacteria in the nose and back of the throat. In Britain it is offered to children aged 14 years and students going to college and university for the first time.

**menarche** *n.* the start of the menstrual periods and other physical and mental changes associated with puberty. The menarche occurs when the reproductive organs become functionally active and may take place at any time between 10 and 18 years of age. *Compare* **GONADARCHE**.

**MENCAP** a British voluntary association that promotes the welfare of people with learning disabilities and their families, through education, campaigning, and the provision of resources for projects.

**mendelism** *n.* the theory of inheritance based on **\*Mendel's laws**.

**Mendel's laws** rules of inheritance based on the breeding experiments of the Austrian monk Gregor Mendel (1822–84), which showed that the inheritance of characteristics is controlled by particles now known as **\*genes**. In modern terms they are as follows. (1) Each body (somatic) cell of an individual carries two factors (genes) for every characteristic and each gamete carries only one. It is now known that the genes are arranged on chromosomes, which are present in pairs in somatic cells and separate during gamete formation by the process of **\*meiosis**. (2) Each pair of factors segregates independently of all other pairs at meiosis, so that the gametes show all possible combinations of factors. This law applies only to genes on different chromosomes; those on the same chromosome are affected by **\*linkage**. *See also* **DOMINANT**; **RECESSIVE**.

**Mendelson's syndrome** inhalation of regurgitated stomach contents by an anaesthetized patient, which may result in death from anoxia or cause extensive lung damage or pulmonary **\*oedema** with severe **\*bronchospasm**. It is a well-recognized hazard of general anaesthesia in obstetrics and may be prevented by giving gastric-acid inhibitors (e.g. **\*cimetidine** or **\*ranitidine**) or sodium citrate before inducing anaesthesia. [C. L. Mendelson (1913–2002), US obstetrician]

**Ménétrier's disease** a rare disorder caused by **\*hypertrophy** of the mucosa. It is characterized by diffusely enlarged gastric folds and excess mucus

production, leading to anaemia, protein loss, and peripheral oedema. [P. Ménétrier (1859–1935), French physician]

**Ménière's disease** a disease of the inner ear characterized by episodes of deafness, buzzing in the ears (*\*tinnitus*), and *\*vertigo*. Typically the attacks are preceded by a sensation of fullness in the ear. Symptoms last for several hours and between attacks the affected ear may return to normal, although hearing does tend to deteriorate gradually with repeated attacks. It is thought to be caused by the build-up of fluid in the inner ear. Drug treatments include *\*prochlorperazine* to reduce vertigo in acute attacks and *\*betahistine* as prophylactic treatment. *\*Transtympanic* injections of steroids into the middle ear are sometimes utilized. Alternatively, ototoxic drugs, such as *\*gentamicin*, can be injected through the eardrum into the middle ear to deliberately damage the *\*vestibular apparatus* and hence reduce activity in the inner ear. Surgical procedures used include decompression or drainage of the *\*endolymphatic sac*, *\*vestibular nerve* section, and *\*labyrinthectomy*. Medical name: **endolymphatic hydrops**. [P. Ménière (1799–1862), French physician]

**mening-** (**meningo-**) *combining form denoting the meninges.*

**meninges** *pl. n. (sing. meninx)* the three connective tissue membranes that line the skull and vertebral canal and enclose the brain and spinal cord (see illustration). The outermost layer – the *\*dura* mater (pachymeninx) – is inelastic, tough, and thicker than the middle layer (the *\*arachnoid* mater) and the innermost layer (the *\*pia* mater). The inner two membranes are together called the **leptomeninges**; between them circulates the *\*cerebrospinal fluid*.

The meninges (in a section through the skull and brain).

**meningioma** *n.* a benign tumour arising from the fibrous coverings of the brain and spinal cord (**\*meninges**). It is usually slow-growing and produces symptoms by pressure on the underlying nervous tissue. In the brain the tumour may cause focal **\*epilepsy** and gradually progressive neurological disability. In the spinal cord it may cause paraplegia and the **\*Brown-Séquard syndrome**. Rarely, meningiomas may behave in a malignant fashion and can invade neighbouring tissues. Treatment of the majority of cases is by surgical removal if the tumour is accessible. The histological classification of malignancy is controversial, but some tumours may also require additional radiotherapy. Some patients have been known to have symptoms for as long as 30 years before the tumour has been discovered.

**meningism** *n.* stiffness of the neck that is found in **\*meningitis**.

**meningitis** *n.* an inflammation of the **\*meninges** due to infection by viruses or bacteria or fungi. Meningitis causes an intense headache, fever, loss of appetite, intolerance to light (photophobia) and sound (phonophobia), rigidity of muscles, especially those in the neck (*see also* **KERNIG'S SIGN**), and in severe cases convulsions, vomiting, and delirium leading to death.

The most important causes of bacterial meningitis are *\*Haemophilus influenzae* (especially in young children); two strains of *Neisseria meningitidis* (the meningococcus), B and C; and *Streptococcus pneumoniae* (**pneumococcal meningitis**). Immunization against *Haemophilus*, *Neisseria meningitidis* B and C, and pneumococcal meningitis is now routine for children (see [HIB VACCINE](#); [MENINGITIS B VACCINE](#); [MENINGITIS C VACCINE](#); [PNEUMOCOCCAL VACCINE](#)); In **meningococcal meningitis** (meningitis B and C, previously known as **cerebrospinal fever** and **spotted fever**) the symptoms appear suddenly and the bacteria can cause widespread meningococcal infection, which may be associated with **meningococcal septicaemia**, with its characteristic purple haemorrhagic rash anywhere on the body. The rash does not disappear on pressure (if a glass is pressed on the rash, it is still visible through the glass). Unless quickly diagnosed and treated, death can occur within a few hours.

Bacterial meningitis is treated with antibiotics administered as soon as possible after diagnosis. With the exception of herpes simplex *\*encephalitis* (which is treated with aciclovir), viral meningitis does not respond to drugs but normally has a relatively benign prognosis. See also [LEPTOMENINGITIS](#); [PACHYMENINGITIS](#).

<https://www.meningitisnow.org/>

- Website of Meningitis Now: includes information on signs and symptoms of meningitis

**meningitis B vaccine (MenB)** a vaccine that provides protection against the B strain of the bacterium *Neisseria meningitidis* (the meningococcus), which accounts for more than 90% of meningococcal infections in young children. The MenB vaccine is offered to all babies with their primary *\*immunizations* at 2 and 4 months of age and as a booster at 12 months. See [MENINGITIS](#).

**meningitis C vaccine (MenC)** a vaccine that provides protection against the C strain of the bacterium *Neisseria meningitidis* (the meningococcus), which accounts for approximately 50% of all cases of meningococcal meningitis and tends to occur in clusters. Owing to the success of the MenC vaccination programme begun in 1999 there have been almost no recent cases of

meningitis C disease in babies and young children in the UK. The vaccine was previously offered to all babies at 12 weeks of age but is now given at 12 months as part of Hib/MenC vaccine and at 14 years as the MenACWY vaccine.

**meningocele** *n.* *see* NEURAL TUBE DEFECTS.

**meningococcaemia** *n.* the presence of meningococci (bacteria of the species *Neisseria meningitidis*) in the bloodstream. *See* MENINGITIS.

**meningococcus** *n.* (*pl.* **meningococci**) the bacterium *\*Neisseria meningitidis*, which can cause a serious form of septicaemia and is a common cause of *\*meningitis*. —**meningococcal** *adj.*

**meningoencephalitis** *n.* inflammation of the brain and its membranous coverings (the meninges) caused by bacterial, viral, fungal, or amoebic infection. The disease may also involve the spinal cord, producing *\*myelitis* with paralysis of both legs, sometimes called **meningoencephalomyelitis**.

**meningoencephalocele** *n.* *see* NEURAL TUBE DEFECTS.

**meningoencephalomyelitis** *n.* *see* MENINGOENCEPHALITIS.

**meningomyelocele** *n.* *see* NEURAL TUBE DEFECTS.

**meningovascular** *adj.* relating to or affecting the meninges covering the brain and spinal cord and the blood vessels that penetrate them to supply the underlying neural tissues. The term is also used to describe tertiary syphilitic infection of the nervous system.

**meninx** *n.* **1.** the thin layer of mesoderm that surrounds the brain of the embryo. It gives rise to most of the skull and the membranes that surround the brain. *See also* CHONDROCRANIUM. **2.** *see* MENINGES.

**meniscectomy** *n.* surgical removal of a cartilage (meniscus) in the knee. This is carried out when the meniscus has been torn or is diseased and is causing symptoms, such as pain, swelling, and ‘locking’ of the knee joint. The operation is now routinely performed using an *\*arthroscope*.

**meniscus** *n.* (in anatomy) a crescent-shaped structure, such as the fibrocartilaginous disc that divides the cavity of a synovial joint.

**Menkes kinky-hair disease** a genetic disorder characterized by severe learning disabilities, seizures, poor vision, colourless fragile hair, and chubby red cheeks. It is inherited as an X-linked (see **SEX-LINKED**) recessive characteristic. There is no treatment and affected infants usually die before the age of three. [J. H. Menkes (1928–2008), US neurologist]

**menopause (climacteric)** *n.* the time in a woman's life when the ovaries cease to produce an egg cell every four weeks: menstruation ceases and the woman is no longer able to bear children. The menopause can occur at any age between the middle thirties and the middle fifties, most commonly between 45 and 55 (the median age is 51). Natural menopause can only be established in retrospect after 12 consecutive months of **\*amenorrhoea**. Around the time of the menopause (the **perimenopause**) there are marked changes in the menstrual cycle. Menstruation may decrease gradually in successive periods or the intervals between the periods may lengthen; alternatively there may be a sudden and complete stoppage of the periods. There is a change in the balance of sex hormones in the body, which sometimes leads to hot flushes and other **\*vasomotor symptoms**, palpitations, and dryness of the mucous membrane lining the vagina. Some women may also experience emotional disturbances. Some of these symptoms may be alleviated by **\*hormone replacement therapy**. The term 'menopause' is also used for the postmenopausal period. See also **POSTMENOPAUSAL BLEEDING**. —**menopausal** *adj.*

**menorrhagia** *n.* abnormally heavy bleeding at menstruation, which may or may not be associated with abnormally long periods. Menorrhagia may be associated with pelvic inflammatory disease, tumours (especially fibroids) in the pelvic cavity, endometriosis, or the presence of an IUCD. In some cases no obvious pathology can be demonstrated; heavy, prolonged, or frequent uterine bleeding not associated with pelvic or systemic disease is known as **dysfunctional uterine bleeding**. Medical treatment for menorrhagia includes **\*NSAIDs**, **\*antifibrinolytic** drugs, and hormonal therapy, such as progestogen-only pills, gonadorelin analogues, or the **\*IUS** (Mirena). Surgical treatments include **\*endometrial ablation** and hysterectomy. In some extreme cases a blood transfusion may be necessary.

**MENS** multiple endocrine neoplasia syndromes, designated as type 1 (**Wermer's syndrome**), type 2A (**Sipple's syndrome**), and type 2B. These

involve tumour formation or hyperplasia in various combinations of endocrine glands. Type 1 involves the parathyroid, pituitary, and pancreas, whereas type 2A involves the thyroid medullary cells, the adrenal medulla (\*[phaeochromocytoma](#)), and the parathyroids. Type 2B is similar to 2A, but patients tend to resemble people with \*[Marfan's syndrome](#) and have multiple \*[neuromas](#) on their mucous membranes. These conditions are inherited as autosomal \*[dominant](#) characteristics.

**menses** *n.* **1.** the blood and other materials discharged from the uterus at menstruation. **2.** *see* [MENSTRUATION](#).

**menstrual cycle** the periodic sequence of events in sexually mature nonpregnant women by which an egg cell (ovum) is released from the ovary at four-weekly intervals until \*[menopause](#). The stages of the menstrual cycle are shown in the diagram. An ovum develops within a \*[Graafian follicle](#) in the ovary. When mature, it bursts from the follicle and travels along the Fallopian tube to the uterus. A temporary endocrine gland – the corpus luteum – develops in the ruptured follicle and secretes the hormone \*[progesterone](#), which causes the lining of the uterus (endometrium) to become thicker and richly supplied with blood in preparation for pregnancy. If the ovum is not fertilized the cycle continues: the corpus luteum shrinks and the endometrium is shed at \*[menstruation](#). If fertilization does take place the fertilized ovum becomes attached to the endometrium and the corpus luteum continues to secrete progesterone, i.e. pregnancy begins.

**The menstrual cycle.**

**menstruation (menses)** *n.* the discharge of blood and of fragments of **\*endometrium** from the vagina at intervals of about one month in women of child-bearing age (see **MENARCHE**; **MENOPAUSE**). Menstruation is that stage of the **\*menstrual cycle** during which the endometrium, thickened in readiness to receive a fertilized egg cell (ovum), is shed because fertilization has not occurred. The normal duration of discharge varies from three to seven days. In **anovular menstruation**, discharge takes place without previous release of an egg cell from the ovary. **Vicarious menstruation** is bleeding from a mucous membrane other than the endometrium when normal menstruation is due. **Retrograde menstruation** is the backflow of blood and endometrial cells through the Fallopian tubes (see **ENDOMETRIOSIS**). See also **AMENORRHOEA**; **DYSMENORRHOEA**; **MENORRHAGIA**; **OLIGOMENORRHOEA**.

**mental**<sup>1</sup> *adj.* relating to or affecting the mind.

**mental**<sup>2</sup> *adj.* relating to the chin.

**mental age** a measure of the intellectual level at which an individual functions; for example, someone described as having a mental age of six years would be functioning at the level of an average six-year-old child. This measure has largely been replaced by a comparison of the functioning of persons of the same age group (see **INTELLIGENCE QUOTIENT**; **INTELLIGENCE TEST**).

**Mental Capacity Act 2005** legislation for England and Wales, which came into force in October 2007, to govern the treatment of people who lack **\*capacity** to make decisions. It gives legal force to the importance of **\*autonomy** in health care and to **\*advance directives, decisions, or statements**. It also provides statutory legislation for medical and social decision-makers to act in the patient's best interests should he or she lose capacity (see **INDEPENDENT MENTAL CAPACITY ADVOCATE**). It allows proportionate force to implement decisions made in a patient's best interests. For Scotland the current legislation is the Adults with Incapacity (Scotland) Act 2000.

**mental handicap** a former term for **\*learning disability**.

**Mental Health Act** an Act of Parliament to govern the treatment of people with a mental disorder, which is defined as including *\*mental illness*, *\*personality disorder*, and *\*learning disability*. For England and Wales the Mental Health Act 1983 has been amended by the Mental Health Act 2007. The legislation provides for the voluntary and compulsory (involuntary) assessment and treatment of patients with a diagnosis or symptoms of a mental disorder. The purposes of involuntary admission are both to act in patients' best interests, providing treatment for them when they have lost *\*insight* into their illness, and to manage the risk that may arise from a mental disorder to the patients themselves or to others. One of the principal amendments in the 2007 Act is the introduction of **Community Treatment Orders**, which provide for the involuntary treatment of patients who have left hospital. Another, more controversial, change was the introduction of *\*sexual deviancy* as a mental disorder to which the Act applies. In Scotland the current legislation is the Mental Health (Care and Treatment) (Scotland) Act 2003, which came into effect in April 2005. *See* [SECTION](#).

**Mental Health Act Commission** a regulating body in England and Wales, governed by the Mental Health Act 2007, that was responsible for regularly visiting psychiatric hospitals, reviewing psychiatric care, giving second opinions on the need for certain psychiatric treatments, and acting as a forum for the discussion of psychiatric issues. It was subsumed under the *\*Care Quality Commission* in April 2009.

**Mental Health Review Tribunal (MHRT)** a tribunal, established under the Mental Health Act 1959 and now operating under the Mental Health Act 2007, to which applications may be made for the discharge from hospital of a person compulsorily detained there under provisions of the Act (*see* [COMPULSORY ADMISSION](#)). When a patient is subject to a restriction order an application may only be made after his or her first six months of detention. The powers of the tribunal, which comprises both legally and medically qualified members, include reclassifying unrestricted patients, recommending leave of absence for a patient, delaying discharge, and transferring patients to other hospitals. Detained patients may also apply to have a **managers hearing** to review their detention. The powers of the managers hearing are slightly different from those of the MHRT, but both are defined in the Mental

Health Act 2007 and both can discharge a patient from a section of the Mental Health Act.

**mental illness** a disorder of one or more of the functions of the mind (such as mood, affect, perception, memory, or thought), which causes suffering to the patient or others. Symptoms of mental illness may be dimensional and only become pathological if at the severe end of the spectrum. Some mental illnesses are syndromes, which are characterized by a set of different symptoms that rarely all happen at once.

Mental illness should be distinguished from **\*learning disability**, in which an individual has a general failure of development of the normal intellectual capacities. Mental illnesses are broadly divided into disorders in which the capacity for appreciating reality is lost (see **PSYCHOSIS**) and those in which it is preserved (see **NEUROSIS**).

<https://www.mentalhealth.org.uk/>

- Website of the Mental Health Foundation

<https://www.rethink.org/>

- Website of Rethink: provides an information and advice service for people living with mental illness

**mental impairment** (mostly in legal usage) the condition of significant or severe impairment of intellectual and social functioning.

**mental retardation** formerly, the state of those whose intellectual powers have failed to develop to such an extent that they are in need of care and protection and require special education. The preferred term is now **\*learning disability**.

**mental state examination (MSE)** a full psychiatric examination of signs and symptoms, which takes place during a psychiatric interview and should apply only to signs and symptoms elicited at that time; it should not take into account historical information. The examination is usually divided into the following subheadings: appearance and behaviour, speech, mood, **\*affect**,

thought and perception, [\\*insight](#), and orientation. Usually it also includes a [\\*risk assessment](#).

**mento-** *combining form denoting the chin.*

**mentum** *n.* the chin.

**mepacrine** *n.* a drug sometimes used to treat giardiasis. Digestive upsets and headache may occur and the skin often turns yellow.

**meralgia paraesthetica** painful tingling and numbness felt over the lateral surface of the thigh when the lateral cutaneous nerve is trapped as it passes through the fibrous and muscular tissues of the groin. It is usually found in pregnant women.

**mercaptoacetyltriglycine** *n.* *see* [MAG3](#).

**mercaptopurine** *n.* a drug that prevents the growth of cancer cells; it is used chiefly in the treatment of acute leukaemias and chronic myeloid leukaemia but also in severe Crohn's disease (*see* [ANTIMETABOLITE](#)). It commonly reduces the numbers of white blood cells; mouth ulcers and digestive upsets may also occur.

**mercurialism (hydrargyria)** *n.* mercury poisoning. Metallic mercury is absorbed through the skin and alimentary canal, and its vapour is taken in through the lungs. Acute poisoning causes vomiting, severe abdominal pains, bloody diarrhoea, and kidney damage, with failure to produce urine. Treatment is with [\\*chelating agents](#). Chronic poisoning causes mouth ulceration, loose teeth, loss of appetite, and intestinal and renal disturbances, with anaemia and nervous irritability. Treatment is removing the patient from further exposure.

**mercury** *n.* a silvery metallic element that is liquid at room temperature. Its toxicity caused a decline in the use of its compounds in medicine during the 20th century; mercurial compounds were formerly used in the treatment of syphilis and as purgatives, teething pastes and powders, fungicides, and antiparasitic agents. Mercury is still widely used in dentistry as a component of [\\*amalgam](#) fillings; when the mercury is combined with the filling alloy, it is nontoxic. Symbol: Hg. *See also* [MERCURIALISM](#); [PINK DISEASE](#).

**merocrine (eccrine)** *adj.* describing a type of **\*secretion** in which the glandular cells remain intact during the process of secretion.

**merozoite** *n.* a stage in the life cycle of the malaria parasite (**\*Plasmodium**). Many merozoites are formed during the asexual division of the schizont (*see* **SCHIZOGONY**). The released merozoites may invade new red blood cells or new liver cells, and continue the asexual phase with the production of yet more merozoites, effectively spreading the infection. Alternatively, merozoites invade red blood cells and begin the sexual cycle with the formation of male and female sex cells (*see* **MICROGAMETOCYTE**; **MACROGAMETOCYTE**).

**MERS** *see* **MIDDLE EAST RESPIRATORY SYNDROME**.

**mes- (meso-)** *combining form denoting* middle or medial.

**MESA** (microsurgical epididymal sperm aspiration) the removal of spermatozoa from the epididymis by needle **\*aspiration**. This procedure, performed under anaesthetic, may be undertaken to assist conception in cases where the normal passage of sperm from the testis is obstructed, for example by blockage (through infection) of the ducts or by vasectomy. The extracted sperm are subjected to special treatment to select the strongest and most motile; these are then chemically treated to activate them and used for in vitro fertilization (*see* **ICSI**).

**mesalazine** *n. see* **AMINOSALICYLATES**.

**mesangial cells** *see* **JUXTAGLOMERULAR APPARATUS**.

**mesangiocapillary glomerulonephritis (membranoproliferative glomerulonephritis)** a renal disease characterized by changes in the glomeruli with mesangial cell proliferation and thickening of the capillary wall (*see* **JUXTAGLOMERULAR APPARATUS**). Three types are distinguished. Type 1 is associated with immune deposits in the subendothelial space and the mesangial cells, and may sometimes be associated with cryoglobulinaemia (*see* **CRYOGLOBULIN**) and infection with the hepatitis C virus. Type 2, also known as **dense deposit disease**, is associated with a ribbon of electron-dense material within the glomerular basement membrane. Type 3 is associated with immune deposits in the

subendothelium, the basement membrane, and the subepithelial spaces. All three types have a variable presentation, ranging from asymptomatic abnormalities of the urinary sediment through **\*nephrotic syndrome** to subacute renal failure. Apart from treatment of any coexisting hepatitis C, there is no consensus regarding specific treatment of these conditions.

**mesaortitis** *n.* inflammation of the middle layer (media) of the wall of the aorta, generally the result of late syphilis. Aneurysm formation may result. The infection can be eradicated with penicillin.

**mesarteritis** *n.* inflammation of the middle layer (media) of an artery, which is often combined with inflammation in all layers of the artery wall. It is seen in syphilis, polyarteritis, temporal arteritis, and Buerger's disease.

**mescaline** *n.* an alkaloid present in **mescal buttons** (the dried tops of the Mexican cactus *Lophophora williamsii*) that produces inebriation and vivid colourful hallucinations when ingested.

**mesencephalon** *n.* *see* **MIDBRAIN**.

**mesenchyme** *n.* the undifferentiated tissue of the early embryo that forms almost entirely from **\*mesoderm**. It is loosely organized and the individual cells migrate to different parts of the body where they form most of the skeletal and connective tissue, the blood and blood system, and the visceral (smooth) muscles.

**mesenteric adenitis** *see* **ADENITIS**.

**mesenteric ischaemia** impairment of the blood flow to the arteries that supply the small and large intestine. The arteries include the **\*coeliac** axis and the superior and inferior mesenteric arteries. Partial or total occlusion of blood flow may occur abruptly or over a protracted period (**acute** vs. **chronic mesenteric ischaemia**). Causes of an acute episode include migration of an arterial blood clot or embolus into the mesenteric vessels, an arterial blood clot in patients with atherosclerosis, profound low blood pressure, or states promoting coagulation. Typically a patient presents with severe abdominal pain, nausea and vomiting, diarrhoea, and rectal bleeding. Rapid diagnosis is essential since impaired intestinal blood flow predisposes to the development of gangrene and necrosis of the bowel. Treatment includes aggressive fluid resuscitation, pain relief, antibiotics,

surgical resection of nonviable bowel, and radiological or surgical **\*revascularization** of implicated arteries. In chronic mesenteric ischaemia, abdominal pain precipitated by eating is the main symptom, often accompanied by loss of appetite and marked weight loss.

**mesentery** *n.* a double layer of **\*peritoneum** attaching the stomach, small intestine, pancreas, spleen, and other abdominal organs to the posterior wall of the abdomen. It contains blood and lymph vessels and nerves supplying these organs. — **mesenteric** *adj.*

**mesial** *adj.* **1.** medial. **2.** relating to or situated in the **\*median** line or plane. **3.** designating the surface of a tooth towards the midline of the jaw.

**mesiodens** *n.* a supernumerary tooth that may occur in the midline of the palate, between the central incisors, and may interfere with their eruption and therefore the occlusion.

**mesmerism** *n.* **\*hypnosis** based on the ideas of the 18th-century physician Franz Mesmer, sometimes employing magnets and a variety of other equipment.

**mesna** *n.* a drug administered to prevent the toxic effects of **\*alkylating agents**, particularly **\*ifosfamide** and **\*cyclophosphamide**, on the bladder. It binds with the toxic metabolite acrolein in the urine.

**mesoappendix** *n.* the **\*mesentery** of the appendix.

**mesocolon** *n.* the fold of peritoneum by which the colon is fixed to the posterior abdominal wall. Usually only the **transverse** and **sigmoid mesocolons** persist in the adult, attached to the transverse and sigmoid colon, respectively.

**mesoderm** *n.* the middle **\*germ layer** of the early embryo. It gives rise to cartilage, muscle, bone, blood, kidneys, gonads and their ducts, and connective tissue. It separates into two layers – an outer **somatic** and an inner **splanchnic mesoderm**, separated by a cavity (**coelom**) that becomes the body cavity. The dorsal somatic mesoderm becomes segmented into a number of **\*somites**. *See also* **MESENCHYME**. — **mesodermal** *adj.*

**mesometrium** *n.* the broad ligament of the uterus: a sheet of connective tissue that carries blood vessels to the uterus and attaches it to the abdominal

wall.

**mesomorphic** *adj.* describing a **\*body type** that has a well developed skeletal and muscular structure and a sturdy upright posture. —**mesomorph** *n.* —**mesomorphy** *n.*

**mesonephros (Wolffian body)** *n.* the second area of kidney tissue to develop in the embryo. Its excretory function only lasts for a very brief period before it degenerates. However, parts of it become incorporated into the male reproductive structures. Its duct – the **Wolffian** (or **mesonephric**) **duct** – persists in males as the epididymis and vas deferens, which conduct sperm from the testis. —**mesonephric** *adj.*

**mesophilic** *adj.* describing organisms, especially bacteria, that grow best at temperatures of about 25–45°C. *Compare* **PSYCHROPHILIC**; **THERMOPHILIC**.

**mesosalpinx** *n.* a fold of peritoneum that surrounds the Fallopian tubes. It is the upper part of the broad ligament that surrounds the uterus.

**mesosome** *n.* a structure occurring in some bacterial cells, formed by infolding of the cell membrane. Mesosomes are associated with the DNA and play a part in cell division.

**mesotendon** *n.* the delicate connective tissue membrane that surrounds a tendon.

**mesothelioma** *n.* a tumour of the pleura, peritoneum, or pericardium. The occurrence of pleural mesothelioma is often due to exposure to asbestos dust (*see* **ASBESTOSIS**), and workers in the asbestos industry who develop such tumours are entitled to industrial compensation. In other cases there is no history of direct exposure to asbestos at work but the patients had been exposed to asbestos via the clothes of relatives who had had direct contact with asbestos, or they themselves had lived very close to an asbestos factory. There is no curative treatment for the disease, but moderately good results have occasionally been obtained from radical surgery for limited disease, from radiotherapy, and more recently from chemotherapy.

**mesothelium** *n.* the single layer of cells that lines **\*serous membranes**. It is derived from embryonic mesoderm. *Compare* **EPITHELIUM**.

**mesovarium** *n.* the **\*mesentery** of the ovaries.

**mesozeaxanthin** *n.* a yellow pigment in the **\*macula** at the back of the eye, where the vision is sharpest. The macula also contains the dietary carotenoids **\*lutein**, from which mesozeaxanthin is derived, and zeaxanthin, and all three pigments are thought to protect the eye from the ageing process.

**messenger RNA** a type of RNA that carries the information of the **\*genetic code** of the DNA from the cell nucleus to the ribosomes, where the code is translated into protein. *See* **TRANSCRIPTION**; **TRANSLATION**.

**mestranol** *n.* a synthetic female sex hormone (*see* **OESTROGEN**) used in combination with a progestogen (**\*norethisterone**) as an **\*oral contraceptive**.

**MET** *see* **MEDICAL EMERGENCY TEAM**.

**met-** (**meta-**) *prefix denoting* **1.** distal to; beyond; behind. **2.** change; transformation.

**meta-analysis** *n.* a statistical technique for combining the results of a number of different studies on the same topic to enable identification of trends and patterns and more accurate estimation of significant effects.

**metabolic syndrome (insulin resistance syndrome, syndrome X)** a very common condition in which impaired glucose tolerance, impaired fasting glucose, or type 2 diabetes (*see* **GLUCOSE TOLERANCE TEST**) is combined with central obesity (increased fat within the abdomen), raised blood pressure (**\*hypertension**), and **\*hyperlipidaemia**. It is associated with a risk of premature vascular disease (heart attack and stroke). The principal underlying cause is **\*insulin** resistance, which is genetically determined.

**metabolism** *n.* **1.** the sum of all the chemical and physical changes that take place within the body and enable its continued growth and functioning. Metabolism involves the breakdown of complex organic constituents of the body with the liberation of energy, which is required for other processes (*see* **CATABOLISM**) and the building up of complex substances, which form the material of the tissues and organs, from simple ones (*see* **ANABOLISM**). *See also* **BASAL METABOLISM**. **2.** the sum of the biochemical changes undergone

by a particular constituent of the body; for example, protein metabolism. — **metabolic** *adj.*

**metabolite** *n.* a substance that takes part in the process of **\*metabolism**. Metabolites are either produced during metabolism or are constituents of food taken into the body.

**metacarpal** **1.** *adj.* relating to the bones of the hand (**\*metacarpus**). **2.** *n.* any of the bones forming the metacarpus.

**metacarpus** *n.* the five bones of the hand that connect the **\*carpus** (wrist) to the **\*phalanges** (digits).

**metacentric** *n.* a chromosome in which the centromere is at or near the centre of the chromosome. — **metacentric** *adj.*

**metacercaria** *n.* (*pl.* **metacercariae**) a mature form of the **\*cercaria** larva of a fluke. Liver fluke metacercariae are enveloped by thin cysts and develop on various kinds of vegetation.

**metachromasia (metachromatism)** *n.* **1.** the property of a dye of staining certain tissues or cells a colour that is different from that of the stain itself. **2.** the variation in colour produced in certain tissue elements that are stained with the same dye. **3.** abnormal coloration of a tissue produced by a particular stain. — **metachromatic** *adj.*

**metaethics** *n.* philosophical study of the theoretical foundations of **\*ethics**, as opposed to practical ethics.

**Metagonimus** *n.* a genus of small flukes, usually less than 3 mm in length, that are common as parasites of dogs and cats in the Far East, N Siberia, and the Balkan States. Adult flukes of *M. yokogawai* occasionally infect the human duodenum if undercooked fish (the intermediate host) is eaten. They may cause inflammation and some ulceration of the intestinal lining, which produces a mild diarrhoea. Flukes can be easily removed with tetrachloroethylene.

**metamorphopsia** *n.* a condition in which objects appear distorted. It is usually due to a disorder of the retina affecting the **\*macula** (the most sensitive part).

**metamyelocyte** *n.* an immature **\*granulocyte** (a type of white blood cell), having a kidney-shaped nucleus (*compare* **MYELOCYTE**) and cytoplasm containing neutrophil, eosinophil, or basophil granules. It is normally found in the blood-forming tissue of the bone marrow but may appear in the blood in a wide variety of diseases, including acute infections and chronic **\*myeloid leukaemia**. *See also* **GRANULOPOIESIS**.

**metanephrine and normetanephrine** metabolites of the hormones adrenaline and noradrenaline, respectively. Both hormones are released in excess from a **\*phaeochromocytoma**, and measurement of their metabolites is the most reliable screening test for this rare but potentially lethal condition. The test is best carried out on a complete 24-hour urine collection.

**metanephros** *n.* the excretory organ of the fetus, which develops into the kidney and is formed from the rear portion of the **\*nephrogenic cord**. It does not become functional until birth, since urea is transferred across the placenta to the mother.

**metaphase** *n.* the second stage of **\*mitosis** and of each division of **\*meiosis**, in which the chromosomes line up at the centre of the **\*spindle**, with their centromeres attached to the spindle fibres.

**metaphysis** *n.* the growing portion of a long bone that lies between the **\*epiphyses** (the ends) and the **\*diaphysis** (the shaft).

**metaplasia** *n.* an abnormal change in the nature of a tissue, usually in response to an environmental factor. For instance, columnar epithelium lining the bronchi may be converted to squamous epithelium (**squamous metaplasia**) following exposure to cigarette smoke. Prolonged exposure to gastric acid may result in the squamous epithelium of the oesophagus being converted to glandular epithelium (**glandular metaplasia**). **Myeloid metaplasia** is the development of bone marrow elements, normally found only within the marrow cavities of the bones, in organs such as the spleen and liver. This may occur after bone marrow failure. Metaplasia is not itself a premalignant condition, but neoplasms (abnormal new growths) may arise in metaplastic tissues if the initiating stimulus is not removed. —**metaplastic** *adj.*

**metaraminol** *n.* a **\*sympathomimetic** drug that stimulates alpha receptors and is used as a **\*vasoconstrictor** to treat acute **\*hypotension**.

**metastasis** *n.* the spread of a malignant tumour from its site of origin. This occurs by three main routes: (1) through the bloodstream (haematogenous); (2) through the lymphatic system; (3) across body cavities, e.g. through the peritoneum (*see* **TRANSCOELOMIC SPREAD**). Highly malignant tumours have a greater potential for metastasis. Individual tumours may spread by one or all of the above routes, although **\*carcinoma** is said classically to metastasize via the lymphatics and **\*sarcoma** via the bloodstream. — **metastatic** *adj.*

**metastasize** *vb.* (of a malignant tumour) to spread by **\*metastasis**.

**metastatic calcification** the calcification of otherwise normal tissues in patients with **\*hypercalcaemia**. *Compare* **DYSTROPHIC CALCIFICATION**.

**metatarsal 1.** *adj.* relating to the bones of the foot (**\*metatarsus**). **2.** *n.* any of the bones forming the metatarsus.

**metatarsalgia** *n.* aching pain in the metatarsal bones of the foot. It usually arises beneath the metatarsal heads in the transverse plantar arch. Repeated injury, arthritis (particularly rheumatoid), and deformities of the foot are common causes, and corrective footwear and insoles may be prescribed.

**metatarsus** *n.* the five bones of the foot that connect the **\*tarsus** (ankle) to the **\*phalanges** (toes).

**metathalamus** *n.* a part of the **\*thalamus** consisting of two nuclei through which impulses pass from the eyes and ears to be distributed to the cerebral cortex.

**metencephalon** *n.* part of the hindbrain, formed by the pons and the cerebellum and continuous below with the medulla oblongata. *See* **BRAIN**.

**meteorism** *n.* *see* **TYMPANITES**.

**-meter** *combining form denoting* an instrument for measuring. Example: **perimeter** (instrument for measuring the field of vision).

**metformin** *n.* a **\*biguanide** drug that is used to treat type 2 diabetes. It may cause loss of appetite and minor digestive upsets; it should not be used in patients with kidney disease, in whom it may cause **\*lactic acidosis**. *See also* **ORAL HYPOGLYCAEMIC DRUG**.

**methadone** *n.* a potent opioid (*see* **OPIATE**) administered to relieve severe pain and as a linctus to suppress coughs in terminal illness. An opioid agonist, it can also be substituted for heroin to prevent withdrawal symptoms in heroin dependence. Digestive upsets, drowsiness, and dizziness may occur, and prolonged use may lead to dependence.

**methaemalbumin** *n.* a chemical complex of the pigment portion of haemoglobin (**haem**) with the plasma protein **\*albumin**. It is formed in the blood in such conditions as **\*blackwater fever** or paroxysmal nocturnal haemoglobinuria, in which red blood cells are destroyed and free haemoglobin is released into the plasma. In such conditions methaemalbumin can be detected in both the blood and urine.

**methaemoglobin** *n.* a substance formed when the iron atoms of the blood pigment **\*haemoglobin** have been oxidized from the ferrous to the ferric form (*compare* **OXYHAEMOGLOBIN**). The methaemoglobin cannot bind molecular oxygen and therefore it cannot transport oxygen round the body. The presence of methaemoglobin in the blood (**methaemoglobinaemia**) may result from the ingestion of oxidizing drugs or from an inherited abnormality of the haemoglobin molecule. Symptoms include fatigue, headache, dizziness, and **\*cyanosis**.

**methanol** *n.* *see* **METHYL ALCOHOL**.

**methenamine (hexamine)** *n.* a drug used for the prevention and treatment of chronic or recurrent lower urinary tract infections. High doses may cause irritation of the stomach or bladder.

**methicillin** *n.* *see* **METICILLIN**.

**methionine** *n.* a sulphur-containing **\*essential amino acid**. *See also* **AMINO ACID**.

**methotrexate** *n.* a drug that interferes with cell growth and is used to treat many types of cancer, including leukaemia in children and various solid tumours (see [ANTIMETABOLITE](#); [DIHYDROFOLATE REDUCTASE INHIBITOR](#)). It also affects the immune response and may be used in the treatment of rheumatoid arthritis, severe Crohn's disease, and severe psoriasis (see [DISEASE-MODIFYING ANTIRHEUMATIC DRUG](#)). Common side-effects include mouth sores, digestive upsets, skin rashes, and hair loss.

**methotrimeprazine** *n.* see [LEVOMEPRMAZINE](#).

**methyl alcohol (methanol)** wood alcohol: an alcohol that is oxidized in the body much more slowly than ethyl alcohol and forms poisonous products. As little as 10 ml of pure methyl alcohol can produce permanent blindness, and 100 ml is likely to be fatal. The breakdown product formaldehyde is responsible for damage to the eyes; it is itself converted to formic acid, which causes acidosis and death from respiratory failure. *See also* [METHYLATED SPIRITS](#).

**methylated spirits** a mixture consisting mainly of ethyl alcohol with [\\*methyl alcohol](#) and petroleum hydrocarbons. The addition of pyridine gives it an objectionable smell, and the dye methyl violet is added to make it recognizable as unfit to drink. It is used as a solvent, cleaning fluid, and fuel.

**methylcellulose** *n.* a compound that absorbs water and is used as a bulk [\\*laxative](#) to treat constipation, to control diarrhoea, and in patients with a [\\*colostomy](#). It usually has no side-effects.

**methyldopa** *n.* a drug that acts on receptors in the brain to reduce blood pressure. Drowsiness commonly occurs during the first days of treatment.

**methylene blue** a blue dye used to stain bacterial cells for microscopic examination.

**methyl green** a basic dye used for colouring the stainable part of the cell nucleus (chromatin) and – with pyronin – for the differential staining of RNA and DNA, which give a red and a green colour respectively.

**methylothiazolinone** *n.* a preservative chemical commonly used in water-based products, such as cosmetics and toiletries. It is responsible for an

epidemic of allergic contact **\*dermatitis**, with intermittent facial dermatitis being the commonest presentation.

**methylmalonic aciduria (methylmalonic acidemia, aminoacidopathy)** a defect of amino acid metabolism causing an excess of methylmalonic acid in the urine and blood. There are two types: one is an **\*inborn error of metabolism** due to a deficiency of the enzyme methylmalonyl-CoA mutase; the other is an acquired type due to deficiency of vitamin B<sub>12</sub>, which results in defective synthesis of adenosylcobalamin (a cofactor in this metabolic process).

**methylphenidate** *n.* a drug that stimulates the central nervous system. It is used to treat attention-deficit/hyperactivity disorder in children; side-effects such as nervousness and insomnia may occur.

**methylprednisolone** *n.* a glucocorticoid (*see* **CORTICOSTEROID**) used in the treatment of inflammatory conditions and allergic states. Side-effects include **\*electrolyte** imbalance, muscle weakness, and abdominal distension.

**methyl salicylate** oil of wintergreen: a liquid with **\*counterirritant** and **\*analgesic** properties, applied to the skin as an ingredient in preparations to relieve pain in lumbago, sciatica, and rheumatic conditions.

**methyl violet (gentian violet)** a dye used mainly for staining protozoans.

**meticillin (methicillin)** *n.* a semisynthetic penicillin that was originally used to treat infections by penicillin-resistant staphylococci. It has been superseded for this purpose by **\*flucloxacillin** but continues to be used to test the drug sensitivity of staphylococci. **Meticillin-resistant staphylococci (MRS)** can be responsible for increasing rates of infection in hospitals. Until recently, such infections have responded to **\*vancomycin**, but strains of bacilli have emerged that are resistant to vancomycin, giving rise to infections that are very difficult to treat. *See also* **SUPERINFECTION**.

**metoclopramide** *n.* a drug that antagonizes the actions of **\*dopamine**; it is used to treat nausea and vomiting, including that associated with migraine. High doses may cause drowsiness and muscle spasms.

**metolazone** *n.* a **\*diuretic** used to treat fluid retention (oedema) and high blood pressure. Side-effects include headache, loss of appetite, and digestive

upsets, and blood potassium levels may be reduced.

**metoprolol** *n.* a drug that controls the activity of the heart (*see* **BETA BLOCKER**) and is used to treat high blood pressure, angina, and abnormal heart rhythms. The commonest side-effects are tiredness and digestive upsets.

**metr-** (**metro-**) *combining form denoting* the uterus.

**metre** *n.* the **\*SI unit** of length that is equal to 39.37 inches. It is formally defined as the length of the path travelled by light in a vacuum during a time interval of 1/299 792 458 of a second. Symbol: m.

**metritis** *n.* inflammation of the uterus. *See also* **ENDOMETRITIS**; **MYOMETRITIS**.

**metronidazole** *n.* a drug used to treat infections of the urinary, genital, and digestive systems (such as trichomoniasis, *Helicobacter pylori* infection, amoebic dysentery, and giardiasis), acute ulcerative gingivitis, fungating wounds, and rosacea. Side-effects include digestive upsets and an unpleasant taste in the mouth.

**-metry** *combining form denoting* measuring or measurement.

**metyrapone** *n.* a drug that interferes with the production of the hormones **\*cortisol** and **\*aldosterone** and is used in the diagnosis and treatment of **\*Cushing's syndrome**. Side-effects may include nausea, vomiting, low blood pressure, and allergic reactions.

**MHC** major histocompatibility complex: a series of genes located on chromosome no. 6 that code for antigens, including the **\*HLA** antigens, that are important in the determination of histocompatibility.

**MHRA** *see* **MEDICINES AND HEALTHCARE PRODUCTS REGULATORY AGENCY**.

**MHRT** *see* **MENTAL HEALTH REVIEW TRIBUNAL**.

**mianserin** *n.* a drug related to the tricyclic **\*antidepressants**, that is used to relieve moderate or severe depression associated with anxiety. Side-effects are milder than with tricyclic antidepressants, the commonest being drowsiness.

**MIBG** Meta-IodoBenzylGuanidine: a radioactive *\*tracer*, labelled with iodine-123 or iodine-131, which binds to adrenergic nerve tissue. With the aid of a gamma camera, it can be used to detect the presence of a range of adrenergic tumours, including *\*neuroblastoma* and *\*phaeochromocytoma*.

**micelle** *n.* one of the microscopic particles into which the products of fat digestion (i.e. fatty acids and monoglycerides), present in the gut, are dispersed by the action of *\*bile salts*. Fatty material in this finely dispersed form is more easily absorbed by the small intestine.

**Michaelis–Gutmann bodies** *see* MALAKOPLAKIA.

**miconazole** *n.* a drug used to treat fungal skin infections, such as *\*ringworm* of the scalp, body, and feet, and oral and vaginal candidiasis (*see* IMIDAZOLE). Side-effects include itching, skin rash, and nausea and vomiting.

**micr- (micro-)** *combining form denoting* **1.** small size. **2.** one millionth part.

**microaerophilic** *adj.* describing microorganisms that grow best at very low oxygen concentrations (i.e. below the atmospheric level).

**microalbumin:creatinine ratio** a laboratory measurement used as a screening test for the first signs of kidney damage in *\*diabetes* mellitus. It detects an increase in the very small levels of the protein albumin present in urine, relative to the concentration of creatinine. It is best measured in an early morning urine sample. *See* MICROALBUMINURIA.

**microalbuminuria** *n.* the presence of albumin in the urine at levels that are higher than normal (>30 mg/24 hours) but lower than those detected by standard urine protein dipsticks (>300 mg/24 hours). The usual screening method for microalbuminuria is to measure the *\*microalbumin:creatinine ratio*. In people with diabetes microalbuminuria is an important risk factor for the development of progressive kidney damage and (particularly in those with type 2 diabetes) coronary heart disease. At an early stage of microalbuminuria its presence may be reversed by careful control of blood pressure and blood glucose.

**microaneurysm** *n.* a minute localized swelling of a capillary wall, which is found in the retina of patients with diabetic *\*retinopathy*. It is recognized as a

small red dot when the interior of the eye is examined with an **\*ophthalmoscope**.

**microangiopathy** *n.* damage to the walls of the smallest blood vessels. It may result from a variety of diseases, including diabetes mellitus, connective-tissue diseases, infections, and cancer. Some common manifestations of microangiopathy are kidney failure, haemolysis (damage to red blood cells), and purpura (bleeding into the skin). The treatment is that of the underlying cause.

**microbe** *n.* *see* **MICROORGANISM**.

**microbiology** *n.* the science of **\*microorganisms**. Microbiology in relation to medicine is concerned mainly with the isolation and identification of the microorganisms that cause disease. — **microbiological** *adj.* — **microbiologist** *n.*

**microblepharon (microblepharism)** *n.* the condition of having abnormally small eyelids.

**microbubbles** *pl. n.* (in radiology) an ultrasound **\*contrast medium** consisting of suspensions of biocompatible gas-filled microspheres that are introduced into the vascular system or the Fallopian tubes in order to enhance ultrasound images.

**microcephaly** *n.* abnormal smallness of the head in relation to the size of the rest of the body: a congenital condition in which the brain is not fully developed. *Compare* **MACROCEPHALY**.

**microcheilia** *n.* abnormally small size of the lips. *Compare* **MACROCHEILIA**.

**Micrococcus** *n.* a genus of spherical Gram-positive bacteria occurring in colonies. They are saprophytes or parasites. The species *M. tetragenus* (formerly *Gaffkya tetragena*) is normally a harmless parasite in humans but it can become pathogenic, causing arthritis, endocarditis, meningitis, or abscesses in tissues. It occurs in groups of four.

**microcyte** *n.* an abnormally small red blood cell (**\*erythrocyte**). *See also* **MICROCYTOSIS**. — **microcytic** *adj.*

**microcytosis** *n.* the presence of abnormally small red cells (**microcytes**) in the blood. Microcytosis is a feature of certain anaemias (**microcytic anaemias**), including iron-deficiency anaemias, certain **\*haemoglobinopathies**, anaemias associated with chronic infections, etc.

**microdactyly** *n.* abnormal smallness or shortness of the fingers.

**microdebrider** *n.* a surgical instrument that comprises a small powered partially guarded rotating blade to remove tissue during operative procedures. An inbuilt suction–irrigation system removes the resulting tissue fragments and blood. It is most commonly used in **\*endoscopic sinus surgery** but can also be used to perform tonsillectomy and adenoidectomy and in some types of laryngeal and bronchial surgery.

**microdiscectomy** *n.* surgical removal of all or part of a **\*prolapsed intervertebral disc** using an **\*operating microscope**, a very short incision, and very fine instruments that can be inserted between the individual vertebrae of the backbone. The procedure is used to relieve pressure on spinal nerve roots or on the spinal cord caused by protrusion of the pulpy matter of the disc (**nucleus pulposus**). This is a form of **\*minimally invasive surgery**.

**microdissection** *n.* the process of dissecting minute structures under the microscope. Miniature surgical instruments, such as knives made of glass, are manipulated by means of geared connections that reduce the relatively coarse movements of the operator's fingers into microscopic movements. Using this technique it is possible to dissect the nuclei of cells and even to separate individual chromosomes. *See also* **MICROSURGERY**.

**microdochectomy** *n.* excision of a single mammary duct that is causing nipple discharge. The duct is sent for histology to determine the presence of a papilloma or carcinoma.

**microdontia** *n.* a condition in which the teeth are unusually small. It may be generalized, where all teeth are involved, or localized, where only a few teeth are involved.

**microelectrode** *n.* an extremely fine wire used as an electrode to measure the electrical activity in small areas of tissue. Microelectrodes can be used for recording the electrical changes that occur in the membranes of cells, such as those of nerve and muscle.

**microfilaria** *n.* (*pl.* **microfilariae**) the motile embryo of certain nematodes (*see* **FILARIA**). The slender microfilariae, 150–300 µm in length, are commonly found in the circulating blood or lymph of patients suffering an infection with any of the filarial worms, e.g. *Wuchereria*. They mature into larvae, which are infective, within the body of a bloodsucking insect, such as a mosquito.

**microgamete** *n.* the motile flagellate male sex cell of the malarial parasite (*Plasmodium*) and other protozoans. The microgamete is similar to the sperm cell of animals and smaller than the female sex cell (*see* **MACROGAMETE**).

**microgametocyte** *n.* a cell that undergoes meiosis to form 6–8 mature male sex cells (microgametes) of the malarial parasite (*see* **PLASMODIUM**). Microgametocytes are found in human blood but must be ingested by a mosquito before developing into microgametes.

**microglia** *n.* one of the two basic classes of **\*glia** (the non-nervous cells of the central nervous system), having a mainly scavenging function (*see* **MACROPHAGE**). *Compare* **MACROGLIA**.

**microglossia** *n.* abnormally small size of the tongue.

**micrognathia** *n.* a condition in which one or both jaws are unusually small. It is a symptom of various craniofacial conditions and may require surgery to correct.

**microgram** *n.* one millionth of a gram. Symbol: µg.

**micrograph (photomicrograph)** *n.* a photograph of an object as viewed through a microscope. An **electron micrograph** is photographed through an electron microscope; a **light micrograph** through a light microscope.

**microgyria** *n.* a developmental disorder of the brain in which the folds (convolutions) in its surface are small and its surface layer (cortex) is structurally abnormal. It is associated with mental and physical retardation.

**microhaematocrit** *n.* a measurement of the proportion of red blood cells in a volume of circulating blood. It is determined by taking a sample of the patient's blood in a fine tube and spinning it in a centrifuge until settling is complete. *See* **PACKED CELL VOLUME**.

**microkeratome** *n.* a surgical instrument with an oscillating blade designed for creating the corneal flap in laser *\*refractive surgery*.

**microlithiasis** *n.* multiple tiny calcifications seen within the testes. Testicular germ-cell tumour is associated with testicular microlithiasis, but a direct relationship is not established.

**micromanipulation** *n.* the manipulation of extremely small structures under the microscope, as in *\*microdissection*, or *\*microsurgery*.

**micromelia** *n.* abnormally small size of the arms or legs. *Compare* **MACROMELIA**.

**micrometastasis** *n.* a secondary tumour that is undetectable by clinical examination or diagnostic tests but is visible under the microscope.

**micrometer** *n.* an instrument for making extremely fine measurements of thickness or length, often relying upon the movement of a screw thread and the principle of the *\*vernier*.

**micrometre** *n.* one millionth of a metre ( $10^{-6}$  m). Symbol:  $\mu\text{m}$ .

**microorganism (microbe)** *n.* any organism too small to be visible to the naked eye. Microorganisms include *\*bacteria*, some *\*fungi*, *\*mycoplasmas*, *\*protozoa*, *\*rickettsiae*, and *\*viruses*.

**microperimetry** *n.* mapping the pattern of a patient's retinal sensitivity onto an image of that individual's fundus (back of the eye) to measure the patient's response to light stimuli at various retinal points. The data are superimposed on an image captured by a scanning laser *\*ophthalmoscope* or by fundus photography to precisely identify areas of impaired or preserved function.

**microphotograph** *n.* **1.** a photograph reduced to microscopic proportions. **2.** (loosely) a *\*photomicrograph*.

**microphthalmos** *n.* a congenitally small eye, usually associated with a small eye socket.

**micropipette** *n.* an extremely fine tube from which minute volumes of liquid can be delivered. It can also be used to draw up minute quantities of liquid for examination. Using a micropipette it is possible to add or take away material from individual cells under the microscope.

**micropsia** *n.* a condition in which objects appear smaller than they really are. It is usually due to disease of the retina affecting the **\*macula** but may occur in paralysis of **\*accommodation**.

**microscope** *n.* an instrument for producing a greatly magnified image of an object, which may be so small as to be invisible to the naked eye. **Light** or **optical microscopes** use light as a radiation source for viewing the specimen and combinations of lenses to magnify the image; these are usually an **\*objective** and an **\*eyepiece**. *See also* **ELECTRON MICROSCOPE**; **OPERATING MICROSCOPE**; **ULTRAMICROSCOPE**. —**microscopical** *adj.* —**microscopy** *n.*

**microscopic** *adj.* **1.** too small to be seen clearly without the use of a microscope. **2.** of, relating to, or using a microscope.

**microscopic polyangiitis (MPA)** an autoimmune disease characterized by inflammation of small blood vessels, leading to reduced kidney function and breathlessness. It is associated with the presence of antinuclear cytoplasmic antibodies (**\*ANCA**) and can be treated with corticosteroids, cyclophosphamide, or rituximab.

**microsome** *n.* a small particle consisting of a piece of **\*endoplasmic reticulum** to which ribosomes are attached. Microsomes are formed when homogenized cells are centrifuged. —**microsomal** *adj.*

**Microsporum** *n.* a genus of fungi causing **\*ringworm**. *See also* **DERMATOPHYTE**.

**microsurgery** *n.* the branch of surgery in which extremely intricate operations are performed through highly refined **\*operating microscopes** using miniaturized precision instruments (forceps, scissors, needles, etc.). The technique enables surgery of previously inaccessible parts of the eye, inner ear, spinal cord, and brain (e.g. for the removal of tumours and repair of cerebral aneurysms), as well as the reattachment of amputated fingers (necessitating the suturing of minute nerves and blood vessels) and the reversal of vasectomies.

**microsurgical epididymal sperm aspiration** *see* **MESA**.

**microtia** *n.* a congenital deformity of the external ear in which the **\*pinna** is small or absent. The ear canal may also be absent, giving a conductive **\*deafness**. Microtia may be associated with other congenital deformities.

**microtome** *n.* an instrument for cutting extremely thin slices of material that can be examined under a microscope. The material is usually embedded in a suitable medium, such as paraffin wax. A common type of microtome is a steel knife.

**microvascular** *adj.* involving small vessels. The term is often applied to techniques of **\*microsurgery** for reuniting small blood vessels (the same techniques are applied frequently to nerve suture).

**microvillus** *n.* (*pl.* **microvilli**) one of a number of microscopic hairlike structures (about 5 µm long) projecting from the surface of epithelial cells (*see* **EPITHELIUM**). They serve to increase the surface area of the cell and are seen on absorptive and secretory cells. In some regions (particularly the intestinal tract) microvilli form a dense covering on the free surface of the cells: this is called a **brush border**.

**microwave ablation (MWA)** an **\*ablation** technique in which microwaves are used to burn tumour tissues. This has some advantages over **\*radiofrequency ablation** because the heat generated is field heating, as in conventional microwave machines. This makes it possible to get a bigger ablation zone and means that the ablation is not affected by the heat-sink effect of adjacent blood vessels.

**microwave endometrial ablation** *see* **ENDOMETRIAL ABLATION**.

**microwave therapy** a form of **\*diathermy** using electromagnetic waves of extremely short wavelength. In modern apparatus the electric currents induced in the tissues have frequencies of up to 25,000 million cycles per second.

**micturating cystourethrogram (MCU)** *see* **URETHROGRAPHY**.

**micturition** *n.* *see* **URINATION**.

**midazolam** *n.* a **\*benzodiazepine** drug used as a sedative before and after surgery and to induce general anaesthesia. Possible side-effects include

headache, dizziness, and difficulty in breathing.

**midbrain (mesencephalon)** *n.* the small portion of the *\*brainstem*, excluding the pons and the medulla, that joins the hindbrain to the forebrain.

**middle ear (tympanic cavity)** the part of the *\*ear* that consists of an air-filled space within the petrous part of the temporal bone. It is lined with mucous membrane and is connected to the pharynx by the *\*Eustachian tube* and to the outer ear by the eardrum (*\*tympanic membrane*). Within the middle ear are three bones – the auditory *\*ossicles* – which transmit sound vibrations from the outer ear to the inner ear (*see LABYRINTH*).

**middle ear myoclonus** spontaneous involuntary rhythmical contraction of the stapedius and/or tensor tympani muscles in the middle ear that can give rise to a form of *\*pulsatile tinnitus*.

**middle ear reflex** involuntary contraction of the stapedius and/or tensor tympani muscles in the middle ear in response to various stimuli. The stapedius contracts in response to sound (*see STAPEDIAL REFLEX*). The tensor tympani is thought to contract during chewing. The sound-evoked middle ear reflex can be detected using a *\*tympanometer*.

**Middle East respiratory syndrome (MERS)** a viral respiratory infection that was first identified in 2012. Humans seem to be infected most easily by contact with dromedary camels (hence the informal name **camel flu**), although human-to-human infection also occurs. Symptoms include fever, cough, and shortness of breath. Although the syndrome is often mild, death occurs in about a third of diagnosed cases. Most reported cases have been in the Arabian Peninsula, although there was a major outbreak in South Korea in 2015. At present there is no vaccine or treatment.

**midgut** *n.* the middle portion of the embryonic gut, which gives rise to most of the small intestine and part of the large intestine. Early in development it is connected with the *\*yolk sac* outside the embryo via the *\*umbilicus*.

**midstream specimen of urine (MSU)** a specimen of urine that is subjected to examination for the presence of microorganisms. In order to obtain a specimen that is free of contamination, the periurethral area is cleansed and the patient is requested to discard the initial flow of urine before collecting the specimen in a sterile container.

**midwifery** *n.* the profession of providing assistance and medical care to women undergoing labour and childbirth during the antenatal, perinatal, and postnatal periods. *See also* **COMMUNITY MIDWIFE**; **OBSTETRICS**. — **midwife** *n.*

**mifepristone** *n.* a drug used to produce a medical abortion; it acts by blocking the action of **\*progesterone**, which is essential for maintaining pregnancy. It is taken by mouth, followed after 36–48 hours by **\*gemeprost** or **\*misoprostol** intravaginally. Side-effects include faintness, headache, and vaginal bleeding.

**migraine** *n.* a neurovascular disorder in a genetically predisposed individual. There is an instability within the brainstem that is triggered by a variety of stimuli (e.g. foods, light, stress) and results in a recurrent throbbing headache that characteristically affects one side of the head. The patient sometimes has forewarning of an attack (an **aura**) consisting of visual disturbance or tingling and/or weakness of the limbs, which clear up as the headache develops. It is often accompanied by prostration, nausea and vomiting, and **\*photophobia**. Effective preventive medication (e.g. beta blockers and some antiepileptic drugs) is available for patients with frequent migraine attacks, and **\*5HT<sub>1</sub> agonists** may be used to treat acute attacks. *See also* **CLUSTER HEADACHE**.

**Mikulicz's disease** swelling of the lacrimal and salivary glands as a result of infiltration with **\*lymphoid tissue**. [J. von Mikulicz Radecki (1850–1905), Polish surgeon]

**Milan criteria** criteria used to select patients with cirrhosis and **\*hepatoma** for liver transplantation. Transplantation can be considered if patients have a single tumour under 5 cm in size, or no more than three tumours that are less than 3 cm in size, and show no evidence of extrahepatic symptoms and no vascular invasion.

**mild cognitive impairment (MCI)** cognitive impairment beyond that expected for age and education that does not interfere with normal daily function. When memory loss is the predominant symptom it is termed **amnesic MCI** and is frequently seen as an early stage of **\*Alzheimer's disease**. However, other aspects of cognition can be affected and symptoms can be stable or even remit.

**miliaria rubra** *see* [PRICKLY HEAT](#).

**miliary** *adj.* describing or characterized by very small nodules or lesions, resembling millet seed.

**miliary tuberculosis** acute generalized [\\*tuberculosis](#) characterized by lesions in affected organs, which resemble millet seeds.

**milium** *n.* (*pl.* **milium**) a white nodule in the skin, particularly on the face. Up to 2 mm in diameter, milia are tiny [\\*keratin](#) cysts occurring just beneath the outer layer (epidermis) of the skin. Milia are commonly seen in newborn babies around the nose; they may disappear without active treatment. In adults they may be lifted out with a needle or removed by an abrasive sponge.

**milk** *n.* the liquid food secreted by female mammals from the mammary gland. It is the sole source of food for the young of most mammals at the start of life. Milk is a complete food in that it has most of the nutrients necessary for life: protein, carbohydrate, fat, minerals, and vitamins. The composition of milk varies very much from mammal to mammal. Cows' milk contains nearly all the essential nutrients but is comparatively deficient in vitamins C and D. Human milk contains more sugar (lactose) and less protein than cows' milk. Many non-dairy milks are now available based on rice, almonds, and soya, many of which are fortified with [\\*calcium](#).

**milk formulas** *see* [APPENDIX 12](#).

**milk rash** a spotty red facial rash that is common during the first few months of life; it disappears without treatment.

**milk teeth** a colloquial name for the [\\*primary teeth](#) of children. *See also* [DENTITION](#).

**Miller–Deiker syndrome** a chromosomal abnormality resulting in a characteristic facial appearance and the absence of the grooves on the surface of the brain (*see* [LISSENCEPHALY](#)). Affected individuals have severe learning disabilities.

**milli-** *prefix denoting one thousandth part.*

**milliamp** *n.* short for **milliampere**: one thousandth of an **\*ampere** ( $10^{-3}$  A; symbol: mA). In radiography, the mA setting on an X-ray machine determines the number of X-ray photons produced per second. The setting is important to obtain appropriate exposure and varies with body size (among other factors). *See also* **KILOVOLT**.

**milligram** *n.* one thousandth of a gram. Symbol: mg.

**millilitre** *n.* one thousandth of a litre. Symbol: ml. *See* **LITRE**.

**millimetre** *n.* one thousandth of a metre ( $10^{-3}$  m). Symbol: mm.

**millimole** *n.* one thousandth of a mole (*see* **MOLE**<sup>1</sup>). The concentration of a solution is expressed in millimoles per litre. Symbol: mmol.

**Milroy's disease** *see* **LYMPHOEDEMA**. [W. F. Milroy (1855–1942), US physician]

**Minamata disease** a form of mercury poisoning (from ingesting methyl mercury in contaminated fish) that caused 43 deaths in the Japanese coastal town of Minamata during 1953–56. The source of mercury was traced to an effluent containing mercuric sulphate from a local PVC factory. Symptoms include numbness, difficulty in controlling the limbs, and impaired speech and hearing.

**MIND** a voluntary association, registered as a charity that promotes the welfare of those with **\*mental illness** through advice, education, campaigning, and the provision of resources. It was founded in 1946 as the National Association for Mental Health.

<http://www.mind.org.uk/>

- Website of MIND

**mineralocorticoid** *n.* *see* **CORTICOSTEROID**.

**minim** *n.* a unit of volume used in pharmacy, equivalent to one sixtieth part of a fluid **\*drachm**.

**minimal change nephropathy** the commonest cause of **\*nephrotic syndrome** in children and an important cause of this syndrome in adults. The condition is so named because of the apparent lack of abnormalities seen on light microscopy of biopsy samples. Changes can, however, be seen on electron microscopy, with effacement of the **\*podocyte** foot processes along the glomerular basement membrane. It is postulated that minimal change disease is a T-cell disease and that **\*cytokine** damage to the podocytes leads to loss of the selective filtering characteristics of the glomerulus. The condition usually responds to corticosteroids and has a good prognosis, but there is clinical overlap with primary **\*focal segmental glomerulosclerosis**, which may have similar histological appearances in its early stages, tends not to respond to steroids, and is associated with a poor renal prognosis.

**minimally conscious state (MCS)** a disorder of consciousness distinct from **\*persistent vegetative state** (PVS) and locked-in syndrome (*see* **VEGETATIVE STATE**). Unlike PVS, patients with MCS have partial preservation of conscious awareness although the level of awareness frequently fluctuates over time.

**minimally invasive surgery (minimal-access surgery)** surgical intervention involving the least possible physical trauma to the patient, particularly surgery performed using an operating laparoscope or other endoscope (*see* **LAPAROSCOPY**) passed through tiny incisions; it is known popularly as **keyhole surgery**. Several types of abdominal surgery, including gall bladder removal (*see* **CHOLECYSTECTOMY**) and extracorporeal shock-wave **\*lithotripsy** for stones in the urinary or bile drainage system, are commonly performed in this way. Such methods are usually more comfortable and allow the patient to resume normal activity much sooner than would be possible after more conventional procedures. *See also* **INTERVENTIONAL RADIOLOGY**.

**Mini-Mental State Examination (MMSE)** a brief 30-point questionnaire that is used to screen for cognitive impairment in the diagnosis of dementia. It is also used to estimate the severity of cognitive impairment and to follow the course of cognitive changes in an individual over time, thus making it an effective way to document response to treatment. It tests functions including arithmetic, memory, and orientation.

**minitracheostomy** *n.* temporary **\*tracheostomy** using a needle or fine-bore tube inserted through the skin.

**minocycline** *n.* a **\*tetracycline** antibiotic active against a wide range of bacteria, including *Chlamydia*, *Borrelia*, meningococcus, rickettsiae, and mycoplasmas. Side-effects include loss of appetite, skin rash, and dizziness.

**minoxidil** *n.* a peripheral vasodilator used in the treatment of high blood pressure (hypertension) when other drugs are not effective; it is administered in conjunction with a diuretic and a beta blocker. Side-effects include ECG changes and transient oedema. It is also applied to the scalp to restore hair growth.

**mio-** *combining form denoting* **1.** reduction or diminution. **2.** rudimentary.

**miosis (myosis)** *n.* constriction of the pupil. This occurs normally in bright light. It is also seen in **\*Horner's syndrome**, but persistent miosis is most commonly caused by certain types of eye drops used to treat glaucoma. *See also* **MIOTIC**. *Compare* **MYDRIASIS**. — **miotic** *adj.*

**miotic 1.** *n.* a drug that causes the pupil of the eye to contract by constricting the ciliary muscle (*see* **CILIARY BODY**). Miotics, such as **\*pilocarpine**, are used to reduce the pressure in the eye in the treatment of glaucoma: contraction of the ciliary muscle increases the angle between the iris and cornea through which aqueous humour drains from the eye. **2.** *adj.* showing **\*miosis**.

**MIP** *see* **MAXIMUM INTENSITY PROJECTION**.

**miracidium** *n.* (*pl.* **miracidia**) the first-stage larva of a parasitic **\*fluke**. Miracidia hatch from eggs released into water with the host's excreta. They have **\*cilia** and swim about until they reach a snail. The miracidia then bore into the snail's soft tissues and there continue their development as **\*sporocysts**.

**miscarriage** *n.* spontaneous loss of pregnancy before 24 weeks, formerly known as **spontaneous abortion**. In **threatened miscarriage** there is vaginal bleeding (often minimal) associated with mild period-type pains; the cervix is closed and ultrasound confirms a viable pregnancy. In **inevitable miscarriage**, vaginal bleeding is associated with crampy pelvic pains and an

open cervix; the pregnancy has not yet been expelled, but eventually will be. The miscarriage is **incomplete** if the cervix remains open and the uterus still contains some fetal tissue (which may need to be removed to prevent further haemorrhage). The miscarriage is **complete** if the cervix has closed and ultrasound scanning shows an empty uterus. Failure of a nonviable fetus to be expelled from the uterus is called a **silent** (or **missed**) **miscarriage**. A **late miscarriage** is one occurring after 20–24 weeks when the fetus has shown no signs of life after delivery. **Recurrent miscarriage** is the loss of three or more pregnancies consecutively; there are many possible causes, including *\*antiphospholipid antibody syndrome*.

**miso-** *combining form denoting hatred*. Example: **misopedia** (of children).

**misophonia** *n.* dislike of or aversion to particular sounds, irrespective of the level of that sound. See *HYPERACUSIS*, *PHONOPHOBIA*.

**misoprostol** *n.* a *\*prostaglandin* drug administered in the prevention and treatment of peptic ulcer, especially when caused by nonsteroidal anti-inflammatory drugs (see *NSAID*), in which case it is given in conjunction with the NSAID (see *DICLOFENAC*; *NAPROXEN*). It is also used to terminate a pregnancy, being administered vaginally following *\*mifepristone*. Possible side-effects include diarrhoea.

**missed case** a person with a communicable disease in whom the symptoms and signs are so minimal that either there is no request for medical assistance or the doctor fails to make the diagnosis. The patient usually has partial immunity to the disease, but since the infecting organisms are of normal virulence, nonimmune contacts can be affected with the full manifestations of the illness. The period of infectivity is confined to the shortened duration of the illness (in contrast to a *\*carrier*, in whom the pathogen is present without necessarily causing any ill effect). Alternatively, the subject has had the disease but retains some of the pathogens (e.g. in the throat or bowel) and so acts as a continuing reservoir of infection.

**Misuse of Drugs Act 1971** (in the UK) an Act of Parliament restricting the use of dangerous drugs. These **controlled drugs** are divided into three classes: class A drugs (e.g. heroin, morphine and other potent opioid analgesics, cocaine, LSD) cause the most harm when misused; class B drugs include amphetamines, barbiturates, and cannabis, and class C drugs include

most benzodiazepines and anabolic steroids. The Act specifies certain requirements for writing prescriptions for these drugs. The Misuse of Drugs (Supply to Addicts) Regulations 1997 and the Misuse of Drugs Regulations 2001 lay down who may supply controlled drugs and the rules governing their supply, prescription, etc.

**mite** *n.* a free-living or parasitic arthropod belonging to a group (Acarina) that also includes the *\*ticks*. Most mites are small, averaging 1 mm or less in length. A mite has no antennae or wings, and its body is not divided into a distinct head, thorax, and abdomen. Medically important mites include the many species causing dermatitis (e.g. *Dermatophagoides*) and the harvest mite (see *TROMBICULA*), which transmits scrub typhus.

**mitochondrial disorders** a group of inherited conditions transmitted through mitochondrial DNA (see *MITOCHONDRION*), which can affect any organ and can present at any age. Most of these conditions are very rare; examples of those that are less rare include *\*Leigh syndrome*, congenital *\*lactic acidosis*, *\*MELAS*, and Pearson syndrome.

**mitochondrion (chondriosome)** *n.* (*pl.* **mitochondria**) a structure, occurring in varying numbers in the cytoplasm of every cell, that is the site of the cell's energy production. Mitochondria contain *\*ATP* and the enzymes involved in the cell's metabolic activities, and also their own DNA; mitochondrial genes (which in humans encode 13 proteins) are inherited through the female line. Each mitochondrion is bounded by a double membrane, the inner being folded inwards to form projections (**cristae**). —**mitochondrial** *adj.*

**mitogen** *n.* any substance that can cause cells to begin division (*\*mitosis*).

**mitomycin** an *\*anthracycline* antibiotic that inhibits the growth of cancer cells. It causes severe marrow suppression but is of use in the treatment of stomach, breast, and bladder cancers.

**mitosis** *n.* a type of cell division in which a single cell produces two genetically identical daughter cells. It is the way in which new body cells are produced for both growth and repair. Division of the nucleus (**karyokinesis**) takes place in four stages (see *PROPHASE*; *METAPHASE*; *ANAPHASE*; *TELOPHASE*) and is followed by division of the cytoplasm (**cytokinesis**) to

form the two daughter cells (see illustration overleaf). *Compare* [MEIOSIS](#). —  
**mitotic** *adj.*

## Stages in mitosis.

**mitotic index** the proportion of cells in a tissue that are dividing at a given time.

**mitoxantrone** *n.* an **\*anthracycline** antibiotic used in the treatment of certain cancers, including metastatic breast cancer and non-Hodgkin's lymphoma. Side-effects are usually mild.

**mitral regurgitation (mitral incompetence)** failure of the **\*mitral valve** to close, allowing a reflux of blood from the left ventricle of the heart to the left atrium. It may be due to **mitral valve prolapse (MVP)** in which one or both valve leaflets flop back into the left atrium (also known as 'floppy mitral valve'). It also results from chronic rheumatic scarring of the valve, or is secondary to left ventricular muscle damage. Its manifestations include breathlessness, atrial **\*fibrillation**, embolism, enlargement of the left ventricle, and a systolic **\*murmur**. Mild cases are symptomless and require no treatment, but in severe cases the affected valve should be repaired or replaced with an artificial one (**mitral prosthesis**).

**mitral stenosis** narrowing of the opening of the mitral valve: a result of chronic scarring that follows rheumatic fever. It may be seen alone or combined with **\*mitral regurgitation**. The symptoms are similar to those of mitral regurgitation except that the patient has a diastolic **\*murmur**. Mild cases need no treatment, but severe cases are treated by reopening the stenosis with an Inoue balloon passed to the heart through the venous system under X-ray control (**percutaneous balloon mitral valvuloplasty**) or surgically by inserting an artificial valve (**mitral prosthesis**).

**mitral valve (bicuspid valve)** a valve in the heart consisting of two flaps (cusps) attached to the walls at the opening between the left atrium and left ventricle. It allows blood to pass from the atrium to the ventricle, but prevents any backward flow.

**mittelschmerz** *n.* pain in the lower abdomen experienced about midway between successive menstrual periods, i.e. when the egg cell is being released from the ovary. *See also* **MENSTRUAL CYCLE**.

**mixed affective state** a state of disordered mood that combines elements of *\*mania* and *\*depression*; it is a common feature of *\*bipolar affective disorder*. Symptoms include overactivity, flight of ideas, depressed mood, and suicidal *\*ideation*.

**mixed connective tissue disease** a disease with features in common with systemic *\*lupus erythematosus*, *\*polymyositis*, and *\*scleroderma*. It is characterized by high levels of antibodies to ribonucleoprotein and most commonly affects women between 20 and 40 years of age.

**ml** *symbol for* *\*millilitre*.

**MLC** *see* *MLR*.

**MLD** minimal lethal dose: the smallest quantity of a toxic compound that is recorded as having caused death. *See also* *LD<sub>50</sub>*.

**MLR (MLC)** mixed lymphocyte reaction (or culture): a test in which lymphocytes from prospective donor and recipient are cultured together in a test tube to assess the suitability of transplanting organs or bone marrow cells.

**mmHg** a unit of pressure equal to 1 millimetre of mercury. 1 mmHg = 133.3224 pascals.

**MMR vaccine** a combined vaccine against *measles*, *mumps*, and German measles (*rubella*). It is currently recommended that this vaccine is given to all children at 12 months of age with a booster dose at 3 years 4 months of age or soon after (*see* *IMMUNIZATION*). Specific contraindications include immunosuppression and allergy to eggs. Claims of a link between the vaccine and autism and Crohn's disease have been investigated and no credible evidence for such a relationship has been found.

**MMSE** *see* *MINI-MENTAL STATE EXAMINATION*.

**MND** *see* *MOTOR NEURON DISEASE*.

**mobilization** *n.* (in surgery) a technique of tissue dissection used to allow tissues to be freed from their attachments and thus allow movement.

**Mobitz type I and type II** types of abnormality on an **\*electrocardiogram** (ECG) tracing that indicate forms of **\*heart block**, in which the communication between the upper and lower chambers of the heart is impaired. [W. Mobitz (20th century), German cardiologist]

**moclobemide** *n.* an antidepressant drug that reversibly inhibits the enzyme **\*monoamine oxidase**. A. The adverse effects of irreversible **\*MAO inhibitors**, which include severe hypertensive reactions when cheese or other tyramine-containing foods are eaten by patients taking them, are less likely with reversible inhibitors. Moclobemide is used to treat major depression and social anxiety disorder.

**modality** *n.* **1.** a form of sensation, such as smell, hearing, tasting, or detecting temperature. Differences in modality are not due to differences in the structure of the nerves concerned, but to differences in the working of the sensory receptors and the areas of brain that receive the messages. **2.** one form of therapy as opposed to another, such as the modality of physiotherapy contrasted with that of radiotherapy.

**mode** *n.* *see* **MEAN**.

**Modecate** *n.* *see* **FLUPHENAZINE**.

**modelling** *n.* **1.** a technique used in **\*behaviour modification**, whereby an individual learns a behaviour by observing someone else doing it. Together with **\*prompting**, it is useful for introducing new behaviours to the individual. **2.** An element of normal social learning and development whereby children learn through emulating other people's behaviour (often that of parents, other adults, or other children).

**modified release (sustained release)** describing an oral drug formulation that releases the active component slowly over a long period.

**modiolus** *n.* the conical central pillar of the **\*cochlea** in the inner ear.

**MODS** *see* **MULTIPLE ORGAN DYSFUNCTION SYNDROME**.

**Moduretic** *n.* *see* **AMILORIDE**.

**MODY** *see* **MATURITY-ONSET DIABETES OF THE YOUNG**.

**MOF** multi-organ failure. See **MULTIPLE ORGAN DYSFUNCTION SYNDROME**.

**Mohs' micrographic surgery** a surgical technique used for removing primarily high-risk nonmelanoma skin cancers, particularly basal cell carcinoma. The technique allows the surgeon to see beyond the visible tumour as the specimen is removed and the histology checked in stages. At each stage, if the tumour involves the margins, further tissue is resected until they are clear. There is an extremely high cure rate. [F. E. Mohs (1910–2002), US surgeon]

**molar** *n.* a large grinding tooth at the back of the mouth. In the permanent **\*dentition**, the sixth, seventh, and eighth teeth from the midline on each side in each jaw (*see also* **WISDOM TOOTH**). Permanent molars do not replace primary teeth. In the primary dentition, molars are the fourth and fifth teeth from the midline on each side in each jaw. Molars commonly have two or three roots.

**molar–incisor hypomineralization** a defect involving a deficiency in the mineralization of permanent first molar and incisor teeth during their maturation phase, thought to be due to a disturbance of development around the time of birth. It often presents in discolouration (yellow, brown, cream, or white depending on severity) and results in the affected teeth being more susceptible to decay.

**molarity** *n.* the strength of a solution, expressed as the weight of dissolved substance in grams per litre divided by its molecular weight, i.e. the number of moles per litre. Molarity is indicated as 0.1 M, 1 M, 2 M, etc.

**molar solution** a solution in which the number of grams of dissolved substance per litre equals its molecular weight, i.e. a solution of molarity 1 M.

**mole**<sup>1</sup> *n.* the **\*SI unit** of amount of substance, equal to the amount of substance that contains as many elementary units as there are atoms in 0.012 kilograms of carbon-12. The elementary units, which must be specified, may be atoms, molecules, ions, electrons, etc., or a specified group of such entities. One mole of a compound has a mass equal to its molecular weight expressed in grams. Symbol: mol.

**mole<sup>2</sup>** *n.* a nonmalignant collection of pigmented cells in the skin. Moles are rare in infancy, increase in numbers during childhood and especially in adolescence, but decline in numbers in old age. They vary widely in appearance, being flat or raised, smooth or hairy. Changes in the shape, colour, etc., of moles in adult life should be investigated as this may be an early sign of malignant **\*melanoma**. Medical name: **pigmented naevus**. *See also* **ATYPICAL MOLE SYNDROME**.

**molecular biology** the study of the molecules that are associated with living organisms, especially proteins and nucleic acids.

**molecular imaging** an emerging area of imaging that exploits recent developments of molecular and cell biology to create new markers. Most molecular imaging uses versions of these markers labelled with radioactive isotopes, which – after administration – are localized in the body and can be detected using such techniques as **\*positron emission tomography**, **\*SPECT scanning**, **\*magnetic resonance imaging**, and optical imaging.

**molluscum contagiosum** a common disease of the skin, mainly affecting children. Characterized by papules less than 5 mm in diameter, each with a central depression, the disease is caused by a **\*poxvirus** and is spread by direct contact. Untreated, the papules generally disappear in 6–9 months. Widespread molluscum contagiosum in an adult may be a sign of HIV infection.

**Molteno implant** a valved device used in the surgical treatment of some types of glaucoma to control intraocular pressure by allowing fluid to drain from the anterior chamber into the subconjunctival space.

**mon- (mono-)** *combining form denoting one, single, or alone.*

**MONA** morphine, oxygen, nitrates, aspirin: the standard treatments for **\*acute coronary syndromes**.

**Mongolian blue spots** blue-black pigmented areas seen at the base of the back and on the buttocks of babies. They are more common in dark-skinned babies and usually fade during the first year of life. The spots are sometimes mistaken for bruising.

**mongolism** *n. see* **DOWN'S SYNDROME**.

**Monilia** *n.* the former name of the genus of yeasts now known as *\*Candida*.

**moniliasis** *n.* an obsolete name for *\*candidiasis*.

**Monitor** formerly, an independent body set up under the Health and Social Care Act 2003 to authorize, monitor, and regulate *\*foundation trusts*. Monitor's remit was substantially expanded under the Health and Social Care Act 2012 to include regulation of all providers of health-care services for the NHS. Monitor also set prices for NHS-funded care in partnership with *\*NHS England*, protected essential health services for patients if an NHS provider entered financial difficulty, and held responsibilities for enabling *\*integrated care* and preventing anticompetitive behaviour by health-care providers. In 2016 the functions of Monitor were transferred to a new organization, *\*NHS Improvement*.

**monoamine oxidase (MAO)** an enzyme that catalyses the oxidation of a large variety of monoamines, including adrenaline, noradrenaline, and serotonin. Monoamine oxidase is found in most tissues, particularly the gastrointestinal tract and nervous system, and exists in two forms in humans: monoamine oxidase A primarily breaks down noradrenaline and serotonin, whereas monoamine oxidase B primarily degrades dopamine. Drugs that act as inhibitors of monoamine oxidase A may be used in the treatment of depression (*see* **MAO INHIBITOR**); monoamine oxidase B inhibitors are used to treat Parkinson's disease.

**monoarthritis** *n.* *see* **ARTHRITIS**.

**monoblast** *n.* the earliest identifiable cell that gives rise to a *\*monocyte*. It is probably identical with the *\*myeloblast* and matures via an intermediate stage (**promonocyte**). It is normally found in the blood-forming tissue of the *\*bone marrow* but may appear in the blood in certain diseases, most notably in acute monoblastic *\*leukaemia*.

**monochorionicity** *n.* *see* **CHORIONICITY**; **TWINS**. — **monochorionic** *adj.*

**monochromat** *n.* a person who is completely colour-blind. There are two types. The **rod monochromat** appears to have totally defective *\*cones*: he or she has very poor visual acuity as well as the inability to discriminate colours. The **cone monochromat** has normal visual acuity: the cones appear to respond normally to light but to be completely unable to discriminate

colours. It is possible in this case that the defect does not lie in the cones themselves but in the integration of the nerve impulses as they pass from the cones to the brain. Both types of colour blindness are probably inherited.

**monochromatic** *adj.* denoting radiation, especially light, of the same frequency or wavelength.

**monoclonal antibody** an antibody produced artificially from a cell *\*clone* and therefore consisting of a single type of immunoglobulin. Monoclonal antibodies are produced by fusing antibody-forming lymphocytes from mouse spleen with mouse myeloma cells. The resulting hybrid cells multiply rapidly (like cancer cells) and produce the same antibody as their parent lymphocytes. In addition to their use in research, monoclonal antibodies are valuable diagnostic tools and have also been developed as pharmaceutical agents for treating a variety of conditions. For example, they are used in the detection and treatment of cancer, as each one recognizes different proteins on the surface of both malignant and benign cells. They can be used alone as monotherapy or to deliver drugs or radioactive materials (e.g. yttrium-90) directly to tumour cells.

**monocular** *adj.* relating to or used by one eye only. *Compare* **BINOCULAR**.

**monocyte** *n.* a variety of white blood cell, 16–20 µm in diameter, that has a kidney-shaped nucleus and greyish-blue cytoplasm (when treated with *\*Romanowsky stains*). Its function is the ingestion of foreign particles, such as bacteria and tissue debris. There are normally  $0.2\text{--}0.8 \times 10^9$  monocytes per litre of blood. —**monocytic** *adj.*

**monocytosis** *n.* an increase in the number of *\*monocytes* in the blood. It occurs in a variety of diseases, including monocytic *\*leukaemia* and infections due to some bacteria and protozoa.

**monodactylism** *n.* the congenital absence of all but one digit on each hand and foot.

**monodelusional disorder** a condition marked by a persistent delusion not associated with any other *\*mental illness*. It is often of a *\*paranoid* or persecutory nature, but can have any delusional content. Treatment is often difficult because patients commonly lack insight and refuse to try medication.

When compliance can be achieved, the majority of patients respond well to antipsychotic medication.

**monogenic diabetes** *see* MATURITY-ONSET DIABETES OF THE YOUNG.

**monoiodotyrosine** *n.* an iodine-containing substance produced in the thyroid gland from which the **\*thyroid hormones** are derived.

**mononeuritis** *n.* disease affecting a single peripheral nerve. **Mononeuritis multiplex** is the separate involvement of two or more nerves. *See also* PERIPHERAL NEUROPATHY.

**mononucleosis** *n.* the condition in which the blood contains an abnormally high number of mononuclear leucocytes (**\*monocytes** and **\*lymphocytes**). *See* GLANDULAR FEVER.

**monophasic defibrillator** *see* DEFIBRILLATOR.

**monophyletic** *adj.* describing a number of individuals, species, etc., that have evolved from a single ancestral group. *Compare* POLYPHYLETIC.

**monoplegia** *n.* paralysis of one limb. —**monoplegic** *adj.*

**monoploid** *adj.* *see* HAPLOID.

**monorchism** *n.* absence of one testis. This is usually due to failure of one testicle to descend into the scrotum before birth. The term is sometimes used for the condition in which one testicle has been removed surgically or destroyed by injury or disease. If the single testis is normal, no adverse effects result from the absence of the other.

**monosaccharide** *n.* a simple sugar having the general formula  $(\text{CH}_2\text{O})_n$ . Monosaccharides may have between three and nine carbon atoms, but the most common number is five or six. Monosaccharides are classified according to the number of carbon atoms they possess. Thus **trioses** have three carbon atoms, **tetroses** four, **pentoses** five, and **hexoses** six. The most abundant monosaccharide is glucose (a hexose).

**monosomy** *n.* a condition in which there is one chromosome missing from the normal (**\*diploid**) set. *Compare* TRISOMY. —**monosomic** *adj.*

**monozygotic twins** *see* TWINS.

**mons** *n.* (in anatomy) a rounded eminence. The **mons pubis** is the mound of fatty tissue lying over the pubic symphysis.

**montelukast** *n. see* LEUKOTRIENE RECEPTOR ANTAGONIST.

**mood disorder** *see* AFFECTIVE DISORDER.

**mood stabilizer** a drug used in the treatment of bipolar affective disorder to reduce the severity of manic and depressive episodes. Mood stabilizers include \*lithium and antiepileptics. More recently antipsychotics have been marketed as mood stabilizers but evidence about their efficacy for this purpose is scarce and their clinical usefulness needs further evaluation.

**moon face** the classical facial appearance of a patient with \*Cushing's syndrome. The face is rounded and free of wrinkles, and the hair is often thin.

**Mooren's ulcer** a severe ulceration at the periphery of the cornea, characterized by an overhanging advancing edge and vascularization of the ulcer bed. It is usually very painful, progressive, and difficult to control. [A. Mooren (1829–99), German ophthalmologist]

**moral agency** the ability to make moral judgments and to take responsibility for choices and actions.

**morality** *n.* those values, normative rules, or principles according to which intentions or behaviours are judged to be \*good or bad, \*right or wrong. Such judgment can arise from cultural, religious, or philosophical beliefs. *See* ETHICS.

**Moraxella** *n.* a genus of short rodlike Gram-negative aerobic bacteria, usually occurring in pairs. They exist as parasites in many warm-blooded animals. The species *M. lacunata* causes conjunctivitis.

**morbid** *adj.* diseased or abnormal; pathological.

**morbidity** *n.* the state of being ill or having a disease. *See also* INCIDENCE RATE; PREVALENCE.

**morbilli** *n. see* MEASLES.

**morbilliform** *adj.* describing a **\*maculopapular** skin rash resembling that of measles. A morbilliform rash is usually caused by viral infection, medications, or both.

**morbus** *n.* disease. The term is usually used as part of the medical name of a specific disease.

**mordant** *n.* (in microscopy) a substance, such as alum or phenol, used to fix a **\*stain** in a tissue.

**moribund** *adj.* dying.

**morning sickness** nausea and vomiting occurring during early pregnancy. In some women the symptoms disappear if a small amount of food is eaten before rising in the morning. *Compare* **HYPEREMESIS GRAVIDARUM**.

**Moro reflex (startle reflex)** a primitive reflex seen in newborn babies in response to the stimulus of a sudden noise or movement: the baby will fling its arms and legs wide and will appear to stiffen; the arms and legs are then drawn back into flexion. The Moro reflex should disappear spontaneously by four months. Its presence beyond this age is suggestive of an underlying neurological disorder, such as cerebral palsy. [E. Moro (1874–1951), German paediatrician]

**morphine** *n.* a potent opioid analgesic (*see* **OPIATE**) used mainly to relieve severe and persistent pain, particularly in terminally ill patients; it also induces feelings of euphoria. Common side-effects are nausea and vomiting, constipation, and drowsiness. With regular use, **\*tolerance** develops and **\*dependence** may occur.

**morpho-** *combining form denoting* form or structure.

**morphoea** *n.* a localized form of **\*scleroderma** characterized by firm ivory-coloured waxy plaques in the skin without any internal sclerosis. The plaques may often disappear spontaneously but resolution is slow.

**morphogenesis** *n.* the development of form and structure of the body and its parts.

**morphology** *n.* *see* **ANATOMY**.

**-morphous** *combining form denoting form or structure (of a specified kind).*

**Morquio–Brailsford disease** a defect of *\*mucopolysaccharide* metabolism (see **INBORN ERROR OF METABOLISM**) that causes dwarfism with a *\*kyphosis*, a short neck, *\*knock-knee*, and an angulated sternum in affected children. Intelligence is normal. [L. Morquio (1865–1935), Uruguayan physician; J. F. Brailsford (1888–1961), British radiologist]

**mortality rate** the incidence of death in the population in a given period. The **annual mortality rate** is the number of registered deaths in a year, multiplied by 1000 and divided by the population at the middle of the year. *See also* **INFANT MORTALITY RATE**; **MATERNAL MORTALITY RATE**.

**mortification** *n. see* **NECROSIS**.

**morula** *n.* an early stage of embryonic development formed by *\*cleavage* of the fertilized ovum. It consists of a solid ball of cells and is an intermediate stage between the zygote and *\*blastocyst*.

**mosaicism** *n.* a condition in which the cells of an individual do not all contain identical chromosomes; there may be two or more genetically different populations of cells. Often one of the cell populations is normal and the other carries a chromosome defect such as *\*Down's syndrome* or *\*Turner's syndrome*. In affected individuals the chromosome defect is usually not fully expressed. —**mosaic** *adj.*

**mosquito** *n.* a small winged bloodsucking insect belonging to a large group – the *\*Diptera* (two-winged flies). Its mouthparts are formed into a long proboscis for piercing the skin and sucking blood. Female mosquitoes transmit the parasites responsible for several major infectious diseases, such as *\*malaria*. The mosquito-borne **zika** virus has recently been shown to cause *\*microcephaly*. *See* **ANOPHELES**; **AËDES**; **CULEX**.

**motile** *adj.* being able to move spontaneously, without external aid: usually applied to a *\*microorganism* or a cell (e.g. a sperm cell).

**motilin** *n.* a polypeptide hormone, secreted in the small intestine, that controls smooth muscle contractions in the stomach and small intestine, increasing gut motility and promoting the production of pepsin.

**motion sickness (travel sickness)** nausea, vomiting, and headache caused by motion during travel by sea, road, or air. The symptoms are due to overstimulation of the balance organs in the inner ear by repeated small changes in the position of the body and are aggravated by movements of the horizon. Sedative antihistamine drugs (*see* **ANTIEMETIC**) are effective in preventing motion sickness.

**motivational interviewing** a technique that combines psychiatric assessment with elements of problem-solving **\*psychotherapy**. It is mostly used with patients who have substance misuse problems. The interviewer elicits the psychiatric history and the extent of the patient's difficulties, gives educational information, and tries to motivate the patient to change his or her habits.

**motor cortex** the region of the **\*cerebral cortex** that is responsible for initiating nerve impulses that bring about voluntary activity in the muscles of the body. It is possible to map out the cortex to show which of its areas is responsible for which particular part of the body. The motor cortex of the left cerebral hemisphere is responsible for muscular activity in the right side of the body.

**motor nerve** one of the nerves that carry impulses outwards from the central nervous system to bring about activity in a muscle or gland. *Compare* **SENSORY NERVE**.

**motor neuron** one of the units (**\*neurons**) that goes to make up the nerve pathway between the brain and an effector organ, such as a skeletal muscle. An **upper motor neuron** has a cell body in the brain and an axon that extends into the spinal cord, where it ends in synapses. It is thus entirely within the central nervous system. A **lower motor neuron**, on the other hand, has a cell body in the spinal cord or brainstem and an axon that extends outwards in a cranial or spinal motor nerve to reach an effector.

**motor neuron disease (motor neurone disease, MND)** a progressive degenerative disease of the motor system occurring in middle age and causing muscle weakness and wasting. It primarily affects the cells of the anterior horn of the spinal cord, the motor nuclei in the brainstem, and the corticospinal fibres. There are three clinically distinct forms: **amyotrophic lateral sclerosis (ALS, Lou Gehrig's disease)**, **progressive muscular**

**atrophy**, and **progressive bulbar palsy**. Some forms of MND (5%) are familial (inherited). The drug **\*riluzole** has been licensed for the treatment of MND with upper motor neuron involvement, but its benefits are limited.

<https://www.mndassociation.org/>

- Website of the Motor Neurone Disease Association: information for patients, carers, and professionals

**mould** *n.* any multicellular filamentous fungus that commonly forms a rough furry coating on decaying matter.

**moulding** *n.* the changing of the shape of an infant's head during labour, due to movement of the bones of the skull, brought about by the pressures to which it is subjected when passing through the birth canal.

**mountain sickness** *see* **ALTITUDE SICKNESS**.

**mouth-to-mouth resuscitation** a form of **\*artificial respiration** (known informally as the 'kiss of life') performed on an individual who has stopped breathing. The nostrils are pinched shut, the head is placed in the **\*head-tilt, chin-lift** position, a seal is formed between the mouths of the casualty and rescuer, and air is blown firmly and steadily into the lungs for intervals of around three seconds. The small but definite infection risk with this technique can be avoided by using a **\*pocket resuscitation mask**. **Mouth-to-nose resuscitation** is a similar technique in which the breaths are delivered through the casualty's nose.

**mouthwash** *n.* an aqueous solution used for rinsing of the mouth and teeth. Mouthwashes are used to prevent dental caries and gingivitis (*see also* **CHLORHEXIDINE**), to strengthen teeth against decay (*see* **FLUORIDE**), and to treat mild throat infections.

**mouthwash test** a simple noninvasive procedure that enables the detection of **\*carriers** for single gene defects, e.g. **\*cystic fibrosis**. Epithelial cells from the buccal cavity are obtained from a saline mouthwash: from these it is possible to isolate DNA, which is amplified by the **\*polymerase chain reaction** to enable gene analysis.

**moxibustion** *n.* a form of treatment favoured in Japan, in which cones of sunflower pith or down from the leaves of the plant *Artemisia moxa* are stuck to the skin and ignited. The heat produced by the smouldering cones acts as a counterirritant and is reputed to cure a variety of disorders.

**MPA** *see* [MICROSCOPIC POLYANGIITIS](#).

**MPR** *see* [MULTIPLANAR RECONSTRUCTION](#).

**MR** magnetic resonance: relating to [\\*magnetic resonance imaging](#), as in **MR scan**.

**MRA** magnetic resonance [\\*angiography](#).

**MRC** *see* [MEDICAL RESEARCH COUNCIL](#).

**MRCP** magnetic resonance cholangiopancreatography. *See* [CHOLANGIOGRAPHY](#).

**MRI** *see* [MAGNETIC RESONANCE IMAGING](#).

**MRS** *see* [MAGNETIC RESONANCE SPECTROSCOPY](#).

**MRSA** meticillin- (or multiple-) resistant *Staphylococcus aureus*: an increasingly common dangerous bacterium that is resistant to many antibiotics. It is responsible for many infections in already ill people in hospitals and is now also seen more widely in the general community (**community-associated MRSA**; **CA-MSRA**), usually in the form of skin infections. *See* [METICILLIN](#).

**MRU** magnetic resonance [\\*urography](#).

**MS** *see* [MULTIPLE SCLEROSIS](#).

**MSA** *see* [MULTIPLE SYSTEM ATROPHY](#).

**MSE** *see* [MENTAL STATE EXAMINATION](#).

**MSH** *see* [MELANOCYTE-STIMULATING HORMONE](#).

**MSU** *see* [MIDSTREAM SPECIMEN OF URINE](#).

**MSV manoeuvre** *see* MAURICEAU–SMELLIE–VIET MANOEUVRE.

**mucilage** *n.* (in pharmacy) a thick aqueous solution of a gum used as a lubricant in skin preparations (*see also* GLYCERIN), for the production of pills, and for the suspension of insoluble substances. The most important mucilages are of acacia, tragacanth, and starch.

**mucin** *n.* the principal constituent of \*mucus. Mucin is a \*glycoprotein.

**muco-** *combining form denoting* **1.** mucus. **2.** mucous membrane.

**mucociliary transport** the process by which cilia (*see* CILIUM) move a thin film of \*mucus from the upper and lower respiratory tracts towards the digestive tract. Particles of dust and microorganisms are trapped on the mucus and thereby removed from the respiratory tract.

**mucocoele** *n.* a space or organ distended with mucus. For example, it may occur in the gall bladder when the exit duct becomes obstructed so that the mucus secretions are retained and dilate the cavity of the organ. A mucocoele in the soft tissues arising from a salivary gland occurs when the duct is blocked or ruptured.

**mucolytic** *n.* an agent that dissolves or breaks down mucus. Mucolytics such as carbocisteine and dornase alfa (*see* DNASE) break down mucus in sputum and thus facilitate its expectoration; they are used to treat chest conditions involving excessive or thickened mucus secretions.

**mucopolysaccharide** *n.* one of a group of complex carbohydrates functioning mainly as structural components in connective tissue. Mucopolysaccharide molecules are usually built up of two repeating sugar units, one of which is an amino sugar. An example of a mucopolysaccharide is \*chondroitin sulphate, occurring in cartilage.

**mucopolysaccharidosis** *n.* any one of a group of several rare genetic diseases that are \*inborn errors of metabolism in which the storage of complex carbohydrates is disordered. The two most common are \*Hunter's syndrome and \*Hurler's syndrome.

**mucoprotein** *n.* one of a group of proteins found in the \*globulin fraction of blood plasma. Mucoproteins are globulins combined with a carbohydrate

group (an amino sugar). They are similar to *\*glycoproteins* but contain a greater proportion of carbohydrate.

**mucopurulent** *adj.* containing mucus and pus. See **MUCOPUS**.

**mucopus** *n.* a mixture of *\*mucus* and *\*pus*.

**Mucor** *n.* a genus of mould fungi commonly seen on dead and decaying organic matter. They can be pathogenic in humans.

**mucormycosis** *n.* infection caused by fungi of the genus *\*Mucor*. It most commonly affects the sinuses, lungs, or brain in immunocompromised patients.

**mucosa** *n.* see **MUCOUS MEMBRANE**. —**mucosal** *adj.*

**mucous membrane (mucosa)** the moist membrane lining many tubular structures and cavities, including the nasal sinuses, respiratory tract, gastrointestinal tract, biliary, and pancreatic systems. The surface of the mouth is lined by mucous membrane, the nature of which varies according to its site. The mucous membrane consists of a surface layer of *\*epithelium*, which contains glands secreting *\*mucus*, with underlying layers of connective tissue (lamina propria) and muscularis mucosae, which forms the inner boundary of the mucous membrane.

**mucoviscidosis** *n.* see **CYSTIC FIBROSIS**.

**mucus** *n.* a viscous fluid secreted by *\*mucous membranes*. Mucus acts as a protective barrier over the membranes, a lubricant, and a carrier of enzymes. It consists chiefly of *\*glycoproteins*, particularly **mucin**. —**mucous**, **mucoid** *adj.*

**MUGA scan (multiple-gated acquisition scan)** a technique used in *\*nuclear medicine* for studying the left-ventricular function and wall motion of the heart. The patient's red cells are labelled with radioactive technetium-99m. A gamma camera, connected to an ECG, collects information over a prolonged period for each phase of heart movement (**ECG gating**) to form an image of the blood pool within the heart at specific points in the cardiac cycle. Tomographic reconstructions can be made to give cross-sectional images of the heart in different phases of the cardiac cycle, using

reconstruction **\*algorithms** comparable to CT scanning (see **SPECT SCANNING**).

**Müllerian duct (paramesonephric duct)** either of the paired ducts that form adjacent to the Wolffian ducts (see **MESONEPHROS**) in the embryo. In the female these ducts develop into the Fallopian tubes, uterus, and part of the vagina. In the male **anti-Müllerian hormone** (AMH), produced by the fetal testis, arrests their development and by the tenth week of fetal life they have degenerated almost completely. In females AMH is produced by the ovary and levels are used as a measure of certain aspects of ovarian function, such as response to in vitro fertilization and assessing such conditions as polycystic ovary syndrome, premature ovarian failure, and intersex conditions in infants. [J. P. Müller (1801–58), German physiologist]

**multidetector computerized tomography (MDCT)** a development of **\*spiral CT scanning** that uses more than one array of detectors opposite the X-ray tube, so that more tissue can be included, with thinner cuts, in a single rotation of the machine. This is particularly important for three-dimensional reconstruction of tissues. It also allows volumetric scanning or **\*isotropic** imaging, which are best achieved when the thickness of the slice is similar to the size resolution of the detectors in the other two planes. Modern CT scanners are now usually equipped with between 16 and 640 detector arrays. The technique is particularly valuable for imaging fast-moving structures, such as the heart.

**multidisciplinary team (MDT)** a group of health-care professionals with different areas of expertise who unite to plan and carry out treatment of complex medical conditions.

**multifactorial** *adj.* describing a condition that is believed to have resulted from the interaction of genetic factors, usually polygenes, with an environmental factor or factors. Many disorders, e.g. spina bifida and anencephaly, are thought to be multifactorial.

**multifocal lenses** lenses containing more than one segment made to different prescriptions for visual correction. See **BIFOCAL LENS**; **TRIFOCAL LENSES**.

**multigravida** *n.* a woman who has been pregnant at least twice.

**multi-organ failure (MOF)** *see* **MULTIPLE ORGAN DYSFUNCTION SYNDROME**.

**multipara** *n.* a woman who has given birth to a live child after each of at least two pregnancies. *See also* **GRAND MULTIPARITY**.

**multiplanar reconstruction (MPR)** a computer technique that allows images to be created, after the information has been collected (*see* **POST-PROCESSING**), in any of the three named planes – **\*axial**, **\*sagittal**, or **\*coronal** – or variations of these, such as oblique or curved planes. The effect is similar to allowing parts of the body to be sliced away, revealing the tissues inside so that they can be studied.

**multiple endocrine neoplasia (MEN)** *see* **MENS**.

**multiple organ dysfunction syndrome (MODS, multi-organ failure, multiple organ failure, MOF)** a common cause of death following severe injury, overwhelming infection, or immune deficiency states.

**multiple personality disorder** a controversial diagnostic entity, in which the affected person is alleged to have two or more distinct, and often contrasting, personalities. As each personality assumes dominance, it determines attitudes and behaviour and usually appears to be unaware of the other personality (or personalities). Transition is sudden and the mental states of the different personalities are normal. The vast majority of psychiatrists deny its existence, and many other explanatory models exist for persons who occasionally show symptoms similar to those described above.

**multiple sclerosis (MS, disseminated sclerosis)** a chronic disease of the nervous system affecting young and middle-aged adults. The **\*myelin** sheaths surrounding nerves in the brain and spinal cord are damaged, which affects the function of the nerves involved. The course of the illness is usually characterized by recurrent relapses followed by remissions, but a proportion of patients run a chronic progressive course. The disease affects different parts of the brain and spinal cord, resulting in typically scattered symptoms. These include unsteady gait and shaky movements of the limbs (ataxia), abnormal eye movements (e.g. **\*nystagmus** and internuclear **\*ophthalmoplegia**), defects in speech pronunciation (dysarthria), spastic weakness, and **\*retrobulbar neuritis**. The underlying cause of the nerve

damage remains unknown, but an autoimmune process may be involved. Steroid treatment may be used in an acute relapse. \*Interferon beta and \*glatiramer acetate given by regular self-administered injections reduce the relapse rate by 30% in some patients. Newer monoclonal antibody treatments are also available.

<https://www.mssociety.org.uk/>

- Website of the Multiple Sclerosis Society

**multiple system atrophy (MSA)** a condition that results from degeneration of cells in the \*basal ganglia (resulting in \*parkinsonism), the \*cerebellum (resulting in \*ataxia), the \*pyramidal system, and the \*autonomic nervous system (resulting in symptoms of autonomic failure, such as postural hypotension).

**multipotent** *adj.* *see* STEM CELL.

**multisystem** *adj.* describing a disease that affects many systems of the body.

**multivariate analysis** *see* CORRELATION.

**mummification** *n.* **1.** the conversion of dead tissue into a hard shrunken mass, chiefly by dehydration. **2.** (in dentistry) the application of a fixative to the dental pulp to prevent decomposition.

**mumps** *n.* a common virus infection mainly affecting school-age children. Symptoms appear 2–3 weeks after exposure: fever, headache, and vomiting may precede a typical swelling of the \*parotid salivary glands. The gland on one side of the face often swells up days before the other but sometimes only one side is affected. The symptoms usually vanish within three days, the patient remaining infectious until the swelling has completely disappeared, but the infection may spread to other salivary glands and to the pancreas, brain (causing an aseptic meningitis), and testicles (after puberty mumps affecting the testicles can cause sterility). Vaccination against mumps provides effective immunity (*see* MMR VACCINE). Medical name: **infectious parotitis**.

**Munchausen's syndrome (Münchhausen's syndrome)** a very rare mental disorder, first described by Richard Asher in 1951, in which the patient persistently feigns symptoms in order to obtain invasive hospital treatment, especially surgery. The symptoms may be described in vivid detail, and in some cases injury may be deliberately self-inflicted in an attempt to give the appearance of authenticity to the claims being made. In **Munchausen's syndrome by proxy** the patient (usually a mother) presents false health information about someone else (usually her child) or inflicts harm on this other in order to attract medical attention. Munchausen's syndrome is now often referred to as **factitious disorder imposed on self** and Munchausen's syndrome by proxy as **factitious disorder imposed on another**. [Baron von Münchhausen, a character in German literature loosely based on the German nobleman Hieronymus Karl Friedrich, Freiherr von Münchhausen (1720–97), who told exaggerated stories]

**murmur** *n.* a noise, heard with the aid of a stethoscope, that is generated by turbulent blood flow within the heart or blood vessels. Turbulent flow is produced by damaged valves, **\*septal defects**, narrowed arteries, or arteriovenous communications. Heart murmurs can also be heard in normal individuals, especially those who have hyperactive circulation, and frequently in normal children (**innocent murmurs**). Murmurs are classified as **systolic** or **diastolic** (heard in ventricular **\*systole** or **\*diastole** respectively); **continuous murmurs** are heard throughout systole and diastole (also known as **\*machinery murmurs** because of their characteristic sound).

**Murphy's sign** a sign of inflammation of the gall bladder (*see* **CHOLECYSTITIS**): continuous pressure over the gall bladder while the patient is taking a deep breath will cause pain at the point of maximum inhalation. [J. B. Murphy (1857–1916), US surgeon]

**muscae volitantes** *see* **FLOATERS**.

**muscle** *n.* a tissue whose cells have the ability to contract, producing movement or force (*see* illustration). Muscles possess mechanisms for converting energy derived from chemical reactions into mechanical energy. The major functions of muscles are to produce movements of the body, to maintain the position of the body against the force of gravity, to produce movements of structures inside the body, and to alter pressures or tensions of

structures in the body. There are three types of muscle: **\*striated muscle**, attached to the skeleton; **\*smooth muscle**, which is found in such tissues as the stomach, gut, and blood vessels; and **\*cardiac muscle**, which forms the walls of the heart.

**Muscle.** A voluntary muscle in transverse section (left) and in longitudinal section at its junction with a tendon (right).

**muscle relaxant** an agent that reduces tension in voluntary muscles. Drugs such as **\*baclofen**, **\*dantrolene**, and **\*diazepam** are used to relieve skeletal muscular spasms in various spastic conditions, parkinsonism, and tetanus. The drugs used to relax voluntary muscles during the administration of anaesthetics in surgical operations act by blocking the transmission of impulses at neuromuscular junctions. Nondepolarizing muscle relaxants, e.g. **\*atracurium besilate**, **cisatracurium**, **pancuronium**, and **rocuronium**, bind to receptor sites normally occupied by acetylcholine; depolarizing muscle relaxants, e.g. **\*suxamethonium**, mimic the action of acetylcholine but **\*depolarization** is prolonged.

**muscle spindle** a specialized receptor, sensitive to stretch, that is embedded between and parallel to the fibres of striated muscles. These receptors are important for coordinated muscular movement. *See also* **STRETCH RECEPTOR**.

**muscular dystrophy** a group of muscle diseases, marked by weakness and wasting of selected muscles, in which there is a recognizable pattern of inheritance. The affected muscle fibres degenerate and are replaced by fatty tissue. The muscular dystrophies are classified according to the patient's age

at onset, distribution of the weakness, the progression of the disease, and the mode of inheritance. Isolated cases may occur as a result of gene mutation. Confirmation of the diagnosis is based upon *\*electromyography* and muscle biopsy.

One common form is **Duchenne's muscular dystrophy**, which is inherited as a *\*sex-linked* recessive character and is nearly always restricted to boys. It usually begins before the age of four, with selective weakness and wasting of the muscles of the pelvic girdle and back. The child has a waddling gait and *\*lordosis* of the lumbar spine. The calf muscles – and later the shoulders and upper limbs – often become firm and bulky. Although the disease cannot be cured, physiotherapy and orthopaedic measures can relieve the disability. The identification of the gene abnormality raises the possibility of *\*gene therapy* in the future. See also **BECKER MUSCULAR DYSTROPHY; DYSTROPHIA MYOTONICA**.

<https://www.musculardystrophyuk.org/>

- Website of Muscular Dystrophy UK

**muscularis** *n.* a muscular layer of the wall of a hollow organ (such as the stomach) or a tubular structure (such as the intestine or the ureter). The **muscularis mucosae** is the muscular layer of a mucous membrane complex, especially that of the stomach or intestine.

**muscular rheumatism** any aching pain in the muscles and joints. Commonly the symptoms are due to *\*fibrositis*; wear and tear of the joints (*\*osteoarthritis*); or to inflammation of the muscles associated with abnormal immune reactions (*\*polymyalgia rheumatica*). Generalized muscle pain with specific tender points and fatigue is called *\*fibromyalgia*.

**musculo-** *combining form denoting muscle.*

**musculocutaneous nerve** a nerve of the *\*brachial plexus* that supplies some muscles of the arm and the skin of the lateral part of the forearm.

**mushroom** *n.* the aerial fruiting (spore-producing) body of various fungi. Edible species include field mushrooms and cultivated mushrooms (*Agaricus campestris* and *A. bisporus*), the chanterelle (*Cantherellus cibarius*), and the

parasol (*Lepiota procera*). However, great care must be taken in identifying edible fungi. Many species are poisonous, especially the death cap and panther cap (see [AMANITA](#)).

**musical tinnitus** a form of tinnitus characterized by hearing snippets of music or indistinct speech, usually seen in association with significant [\\*deafness](#).

**MUST (Malnutrition Universal Screening Tool)** a screening tool launched in 2003 to identify adult patients at risk of under- or overnutrition. It is quick to use and is validated for use in primary and secondary care.

**mutagen** *n.* an external agent that, when applied to cells or organisms, can increase the rate of [\\*mutation](#). Mutagens usually only increase the number of mutants formed and do not cause mutations not found under natural conditions. Several kinds of radiation, many chemicals, and certain viruses can act as mutagens. *Compare* [ANTIMUTAGEN](#).

**mutant** *adj.* affected by or showing the effects of a mutation. — **mutant** *n.*

**mutation** *n.* a change in the genetic material ([\\*DNA](#)) of a cell, or the change this causes in a characteristic of the individual, which is not caused by normal genetic processes. In a **point** (or **gene**) **mutation** there is a change in a single gene; in a **chromosome mutation** there is a change in the structure or number of the chromosomes. All mutations are rare events and may occur spontaneously or be caused by external agents ([\\*mutagens](#)). If a mutation occurs in developing sex cells (gametes) it may be inherited. Mutations in any other cells (**somatic mutations**) are not inherited.

**mutism** *n.* inability or refusal to speak. Innate speechlessness most commonly occurs in those who have been totally deaf since birth; this was formerly referred to as **deaf-mutism** but the term is now deprecated, as it implies wrongly that those affected are unable to make vocal sounds or to communicate effectively in other ways (sign language). Inability to speak may result from brain damage (see [APHASIA](#)). It may also be caused by depression, psychosis, or psychological trauma, in which case the patient either does not speak at all or speaks only to particular persons or in particular situations. This latter condition is called **selective mutism**.

Treatment of mutism due to psychological causes is now increasingly by behavioural means, such as [\\*prompting](#): people that the patient does not

address are slowly introduced into the situation where the patient does speak. This may be done either alone or in combination with more traditional psychotherapy. Psychotic or depressive mutism or *\*catatonia* are addressed by treating the underlying condition. —**mute** *adj., n.*

**mutualism** *n.* the intimate but not necessarily obligatory association between two different species of organism in which there is mutual aid and benefit. Compare *SYMBIOSIS*.

**MWA** *see* *MICROWAVE ABLATION*.

**my-** (**myo-**) *combining form denoting muscle.*

**myalgia** *n.* pain in the muscles. —**myalgic** *adj.*

**myalgic encephalomyelitis (myalgic encephalopathy)** *see* *CFS/ME/PVF*.

**myasthenia gravis** a chronic disease marked by abnormal fatigability and weakness of selected muscles, which is relieved by rest. The degree of fatigue is so extreme that these muscles are temporarily paralysed. The muscles initially affected are those around the eyes, mouth, and throat, resulting in drooping of the upper eyelids (*\*ptosis*), double vision, *\*dysarthria*, and *\*dysphagia*. Myasthenia gravis is an *\*autoimmune disease* in which acetylcholine-receptor autoantibodies bind to cholinergic receptors on muscle cells, which impairs the ability of the neurotransmitter acetylcholine to induce muscular contraction. Treatment with *\*anticholinesterase* drugs and surgical removal of the thymus in younger patients (under the age of 45 years) lessen the severity of the symptoms. Steroid therapy, intravenous immunoglobulin treatment, and plasma exchange may be used to treat the more severely affected patients.

**myc-** (**myco-**, **mycet(o)-**) *combining form denoting a fungus.*

**mycelium** *n.* (*pl.* **mycelia**) the tangled mass of fine branching threads that make up the feeding and growing part of a *\*fungus*.

**mycetoma** *n.* a chronic inflammation of tissues caused by a fungus. *See* *MADURA FOOT*.

**Mycobacterium** *n.* a genus of rodlike Gram-positive aerobic bacteria that can form filamentous branching structures. Some species are pathogenic to

animals and humans: *M. leprae* (**Hansen's bacillus**) causes \*leprosy; *M. tuberculosis* (**Koch's bacillus**) causes \*tuberculosis. *M. bovis* causes tuberculosis in cattle but can also infect the human lungs, joints, and intestines. *M. paratuberculosis*, which causes Johne's disease in cattle, can also be transmitted in milk and is suspected of being a cause of Crohn's disease.

*M. tuberculosis* is by far the most common species responsible for infections of the lung. Other mycobacteria that infect the lung are variously described as atypical, anonymous, or \*opportunistic – the favoured term since they usually require pre-existing lung damage or a defect in the patient's immunity before they can give rise to infection. The opportunistic mycobacteria that most commonly cause lung infections are *M. kansasii*, *M. xenopi*, *M. malmoense*, and a group known as the **MAI complex** (*M. avium*, *M. intracellulare*). Infections caused by all these organisms can mimic pulmonary tuberculosis but are much more difficult to treat since they are resistant to many of the antituberculosis drugs. The MAI organisms are particularly likely to cause superimposed infection in cases of AIDS.

**mycology** *n.* the science of fungi. *See also* MICROBIOLOGY. —**mycologist** *n.*

**mycophenolate mofetil (MMF)** an immunosuppressant drug used to prevent rejection in organ transplantation and also in the treatment of severe eczema. It is derived from the fungus *Penicillium stoloniferum* and acts by blocking purine synthesis in lymphocytes. Side-effects may limit its use.

**mycoplasma** *n.* one of a group of minute nonmotile bacteria that lack a rigid cell wall and hence display a variety of forms. The group includes some species that cause severe respiratory disease in cattle, sheep, and goats; one of these, *Mycoplasma pneumoniae*, causes \*atypical pneumonia in humans.

**mycosis** *n.* any disease caused by a fungus, including actinomycosis, aspergillosis, cryptococcosis, rhinosporidiosis, ringworm, and sporotrichosis.

**mycosis fungoides** the most common form of \*cutaneous T-cell lymphoma, with patches, plaques, and later nodules on the skin. It typically progresses very slowly and can be treated with topical corticosteroids, phototherapy, radiotherapy, or other agents.

**Mycota** *n.* see UNDECENOIC ACID.

**mydriasis** *n.* widening of the pupil, which occurs normally in dim light. The commonest cause of prolonged mydriasis is drug therapy (see MYDRIATIC) or injury to the eye. See also CYCLOPLEGIA. Compare MIOSIS.

**mydriatic** *n.* a drug that causes the pupil of the eye to dilate. Examples are \*atropine, \*cyclopentolate, and \*phenylephrine. Mydriatics in the form of eye drops or ointments are used to aid examination of the eye and to treat some eye inflammations such as iritis and cyclitis.

**myectomy** *n.* a surgical operation to remove part of a muscle.

**myel- (myelo-)** combining form denoting 1. the spinal cord. 2. bone marrow. 3. myelin.

**myelencephalon** *n.* see MEDULLA OBLONGATA.

**myelin** *n.* a complex material formed of protein and \*phospholipid that is laid down as a sheath surrounding and insulating the \*axons of certain neurons, known as **myelinated** (or **medullated**) **nerve fibres**. The material is produced and laid down in concentric layers by \*Schwann cells at regular intervals along the nerve fibre (see illustrations). Myelinated nerves conduct impulses more rapidly than nonmyelinated nerves.

**Myelin.** Formation of a myelin sheath by a Schwann cell.

**Myelin.** Longitudinal section through a myelinated nerve fibre.

**myelination** *n.* the process in which **\*myelin** is laid down as an insulating layer around the axons of certain nerves. Myelination of nerve tracts in the central nervous system is completed by the second year of life.

**myelitis** *n.* **1.** an inflammatory disease of the spinal cord. The most usual kind (**transverse myelitis**) most often occurs during the development of multiple sclerosis, but it is sometimes a manifestation of **\*encephalomyelitis**, when it can occur as an isolated attack. The inflammation spreads more or less completely across the tissue of the spinal cord, resulting in a loss of its normal function to transmit nerve impulses up and down. It is as though the spinal cord had been severed: paralysis and numbness affects the legs and trunk below the level of the diseased tissue. **2.** inflammation of the bone marrow. See **OSTEOMYELITIS**.

**myeloblast** *n.* the earliest identifiable cell that gives rise to a **\*granulocyte**, having a large nucleus and scanty cytoplasm. It is normally found in the blood-forming tissue of the bone marrow, but may appear in the blood in a variety of diseases, most notably in acute myeloblastic **\*leukaemia**. See also **GRANULOPOIESIS**. —**myeloblastic** *adj.*

**myelocele** *n.* see **NEURAL TUBE DEFECTS**.

**myelocyte** *n.* an immature form of **\*granulocyte** having an oval nucleus (*compare* **METAMYELOCYTE**) and neutrophil, eosinophil, or basophil granules within its cytoplasm (*compare* **PROMYELOCYTE**). It is normally found in the blood-forming tissue of the bone marrow, but may appear in the

blood in a variety of diseases, including infections, infiltrations of the bone marrow, and certain leukaemias. *See also* [GRANULOPOIESIS](#).

**myelodysplastic syndromes (MDS)** a group of diseases in which the production of any one or all types of blood cells by the bone marrow is disrupted. Although myelodysplastic syndromes were previously referred to as **preleukaemia**, only a minority of patients with myelodysplastic syndromes develop leukaemia.

**myelofibrosis** *n.* a chronic but progressive disease characterized by [\\*fibrosis](#) of the bone marrow, which leads to anaemia and the presence of immature red and white blood cells in the circulation. Other features include enlargement of the spleen and the presence of blood-forming (myeloid) tissue in abnormal sites, such as the spleen and liver (extramedullary [\\*haemopoiesis](#)). Its cause is unknown.

**myelography** *n.* a specialized method of X-ray examination to demonstrate the spinal canal that involves injection of a radiopaque contrast medium into the subarachnoid space by [\\*lumbar puncture](#). The X-rays obtained are called **myelograms**. It is of importance in the recognition of tumours of the spinal cord and other conditions compressing the cord or the nerve roots. The former use of oil-based dyes in myelography was an occasional cause of [\\*arachnoiditis](#). This complication is now avoided by the use of water-soluble contrast media. Myelography is now often combined with simultaneous CT scanning but is becoming increasingly superseded by [\\*magnetic resonance imaging](#).

**myeloid** *adj.* **1.** like, derived from, or relating to bone marrow. **2.** resembling a [\\*myelocyte](#). **3.** relating to the spinal cord.

**myeloid leukaemia** a variety of [\\*leukaemia](#) in which the type of blood cell that proliferates abnormally originates in the blood-forming (myeloid) tissue of the bone marrow. Myeloid leukaemias may be acute or chronic and may involve any one of the cells produced by the marrow. Blood cells in patients with chronic myeloid leukaemia contain a reciprocal [\\*translocation](#) between chromosomes 9 and 22 (*see* [PHILADELPHIA CHROMOSOME](#)); molecular characterization of the translocation has led to the development of specific

drugs to block the effects of this abnormality (see [TYROSINE KINASE INHIBITOR](#)).

**myeloid tissue** a tissue in the [\\*bone marrow](#) in which the various classes of blood cells are produced. *See also* [HAEMOPOIESIS](#).

**myeloma (multiple myeloma, myelomatosis)** *n.* a malignant disease of the bone marrow, characterized by two or more of the following criteria: (1) the presence of an excess of abnormal malignant plasma cells in the bone marrow; (2) typical [\\*lytic](#) deposits in the bones on X-ray, giving the appearance of holes; (3) the presence in the serum of an abnormal gammaglobulin, usually IgG (an immunoglobulin; *see* [PARAPROTEIN](#)). [\\*Bence-Jones protein](#) may also be found in the serum or urine. The patient may complain of tiredness due to anaemia and of bone pain and may develop pathological fractures. Treatment is usually with such drugs as steroids, melphalan, cyclophosphamide, or thalidomide with local radiotherapy to particular areas of pain. *See also* [PLASMACYTOMA](#).

**myeloma kidney** *see* [CAST NEPHROPATHY](#).

**myelomalacia** *n.* softening of the tissues of the spinal cord, most often caused by an impaired blood supply.

**myelomatosis** *n.* *see* [MYELOMA](#).

**myelomeningocele** *n.* *see* [NEURAL TUBE DEFECTS](#).

**myeloproliferative disorders (MPD)** a group of diseases in which there is excessive production of blood cells in the bone marrow. Myeloproliferative disorders include [\\*polycythaemia vera](#), essential [\\*thrombocythaemia](#), idiopathic [\\*myelofibrosis](#), and chronic [\\*myeloid leukaemia](#).

**myelosuppression** *n.* a reduction in blood-cell production by the bone marrow. It commonly occurs after chemotherapy and may result in anaemia, infection, and abnormal bleeding (*see* [THROMBOCYTOPENIA](#); [NEUTROPENIA](#)). —**myelosuppressive** *adj.*

**myenteric reflex** a reflex action of the intestine in which a physical stimulus causes the intestine to contract above and relax below the point of

stimulation.

**myenteron** *n.* the muscular layer of the **\*intestine**, consisting of a layer of circular muscle inside a layer of longitudinal muscle. These muscles are used in **\*peristalsis**. —**myenteric** *adj.*

**myiasis** *n.* an infestation of a living organ or tissue by maggots. The flies normally breed in decaying animal and vegetable matter; myiasis therefore generally occurs only in regions of poor hygiene, and in most cases the infestations are accidental. Various genera may infect humans. **\*Gasterophilus**, **\*Hypoderma**, **\*Dermatobia**, and *Cordylobia* (see **TUMBU FLY**) affect the skin; *Fannia* invades the alimentary canal and the urinary system; **\*Phormia** and **\*Wohlfahrtia** can infest open wounds and ulcers; **\*Oestrus** attacks the eyes; and *Cochliomyia* invades the nasal passages. Treatment of external myiasis involves the destruction and removal of maggots followed by the application of antibiotics to wounds and lesions.

**mylohyoid** *n.* a muscle in the floor of the mouth, attached at one end to the mandible and at the other to the hyoid bone.

**myo-** *combining form.* see **MY-**.

**myoblast** *n.* a cell that develops into a muscle fibre. —**myoblastic** *adj.*

**myocardial infarction** death of a segment of heart muscle, which follows interruption of its blood supply (see **CORONARY THROMBOSIS**). Myocardial infarction is usually confined to the left ventricle. The patient experiences a ‘heart attack’: sudden severe chest pain, which may spread to the arms and throat. Although severe chest pain is the most widely recognized symptom of myocardial infarction, many patients – especially women – do not have chest pain. Other presenting symptoms include abdominal pain, nausea, vomiting, sweating, shortness of breath, and dizziness. The main danger is that of ventricular **\*fibrillation**, which accounts for most of the fatalities. Other **\*arrhythmias** are also frequent. Other complications include heart failure, rupture of the heart, phlebothrombosis, pulmonary embolism, pericarditis, shock, mitral regurgitation, and perforation of the septum between the ventricles.

Patients with myocardial infarction are best cared for in a specialized coronary care unit with facilities for the early detection, prevention, and

treatment of arrhythmias and **\*cardiac arrest**. Blockage of a major coronary artery is detected by elevation of the **\*S–T segment** on the **\*electrocardiogram** (STEMI or S–T elevation myocardial infarction). It is relieved by emergency **\*coronary angioplasty** (commonly called primary **\*percutaneous coronary intervention**) or the intravenous infusion of a drug to dissolve thrombus (**\*thrombolysis**). Most survivors of myocardial infarction are able to return to a full and active life, including those who have been successfully resuscitated from cardiac arrest. Lesser degrees of coronary obstruction may not be seen on the electrocardiogram but are revealed by the detection of raised **\*troponin** levels in the blood (NSTEMI or non-S–T elevation myocardial infarction). Treatment is with **\*antiplatelet drugs** and early percutaneous coronary intervention.

**myocardial perfusion scan (thallium scan)** a method to detect and quantify myocardial **\*ischaemia**. An intravenously injected **\*radionuclide** that is taken up by normal heart muscle can be imaged using a **\*gamma camera**. Areas of scar due to **\*myocardial infarction** emit little or no radioactivity and are seen as ‘cold spots’. Exercise is mimicked by infusing drugs to increase the heart rate in order to provoke cold spots in the diagnosis of ischaemic heart disease.

**myocardial stunning** the temporary loss of function of an area of heart muscle due to transient blockage of a coronary artery. It is typically seen following myocardial infarction that is treated promptly by successful emergency **\*percutaneous** coronary intervention. The stunning may last up to two weeks.

**myocarditis** *n.* acute or chronic inflammation of the heart muscle. It may be seen alone or as part of pancarditis (see **ENDOMYOCARDITIS**).

**myocardium** *n.* the middle of the three layers forming the wall of the heart (see also **ENDOCARDIUM**; **EPICARDIUM**). It is composed of **\*cardiac muscle** and forms the greater part of the heart wall, being thicker in the ventricles than in the atria. —**myocardial** *adj.*

**myoclonus** *n.* a sudden spasm of the muscles. Occasional **myoclonic jerks** occur between seizures in patients with idiopathic **\*epilepsy**, and myoclonus is a major feature of some progressive neurological illnesses with extensive degeneration of the brain cells (including the **\*spongiform encephalopathies**).

Myoclonic jerks on falling asleep (**nocturnal myoclonus**) occur in normal individuals. —**myoclonic** *adj.*

**myocyte** *n.* a muscle cell.

**myoepithelium** *n.* a tissue consisting of cells of epithelial origin having a contractile cytoplasm. Myoepithelial cells play an important role in encouraging the secretion of substances into ducts.

**myofibril** *n.* one of numerous contractile filaments found within the cytoplasm of **\*striated muscle** cells. When viewed under a microscope myofibrils show alternating bands of high and low refractive index, which give striated muscle its characteristic appearance.

**myogenic** *adj.* originating in muscle: applied to the inherent rhythmicity of contraction of some muscles (e.g. cardiac muscle), which does not depend on neural influences.

**myoglobin (myohaemoglobin)** *n.* an iron-containing protein, resembling **\*haemoglobin**, found in muscle cells. Like haemoglobin it contains a haem group, which binds reversibly with oxygen, and so acts as an oxygen reservoir within the muscle fibres.

**myoglobinuria (myohaemoglobinuria)** *n.* the presence in the urine of the pigment myoglobin.

**myoglobinuric acute renal failure** acute kidney injury caused by myoglobin that is released from damaged skeletal muscle (**\*rhabdomyolysis**). This is usually the result of trauma and the condition was first recognized in victims trapped and crushed during the London Blitz. Muscle injury can also occur with pressure necrosis, particularly in the unconscious or immobile patient, or with a **\*compartment syndrome**. Rarely it may complicate intensive muscular exercise or extensive viral myositis and it is a recognized complication of modest overexertion in some inherited disorders of muscle metabolism, such as **\*McArdle's disease**.

**myogram** *n.* a recording of the activity of a muscle. *See* **ELECTROMYOGRAPHY**.

**myograph** *n.* an instrument for recording the activity of muscular tissues. *See* **ELECTROMYOGRAPHY**.

**myohaemoglobin** *n.* *see* **MYOGLOBIN**.

**myohaemoglobinuria** *n.* *see* **MYOGLOBINURIA**.

**myokymia** *n.* prominent quivering of a few muscle fibres, not associated with any other abnormal features. It is usually a benign condition. *See also* **FASCICULATION**.

**myology** *n.* the study of the structure, function, and diseases of the muscles.

**myolysis** *n.* *see* **FIBROID**.

**myoma** *n.* a benign tumour of muscle. It may originate in smooth muscle (*see* **LEIOMYOMA**) or in striated muscle (*see* **RHABDOMYOMA**).

**myomectomy** *n.* surgical removal of a fibroid (myoma) from the uterus.

**myometritis** *n.* inflammation of the muscular wall (myometrium) of the uterus.

**myometrium** *n.* the muscular tissue of the uterus, which surrounds the **\*endometrium**. It is composed of smooth muscle that undergoes small regular spontaneous contractions. The frequency and amplitude of these contractions alter in response to the hormones **\*oestrogen**, **\*progesterone**, and **\*oxytocin**, which are present at particular stages of the menstrual cycle and pregnancy.

**myoneural junction** *see* **NEUROMUSCULAR JUNCTION**.

**myopathy** *n.* any disease of the muscles. The myopathies are usually subdivided into those that are inherited (*see* **MUSCULAR DYSTROPHY**) and those that are acquired. The acquired myopathies include **\*polymyositis** and muscular diseases complicating endocrine disorders, carcinoma, or drug therapy. All are typified by weakness and wasting of the muscles, which may be associated with pain and tenderness.

**myopia (short-sightedness)** *n.* the condition in which parallel light rays are brought to a focus in front of the retina (*see* illustration). Closer objects are clearer as compared to distant objects. Myopia is corrected by wearing spectacles with concave lenses; contact lenses and surgery can also be used

to correct myopia (see [EXCIMER LASER](#); [LASEK](#); [LASIK](#)). Compare [EMMETROPIA](#); [HYPERMETROPIA](#). —**myopic** *adj.*

**Myopia (short-sightedness).**

**myoplasm** *n.* see [SARCOPLASM](#).

**myoplasty** *n.* the plastic surgery of muscle, in which part of a muscle is partly detached and used to repair tissue defects or deformities in the vicinity of the muscle. It is frequently used in [\\*flap](#) surgery and anal operations ([\\*anoplasty](#)).

**myosarcoma** *n.* a malignant tumour of muscle. See also [LEIOMYOSARCOMA](#); [RHABDOMYOSARCOMA](#).

**myosin** *n.* the most abundant protein in muscle fibrils, having the important properties of elasticity and contractility. With actin, it comprises the principal contractile element of muscles. See [STRIATED MUSCLE](#).

**myosis** *n.* see [MIOSIS](#).

**myositis** *n.* any of a group of muscle diseases in which inflammation and degenerative changes occur. [\\*Polymyositis](#) is the most commonly occurring

example, but myositis may be found in relation to systemic **\*connective-tissue diseases** and a minority are caused by bacterial or parasitic infections.

**myositis ossificans** the formation of bone within a **\*muscle**, which most commonly occurs after dislocations or severe muscle bruising, especially around the elbow, shoulder, hip, or knee. Initial symptoms of pain, swelling, and tenderness are followed by joint stiffness; if this persists, surgery may be required to remove the bone once it has stopped growing.

**myotactic** *adj.* relating to the sense of touch in muscles.

**myotatic reflex** *see* **STRETCH REFLEX**.

**myotome** *n.* that part of the segmented mesoderm in the early embryo that gives rise to all the skeletal muscle of the body. Visceral (smooth) muscles develop from unsegmented mesoderm (*see* **MESENCHYME**). *See also* **SOMITE**.

**myotomy** *n.* the dissection or surgical division of a muscle. For example, **cardiomyotomy** is division of the **\*sphincter** muscle of the gastro-oesophageal junction (*see* **ACHALASIA**).

**myotonia** *n.* a disorder of the muscle fibres that results in abnormally prolonged contractions. The patient has difficulty in relaxing a movement (e.g. his grip) after any vigorous effort. It is a feature of a hereditary condition starting in infancy or early childhood (**myotonia congenita**) and of a form of muscular dystrophy (**\*dystrophia myotonica**).

**myotonic** *adj.* **1.** relating to muscle tone. **2.** relating to **\*myotonia**.

**myotonus** *n.* **1.** a tonic muscular spasm. **2.** muscle tone.

**myringa** *n.* the eardrum (*see* **TYMPANIC MEMBRANE**).

**myringitis** *n.* inflammation of the eardrum (*see* **OTITIS**).

**myringoplasty (tympanoplasty)** *n.* surgical repair of a perforated eardrum by grafting.

**myringotomy** *n.* incision of the eardrum to create an artificial opening, either to allow infected fluid to drain from the middle ear in acute **\*otitis media** or

to remove fluid in *\*glue ear* and permit the insertion of a *\*grommet*.

**myroxylon pereirae** a fragrant resin used as a screener in patch testing for allergy to fragrance ingredients.

**myx-** (**myxo-**) *combining form denoting mucus.*

**myxoedema** *n.* **1.** a dry firm waxy swelling of the skin and subcutaneous tissues found in patients with underactive thyroid glands (*see* **HYPOTHYROIDISM**). **2.** the clinical syndrome due to hypothyroidism in adult life, including coarsening of the skin, intolerance to cold, weight gain, and mental dullness. The symptoms are abolished with thyroxine treatment. — **myxoedematous** *adj.*

**myxoedema coma** a life-threatening condition due to severe *\*hypothyroidism*, which is often precipitated by an acute event, such as surgery, prolonged exposure to cold, infection, trauma, other severe illness, or sedative drugs. It manifests as hypothermia, slowing of the heart rate with a reduction in blood pressure and sometimes heart failure, pleural and peritoneal effusions, urinary retention, and a gradually reduced conscious state resulting in coma. Blood tests show hypothyroidism, *\*hyponatraemia*, hypercholesterolaemia, retention of carbon dioxide, and anaemia. Treatment is with intravenous *\*thyroxine* at a high dosage until the patient wakes up, when tablets can be administered. Support on a ventilator and intravenous fluids may be needed. Active slow rewarming should be undertaken.

**myxofibroma** *n.* a benign tumour of fibrous tissue that contains myxomatous elements (*see* **MYXOMA**) or has undergone mucoid degeneration.

**myxoid cyst** a small (and often painful) cyst containing a thick sticky fluid that develops over the end joint of a finger or toe. It may be in communication with the underlying joint.

**myxoma** *n.* a benign gelatinous tumour of connective tissue. **Atrial myxoma** is a tumour of the heart, usually of the left side, arising from the septum dividing the two upper chambers. Symptoms may include fever, lassitude, joint pains, and sudden loss of consciousness due to obstruction of the bloodflow. The tumour may be wrongly diagnosed as stenosis of the mitral valve as it can produce a similar murmur. Treatment requires surgical removal. — **myxomatous** *adj.*

**myxosarcoma** *n.* a **\*sarcoma** containing mucoid material, such as a **\*liposarcoma** or a **\*fibrosarcoma**.

**myxovirus** *n.* one of a group of RNA-containing viruses that are associated with various diseases in animals and humans. The **orthomyxoviruses** cause diseases of the respiratory tract, most notably influenza. The related **paramyxoviruses** include the **\*respiratory syncytial virus** (RSV) and the agents that cause measles, mumps, and parainfluenza.

**nabilone** *n.* a drug related to cannabis, used to control severe nausea and vomiting caused by anticancer drugs when this has not responded to other antiemetics. It can cause drowsiness, vertigo, dry mouth, hallucinations, and mood changes.

**nabothian follicle** (**nabothian cyst**, **nabothian gland**) one of a number of retention *\*cysts* on the neck (cervix) of the uterus, near its opening to the vagina. The sacs, which contain mucus, form when the ducts of the glands in the cervix are blocked by a new growth of surface cells (epithelium) over an area damaged because of infection.

**NAD** (**nicotinamide adenine dinucleotide**) a *\*coenzyme* that acts as a hydrogen acceptor in oxidation-reduction reactions, particularly in the *\*electron transport chain* in cellular respiration. NAD and the closely related coenzyme **NADP** (**nicotinamide adenine dinucleotide phosphate**) are derived from nicotinic acid; they are reduced to **NADH** and **NADPH**, respectively.

**nadolol** *n.* a *\*beta blocker* used mainly in the treatment of angina pectoris and *\*arrhythmias* and to prevent migraine attacks. Side-effects include decreased heart rate, dizziness, and low blood pressure.

**NADP** (**nicotinamide adenine dinucleotide phosphate**) *see* **NAD**.

**Naegle rule** a method used to calculate the estimated date of delivery: nine months and seven days are added to the date of the start of the last menstrual period. A correction is required if the woman does not have 28-day menstrual cycles. [F. K. Naegle (1777–1851), German obstetrician]

**Naegle's obliquity** *see* **ASYNCLITISM**.

**Naegleria** *n.* a genus of *\*amoebae* that normally live in damp soil or mud. *Naegleria* species can, however, live as parasites in humans: *N. fowleri* is responsible for primary amoebic *\*meningoencephalitis*, a very rare, but fatal, infection of the brain.

**naevus** *n.* (*pl.* **naevi**) a birthmark: a clearly defined malformation of the skin, present at birth. There are many different types of naevi. Some, including the strawberry naevus and port-wine stain, are composed of small blood vessels (see **HAEMANGIOMA**). The **strawberry naevus** (or **strawberry mark**) is a raised red lump usually appearing on the face and growing rapidly in the first month of life. These birthmarks slowly resolve and spontaneously disappear between the ages of five and ten. The **port-wine stain** (or **capillary naevus**) is a permanent purplish discoloration that may occur anywhere but usually appears on the upper half of the body. Laser treatment can reduce the discoloration. Occasionally a port-wine stain may be associated with a malformation of blood vessels over the brain, for example in the Sturge-Weber syndrome (see **ANGIOMA**).

It is not uncommon for a pale or white halo to develop around an ordinary pigmented naevus, especially on the trunk, forming a **halo naevus**. The pigmented naevus disappears over the course of a few months; this is followed by resolution of the pale area. A **blue naevus** is a small blue-grey papule appearing at birth or later in life, mainly on the extremities. Progression to malignant melanoma is very rare. A **naevus of Ota** is a blue-grey pigmented area on the cheek, eyelid, or forehead with similar pigmentation of the sclera of an eye. It is associated with melanomas of the uvea, orbit, and brain as well as with glaucoma of the affected eye. See also **MOLE**<sup>2</sup>.

**NAFLD** see **NONALCOHOLIC FATTY LIVER DISEASE**.

**Naga sore** see **TROPICAL ULCER**.

**NAI** see **NONACCIDENTAL INJURY**.

**nail** *n.* a horny structure, composed of keratin, formed from the epidermis on the dorsal surface of each finger and toe (see illustration). The exposed part of the nail is the **body**, behind which is the **root**. The whitish crescent-shaped area at the base of the body is called the **lunula**. Growth of the nail occurs at

the end of the nail root by division of the germinative layer of the underlying **\*epidermis** (which forms part of the **matrix**). The growing nail slides forward over the **nail bed**. The fold of skin that lies above the root is the **nail fold**; folds of skin on either side of the nail are the **nail walls**. The epidermis of the nail fold that lies next to the nail root is called the **eponychium** (forming the 'cuticle' at the base of the nail). Anatomical name: **unguis**.

**Nail.** Longitudinal section through the fingertip and nail.

**nalidixic acid** a **\*quinolone** antibiotic active against various bacteria and used to treat infections of the urinary tract. Common side-effects are nausea, vomiting, and skin reactions.

**naloxone** *n.* a drug that is a specific antidote to morphine and other opioids. It is used in the emergency treatment of opioid overdose and to reverse the respiratory depression induced by opioid analgesics used during surgery. As it is short-acting, repeated doses may be necessary.

**naltrexone** *n.* an opioid antagonist drug that is used to prevent relapse in formerly heroin- and other opioid-dependent patients. Possible side-effects include abdominal cramps, nausea and vomiting, sleep difficulties, and dizziness.

**nandrolone** *n.* a synthetic male sex hormone with **\*anabolic** effects. It is used in the treatment of aplastic **\*anaemia** and high doses may cause signs of **\*virilization** in women.

**nano-** *combining form denoting* **1.** extremely small size. **2.** one thousand-millionth part ( $10^{-9}$ ).

**nanometre** *n.* one thousand-millionth of a metre ( $10^{-9}$  m). One nanometre is equal to 10 angstrom. Symbol: nm.

**nanophthalmos** *n.* a congenitally small eye in which all the structures are proportionally reduced.

**nanotechnology** *n.* a field of science focused on matter 100 nm or smaller (a DNA double helix has a diameter around 2 nm). Such substances (e.g. **nanoparticles, nanostructures, nanocrystals**) include those at the molecular and atomic levels. **Nanomedicine** is the use of nanotechnology to deliver diagnostic or treatment modalities (e.g. drugs) directly to the relevant cells (e.g. cancer cells) in the human body.

**napkin rash (nappy rash)** a red skin rash within the napkin area, usually caused by chemical irritation (ammoniacal **\*dermatitis**) or infection with **\*Candida**. Ammoniacal dermatitis is caused by skin contact with wet soiled nappies, the stool bacteria reacting with urine to form irritant ammonia. Treatment involves exposure to air, application of barrier creams, and frequent nappy changes. Candidal nappy rash is treated with antifungal creams. Other causes of napkin rash include eczema and psoriasis.

**naprapathy** *n.* a system of medicine based on the belief that a great many diseases are attributable to displacement of ligaments, tendons, and other connective tissues and that cure can be brought about only by manipulation to correct these displacements.

**naproxen** *n.* an analgesic drug that also reduces inflammation and fever (*see* **NSAID**). It is used to treat rheumatoid arthritis, dysmenorrhoea, and gout. Side-effects may include digestive upsets and rashes: gastric bleeding can be prevented by administering naproxen in combination with **\*misoprostol**.

**naratriptan** *n.* *see* **5HT<sub>1</sub> AGONIST**.

**narcissism** *n.* an excessive involvement with oneself and one's self-importance, often to cover insecurity. In Freudian terms it is a state in which the **\*ego** has taken itself as a love object. Some degree of narcissism is

present in most individuals, but when it is shown to an extreme degree it may become a **\*personality disorder**. —**narcissistic** *adj.*

**narco-** *combining form denoting narcosis; stupor.*

**narcolepsy** *n.* an extreme tendency to fall asleep in quiet surroundings or when engaged in monotonous activities. The patient can be woken easily and is immediately alert. It is often associated with **\*cataplexy**, **\*sleep paralysis**, and hypnagogic **\*hallucinations**. One in 2000 individuals may be affected. Narcolepsy is strongly associated with reduced levels of **\*hypocretin** in the cerebrospinal fluid. —**narcoleptic** *adj., n.*

**narcosis** *n.* a state of diminished consciousness or complete unconsciousness caused by the use of narcotic (i.e. opioid) drugs, which have a depressant action on the nervous system. The body's normal reactions to stimuli are diminished and the body may become sedated or completely anaesthetized.

**narcotic** *n.* a drug that induces stupor and insensibility and relieves pain. Now largely obsolete in medical contexts, the term was used particularly for morphine and other derivatives of opium (*see* **OPIATE**) but also referred to other drugs that depress brain function (e.g. general anaesthetics and hypnotics). In legal terms a narcotic is any addictive drug subject to illegal use.

**nares** *pl. n. (sing. naris)* openings of the nose. The two **external** (or **anterior**) **nares** are the nostrils, leading from the nasal cavity to the outside. The two **internal** (or **posterior**) **nares** (**choanae**) are the openings leading from the nasal cavity into the pharynx.

**narrative ethics** an approach to ethical problems and practice that involves listening to and interpreting people's stories rather than applying principles or rules to particular situations. This context-specific empathetic approach to patient and professional life stories is often contrasted with the universalizing rationalist approach of **\*Kantian ethics**. Narrative ethics has an obvious relevance to the doctor–patient relationship and mirrors the clinical context in which moral choices are made.

**NAS** *see* **NEONATAL ABSTINENCE SYNDROME**.

**nasal bone** either of a pair of narrow oblong bones that together form the bridge and root of the nose. *See* [SKULL](#).

**nasal bridle** a fixation device to prevent patients pulling out [\\*nasogastric \(NG\) tubes](#). Two tiny catheter-mounted magnets are inserted either side of the nasal septum to meet in the nasopharyngeal space. This leaves tapes exiting from each nostril. A clip then secures the tapes and NG tube together.

**nasal cavity** the space inside the nose that lies between the floor of the cranium and the roof of the mouth. It is divided into two halves by a septum: each half communicates with the outside via the nostrils and with the nasopharynx through the posterior nares.

**nasal concha (turbinate bone)** any of three thin scroll-like bones that form the sides of the [\\*nasal cavity](#). The **superior** and **middle nasal conchae** are part of the [\\*ethmoid bone](#); the **inferior nasal conchae** are a separate pair of bones of the face. *See* [SKULL](#).

**nasal flu vaccine** (in Britain), a vaccine currently offered to all 2- and 3-year-olds in the form of a spray into each nostril. It contains live forms of the influenza virus that have been attenuated (weakened). The vaccine stimulates the immune system but does not cause disease in healthy people.

**NASH** nonalcoholic steatohepatitis. *See* [NONALCOHOLIC FATTY LIVER DISEASE](#).

**nasion** *n.* the point on the bridge of the nose at the centre of the suture between the nasal and frontal bones.

**naso-** *combining form denoting the nose.*

**nasogastric tube** a tube passed through the nose into the stomach, used to aspirate fluid from, or introduce material into, the stomach (*see* [RYLE'S TUBE](#)).

**nasolacrimal** *adj.* relating to the nose and the lacrimal (tear-producing) apparatus.

**nasolacrimal duct** the duct that passes through the hole (**nasolacrimal canal**) in the palatine bone of the skull. It drains the tears away from the [\\*lacrimal](#)

**apparatus** into the inferior meatus of the nose.

**nasopharyngeal airway** a curved tube to be slotted down one nostril of an unconscious patient, to sit behind the tongue, to create a patent airway. *See also* **OROPHARYNGEAL AIRWAY**.

**nasopharynx (postnasal space, rhinopharynx)** *n.* the part of the **\*pharynx** that lies above the level of the junction of the hard and soft palates. It connects the **\*nasal cavity** to the **\*oropharynx**. —**nasopharyngeal** *adj.*

**natalizumab** *n.* a monoclonal antibody used for the treatment of severe relapsing-remitting multiple sclerosis: it reduces demyelination and inflammation by inhibiting migration of leucocytes into the central nervous system. Side-effects include an increased risk of neurological damage and opportunistic infections.

**natal teeth** teeth that are present at the time of birth.

**nateglinide** *n.* *see* **MEGLITINIDES**.

**nates** *pl. n.* the buttocks. —**natal** *adj.*

**national census** *see* **CENSUS**; **OFFICE FOR NATIONAL STATISTICS**.

**National Clinical Assessment Service** (NCAS) *see* **PRACTITIONER PERFORMANCE ADVICE**.

**National Health Service (NHS)** (in Britain) a comprehensive service offering therapeutic and preventive medical and surgical care, including the prescription and dispensing of medicines, spectacles, and medical and dental appliances. Exchequer funds pay for the services of doctors, nurses, and other professionals, as well as residential costs in NHS hospitals, and meet a substantial part of the cost of the medicines and appliances. Legislation enacted in 1946 was implemented in 1948 and the services were subjected to substantial reorganization in 1974 and again in 1982, 1991, 1999, and in 2013 as a result of the Health and Social Care Act 2012. In England overall responsibility is vested in the Secretary of State for Health. Responsibility for commissioning most services is held by **\*clinical commissioning groups**, consisting of GPs in a local area, and commissioning for primary care services and some specialized services is undertaken by **\*NHS England**.

Public health functions are largely delivered by local authorities, though some specialist functions are provided by *\*Public Health England*. The relationship between the Secretary of State for Health and the NHS also changed in 2013. The Secretary of State for Health, via the *\*Department of Health* and Social Care (DHSC), no longer has direct control of the day-to-day operation of the NHS. This has passed to NHS England. However, the DHSC continues to provide strategic leadership for the NHS.

Different arrangements apply in Northern Ireland, Wales, and Scotland.

<https://www.nhs.uk/>

- NHS website: includes much basic medical information together with a guide to local services

**National Institute for Health and Care Excellence** *see* *NICE*.

**National Institute for Health Research (NIHR)** a national organization, funded through the *\*Department of Health and Social Care*, that coordinates, supports, and funds research within the NHS.

<https://www.nihr.ac.uk/>

- NIHR website

**National Insurance** (in Britain) a compulsory scheme of insurance under the terms of which employers and employees make joint contributions so that those who have contributed for a qualifying period may claim national insurance benefits in times of sickness, injury, maternity leave, unemployment, and retirement; self-employed persons pay all their own contributions. Those who do not qualify under the terms of this insurance scheme may also receive financial payments in times of need, but only subject to a means test.

**National Patient Safety Agency (NPSA)** formerly, a special health authority that led and coordinated work to improve all aspects of patient safety in England. The NPSA comprised three divisions: the **National Reporting and Learning Service**, the **National Research Ethics Service**,

and the **National Clinical Assessment Service**. It closed in 2012, with its key functions transferred to [\\*NHS England](#). In 2016 the same functions were transferred from NHS England to the newly formed [\\*NHS Improvement](#).

**national service frameworks (NSFs)** formerly, national standards of care published for a variety of conditions and patient groups (the first were for coronary heart disease and mental health). NSFs were ten-year programmes designed to improve, and reduce variations in, the quality of care by defining long-term strategies for delivery of the standards and by setting specific goals. The NSFs were dropped in the reform of the NHS after 2010 and subsequent establishment of [\\*NHS England](#).

**National Statistics Socio-economic Classification (NS-SEC)** an occupational classification of the national population that was developed to replace older systems based on **social classes** and **socio-economic groups**. The groupings are intended to stratify the population according to different forms of employment: households are classified according to the occupation of the household reference person (the person renting, owning, or otherwise responsible for accommodation). The NS-SEC is used for official surveys and statistics, including the [\\*census](#). The analytic version of the classification has eight classes and is the version used for most analyses.

**natriuresis** *n.* the excretion of sodium in the urine, especially in greater than normal amounts.

**natriuretic** *n.* an agent that promotes the excretion of sodium salts in the urine. Most [\\*diuretics](#) are natriuretics.

**natriuretic peptide** any of several peptides that stimulate diuresis (increased urine production) and vasodilatation (widening of blood vessels). They act on the kidney tubules to promote excretion of sodium (natriuresis) and water. **Atrial natriuretic peptide (ANP)** is produced in the atria of the heart in response to a rise in atrial pressure. **Brain natriuretic peptide (BNP)** is produced in the brain and the ventricles of the heart, mainly in response to stretching of the ventricular muscle (as occurs in congestive heart failure). Measurement of blood levels of BNP can be used as a diagnostic test for heart failure and also as an indicator of prognosis.

**natural killer cell (NK cell)** a type of [\\*lymphocyte](#) that is able to kill virus-infected cells and cancerous cells and mediates rejection of bone-marrow

grafts. NK cells are a part of natural (or innate) [\\*immunity](#). Their function is regulated by a balance between activating receptors, which recognize proteins on cancerous or virus-infected cells, and inhibitory receptors specific for certain molecules encoded by the [\\*HLA system](#).

**naturopathy** *n.* a system of medicine that relies upon the use of only ‘natural’ substances for the treatment of disease, rather than drugs. Herbs, food grown without artificial fertilizers and prepared without the use of preservatives or colouring material, pure water, sunlight, and fresh air are all employed in an effort to rid the body of ‘unnatural’ substances, which are said to be at the root of most illnesses.

**nausea** *n.* the feeling that one is about to vomit, as experienced in seasickness and in morning sickness of early pregnancy. Actual vomiting often occurs subsequently.

**navel** *n.* *see* [UMBILICUS](#).

**navicular bone** a boat-shaped bone of the ankle (*see* [TARSUS](#)) that articulates with the three cuneiform bones in front and with the talus behind.

**NEAD** *see* [NON-EPILEPTIC ATTACK DISORDE](#).

**nearthrosis** *n.* *see* [PSEUDARTHROSIS](#).

**nebula** *n.* a faint opacity of the cornea that remains after an ulcer has healed.

**nebulizer** *n.* an instrument used for applying a liquid in the form of a fine spray.

**NEC** *see* [NECROTIZING ENTEROCOLITIS](#).

**Necator** *n.* a genus of [\\*hookworms](#) that live in the small intestine. The human hookworm, *N. americanus*, occurs in tropical Africa, Central and South America, India, and the Pacific Islands. The worm possesses two pairs of sharp cutting plates inside its mouth cavity, which enable it to feed on the blood and tissues of the gut wall. *Compare* [ANCYLOSTOMA](#).

**necatoriasis** *n.* an infestation of the small intestine by the parasitic hookworm *Necator americanus*. *See also* [HOOKWORM DISEASE](#).

**necessity** *n.* the ethical and legal doctrine that provides justification for doing something that might otherwise be seen as blameworthy when the consequences of not doing so would be worse. For example, doctors have no right to touch a patient without consent, yet might be considered lacking in duty of care if they did not restrain patients who were about to kill themselves. See also PATERNALISM.

**neck** *n.* **1.** the part of the body that connects the head and the trunk. It is the region supported by the *\*cervical vertebrae*. **2.** *see* CERVIX.

**necro-** *combining form denoting death or dissolution.*

**necrobiosis** *n.* a gradual process by which cells lose their function and die. **Necrobiosis lipoidica** is a disease in which degeneration of collagen produces sharply demarcated yellowish-brown plaques, especially on the shins of women. The association with diabetes mellitus is controversial.

**necrology** *n.* the study of the phenomena of death, involving determination of the moment of death and the different changes that occur in the tissues of the body after death.

**necropsy** *n.* *see* AUTOPSY.

**necrosis (mortification)** *n.* the death of some or all of the cells in an organ or tissue, caused by disease, physical or chemical injury, or interference with the blood supply (*see* GANGRENE). **Caseous necrosis** occurs in pulmonary tuberculosis, the lung tissue becoming soft, dry, and cheeselike. **Coagulative necrosis** – the commonest form of necrosis – occurs in almost all organs (except the brain) and results in a solid mass of dead tissue. **Colliquative necrosis** occurs in the brain, where the absence of stroma (connective tissue) results in total liquefaction of necrotic tissue. —**necrotic** *adj.*

**necropermia** *n.* the presence of either dead or motionless spermatozoa in the semen. *See* INFERTILITY.

**necrotizing enterocolitis (NEC)** a serious disease affecting the bowel during the first three weeks of life; it is much more common in preterm babies. The abdomen distends and blood and mucus appear in the stools; the bowel may perforate. Treatment is to rest the bowel and administer

antibiotics. If the bowel becomes necrotic, surgery may be necessary. The cause is unknown but the disease may be the result of a reduced supply of oxygen to the bowel or infection.

**necrotizing fasciitis** a life-threatening bacterial infection of the layer of **\*fascia** beneath the skin, usually by *Streptococcus* Type A. Symptoms appear rapidly after initial infection; they include a rash with blistering and discoloration of the skin, pain and inflammation of lymph nodes, fever, drowsiness, diarrhoea, and vomiting. Tissue necrosis and toxin production can result in shock and possible multi-organ failure. Necrotizing fasciitis is often associated with vascular disease, especially in diabetics, and the elderly and those who have recently undergone surgery are also vulnerable to the infection, which requires prompt treatment with intravenous antibiotics and excision of the involved tissue.

**nedocromil** *n.* a drug, related to sodium **\*cromoglicate**, used to prevent asthma attacks and to treat allergic conjunctivitis. Possible side-effects include local irritation.

**need** *n.* what is required rather than simply desired or wanted. In allocating limited health-care resources, clinical need is often defined as the capacity to benefit from an intervention and assessed on a utilitarian basis (*see* **QUALITY OF LIFE**). Other conceptions of need, such as the state of requiring rescue from a life-threatening situation, are based on **\*deontology**.

**needle** *n.* a slender sharp-pointed instrument used for a variety of purposes. The size and shape of needles used in surgery for stitching tissue depend on the type of surgery. Most surgical needles have suture material fused onto them (so-called **atraumatic needles**). Hollow needles are used to inject substances into the body (in hypodermic syringes), to obtain specimens of tissue (*see* **PUNCTURE**), or to withdraw fluid from a cavity (*see* **ASPIRATION**; **BIOPSY**). *See also* **STOP NEEDLE**.

**needle-stick injury** a common accidental injury to the fingers and hands of nurses and doctors by contaminated injection needles. It can result in transmitted infections (e.g. hepatitis, AIDS).

**needling** *n.* the use of a sharp needle to make a hole in the lens capsule, usually to deal with the haze developing in the posterior capsule after

cataract. This technique has now largely been replaced by use of the **\*YAG laser**.

**negative feedback loop** a physiological loop for the control of hormone production by a gland. High levels of a circulating hormone act to reduce production of the releasing factors triggering its own production, i.e. they have a negative **\*feedback** on these trigger factors. As circulating levels of the hormone fall, the negative feedback is reduced and the releasing factor starts to be produced again, allowing the hormone level to rise again.

**negative symptoms** (in psychiatry) symptoms of schizophrenia characterized by a deficiency in or absence of some aspect of functioning, such as social withdrawal, loss of initiative, and blunted affect. *Compare* **POSITIVE SYMPTOMS**.

**negativism** *n.* behaviour that is the opposite of that suggested by others. In **active negativism** the individual does the opposite of what is asked for (for example, screws the eyes up when asked to open them). In **\*psychosis** it is usually associated with other features of **\*catatonia**. In **passive negativism** the person fails to cooperate (for example, stops eating). This occurs in **\*schizophrenia** and **\*depression**.

**neglected tropical diseases (NTDs)** as defined by the **\*World Health Organization** (WHO), a diverse group of **\*communicable diseases** found almost entirely among poor populations in tropical and subtropical parts of Africa, Asia, and the Americas. Although they affect more than 1.4 billion people, and countermeasures would in many cases be inexpensive, NTDs have traditionally received far less attention than the major infectious diseases HIV/AIDS, tuberculosis, and malaria. In 2013 the WHO resolved to intensify its efforts to eradicate or control NTDs. The current WHO list identifies 24 such diseases, including **\*Buruli ulcer**, **\*chikungunya fever**, **\*dengue**, **\*leishmaniasis**, and **\*Madura foot** (mycetoma).

**neglect syndrome** *see* **HEMISPATIAL NEGLECT**.

**negligence** *n.* failure by a health-care professional to exercise a reasonable standard of care, as defined in the UK by the **\*Bolam and Bolitho tests**, which ask whether the care provided fell short of that of a reasonable body of professional opinion and whether actions or omissions withstand logical

analysis (the determination of which falls to the court). In order to establish negligence a claimant must show that a doctor had a **\*duty** of care, that he or she breached this duty by falling below the expected standard of care, and that foreseeable harm was caused as a result of the professional's conduct. The standard of proof in negligence actions is that of the civil law (i.e. on the balance of probabilities). Payment of **\*compensation** to the claimant upon proving negligence is required by the UK civil law. Rarely, doctors may be charged with the criminal offence of manslaughter by gross negligence, which must be proved according to the standards of the criminal law (beyond reasonable doubt). If convicted, the sentence for gross negligence cases is likely to be custodial.

**Neisseria** *n.* a genus of spherical Gram-negative aerobic nonmotile bacteria characteristically grouped in pairs. They are parasites of animals, and some species are normal inhabitants of the human respiratory tract. The species *N. gonorrhoeae* (the **gonococcus**) causes **\*gonorrhoea**. Gonococci are found within pus cells of urethral and vaginal discharge; they can be cultured only on serum or blood agar. *N. meningitidis* (the **meningococcus**) causes meningococcal **\*meningitis**. Meningococci are found within pus cells of infected cerebrospinal fluid and blood or in the nasal passages of carriers. They too can only be cultured on serum or blood agar.

**Nelson's syndrome** a condition in which an **\*ACTH**-producing pituitary tumour expands after loss of negative **\*feedback** following bilateral adrenalectomy for Cushing's disease. (see **CUSHING'S SYNDROME**) Hyperpigmentation due to excess pituitary MSH secretion is a prominent feature. Nelson's syndrome has become rare because the standard treatment for Cushing's disease is now surgical removal of the tumour; bilateral adrenalectomy is used only in extreme circumstances. [D. H. Nelson (1925–2009), US physician]

**nematode (roundworm)** *n.* any one of a large group of worms having an unsegmented cylindrical body, tapering at both ends. This distinguishes nematodes from other **\*helminths**. Nematodes occur either as free-living forms in the sea, fresh water, and soil or as parasites of plants, animals, and humans. **\*Hookworms** and **\*threadworms** infest the alimentary canal. **\*Filariae** are found in the lymphatic tissues. The **\*guinea worm** and **\*Onchocerca** affect connective tissue. Some nematodes (e.g. threadworms)

are transmitted from host to host by the ingestion of eggs; others (e.g. *\*Wuchereria*) by the bite of a bloodsucking insect.

**neiosis** *n.* the activation of normal fibroblasts that occurs if they cluster and make cell-to-cell contact. This induces the production of *\*chemokines*, *\*growth factors*, enzymes, etc., which can influence cancer cells and inflammation. It leads to programmed cell death (*see* **APOPTOSIS**).

**neo-** *combining form denoting new or newly formed.*

**neoadjuvant chemotherapy** chemotherapy that is given before the (usually) surgical treatment of a primary tumour with the aim of shrinking the tumour and therefore improving the results of surgery or radiotherapy and preventing the development of metastases. *Compare* **ADJUVANT THERAPY**.

**neocerebellum** *n.* the middle lobe of the *\*cerebellum*, excluding the pyramid and uvula. In evolutionary terms it is the newest part, occurring only in mammals.

**neointimal hyperplasia** a pathological process involved in *\*atherosclerosis* of arteries and vein grafts, and in *\*restenosis*, that may be in response to angioplasty and stent placement. Damage to the endothelium of the artery exposes the underlying smooth muscle cells in the *\*media* to cytokines, growth factors, and other plasma components in the circulation, which results in loss of their contractile characteristics. These abnormal muscle cells migrate to the *\*intima*, where they proliferate and eventually form a thick layer of tissue (neointima), which occludes the artery.

**neologism** *n.* (in psychiatry) the invention of words that do not exist in one's language. It is common in childhood, but when it occurs in an adult it may be a symptom of a psychotic illness, such as *\*schizophrenia*. It should be distinguished from *\*paraphasia*, in which new meanings are attached to ordinary words.

**neomycin** *n.* an *\*aminoglycoside* antibiotic used to treat infections caused by a wide range of bacteria, mainly those affecting the skin, ears, and eyes. It is sometimes given by mouth to sterilize the bowel before surgery.

**neonatal abstinence syndrome (NAS)** symptoms and signs exhibited by a newborn baby (neonate) due to drug withdrawal (*see* **DEPENDENCE**). This

results when the fetus has been exposed to addictive drugs through maternal substance abuse or misuse. Symptoms tend to occur in the first few days of life (in the case of methadone, which is a long-acting opioid, symptom onset may be delayed). They include tremors and jerking, high-pitched crying, sneezing, sucking of fists, feeding difficulties, shortened periods of sleep between feeds, rapid breathing, sweating, loose stools, nasal stuffiness, and frequent yawning. Treatment includes swaddling or snugly wrapping in a blanket, as babies with NAS are often difficult to comfort. Other nonpharmacological measures include frequent small feeds using high-calorie formula and intravenous fluids if babies become dehydrated. Drug therapy may be used for seizures and withdrawal symptoms.

**neonatal early warning score** an assessment tool for newborn babies, consisting of a chart in which a combination of **\*vital signs**, neurological involvement, observation of blue skin and lips, and level of behavioural response indicate the appropriate level of concern. It is colour-coordinated from red to green to enable standardized escalation of concerns about the sick baby.

**neonatal mortality rate** *see* **INFANT MORTALITY RATE**.

**neonatal screening** **\*screening tests** carried out on newborn babies to detect diseases that appear in the neonatal period, such as phenylketonuria (*see* **GUTHRIE TEST**). If these diseases are detected early enough, treatment may be instigated before any irreversible damage occurs to the baby.

**neonatal teeth** teeth that emerge through the gingiva (gums) during the first month of life.

**neonatal urticaria** *see* **ERYTHEMA**.

**neonate** *n.* an infant at any time during the first 28 days of life. The word is particularly applied to infants just born or in the first week of life. — **neonatal** *adj.*

**neopallium** *n.* an enlargement of the wall of each cerebral hemisphere. In evolutionary terms it is the newest part of the cerebrum, formed by the development of new pathways for sight and hearing in mammals.

**neoplasia** *n.* a form of abnormal growth that is independent of the body's normal homeostatic growth-regulating mechanisms, continues after the initiating stimulus has been removed, and is purposeless. Neoplasia is always pathological. *See* CERVICAL INTRAEPITHELIAL NEOPLASIA; MENS; PROSTATIC INTRAEPITHELIAL NEOPLASIA; VULVAL INTRAEPITHELIAL NEOPLASIA. *Compare* HYPERPLASIA. —**neoplastic** *adj.*

**neoplasm** *n.* any new and abnormal growth: any \*benign or \*malignant tumour. —**neoplastic** *adj.*

**neosphincter** *n.* a substituted muscle or an implant for an absent or ineffective sphincter (*see* ARTIFICIAL SPHINCTER).

**neostigmine** *n.* an \*anticholinesterase drug used mainly to diagnose and treat \*myasthenia gravis and to reverse the action of nondepolarizing \*muscle-relaxant drugs used during surgery. Side-effects include abdominal cramps, diarrhoea, increased salivation, and a slow heart rate (\*bradycardia).

**neovascularization** *n.* the abnormal formation of new and fragile blood vessels, usually in response to ischaemia. In **choroidal neovascularization**, which occurs in such conditions as \*macular degeneration, abnormal vessels, derived from the \*choroid, form in the space between the retinal pigment epithelium (RPE) and the choroid (*see* RETINA).

**nephro-** (**nephro-**) *combining form denoting the kidney(s).*

**nephralgia** *n.* pain in the kidney. The pain is felt in the loin and can be caused by a variety of kidney complaints.

**nephrectomy** *n.* surgical removal of a kidney. When performed for cancer of the kidney, the entire organ is removed together with its surrounding fat and the adjacent adrenal gland (**radical nephrectomy**). When performed for a benign condition the procedure is called a **simple nephrectomy**. Removal of either the upper or lower pole of the kidney is termed **partial nephrectomy**. The operation can be performed by \*laparoscopy.

**nephrin** *n.* a transmembrane protein localized to the slit diaphragm of the \*podocyte and necessary for the proper functioning of the renal filtration

barrier. The latter consists of fenestrated endothelial cells, the basement membrane, and the epithelial podocyte. A defect in the gene coding for nephrin (*NPHS1*) on chromosome 19 results in congenital nephrotic syndrome of Finnish type (which is not exclusive to the Finnish population).

**nephritic syndrome** generalized inflammation of the glomeruli of the kidneys resulting in a reduction in *\*glomerular filtration rate*, with mild oedema and hypertension resulting from renal salt and water retention. Urine analysis shows the presence of proteinuria and microscopic haematuria with red cell casts. Common and usually self-limiting causes are *\*Berger's nephropathy* and poststreptococcal glomerulonephritis. Less common but more serious causes of the nephritic syndrome are the vasculitides (*see VASCULITIS*) and *\*Goodpasture's disease*, which, untreated, usually prove fatal.

**nephritis (Bright's disease)** *n.* inflammation of the kidney. Nephritis is a nonspecific term used to describe a condition resulting from a variety of causes. *See GLOMERULONEPHRITIS.*

**nephroblastoma (Wilms' tumour)** *n.* a malignant tumour arising from the embryonic kidney and occurring in young children, usually below the age of three and rarely over the age of eight. In approximately 5% of cases it involves both kidneys. Treatment consists of removing the kidney (*see NEPHRECTOMY*) and giving chemotherapy and sometimes radiotherapy. Although almost half the cases have spread by the time diagnosis is made, this does not prevent a cure: the number of children that survive at least five years after diagnosis is improving, being currently around 75%. In some children the tumour is associated with an abnormality of chromosome number 13; in these cases other features, such as absence of the iris in the eye (*see ANIRIDIA*) and *\*hemihypertrophy*, are present. In other cases there is an association with congenital nephropathy and intersex disorders (*see DENYS-DRASH SYNDROME*).

**nephrocalcinosis** *n.* the presence of calcium deposits in the kidneys. This can be caused by excess calcium in the blood, as caused by overactivity of the parathyroid glands, or it may result from an underlying abnormality of the kidney. The cause of nephrocalcinosis must be detected by full biochemical, radiological, and urological investigation so that appropriate treatment can be undertaken.

**nephrogenic cord** either of the paired ridges of tissue that run along the dorsal surface of the abdominal cavity of the embryo. Parts of it develop into the kidney, ovary, or testis and their associated ducts. Intermediate stages of these developments are the *\*pronephros*, *\*mesonephros*, and *\*metanephros*.

**nephrogenic diabetes insipidus (NDI)** a condition characterized by *\*polyuria* and *\*polydipsia* and due to failure of the renal tubules to respond, or to respond fully, to *\*vasopressin*. One form of congenital NDI is caused by an X-linked (*see* **SEX-LINKED**) dominant mutation of the gene encoding the vasopressin V2 receptor. A rarer form of congenital NDI is an autosomal recessive condition associated with genetic mutations in the gene encoding AQP-2 water channels (*see* **AQUAPORIN**). Acquired NDI is much commoner than the congenital form and usually less severe. It is present in most patients with advancing chronic renal failure, is a feature of certain electrolyte disorders (hypokalaemia, hypercalcaemia), and can complicate chronic lithium treatment.

**nephrogenic systemic fibrosis (NSF, nephrogenic fibrosing dermopathy)** a rare condition, first reported in 1997, that occurs exclusively in patients with chronic kidney disease (CKD), who develop large areas of hardened skin with fibrotic nodules and plaques. Flexion contractures with an accompanying limitation of range of motion can also occur. Exposure to gadolinium, used as a contrast agent in magnetic resonance imaging, has been identified as a causative factor, but many patients with severe CKD have been exposed to gadolinium without consequence. Linear gadolinium preparations (Omniscan, OptiMARK) appear to carry the highest risk of NSF. There is no cure for the condition.

**nephrolithiasis** *n.* the presence of stones in the kidney (*see* **CALCULUS**). Such stones can cause pain and blood in the urine, but they may produce no symptoms. Full investigation is undertaken to determine the underlying cause of stone formation. When stones are associated with urinary obstruction and infection they usually require surgical removal (*see* **NEPHROLITHOTOMY**; **PYELOLITHOTOMY**).

**nephrolithotomy** *n.* the surgical removal of a stone from the kidney by an incision into the kidney substance. It is normally performed in combination

with an incision into the renal pelvis (see [PYEOLITHOTOMY](#)). *See also* [PERCUTANEOUS NEPHROLITHOTOMY](#).

**nephrology** *n.* the branch of medicine concerned with the study, investigation, and management of diseases of the kidney. *See also* [UROLOGY](#). —**nephrologist** *n.*

**nephron** *n.* the active unit of excretion in the kidney (see illustration). Blood, which is supplied by branches of the renal artery, is filtered through a knot of capillaries (**glomerulus**) into the cup-shaped **Bowman's capsule** so that water, nitrogenous waste, and many other substances (excluding colloids) pass into the **renal tubule**. Here most of the substances are reabsorbed back into the blood, the remaining fluid ([\\*urine](#)) passing into the collecting duct, which drains into the [\\*ureter](#).

**A single nephron.**

**nephropathy** *n.* disease of the kidney. *See also* BALKAN NEPHROPATHY; BERGER'S NEPHROPATHY; CAST NEPHROPATHY; CHINESE HERB NEPHROPATHY; DIABETIC NEPHROPATHY; HAN; HIVAN; HYPERCALCAEMIC NEPHROPATHY; HYPOKALAEMIC NEPHROPATHY; MEMBRANOUS NEPHROPATHY; MINIMAL CHANGE NEPHROPATHY; SICKLE-CELL NEPHROPATHY.

**nephropexy** *n.* an operation to fix a mobile kidney. The kidney is fixed to the twelfth rib and adjacent posterior abdominal wall to prevent descent of the

kidney on standing (see [NEPHROPTOSIS](#)). It is now usually performed laparoscopically.

**nephroptosis** *n.* abnormal descent of a kidney into the pelvis on standing, which may occur if it is excessively mobile (for example, in thin women). If this is accompanied by pain and obstruction to free drainage of urine by the kidney, [\\*nephropexy](#) may be advised.

**nephrosclerosis** *n.* hardening of the arteries and arterioles of the kidneys. **Benign nephrosclerosis** is associated with essential hypertension. There is preferential involvement of the preglomerular arterial vessels, primarily the afferent arteriole and the interlobular artery. The classic arterial lesion, which is termed **arteriosclerosis**, involves replacement of smooth muscle cells in the media of the vessel by connective tissue. There is often evidence of ischaemia in the glomerulus and [\\*tubulointerstitium](#). Functionally there may be some degree of renal impairment. End-stage renal failure is uncommon, but more likely to occur in Afro-Caribbeans. **Malignant nephrosclerosis** is the hallmark of [\\*malignant hypertension](#), with arterioles showing mucoid change, endothelial cell swelling, and fibrinoid necrosis. The lumen of the vessel is reduced and red cells fragmented in their passage through the narrowing. The kidney shows petechial haemorrhage on the subcapsular surface, with mottling and areas of infarction. Malignant nephrosclerosis can lead to a very rapid destruction of renal function and is recognized as a potential cause of acute renal failure.

**nephroscope** *n.* an instrument ([\\*endoscope](#)) used for examining the interior of the kidney, usually passed into the renal pelvis through a track from the skin surface after needle [\\*nephrostomy](#) and dilatation of the tract over a guidewire. The nephroscope allows the passage of instruments under direct vision to remove calculi (see [PERCUTANEOUS NEPHROLITHOTOMY](#)), or to disintegrate them using ultrasound probes or pneumatic energy via a lithoclast, or a combination of the two.

**nephroscopy** *n.* inspection of the interior of the kidney with a [\\*nephroscope](#).

**nephrosis** *n.* (in pathology) degenerative changes in the epithelium of the kidney tubules. The term is sometimes used loosely for the [\\*nephrotic syndrome](#).

**nephrostogram** *n.* X-ray imaging (see **FLUOROSCOPY**) of the interior of the kidney and ureter after injecting a radiographic **\*contrast medium** through a catheter placed inside the renal pelvis (see **NEPHROSTOMY**). This procedure is done to check for any problems with the drainage of urine from the pelvis to the ureter.

**nephrostomy** *n.* drainage of urine from the kidney by a tube (catheter) passing through the kidney into the renal pelvis via the skin surface. The procedure is performed by a urologist or an interventional radiologist, often under ultrasound guidance. This is commonly used as a temporary procedure to alleviate renal obstruction. Long-term urine drainage by nephrostomy may be complicated by the attendant problems of infection and obstruction of the catheter by debris. Nephrostomy is also performed to enable the passage of a **\*nephroscope**.

**nephrotic syndrome (NS)** a condition defined by the triad of peripheral oedema, heavy proteinuria (>3.5 g/day), and hypoalbuminaemia (serum albumin usually >25 g/l). In most cases there is hypercholesterolaemia and lipiduria. There are many causes of the nephrotic syndrome. In children, the main cause is **\*minimal change nephropathy**, which is usually steroid-responsive. In adults, minimal change disease is still an important cause of NS, but is responsible for only a minority of cases. Many of the other causes of NS in adults are unlikely to respond to steroids and it is therefore usual practice to perform a biopsy before considering specific treatment. The commonest causes of NS in adults are **\*diabetic nephropathy**, **\*focal segmental glomerulosclerosis**, and **\*membranous nephropathy**. Pre-eclampsia is an important cause in late pregnancy.

**nephrotomy** *n.* surgical incision into the substance of the kidney. This is usually undertaken to remove a kidney stone (see **NEPHROLITHOTOMY**).

**nephrotoxic** *adj.* liable to cause damage to the kidneys. Nephrotoxic drugs include **\*aminoglycoside** antibiotics, sulphonamides, and gold compounds.  
—**nephrotoxicity** *n.*

**nephroureterectomy (ureteronephrectomy)** *n.* the surgical removal of a kidney together with its ureter. This operation is performed for cancer of the kidney pelvis or ureter. It is also undertaken when the kidney has been destroyed by **\*vesicoureteric reflux**, to prevent subsequent continuing reflux

into the stump of the ureter that would occur if only the kidney were removed.

**nerve** *n.* a bundle of conducting **\*nerve fibres** (see illustration) that transmit impulses from the brain or spinal cord to the muscles and glands (**motor nerves**) or inwards from the sense organs to the brain and spinal cord (**sensory nerves**). Most large nerves are **mixed nerves**, containing both motor and sensory nerve fibres running to and from a particular region of the body.

**Nerve.** Transverse section through a peripheral nerve with five fascicles.

**nerve block** a method of producing **\*anaesthesia** in part of the body by blocking the passage of pain impulses in the sensory nerves supplying it. A local anaesthetic, such as lidocaine, is injected into the tissues in the region of a nerve. In this way anaesthesia can be localized, so that minor operations can be performed without the necessity of giving a general anaesthetic. A **\*ring block** is a common technique used for anaesthetizing a digit.

**nerve cell** *see* NEURON.

**nerve conduction study** a test done to assess the peripheral nervous system. It involves activating the nerves electronically with electrical pulses and measuring the responses obtained.

**nerve ending** the final part (terminal) of one of the branches of a nerve fibre, where a **\*neuron** makes contact either with another neuron at a synapse or with a muscle or gland cell at a neuromuscular or neuroglandular junction.

**nerve entrapment syndrome** any syndrome resulting from pressure on a nerve from surrounding structures. Examples include the **\*carpal tunnel syndrome** and **\*meralgia paraesthetica**.

**nerve fibre** the long fine process that extends from the cell body of a **\*neuron** and carries nerve impulses. Bundles of nerve fibres running together form a **\*nerve**. Each fibre has a sheath, which in medullated nerve fibres is a relatively thick layer containing the fatty insulating material **\*myelin**.

**nerve gas** any gas that disrupts the normal functioning of nerves and thus of the muscles they supply. There are two groups, the **G agents** and the **V agents**. The latter are more than 300 times as deadly as mustard gas: one inhalation can kill by paralysing the respiratory muscles. V agents also act through the skin, therefore gas masks are ineffective protection against them.

**nerve growth factor (NGF)** a protein (see **GROWTH FACTOR**), consisting of two polypeptide chains, that is required for the development and longevity of some neurons, including those in the sympathetic nervous system and some central nervous system and sensory neurons. Nerve growth factor is necessary for axon growth and also for initiating new neuronal connections with other cells. The role of NGFs in preventing the degeneration of brain cells is being explored in research into Alzheimer's disease.

**nerve impulse** the electrical activity in the membrane of a **\*neuron** that – by its rapid spread from one region to the next – is the means by which information is transmitted within the nervous system along the axons of the neurons. The membrane of a resting nerve is charged (**polarized**) because of the different concentrations of ions inside and outside the cell. When a nerve impulse is triggered, a wave of **\*depolarization** spreads, and ions flow across the membrane (see **ACTION POTENTIAL**). Until the nerve has undergone **\*repolarization** no further nerve impulses can pass.

**nerve regeneration** the growth of new nerve tissue, which occurs at a very slow rate (1–2 mm per day) after a nerve has been severed and is often partially or totally incomplete. *\*Microsurgery* has improved the results by facilitating primary repair in the immediate aftermath of injury. *See also* **AXONOTMESIS**; **NEUROTMESIS**.

**nervous breakdown** a nonmedical term applied to a range of emotional crises varying from a brief attack of ‘hysterical’ behaviour to a major *\*mental illness*. The term is also sometimes used as a euphemism for a frank psychiatric illness, such as *\*schizophrenia*.

**nervous system** the vast network of cells specialized to carry information (in the form of *\*nerve impulses*) to and from all parts of the body in order to bring about bodily activity. The brain and spinal cord together form the *\*central nervous system*; the remaining nervous tissue is known as the *\*peripheral nervous system* and includes the *\*autonomic nervous system*, which is itself divided into the sympathetic and parasympathetic nervous systems. The basic functional unit of the nervous system is the *\*neuron* (nerve cell).

**Nesbit’s operation** an operation devised to surgically straighten a congenitally curved penis but now more frequently employed to correct the penile curvature caused by *\*Peyronie’s disease*. The procedure can often result in penile shortening. [R. M. Nesbit (20th century), US surgeon]

**nesidioblastosis** *n.* a rare condition of childhood in which abnormal cells in the pancreas fail to mature properly and secrete a selection of hormones (including insulin) in an uncontrolled manner. This causes a variety of problems, including recurrent *\*hypoglycaemia*. It can sometimes be treated with medication; if this fails, surgical removal of a portion of the pancreas may be necessary.

**NETs** neuroendocrine tumours. *See* **NEUROENDOCRINE SYSTEM**.

**nettle rash** *see* **URTICARIA**.

**neur- (neuro-)** *combining form denoting* nerves or the nervous system.

**neural arch** *see* **VERTEBRA**.

**neural crest** the two bands of ectodermal tissue that flank the **\*neural plate** of the early embryo. Cells of the neural crest migrate throughout the embryo and develop into sensory nerve cells and peripheral nerve cells of the autonomic nervous system.

**neuralgia** *n.* a severe burning or stabbing pain often following the course of a nerve. **Postherpetic neuralgia** is an intense debilitating pain felt at the site of a previous attack of shingles. In **trigeminal neuralgia** (**tic douloureux**) there are brief paroxysms of searing pain felt in the distribution of one or more branches of the **\*trigeminal nerve** in the face. Trigeminal neuralgia is managed principally by prescription of **\*carbamazepine**. **Migrainous neuralgia** is characterized by severe unilateral pain around one eye (*see* **CLUSTER HEADACHE**).

**neural plate** the strip of ectoderm lying along the central axis of the early embryo that forms the **\*neural tube** and subsequently the central nervous system.

**neural spine** the spinous process situated on the neural arch of a **\*vertebra**.

**neural tube** the embryological structure from which the brain and spinal cord develop. It is a hollow tube of ectodermal tissue formed when two edges of a groove in a plate of primitive neural tissue (**neural plate**) come together and fuse. Failure of normal fusion results in a number of congenital defects (*see* **NEURAL TUBE DEFECTS**).

**neural tube defects** a group of congenital abnormalities caused by failure of the **\*neural tube** to form normally. In **\*spina bifida** the bony arches of the spine, which protect the spinal cord and its coverings (the meninges), fail to close. More severe defects of fusion of these bones will result in increasingly serious neurological conditions. A **meningocele** is the protrusion of the meninges through the gap in the spine, the skin covering being vestigial. There is a constant risk of damage to the meninges, with resulting infection. Urgent surgical treatment to protect the meninges is therefore required. In a **meningomyelocele** (**myelomeningocele**, **myelocele**) the spinal cord and the nerve roots are exposed, often adhering to the fine membrane that overlies them. There is a constant risk of infection and this condition is accompanied by paralysis and numbness of the legs and urinary incontinence. **\*Hydrocephalus** and an **\*Arnold–Chiari malformation** are

usually present. A failure of fusion at the cranial end of the neural tube (**cranium bifidum**) gives rise to comparable disorders. The bone defect is most often in the occipital region of the skull but it may occur in the frontal or basal regions. A protrusion of the meninges alone is known as a **cranial meningocele**. The terms **meningoencephalocele**, **encephalocele**, and **cephalocele** are used for the protrusion of brain tissue through the skull defect. This is accompanied by severe mental and physical disorders.

**neuraminidase (NA, N)** a glycoprotein projecting from the surface layer of the lipid bilayer envelope of **\*influenza** virions. It attacks sialic acid residues on host cells and may be involved in virus release. It is a key target for antibody attack and therefore is important in vaccination.

**neurapraxia** *n.* temporary loss of nerve function resulting in tingling, numbness, and weakness. It is usually caused by compression of the nerve and there is no structural damage involved. Complete recovery occurs. *Compare* **AXONOTMESIS**; **NEUROTMESIS**.

**neurasthenia** *n.* a set of psychological and physical symptoms, including fatigue, irritability, headache, dizziness, and intolerance of noise. It can be caused by organic damage, such as a head injury, or it can be due to anxiety. —**neurasthenic** *adj., n.*

**neurectasis** *n.* the surgical procedure for stretching a peripheral nerve.

**neurectomy** *n.* the surgical removal of the whole or part of a nerve.

**neurilemma (neurolemma)** *n.* the sheath of the **\*axon** of a nerve fibre. The neurilemma of a medullated fibre contains **\*myelin** laid down by Schwann cells. —**neurilemmal** *adj.*

**neurilemmoma (neurinoma)** *n.* a benign slow-growing tumour that arises from the neurilemma of a nerve fibre.

**neurinoma** *n.* *see* **NEURILEMMOMA**.

**neuritis** *n.* a disease of the peripheral nerves showing the pathological changes of inflammation. The term is also used in a less precise sense as an alternative to **\*neuropathy**. *See also* **RETROBULBAR NEURITIS**.

**neuroanatomy** *n.* the study of the structure of the nervous system, from the gross anatomy of the brain down to the microscopic details of neurons.

**neurobiotaxis** *n.* the predisposition of a nerve cell to move towards the source of its stimuli during development.

**neuroblast** *n.* any of the nerve cells of the embryo that give rise to functional nerve cells (neurons).

**neuroblastoma** *n.* a malignant tumour, usually of childhood, composed of embryonic nerve cells. It may originate in any part of the sympathetic nervous system, most commonly in the medulla of the adrenal gland, and secondary growths are often widespread in other organs and in bones. It can nevertheless be very responsive to systemic chemotherapy.

**neurocardiogenic syncope (malignant vasovagal syndrome)** recurrent loss of consciousness due to a drop in blood pressure mediated by *\*vasodilatation*, *\*bradycardia*, or a combination of the two. Attacks resemble a simple faint, but can be very disabling because they are much more frequent and severe. Treatment comprises increased fluid and salt intake together with training in postural manoeuvres that may prevent attacks. A variety of drug treatments is available, but these are commonly ineffective. Implantation of a permanent *\*pacemaker* may be required if profound bradycardia is a feature.

**neurocranium** *n.* the part of the skull that encloses the brain.

**neurodermatitis** *n.* *see* **LICHEN SIMPLEX CHRONICUS**.

**neuroendocrine system** the system of dual control of certain activities of the body by means of both nerves and circulating hormones. The functioning of the autonomic nervous system is particularly closely linked to that of the pituitary and adrenal glands. The system can give rise to **neuroendocrine tumours (NETs)**, which have special structural features and often produce active hormones. *See also* **NEUROHORMONE**; **NEUROSECRETION**.

**neuroepithelioma** *n.* a malignant tumour of the retina of the eye. It is a form of *\*glioma* and may spread into the brain if not treated early.

**neuroepithelium** *n.* a type of epithelium associated with organs of special sense. It contains sensory nerve endings and is found in the retina, the

membranous labyrinth of the inner ear, the mucous membrane lining the nasal cavity, and the taste buds. —**neuroepithelial** *adj.*

**neurofibril** *n.* one of the microscopic threads of cytoplasm found in the cell body of a **\*neuron** and also in the **\*axoplasm** of peripheral nerves.

**neurofibrillary tangles** twisted filaments composed of an abnormal form of tau protein, which normally occurs in microtubules (structural elements) of cells. They are found in the brains of patients with **\*Alzheimer's disease**.

**neurofibroma** *n.* a benign tumour growing from the fibrous coverings of a peripheral nerve: it arises from **\*Schwann cells**, lacks a capsule (therefore it may incorporate nerve fibres), and is usually symptomless. When it develops from the sheath of a nerve root, it causes pain and may compress the spinal cord. A **schwannoma** is similar but encapsulated (sometimes the terms are used synonymously).

**neurofibromatosis** *n.* either of two hereditary conditions inherited as autosomal **\*dominant** traits and characterized by benign tumours growing from the fibrous coverings of nerves (*see* **NEUROFIBROMA**). In **neurofibromatosis type I (von Recklinghausen's disease)**, in which the abnormal gene is found on chromosome 17, numerous tumours affect the peripheral nerves. The tumours can be felt beneath the skin along the course of the nerves; they may become large, causing disfigurement, and rarely they become malignant, giving rise to **neurofibrosarcomas**. Pigmented patches on the skin (*see* **CAFÉ AU LAIT SPOTS**) are commonly found and **\*Lisch nodules** are present. **Neurofibromatosis type II** presents with bilateral **\*vestibular schwannomas** (causing hearing loss) and **\*meningiomas**. The abnormal gene is on chromosome 22.

**neurogenesis** *n.* the growth and development of nerve cells.

**neurogenic** *adj.* **1.** caused by disease or dysfunction of the nervous system. **2.** arising in nervous tissue. **3.** caused by nerve stimulation.

**neuroglia** *n.* *see* **GLIA**.

**neurohormone** *n.* a hormone that is produced within specialized nerve cells and is secreted from the nerve endings into the circulation. Examples are the hormones oxytocin and vasopressin, produced within the nerve cells of the

hypothalamus and released into the circulation in the posterior pituitary gland, and noradrenaline, released from *\*chromaffin* tissue in the adrenal medulla.

**neurohumour** *n.* a *\*neurohormone* or a *\*neurotransmitter*.

**neurohypophysis** *n.* the posterior lobe of the *\*pituitary gland*.

**neurolemma** *n.* *see* NEURILEMMA.

**neuroleptic malignant syndrome** a life-threatening syndrome seen after starting *\*antipsychotic* medication. It is characterized by confusion, muscle rigidity, fever, pallor and sweating, urinary incontinence, and a high level of *\*creatine kinase*. Its symptoms can appear similar to *\*catatonia*. Treatment in a high-dependency unit with high-dose benzodiazepines and immediate cessation of antipsychotic drugs is usually indicated.

**neurology** *n.* the study of the structure, functioning, and diseases of the nervous system (including the brain, spinal cord, the peripheral nerves, and muscles). —**neurological** *adj.* —**neurologist** *n.*

**neuroma** *n.* any tumour derived from cells of the nervous system. Such tumours are now usually categorized more specifically (e.g. *\*neurofibroma*, *\*neurilemmoma*). *See also* VESTIBULAR SCHWANNOMA.

**neuromuscular junction (myoneural junction)** the meeting point of a nerve fibre and the muscle fibre that it supplies. Between the enlarged end of the nerve fibre (**motor end-plate**) and the membrane of the muscle is a gap across which a *\*neurotransmitter* must diffuse from the nerve to trigger contraction of the muscle.

**neuromyelitis optica (Devic's disease)** a condition that resembles multiple sclerosis. The diagnosis is confirmed by the finding of the antiaquaporin-4 antibody (NMO IgG antibody). Typically there is a transverse *\*myelitis*, producing paralysis and numbness of the legs and trunk below the inflamed spinal cord, and *\*retrobulbar (optic) neuritis* affecting both optic nerves. The attacks of myelitis and optic neuritis may coincide or they may be separated by days or weeks. Recovery from the initial attack is often incomplete and severe relapses occur commonly unless treatment with immunosuppressive therapies is started.

**neuron (neurone, nerve cell)** *n.* one of the basic functional units of the nervous system: a cell specialized to transmit electrical *\*nerve impulses* and so carry information from one part of the body to another (see illustration). Each neuron has an enlarged portion, the **cell body (perikaryon)**, containing the nucleus; from the body extend several processes (**dendrites**) through which impulses enter from their branches. A longer process, the nerve fibre (*see* **AXON**), extends outwards and carries impulses away from the cell body. This is normally unbranched except at the *\*nerve ending*. The point of contact of one neuron with another is known as a *\*synapse*.

**Neuron.** A motor neuron (left) and a sensory neuron (right).

**neuronophagia** *n.* the process whereby damaged or degenerating nerve cells finally disintegrate and are removed by scavenger cells (\*phagocytes).

**neuronoplasty** *n.* reconstructive surgery for damaged or severed peripheral nerves.

**neuropathic arthritis (Charcot's joint)** a condition leading to progressive destruction and deformity of weight-bearing joints, resulting from damage to the sensory nerves that supply them. Causes include diabetes mellitus (*see* **DIABETIC NEUROPATHY**), \*tabes dorsalis, \*syringomyelia, leprosy, congenital insensitivity to pain, and other neurological problems. Patients develop an unstable painless swollen joint; treatment is focused on limitation of activity and bracing.

**neuropathic bladder** a malfunctioning bladder due to partial or complete interruption of its nerve supply. Causes include injury to the spinal cord, spina bifida, multiple sclerosis, and diabetic neuropathy.

**neuropathy** *n.* any disease of the peripheral nerves, usually causing weakness and numbness. In a **mononeuropathy** a single nerve is affected and the extent of the symptoms depends upon the distribution of that nerve. In a **polyneuropathy** (*see* **PERIPHERAL NEUROPATHY**) many or all of the nerves are involved and the symptoms are most profound at the extremities of the limbs. *See also* **DIABETIC NEUROPATHY**. —**neuropathic** *adj.*

**neuropeptide Y** a peptide, related to \*pancreatic polypeptide, that is found in the central and peripheral nervous systems (it is particularly abundant in the hypothalamus). It has a variety of actions, including stimulation of appetite, gastrointestinal regulation, reproduction, memory, circadian rhythms, and cardiovascular functioning.

**neurophysiology** *n.* the study of the complex chemical and physical changes that are associated with the activity of the nervous system.

**neuropil** *n.* nerve tissue that is visible microscopically as a mass of interwoven and interconnected nerve endings, dendrites, and other neuron components, rather than an ordered array of axons.

**neuroplasticity (neural plasticity)** *n.* the ability of the brain to develop new neurons and/or new synapses in response to stimulation and learning. Recent

research shows that the brain retains its plasticity throughout life, more or less, depending on the person's state of health, etc. Following injury to the brain, neuroplasticity may allow uninjured areas to take over the processes previously carried out by the injured areas.

**neuropsychiatry** *n.* the branch of medicine concerned with the psychiatric effects of disorders of neurological function or structure. Increasingly, the correlation is being drawn between demonstrable brain changes and the resulting effects on the mind. It is the function of the growing specialty of neuropsychiatry to investigate this relationship.

**neuroretinitis** *n.* combined inflammation of the optic nerve and the retina.

**neurosecretion** *n.* any substance produced within, and secreted by, a nerve cell. Important examples are the hormone-releasing factors produced by the cells of the **\*hypothalamus** and released into blood vessels of the pituitary gland, on which they act.

**neurosis** *n.* (*pl.* **neuroses**) any long-term mental or behavioural disorder in which contact with reality is retained and the condition is recognized by the sufferer as abnormal: the term and concept originated from Freud. A neurosis essentially features anxiety or behaviour exaggeratedly designed to avoid anxiety. Defence mechanisms against anxiety take various forms and may appear as phobias, obsessions, compulsions, or sexual dysfunctions. In recent classifications, the disorders formerly included under the neuroses have been renamed. The general term is now **anxiety disorder**; hysteria has become **\*conversion disorder**; amnesia, fugue, and depersonalization are **\*dissociative disorders**; obsessional neurosis is now known as **\*obsessive–compulsive disorder**; and depressive neurosis has become **\*dysthymia**. Psychoanalysis has proved of little value in curing these conditions; **\*behaviour therapy** and **\*SSRIs** are effective in many cases. —**neurotic** *adj.*

**neurosurgery** *n.* the surgical or operative treatment of diseases of the brain and spinal cord. This includes the management of head injuries, the relief of raised intracranial pressure and compression of the spinal cord, the eradication of infection (e.g. cerebral **\*abscess**), the control of intracranial haemorrhage, and the diagnosis and treatment of tumours. The development of neurosurgery has been supported by advances in anaesthetics, radiology, and scanning techniques.

**neurosyphilis** *n.* **\*syphilis** affecting the nervous system.

**neuroticism** *n.* a dimension of personality derived from questionnaires and psychological tests. People with high scores in neuroticism are anxious and intense, emotionally unstable, and more prone to develop **\*neurosis**.

**neurotmesis** *n.* the complete severance of a peripheral nerve, which is associated with degeneration of the nerve fibres distal to the point of severance and slow **\*nerve regeneration**. Compare **AXONOTMESIS**; **NEURAPRAXIA**.

**neurotomy** *n.* the surgical procedure of severing a nerve.

**neurotoxic** *adj.* poisonous or harmful to nerve tissue and dental pulp cells.  
—**neurotoxicity** *n.*

**neurotransmitter** *n.* a chemical substance released from nerve endings to transmit impulses across **\*synapses** to other nerves and across the minute gaps between the nerves and the muscles or glands that they supply. Outside the central nervous system the chief neurotransmitter is **\*acetylcholine**; **\*noradrenaline** is released by nerve endings of the sympathetic system. In the central nervous system, as well as acetylcholine and noradrenaline, **\*dopamine**, **\*serotonin**, **\*gamma-aminobutyric acid**, the amino acid glutamate, and several other substances act as transmitters.

**neurotrophic** *adj.* relating to the growth and nutrition of neural tissue in the body.

**neurotropic** *adj.* growing towards or having an affinity for neural tissue. The term may be applied to viruses, chemicals, or toxins.

**neutropenia** *n.* an abnormal decrease in the number of **\*neutrophils** in peripheral blood. Neutropenia may occur in a wide variety of diseases, including certain hereditary defects, aplastic **\*anaemias**, tumours of the bone marrow, **\*agranulocytosis**, and acute leukaemias. In cancer patients it is often due to the deleterious effects of **\*cytotoxic drugs** on bone marrow cells. Neutropenia results in an increased susceptibility to infections; if patients become unwell, due to infection, this can lead to neutropenic sepsis, which can be life-threatening. —**neutropenic** *adj.*

**neutrophil** *n.* a variety of **\*granulocyte** (a type of white blood cell) distinguished by a lobed nucleus and the presence in its cytoplasm of fine granules that stain purple with **\*Romanowsky stains**. It is capable of ingesting and killing bacteria and provides an important defence against infection. There are normally  $2.0\text{--}7.5 \times 10^9$  neutrophils per litre of blood. *See also* **POLYMORPH**.

**newton** *n.* the **\*SI unit** of force, equal to the force required to impart to 1 kilogram an acceleration of 1 metre per second per second. Symbol: N.

**nexus** *n.* (in anatomy) a connection or link.

**NGF** *see* **NERVE GROWTH FACTOR**.

**NHS** *see* **NATIONAL HEALTH SERVICE**.

**NHS 111** a nonemergency medical telephone helpline number operating in England. The service is available 24 hours a day to give health-care advice to patients with urgent but not life-threatening health problems, or to direct them to the local service best equipped to provide assistance. It is staffed by trained call handlers, supported by nurses and paramedics. NHS 111 was initially commissioned on a regional basis, but is accountable to **\*clinical commissioning groups**. It replaced the **NHS Direct** phone service.

**NHS Blood and Transplant (NHSBT)** a **\*special health authority** established in 2005 to provide a safe and reliable supply of blood, organs, stem cell services, and diagnostics to hospitals. NHSBT also provides specialist therapeutic apheresis services, which remove or replace a single component of blood (e.g. malignant white cells or low-density lipoprotein), at six sites in England.

<https://www.nhsbt.nhs.uk/>

- NHS Blood and Transplant website

**NHS Business Services Authority (NHSBSA)** a **\*special health authority** formed in 2006 to provide a range of back office and financial services to NHS organizations, contractors, and patients. These include administering the NHS pension scheme, issuing European Health Insurance Cards to UK

residents, and issuing penalty charge notices to patients who falsely claim to be exempt from paying prescription charges. NHSBSA also hosts **NHS Prescription Services**, which provides pharmacies with reimbursement for items supplied under NHS prescriptions.

<https://www.nhsbsa.nhs.uk/>

- NHS Business Services Authority website

**NHS Choices** the website for **\*NHS England**. It provides comprehensive health information to help patients make the best choices about their health and the best use of NHS and social-care services.

**NHS Constitution for England** a single document, first published in 2009, that sets out the rights and responsibilities of health-care organizations, patients, and staff members. The constitution lists legally binding rights for patients, which largely formalize legal positions that had previously developed through case law. The constitution also lists nonbinding pledges.

<https://www.gov.uk/government/publications/the-nhs-constitution-for-england>

- Full text of the document

**NHS Counter Fraud Authority (NHSCFA)** a **\*special health authority** formed in 2017 to identify, investigate, and prevent fraud, bribery, and corruption within NHS organizations in England. These functions were formerly carried out by NHS Protect, part of the **\*NHS Business Services Authority**.

<https://cfa.nhs.uk/>

- NHS Counter Fraud Authority website

**NHS Digital** the trading name of the **\*Health and Social Care Information Centre (HSCIC)** since 1 August 2016. It is the national provider of information, data, and IT systems for commissioners, analysts, and clinicians

for the National Health Service (England). It also runs the [\\*NHS Choices](#) website.

**NHS Direct** *see* [NHS 111](#).

**NHS England** an executive nondepartmental public body of the Department of Health and Social Care that oversees the day-to-day operation of the NHS in England. NHS England is also responsible for commissioning GP services and some specialized health-care services beyond the purview of [\\*clinical commissioning groups](#) (CCGs). Formed as a result of the Health and Social Care Act 2012, it was previously known as the **NHS Commissioning Board** and the **NHS Commissioning Board Authority**.

<https://www.england.nhs.uk/>

- NHS England website

**NHS e-Referral Service** an electronic referral system administered by [\\*NHS Digital](#). Since 2015 it has been used by NHS England to support referrals from GPs to secondary care. Replacing the earlier **choose and book** system, it enables patients to choose which hospital they are referred to and then to book a convenient date and time for the appointment.

**NHS Improvement (NHSI) 1.** a non-departmental public body set up in 2016 to drive improvement within the NHS by providing oversight of foundation trusts, acute trusts, and independent providers of NHS-funded care. Among other responsibilities, it has taken on the regulatory functions of [\\*Monitor](#), the trust-support functions of the [\\*NHS Trust Development Authority](#), and the reporting and alerting functions formerly delivered by the [\\*National Patient Safety Agency](#). **2.** an organization set up in 2008 to drive clinical improvement within the NHS. In 2013 it was subsumed into a newly formed organization, NHS Improving Quality. This was itself subsumed into [\\*NHS England](#) in 2016.

<https://improvement.nhs.uk/>

- NHS Improvement website

**NHS Prescription Services Authority (NHPSA)** *see* **NHS BUSINESS SERVICES AUTHORITY**.

**NHS Resolution** a *\*special health authority* of the NHS established in 1995 and responsible for handling *\*negligence* and other claims against NHS organizations in England. NHS Resolution also advises the NHS on human rights case law and handles equal pay claims. Until 2017 it was known as the **NHS Litigation Authority (NHSLA)**.

<https://resolution.nhs.uk/>

- NHS Resolution website

**NHS Trust Development Authority** formerly, a *\*special health authority* of the NHS established under the Health and Social Care Act 2012 to oversee NHS trusts without *\*foundation trust* status and to support their transition to such status. The Authority closed in 2016, when its functions were transferred to the newly established *\*NHS Improvement*.

**NHS walk-in centre** a medical centre offering free and fast access to health-care advice and treatment. The first centres were opened in 2000. They provide advice and treatment for minor injuries and illnesses as well as guidance on how to use NHS services. Currently, the NHS offers a mix of walk-in centres, urgent care centres, minor injury units, and **urgent treatment centres**, all with different levels of service. By the end of 2019, these will all be called urgent treatment centres.

**niacin** *n. see* **NICOTINIC ACID**.

**nicardipine** *n.* a *\*calcium-channel blocker* used to prevent angina and treat hypertension. Possible side-effects include nausea, dizziness, headache, flushing, and palpitations.

**NICE (National Institute for Health and Care Excellence)** a non-departmental public body that provides national guidance and advice to improve health and social care. NICE was originally set up in 1999 as the **National Institute for Clinical Excellence**, a special health authority, to reduce variation in the availability and quality of NHS treatments and care.

In 2005, after merging with the Health Development Agency, it began developing public health guidance to help prevent ill health and promote healthier lifestyles and the name changed to the **National Institute for Health and Clinical Excellence**. In April 2013 NICE was established in primary legislation, placing it on a statutory footing as set out in the Health and Social Care Act 2012. At this time it took on responsibility for developing guidance and quality standards in social care, and the name changed once more to reflect these new responsibilities.

<https://www.nice.org.uk/>

- NICE website

**niche** *n.* (in anatomy) a recess or depression in a smooth surface.

**niclosamide** *n.* an **\*anthelmintic** drug used to remove tapeworms. Side-effects are limited to gastrointestinal disturbance, itching, and lightheadedness.

**nicorandil** *n.* *see* **POTASSIUM-CHANNEL ACTIVATOR**.

**nicotinamide** *n.* a B vitamin: the amide of **\*nicotinic acid**.

**nicotinamide adenine dinucleotide** *see* **NAD**.

**nicotine** *n.* a poisonous alkaloid derived from **\*tobacco**, responsible for the dependence of regular smokers on cigarettes. In small doses nicotine has a stimulating effect on the autonomic nervous system, causing in regular smokers such effects as raised blood pressure and pulse rate and impaired appetite. Large doses cause paralysis of the autonomic ganglia. Nicotine replacement therapy (nicotine products formulated as chewing gum, skin patches, nasal sprays, etc.) is used as an aid to stop smoking.

**nicotinic acid (niacin)** a B vitamin. Nicotinic acid is a derivative of pyridine and is interchangeable with its amide, **nicotinamide**. Both forms of the vitamin are equally active. Nicotinamide is a component of the coenzymes **\*NAD** (nicotinamide adenine dinucleotide) and NADP, its phosphate. Nicotinic acid is required in the diet, but can also be synthesized from the essential amino acid tryptophan. A deficiency of the vitamin leads to

**\*pellagra**. Good sources of nicotinic acid are meat, yeast extracts, and pulses. The adult RNI (*see* **DIETARY REFERENCE VALUES**) depends on the kcal content of the diet and is 6.6 mg niacin equivalent/1000 kcal, which equates to about 17 mg/day for males and 13 mg/day for females. 1 mg niacin equivalent is equal to 1 mg of available nicotinic acid or 60 mg tryptophan.

**nictitation** *n.* exaggerated and frequent blinking or winking of the eyes.

**nidation** *n.* *see* **IMPLANTATION**.

**nidus** *n.* **1.** a place in which bacteria have settled and multiplied because of particularly suitable conditions: a focus of infection. **2.** the nucleus of a crystal.

**Niemann–Pick disease** an inherited (autosomal **\*recessive**) disorder of lipid metabolism due to a defect in the enzyme sphingomyelinase and resulting in accumulation of sphingomyelin (a sphingolipid) and other phospholipids in the bone marrow, brain, liver, and spleen. Patients present with neurological problems, learning disabilities, and enlargement of the liver and spleen at a young age. There are four known types of the disease. [A. Niemann (1880–1921), German paediatrician; L. Pick (1868–1944), German pathologist]

**nifedipine** *n.* a **\*calcium-channel blocker** used in the prevention of angina and treatment of high blood pressure (hypertension) and Raynaud's phenomenon. Side-effects include dizziness, headache, and nausea.

**night blindness (nyctalopia)** the inability to see in dim light or at night. It is due to a disorder of the cells in the retina that are responsible for vision in dim light (*see* **ROD**), and can result from dietary deficiency of **\*vitamin A**. Vitamin A deficiency may progress to cause **\*xerophthalmia** and **\*keratomalacia**. Night blindness may be caused by other retinal diseases, e.g. **\*retinitis pigmentosa**. **Congenital stationary night blindness** is characterized by poor night vision from early childhood that does not get worse, in association with **\*nystagmus**. *Compare* **DAY BLINDNESS**.

**night sweat** copious sweating during sleep. Night sweats may be an early indication of tuberculosis, AIDS, or other disease.

**night terror** the condition in which a child (usually aged 2–7 years), soon after falling asleep, starts screaming and appears terrified. The child cannot

be comforted because he or she remains mentally inaccessible; the attack ceases on fully waking and is never remembered. Attacks sometimes follow a stressful experience.

**Nile blue** an oxazine chloride, used for staining lipids and lipid pigments. **Nile blue A (Nile blue sulphate)**, which stains fatty acids, changes from blue to purplish at pH 10–11.

**nilotinib** *n. see* **TYROSINE KINASE INHIBITOR**.

**ninhydrin reaction** a histochemical test for proteins, in which ninhydrin (triketohydrindene hydrate) is boiled with the test solution and gives a blue colour in the presence of amino acids and proteins.

**nipple (mamilla, papilla)** *n.* the protuberance at the centre of the **\*breast**. In females the milk ducts open at the nipple.

**NIPPV** noninvasive intermittent positive-pressure ventilation (*see* **NONINVASIVE VENTILATION**).

**Nippy** trade name for a brand of noninvasive positive-pressure ventilator that delivers air through a close-fitting nasal mask (*see* **NONINVASIVE VENTILATION**). The Nippy was one of the early ventilators from the late 1980s and early 1990s, initially used in intensive care units. Although many others are now in use, the name is often used as a generic term for devices used on general wards for ventilatory support for patients with acute exacerbations of **\*chronic obstructive pulmonary disease**.

**Nissl granules** collections of dark-staining material, containing RNA, seen in the cell bodies of neurons on microscopic examination. [F. Nissl (1860–1919), German neuropathologist]

**nit** *n.* the egg of a **\*louse**. The eggs of head lice are firmly cemented to the hair, usually at the back of the head; those of body lice are fixed to the clothing. Nits,  $0.8 \times 0.3$  mm, are visible as light white specks.

**nitrates** *pl. n.* a class of drugs used as coronary **\*vasodilators** for the treatment and prevention of angina attacks. They include **\*glyceryl trinitrate**, **\*isosorbide dinitrate**, and isosorbide mononitrate.

**nitrazepam** *n.* a benzodiazepine drug administered for the short-term treatment of insomnia and sleep disturbances (*see* **HYPNOTIC**). Morning drowsiness, lightheadedness, and confusion may occur.

**nitric acid** a strong corrosive mineral acid,  $\text{HNO}_3$ , the concentrated form of which is capable of producing severe burns of the skin. Swallowing the acid leads to intense burning pain and ulceration of the mouth and throat. Treatment is by immediate administration of alkaline solutions, followed by milk or olive oil.

**nitric oxide** an important member of the group of gaseous mediators, which – together with amine mediators (e.g. adrenaline, noradrenaline, histamine, acetylcholine) and lipid mediators (e.g. prostaglandins) – produce many physiological responses (e.g. smooth muscle relaxation). Nitric oxide is involved in the manifestations of sepsis and septic shock. Formula: NO.

**nitrofurantoin** *n.* a drug used to treat bacterial infections of the urinary system. It may cause nausea, vomiting, loss of appetite, diarrhoea, and skin rashes.

**nitrogen** *n.* a gaseous element and a major constituent of air (79 per cent). Nitrogen is an essential constituent of proteins and nucleic acids and is obtained by animals in the form of protein-containing foods (atmospheric nitrogen cannot be utilized directly). Nitrogenous waste is excreted as **\*urea**. Liquid nitrogen is used to freeze some specimens before pathological examination. Symbol: N.

**nitrogen balance** the relationship between the nitrogen taken into the body and that excreted, denoting the balance between the manufacture and breakdown of the body mass. A negative nitrogen balance, when excretion exceeds intake, is usual after injury or operations as the energy requirements of the body are met disproportionately from endogenous sources.

**nitroglycerin** *n.* *see* **GLYCERYL TRINITRATE**.

**nitroprusside (sodium nitroprusside)** *n.* a cyanide-containing drug used mainly in the emergency treatment of high blood pressure. It is the most effective known means of reducing dangerously high pressure, but its effects and level in the blood must be closely monitored. Possible side-effects include nausea, vomiting, headache, palpitations, sweating, and chest pain.

**nitrous oxide** a colourless gas used as an *\*anaesthetic* with good analgesic properties. It is administered by inhalation, in conjunction with oxygen and other agents, for the maintenance of anaesthesia. A mixture of oxygen and nitrous oxide provides effective analgesia for some dental procedures and in childbirth; such a state is known as *\*relative analgesia*. Nitrous oxide was formerly referred to as **laughing gas** because of its tendency to excite the patient when used alone.

**NIV** *see* **NONINVASIVE VENTILATION**.

**nizatidine** *n.* an H<sub>2</sub>-receptor antagonist (*see* **ANTI-HISTAMINE**) used to treat gastric and duodenal ulcers and prevent their recurrence and to treat *\*gastro-oesophageal reflux disease*. Side-effects include diarrhoea, dizziness, sweating, and headache.

**NK cell** *see* **NATURAL KILLER CELL**.

**nm** *symbol for* *\*nanometre*.

**NMC** *see* **NURSING AND MIDWIFERY COUNCIL**.

**NMDA receptor** a receptor on synapses that binds the *\*neurotransmitter* glutamate and also binds its *\*agonist* NMDA (*N-methyl-D-aspartate*). This receptor is involved in learning, memory, mood, and cognition; its overactivity is associated with chronic pain. NMDA-receptor antibodies are associated with an *\*encephalitis* preceded by psychiatric symptoms, often in patients with ovarian malignancy (teratoma). **NMDA-receptor antagonists** (e.g. *\*amantadine*, *\*memantine hydrochloride*, *\*riluzole*) are used in the treatment of (among other conditions) epilepsy, Alzheimer's disease, and chronic pain syndromes.

**NMP22** nuclear matrix protein 22, which is involved in DNA replication and gene expression. Significantly elevated levels of NMP22 have been detected in the urine of patients with bladder cancer, which can aid the diagnosis of primary cancer or identify recurrent cancer. The test has a higher *\*sensitivity* but lower specificity in comparison with urine cytology.

**NMR** *see* **NUCLEAR MAGNETIC RESONANCE**.

**Nocardia** *n.* a genus of rodlike or filamentous Gram-positive nonmotile bacteria found in the soil. As cultures age, filaments form branches, but these soon break up into rodlike or spherical cells. Three or more spores may form in each cell; these germinate to form filaments. Some species are pathogenic: *N. asteroides* causes \***nocardiosis** and *N. madurae* is associated with the disease \***Madura foot**.

**nocardiosis** *n.* a disease caused by bacteria of the genus *Nocardia*, primarily affecting the lungs, skin, and brain, resulting in the formation of abscesses. Treatment involves antibiotics and sulphonamides.

**noci-** *combining form denoting pain or injury.*

**nociceptive** *adj.* describing nerve fibres, endings, or pathways that are concerned with the condition of pain.

**nociceptor** *n.* a \***receptor** that responds to the stimuli responsible for the sensation of pain. Nociceptors may be \***interoceptors**, responding to such stimuli as inflammation, or \***exteroceptors**, sensitive to heat, etc.

**noct- (nocti-)** *combining form denoting night.*

**nocturia** *n.* the passage of urine at night. In the absence of a high fluid intake, sleep is not normally interrupted by the need to pass urine. Nocturia usually occurs in elderly men or women. In younger men or women, less urine is made at night than during the day, but this rhythm is lost with age in both sexes. Men may have additional problems arising from benign prostatic hyperplasia (see **PROSTATE GLAND**), but transurethral resection of the prostate often does not reduce nocturia.

**node** *n.* a small swelling or knot of tissue. See **ATRIOVENTRICULAR NODE**; **LYMPH NODE**; **SINOATRIAL NODE**.

**node of Ranvier** one of the gaps that occur at regular intervals in the \***myelin** sheath of medullated nerve fibres, between adjacent \***Schwann cells**.

**nodule** *n.* a small swelling or aggregation of cells.

**noma (cancrum oris)** *n.* a gangrenous condition that begins as a severe form of \***ulcerative gingivitis** and then spreads to involve the face. It causes progressive and mutilating tissue degradation and destruction of bone and

soft tissue in the infected areas of the face and jaws. It is rare in countries with working infrastructures and is usually found in debilitated or malnourished individuals.

**nonaccidental injury (NAI)** injury inflicted on babies and young children; the perpetrator is usually an adult – often a parent or step-parent. Most commonly seen in babies aged six months or less, it usually takes the form of bruising, particularly on the face; bite marks; burns or scalds, particularly cigarette burns; and bone injuries, especially spiral fractures of the long bones in the limbs and skull fractures. Internal injuries may be fatal. Careful examination often reveals several injuries of different ages, indicating long-term abuse. NAI usually has serious consequences for the child, including *\*failure to thrive* and behavioural problems.

Known colloquially as the **battered baby (or child) syndrome**, it may be precipitated by many factors, including relationship difficulties, social problems, and ill health, and is more common if the child is physically or mentally disabled. It is often found that abusers suffered similar abuse themselves when young. Many abused children suffer further injury if discharged into the same environment with no support (*see also* **RISK REGISTER**). A child at considerable risk may need to be removed from the family home.

**nonadherence** *n. see* **ADHERENCE**.

**nonalcoholic fatty liver disease (NAFLD)** a spectrum of conditions affecting the liver in the absence of excessive alcohol consumption. NAFLD is a common cause of referral for patients with abnormal liver function tests. **Fatty liver** is excessive fat accumulation in the liver seen as an area of brightness within the liver on ultrasound examination. Fatty liver does not lead to irreversible liver damage in the majority of cases. **Nonalcoholic steatohepatitis (NASH)** is inflammation of the liver associated with accumulation of fat. It is often linked to insulin resistance, diabetes, hypertension, obesity, and *\*metabolic syndrome*. Treatment involves dietary modification, regular physical exercise, weight reduction, and management of underlying conditions (e.g. diabetes, hypertension, and hiperlipidaemia). NASH may predispose to *\*cirrhosis* and may ultimately require liver transplantation.

**noncompaction** *n.* a congenital condition in which the myocardium has a spongelike appearance with only a thin rim of functioning heart muscle. This is normal in the fetus but when it persists into childhood or adult life heart failure commonly ensues, although the age of onset and severity are very variable.

**nondisjunction** *n.* a condition in which pairs of homologous chromosomes fail to separate during meiosis or a chromosome fails to divide at *\*anaphase* of mitosis or meiosis. It results in a cell with an abnormal number of chromosomes (*see* **MONOSOMY**; **TRISOMY**).

**non-epileptic attack disorder (NEAD)** a condition characterized by episodes that resemble epileptic seizures but lack the abnormal electrical activity in the brain typically associated with *\*epilepsy*. *See* **NON-EPILEPTIC SEIZURE**.

**non-epileptic seizure** *n.* an event with symptoms that mimic an epileptic seizure but that does not involve abnormal discharges of cortical neurons that would be captured on an EEG. It can be caused by both physiological and psychological conditions. Physiological causes include syncope, cataplexy, migraine, narcolepsy, parasomnias, and tics. Psychological non-epileptic seizures, also known as **psychogenic non-epileptic seizures**, can arise from acute distress or anxiety or in the context of a *\*somatic* symptom. People who suffer from epilepsy may have non-epileptic seizures as well. The main visible difference between a non-epileptic seizure and an epileptic seizure is that the former commonly lasts longer than two minutes and can last up to 30 minutes. Also there is occasional pelvic thrusting, the patient's eyes and mouth are typically closed, and side-to-side head movements are more common than in epileptic seizures. Crying or talking during the attack is possible. There is no *\*postictal phase*. Other names for non-epileptic seizures include **pseudo seizures**, **functional seizures**, and **conversion seizures**.

**non-Hodgkin's lymphoma** *see* **LYMPHOMA**.

**noninvasive** *adj.* **1.** denoting techniques of investigation or treatment that do not involve penetration of the skin by needles or knives. **2.** denoting tumours that do not spread into surrounding tissues (*see* **BENIGN**).

**noninvasive prenatal diagnosis (NIPD)** *see* **PRENATAL DIAGNOSIS**.

**noninvasive ventilation (NIV)** mechanical assistance with breathing that does not require the insertion of an endotracheal tube (*see* **INTUBATION**). In **noninvasive intermittent positive-pressure ventilation (NIPPV)** air is blown into the lungs through a close-fitting mask: designs range from helmet-like devices to nasal cushions and full-face or nasal masks (*see also* **NIPPY**). A ventilator then applies positive pressure to the mask in a cyclical fashion. The technique simplifies the process of ventilation in respiratory failure and reduces or eliminates the need for paralysis and anaesthesia, which are required for endotracheal intubation. *See also* **BiPAP**; **CONTINUOUS POSITIVE AIRWAYS PRESSURE**.

**Negative-pressure ventilation** involves the use of devices that draw air into and out of the lungs noninvasively by applying negative pressure in a cyclical way (*see* **VENTILATOR**).

**nonmaleficence** *n.* one of the **\*four principles** and common to many theories of medical ethics: doctors should avoid causing harm to patients (*see* **PRIMUM NON NOCERE**). As almost all medical interventions carry some risk of harm, however small, in practice a doctor should avoid risking unnecessary harm or any harm that is disproportionate to the benefit intended. Consequently, risks should be minimized and considered along with the intended benefits when evaluating specific interventions. Harm can include psychological, emotional, or social harm as well as physical damage. *Compare* **BENEFICENCE**.

**nonsecretor** *n.* a person in whose body fluids it is not possible to detect soluble forms of the A, B, or O agglutinogens that determine blood group. *Compare* **SECRETOR**.

**non-small-cell lung cancer (NSCLC)** any type of lung cancer other than **\*small-cell lung cancer**. Such cancers include **\*adenocarcinoma** of the lung, large-cell carcinomas, and squamous-cell carcinoma of the lung.

**nonspecific interstitial pneumonia (NSIP)** *see* **INTERSTITIAL PNEUMONIA**.

**nonsteroidal anti-inflammatory drug** *see* **NSAID**.

**Noonan's syndrome** an autosomal **\*dominant** condition of males who have all or some of the physical features of **\*Turner's syndrome** in females but normal sex chromosomes. It is often associated with a low testosterone level and sometimes with reduced sperm production. Other features include cardiovascular defects and most affected individuals have short stature and mild learning disabilities. [J. Noonan (1928– ), US paediatrician]

**noradrenaline (norepinephrine)** *n.* a hormone, closely related to **\*adrenaline** and with similar actions, secreted by the medulla of the **\*adrenal gland** and also released as a **\*neurotransmitter** by sympathetic nerve endings. Among its many actions are constriction of small blood vessels leading to an increase in blood pressure, increased blood flow through the coronary arteries and a slowing of the heart rate, increase in the rate and depth of breathing, and relaxation of the smooth muscle in intestinal walls.

**norepinephrine** *n.* *see* **NORADRENALINE**.

**norethisterone** *n.* a synthetic female sex hormone (*see* **PROGESTOGEN**) administered by mouth to treat menstrual disorders, including endometriosis. Its main use, however, is in contraceptives, either alone or in combination with an oestrogen; it is also used in **\*hormone replacement therapy**.

**norfloxacin** *n.* a **\*quinolone** antibiotic used for treating urinary-tract infections. Side-effects are those of the other quinolones.

**norma** *n.* a view of the skull from one of several positions, from which it can be described or measured. For example the **norma lateralis** is a side view of the skull; the **norma verticalis** is the view of the top of the skull.

**normal distribution** *see* **DISTRIBUTION**; **SIGNIFICANCE**.

**normalization** *n.* (in psychiatry) the process of making the living conditions of people with learning disabilities as similar as possible to those of people who are not disabled. This includes moves to living outside institutions and encouragement to cope with work, pay, social life, sexuality, and civil rights.

**normative** *adj.* describing a statement about what is or is not desirable (based on accepted standards or norms), as opposed to a statement of what is or is not the case (based on evidence and fact). This distinction between normative and **positive** statements is of basic importance in medical **\*ethics**.

**normo-** *combining form denoting normality.*

**normoblast** *n.* a nucleated cell that forms part of the series giving rise to the red blood cells and is normally found in the blood-forming tissue of the bone marrow. Normoblasts pass through three stages of maturation: **early** (or **basophilic**), **intermediate** (or **polychromatic**), and **late** (or **orthochromatic**) forms. *See also* **ERYTHROBLAST**; **ERYTHROPOIESIS**.

**normocyte** *n.* a red blood cell of normal size. A **normocytic anaemia** is one characterized by the presence of such cells. —**normocytic** *adj.*

**normoglycaemia (euglycaemia)** *n.* the state of having normal blood glucose levels, which – depending on when food was last eaten – are generally between 4 and 7 mmol/l.

**normotensive** *adj.* describing the state in which the arterial blood pressure is within the normal range. *Compare* **HYPERTENSION**; **HYPOTENSION**.

**norovirus (Norwalk virus)** *n.* a member of a group of RNA viruses that cause acute gastroenteritis in humans. The faecal–oral route is the typical mode of transmission. Symptoms appear after an incubation period of between 24 and 48 hours. Noroviruses are highly contagious and are implicated in over 50% of all outbreaks of gastroenteritis. Symptomatic treatment with fluid replacement and electrolyte correction remains the mainstay of treatment.

**Northern blot analysis** a technique for identifying a specific form of messenger RNA in cells. It uses a gene **\*probe** known to match the RNA being sought. *Compare* **SOUTHERN BLOT ANALYSIS**; **WESTERN BLOT ANALYSIS**.

**Northern Irish Sign Language (NISL)** *see* **SIGN LANGUAGE**.

**nortriptyline** *n.* a tricyclic **\*antidepressant** drug that is used to relieve depression and treat neuropathic pain. Side-effects may include dry mouth and drowsiness.

**nose** *n.* the organ of olfaction, which also acts as an air passage that warms, moistens, and filters the air on its way to the lungs. The **external nose** is a triangular projection in the front of the face that is composed of cartilage and

covered with skin. It leads to the **nasal cavity (internal nose)**, which is lined with mucous membrane containing olfactory cells and is divided into two chambers (**fossae**) by the **nasal septum**. The lateral wall of each chamber is formed by the three scroll-shaped **\*nasal conchae**, below each of which is a groovelike passage (**meatus**). The **\*paranasal sinuses** open into these meatuses.

**nosebleed** *n. see* **EPISTAXIS**.

**nos-** *combining form denoting disease.*

**nosocomial infection (hospital infection)** an infection that originates in a hospital. It may develop in a hospitalized patient or a member of the hospital staff, or it may be acquired in hospital but only develops after discharge. Such infections include those caused by fungi and opportunist bacteria. They are aggravated by factors favouring the spread of organisms (cross-contamination), such as insufficient hand washing among medical staff, and by reduced resistance of individual patients, as well as by antibiotic-resistant strains of bacteria (*see* **CLOSTRIDIUM**; **ENTEROCOCCUS**; **MRSA**).

**nosology** *n. the naming and classification of diseases.*

**Nosopsyllus** *n. a genus of fleas. The common rat flea of temperate regions, N. fasciatus, will, in the absence of rats, bite humans and may therefore transmit plague or murine typhus from an infected rat population. The rat flea is also an intermediate host for the larval stage of two tapeworms, \*Hymenolepis diminuta and H. nana.*

**nostrils** *n. see* **NARES**.

**notch** *n. (in anatomy) an indentation, especially one in a bone.*

**NOTES (natural orifice transluminal endoscopic surgery)** an emerging technique of performing laparoscopic abdominal operations with access to the abdominal cavity via natural orifices (e.g. the mouth, rectum, vagina, or urethra), thereby avoiding abdominal wall incisions.

**notifiable disease** a disease that must be reported to a proper officer of the local authority so that prompt control and preventive action may be undertaken if necessary. The 'proper officer' duty is often delegated by local

authorities to a *\*Consultant* in Health Protection within *\*Public Health England*. Notifiable diseases in England include anthrax, diphtheria, food poisoning, malaria, measles, rabies, tetanus, tuberculosis, and whooping cough. The list varies for different countries, including the other parts of the United Kingdom. Some diseases are internationally notifiable through the *\*World Health Organization*; these include cholera, plague, relapsing fever, typhus, and yellow fever. The appropriate reporting of notifiable diseases is legally required by the Health Protection (Notification) Regulations 2010 (and similar legislation in the other parts of the UK).

<https://www.gov.uk/notifiable-diseases-and-causative-organisms-how-to-report#list-of-notifiable-diseases>

- List of notifiable diseases in England and guidance on how to report them

**notochord** *n.* a strip of mesodermal tissue that develops along the dorsal surface of the early embryo, beneath the *\*neural tube*. It becomes almost entirely obliterated by the development of the vertebrae, persisting only as part of the intervertebral discs.

**novel substrate** a nutrient that has an additional pharmacological effect when added to feeds, which may improve clinical outcomes after surgery. Novel substrates include the amino acids glutamine, arginine, and ornithine and possibly some fatty acids.

**NSAID (nonsteroidal anti-inflammatory drug)** any one of a large group of drugs used for pain relief, particularly in rheumatic disease associated with inflammation but also in dysmenorrhoea and metastatic bone disease. NSAIDs act by inhibiting the cyclo-oxygenase enzymes (COX-1 and COX-2) responsible for controlling the formation of *\*prostaglandins*, which are important mediators of inflammation. They include *\*aspirin*, *\*ibuprofen*, *\*ketoprofen*, and *\*naproxen*. Adverse effects include gastrointestinal bleeding and ulceration. Some NSAIDs act by selectively inhibiting COX-2 and are therefore less likely to cause gastric side-effects (see *COX-2 INHIBITOR*).

**NSFs** see *NATIONAL SERVICE FRAMEWORKS*.

**NSIP** nonspecific *\*interstitial pneumonia*.

**NSTEMI** non-S–T elevation *\*myocardial infarction*.

**NTDs** *see* **NEGLECTED TROPICAL DISEASES**.

**nucha** *n.* the nape of the neck. — **nuchal** *adj.*

**nuchal translucency scanning (NT scanning)** an ultrasound screening test performed during pregnancy at 11 weeks of gestation that measures the maximum thickness of the translucency between the skin and the soft tissue overlying the cervical (neck) region of the spine of the fetus. Increased NT is associated with an increased risk of chromosomal abnormalities and of a wide variety of structural abnormalities (e.g. heart defects). *See also* **ULTRASOUND MARKER**.

**nuclear cardiology** the study and diagnosis of heart disease by the intravenous injection of different types of *\*radionuclide*. The radionuclide emits gamma rays, enabling a gamma camera and computer to form an image of the heart. *See* **MUGA SCAN**; **MYOCARDIAL PERFUSION SCAN**; **SPECT SCANNING**.

**nuclear magnetic resonance (NMR)** the absorption and emission of high-frequency radio waves by the nuclei of certain elements when placed in a strong magnetic field. The strongest signal is obtained from hydrogen atoms, which are abundant in the water and organic molecules in the body. In clinical use for *\*magnetic resonance imaging*, the signal is highly dependent on the concentration and mobility of water molecules within each tissue. NMR has important applications in noninvasive diagnostic techniques. *See also* **MAGNETIC RESONANCE SPECTROSCOPY**.

**nuclear medicine** a medical specialty in which *\*radionuclides* (especially *\*technetium-99m*) are used as *\*tracers* to study the structure and function of organs of the body. The radionuclide is attached to a compound suitable for the particular test and then injected, inhaled, or ingested. When concentrated in the organ under investigation, the tracer can be imaged using a *\*gamma camera*, revealing the structure or demonstrating the function of the organ. Alternatively, blood or urine samples may be analysed. *See also* **NUCLEAR CARDIOLOGY**.

**nuclease** *n.* an enzyme that catalyses the breakdown of nucleic acids by cleaving the bonds between adjacent nucleotides. Examples are **ribonuclease**, which acts on RNA, and **deoxyribonuclease**, which acts on DNA.

**nucleic acid** either of two organic acids, **\*DNA** or **\*RNA**, present in the nucleus and in some cases the cytoplasm of all living cells. Their main functions are in heredity and protein synthesis.

**nucleolus** *n.* (*pl.* **nucleoli**) a dense spherical structure within the cell **\*nucleus** that disappears during cell division. The nucleolus contains **\*RNA** for the synthesis of **\*ribosomes** and plays an important part in RNA and protein synthesis.

**nucleoplasm (karyoplasm)** *n.* the protoplasm making up the nucleus of a cell.

**nucleoprotein** *n.* a compound that occurs in cells and consists of nucleic acid and protein tightly bound together. **\*Ribosomes** are nucleoproteins containing RNA; **\*chromosomes** are nucleoproteins containing DNA.

**nucleoside** *n.* a compound consisting of a nitrogen-containing base (a **\*purine** or **\*pyrimidine**) linked to a sugar. Examples are **\*adenosine**, **\*guanosine**, **\*cytidine**, **\*thymidine**, and uridine.

**nucleotide** *n.* a compound consisting of a nitrogen-containing base (a **\*purine** or **\*pyrimidine**) linked to a sugar and a phosphate group. Nucleic acids (DNA and RNA) are long chains of linked nucleotides (**polynucleotide** chains), which in DNA contain the purine bases adenine and guanine and the pyrimidines thymine and cytosine; in RNA, thymine is replaced by uracil.

**nucleus** *n.* **1.** the part of a **\*cell** that contains the genetic material, **\*DNA**. The DNA, which is combined with protein, is normally dispersed throughout the nucleus as **\*chromatin**. During cell division the chromatin becomes visible as **\*chromosomes**. The nucleus also contains **\*RNA**, most of which is located in the **\*nucleolus**. The nucleus is separated from the cytoplasm by a double membrane, the **nuclear envelope**. **2.** an anatomically and functionally distinct mass of nerve cells within the brain or spinal cord. **3.** the central part of the lens of the eye, which is harder than the outer cortex.

**nude mouse** a mouse born without a thymus and therefore no T lymphocytes. Human tumours will often grow in these mice. For unknown reasons these mice are also hairless, hence the name.

**nuisance** *n.* any noxious substance, accumulating in refuse or as dust or effluent, that is deemed by British law to be injurious to health or offensive. It can also include dwellings, work premises, animals, and noise.

**null hypothesis** *see* **SIGNIFICANCE**.

**nullipara** *n.* a woman who has never given birth. *See also* **GRAVID**.

**number needed to treat (NNT)** the average number of patients who need to be treated to prevent one additional negative outcome. This is the reciprocal of the **absolute risk reduction**: the difference between the risk of an adverse event in control and intervention groups.

**nurse** *n.* a person trained and experienced in nursing matters and entrusted with the care of the sick and the carrying out of medical and surgical routines. In Britain, student nurses gain a diploma or degree in nursing and must undertake a specified period of training in a hospital approved by the **\*Nursing and Midwifery Council** before qualifying for registration as a **general nurse**. *See also* **COMMUNITY MIDWIFE**; **DISTRICT NURSE**; **HEALTH VISITOR**; **NURSE PRACTITIONER**; **PRACTICE NURSE**; **SCHOOL NURSE**.

**nurse practitioner** a registered nurse with advanced training and experience who assumes some of the duties and responsibilities formerly assumed only by a physician. Such nurses can practise in hospital or community settings within various domains of clinical activity, which may be condition-specific (e.g. diabetes, breast care), client-specific (e.g. children, the elderly, the homeless), or area-specific (e.g. general practice, dermatology).

**Nursing and Midwifery Council (NMC)** a statutory body that regulates the nursing and midwifery professions in the public interest. *See* **NURSE**.

**nursing home** a residential facility that provides nursing supervision and limited medical care to individuals who do not require hospitalization.

**nutatation** *n.* the act of nodding the head.

**nutrient** *n.* a substance that must be consumed in order to provide the essential components needed for growth and the maintenance of life. Nutrients include carbohydrates, fats, proteins, minerals, and vitamins. *See also* [ESSENTIAL AMINO ACID](#); [ESSENTIAL FATTY ACID](#); [TRACE ELEMENT](#).

**nutrition** *n.* **1.** the study of food in relation to the physiological processes that depend on its absorption by the body (growth, energy production, repair of body tissues, etc.). The science of nutrition includes the study of diets and of deficiency diseases. **2.** the intake of nutrients and their subsequent absorption and assimilation by the tissues. Patients who cannot be fed in a normal way can be given nutrients by tubes into the gastrointestinal tract (*see* [ARTIFICIAL NUTRITION AND HYDRATION](#); [ENTERAL FEEDING](#)) or by infusion into a vein (**intravenous feeding** or **parenteral nutrition**; *see* [TOTAL PARENTERAL NUTRITION](#)).

**nutritional genomics** the study of the relationships between the human genome, nutrition, and health. There are two main branches of study: **nutrigenetics** investigates how an individual's genes affect their response to certain dietary nutrients, whereas **nutrigenomics** investigates how nutrients ingested can modulate gene expression. In time, nutrigenomics may help to identify the aetiology of certain chronic diseases.

**nux vomica** the seed of the tree *Strychnos nux-vomica*, which contains the poisonous alkaloid [\\*strychnine](#).

**nyct- (nycto-)** *combining form denoting* night or darkness.

**nyctalopia** *n.* *see* [NIGHT BLINDNESS](#).

**nyctohemeral** *adj.* denoting a cyclical event occurring both in the day and the night. *Compare* [CIRCADIAN](#); [ULTRADIAN](#).

**nymph** *n.* **1.** an immature stage in the life history of certain insects, such as grasshoppers and [\\*reduviid](#) bugs. On emerging from the eggs, nymphs resemble the adult insects except that they are smaller, do not have fully developed wings, and are not sexually mature. **2.** the late larval stage of a tick.

**nympho-** *combining form denoting* **1.** the labia minora. **2.** female sexuality.

**nystagmus** *n.* rapid involuntary movements of the eyes, which may be from side to side, up and down, rotatory, or a mixture. Nystagmus may be congenital and associated with poor sight; it also occurs in disorders of the part of the brain responsible for eye movements and their coordination (e.g. multiple sclerosis) and in disorders of the organ of balance in the ear or the associated parts of the brain. Certain drugs, especially in excessive doses (e.g. phenytoin), also cause nystagmus. **Optokinetic nystagmus** occurs in normal people when they try to look at a succession of objects moving quickly across their line of sight. Jerking eye movements sometimes occur in normal people when tired, on concentrating their gaze in any direction. These are called **nystagmoid jerks** and they do not imply disease.

**nystagmus block syndrome** a type of squint (convergent **\*strabismus**) that results from the use of the convergence mechanism to block or dampen down **\*nystagmus** in an attempt to improve visual acuity.

**nystatin** *n.* an antifungal drug used especially to treat skin, oral, and intestinal infections caused by *Candida*. Side-effects include mild digestive upsets.

**OAD** *see* OBSCURE AUDITORY DYSFUNCTION.

**OAE** *see* OTOACOUSTIC EMISSIONS.

**OASIS** *see* OBSTETRIC ANAL SPHINCTER INJURY.

**oat cell** *see* SMALL-CELL LUNG CANCER.

**Obamacare** *see* AFFORDABLE CARE ACT 2010.

**obeseogenic** *adj.* referring to an environment that predisposes to **\*obesity**, generally because of factors that encourage over-consumption of food or low levels of physical activity.

**obesity** *n.* the condition in which excess fat has accumulated in the body, in both the subcutaneous and visceral tissues. Clinical obesity is defined as a **\*body mass index** of 30 or over. A waist circumference of greater than 102 cm in men and 88 cm in women is a strong predictor of a person developing additional medical conditions associated with obesity. The accumulation of fat is usually caused by the consumption of more food than is required for producing enough energy for daily activities. There is ongoing research into how much obesity is due to genetics and how much to environmental factors. Hunger and satiety appear to be controlled by peptide messengers, encoded by specific genes and acting on the brain; an example is **\*leptin**. Treatment includes traditional weight reduction diets; surgery, such as gastric banding or gastric bypass; and drug treatment (**\*orlistat**). Obesity is now seen as the precursor of lethal conditions such as cancer and diabetes, making it a global public health issue. —**obese** *adj.*

**obex** *n.* the curved lower margin of the fourth **\*ventricle** of the brain, between the medulla oblongata and the cerebellum.

**objective** *n.* (in microscopy) the lens or system of lenses in a light microscope that is nearest to the object under examination and furthest from the **\*eyepiece**. In many types of microscope interchangeable objectives with different powers of magnification are provided.

**objective structured clinical examination (OSCE)** a type of examination used increasingly in the health sciences (medicine, dentistry, nursing, physiotherapy, pharmacy) to assess clinical skills in examination, communication, medical procedures, and interpretation of results. The examination usually takes the form of a circuit of stations around which each candidate moves after a specified time interval (5–10 minutes) at each station. Stations are a mixture of interactive and noninteractive tasks. Some have an examiner and a simulated patient, either an actor for assessment of communication or history-taking skills or a manikin of a specific part of the body (e.g. to demonstrate how to use an auriscope). Other stations have investigation results with a list of questions that are to be completed on computer-marked examination papers. Each station has a different examiner and the stations are standardized with specific marking criteria, thus enabling fairer comparison with peers.

**obligate** *adj.* describing an organism that is restricted to one particular way of life; for example, an **obligate parasite** cannot exist without a host. Compare **FACULTATIVE**.

**obligation** *n.* *see* **DUTY**.

**obscure auditory dysfunction (OAD, King–Kopetzky syndrome)** hearing difficulty, especially in noisy environments, in an individual with a normal **\*audiogram**: a form of **\*auditory processing disorder**. Treatment includes **\*hearing therapy**.

**observer error** *see* **VALIDITY**.

**obsession** *n.* a recurrent thought, feeling, or impulse that is unpleasant and provokes anxiety but cannot be eliminated. Although an obsession dominates the person, he (or she) realizes its senselessness and struggles to resist it: this resistance causes anxiety. It is a feature of **\*obsessive–compulsive**

**disorder** and sometimes of depression and of organic states, such as encephalitis. —**obsessional** *adj.*

**obsessional traits** *see* ANANKASTIC.

**obsessive–compulsive disorder (OCD)** a mental illness prevalent in about 1% of the adult population but more common in children. Males are most commonly affected. The affected person has **\*obsessions** or **\*compulsions** he or she recognizes as senseless. Resisting the obsession causes anxiety, which is relieved by giving in to the compulsion. The obsession may, for example, be a vivid image, a fear (e.g. of contamination), or an impulse (e.g. to wash the hands repetitively). In severe cases obsessions and rituals can take over many hours of a person's life each day. The condition can be treated with behaviour therapy and antidepressant medication, particularly clomipramine and SSRIs. **\*Psychosurgery** is still a rare option in very severe and treatment-resistant cases.

**obstetric anal sphincter injury (OASIS)** a spectrum of injuries that encompasses both third- and fourth-degree **\*perineal tears**. Injury to the anal sphincter mechanism during childbirth may arise secondarily to direct disruption of the sphincter muscles and/or traction of the pudendal nerves. Disruption of the anal sphincter muscles is best assessed by anal ultrasound examination. This is usually performed using a high-frequency (10 MHz) endoanal probe. In selected cases with complex injury and/or suspected rectovaginal **\*fistula**, magnetic resonance imaging (MRI) may also be employed.

**obstetric cholestasis** a pregnancy-related condition characterized by intense **\*pruritus** (itch) – and consequent sleep deprivation – in the absence of a skin rash, with abnormal liver function tests and elevated bile acids, all of which remit following delivery. The clinical importance of obstetric cholestasis lies in the potential fetal risks, which may include prematurity and intrauterine death.

**obstetrics** *n.* the branch of medical science concerned with the care of women during pregnancy, childbirth, and the period of about six weeks following the birth, when the reproductive organs are recovering. *Compare* GYNAECOLOGY. —**obstetric** *adj.* —**obstetrician** *n.*

**obstipation** *n.* Chiefly US. severe or absolute constipation, usually with intestinal obstruction.

**obstructed labour** failure of the presenting part to descend in spite of uterine contractions, which implies a mechanical cause. Obstruction is usually due to (1) an abnormality in the woman's pelvis (a contracted pelvis); (2) an abnormality in her baby (e.g. hydrocephaly); or (3) an abnormality in the relationship between them, either (a) an abnormal *\*lie* (e.g. transverse) or *\*malpresentation*, or (b) *\*cephalopelvic disproportion* (CPD). CPD and impacted transverse lie are the most important causes. Much of the purpose of antenatal care is to screen mothers who are at risk from obstructed labour, which can be detected early by means of a *\*partogram*. If undetected, it can lead to rupture of the uterus, death of the fetus, obstetric fistulae, or maternal death.

**obstructive airways disease** *see* BRONCHOSPASM.

**obstructive sleep apnoea (OSA, obstructive sleep apnoea syndrome, OSAS)** a serious condition in which airflow from the nose and mouth to the lungs is restricted during sleep, also called **sleep apnoea syndrome (SAS)**. It is defined by the presence of more than five episodes of *\*apnoea* per hour of sleep associated with significant daytime sleepiness. Snoring is a feature of the condition but it is not universal. There are significant medical complications of prolonged OSA, including heart failure and high blood pressure. Patients perform poorly on driving simulators, and driving licence authorities may impose limitations on possession of a driving licence. There are associated conditions in adults, the *\*hypopnoea* syndrome and the upper airways resistance syndrome, with less apnoea but with daytime somnolence and prominent snoring. In children the cause is usually enlargement of the tonsils and adenoids and treatment is by removing these structures. In adults the tonsils may be implicated but there are often other abnormalities of the pharynx, and patients are often obese. Treatment may include weight reduction or nasal *\*continuous positive airways pressure* (nCPAP) devices, *\*mandibular advancement splints*, or noninvasive ventilation. Alternatively *\*tonsillectomy*, *\*uvulopalatopharyngoplasty*, *\*laser-assisted uvulopalatoplasty*, or *\*tracheostomy* may be required.

**obstructive sleep apnoea syndrome (OSAS)** *see* **OBSTRUCTIVE SLEEP APNOEA**.

**obtund** *vb.* to blunt or deaden sensitivity; for example, by the application of a local anaesthetic, which reduces or causes complete loss of sensation in nearby nerves.

**obturation** *n.* obstruction of a bodily passage, usually by impaction of a foreign body, viscid secretions, or hardened faeces.

**obturator** *n.* **1.** *see* **OBTURATOR MUSCLE**. **2.** a wire or rod within a cannula or hollow needle for piercing tissues or fitting aspirating needles. **3.** a removable prosthetic device that both closes a defect in the palate and also restores the dentition. The defect may result from removal of a tumour or, less commonly, be congenital, as in a cleft palate.

**obturator foramen** a large opening in the **\*hip bone**, below and slightly in front of the acetabulum. *See also* **PELVIS**.

**obturator muscle** either of two muscles that cover the outer surface of the anterior wall of the pelvis (the **obturator externus** and **obturator internus**) and are responsible for lateral rotation of the thigh and movements of the hip.

**obtusion** *n.* the weakening or blunting of normal sensations. This may be associated with disease.

**occipital bone** a saucer-shaped bone of the **\*skull** that forms the back and part of the base of the cranium. At the base of the occipital are two **occipital condyles**: rounded surfaces that articulate with the first (atlas) vertebra of the backbone. Between the condyles is the **foramen magnum**, the cavity through which the spinal cord passes.

**occiput** *n.* the back of the head. In obstetrics, the occiput is used as a **\*denominator** when a fetus presents by the vertex (*see* **PRESENTATION**). The most favourable position for delivery is **occipitoanterior** (or **occipital anterior**), with the occiput of the fetus presenting towards the anterior aspect of the maternal pelvis as it enters the pelvic inlet. In the **occipitotransverse** (or **occipital transverse**) and **occipitoposterior** (or **occipital posterior**)

positions, the occiput presents towards the lateral and posterior aspects, respectively, of the maternal pelvis; these are *\*malpositions*. —**occipital** *adj.*

**occlusal** *adj.* (in dental anatomy) denoting or relating to the biting surface of a premolar or molar tooth.

**occlusal rim** the occlusal extension of a denture base to allow analysis of jaw relations and to record jaw relations for the construction of *\*dentures*, bridges, and extensive crowning.

**occlusion** *n.* **1.** the closing or obstruction of a hollow organ or part. **2.** (in dentistry) the relation of the upper and lower teeth when they are in contact. Maximum contact between the teeth is known as **intercuspal** (or **centric**) **occlusion**. *See also* **MALOCCLUSION**.

**occult** *adj.* not apparent to the naked eye; not easily determined or detected. For example **occult blood** is blood present in such small quantities that it can only be detected microscopically or by chemical testing. *See* **FAECAL OCCULT BLOOD TEST**.

**occupational disease** a disease to which workers in certain occupations are particularly prone. **Industrial diseases**, associated with a particular industry or group of industries, fall within this category. Examples of such diseases include the various forms of *\*pneumoconiosis*, which affect the lungs of workers continually exposed to dusty atmospheres; cataracts in glassblowers; decompression sickness in divers; poisoning from toxic metals in factory and other workers; and infectious diseases contracted from animals by farm workers, such as woolsorter's disease (*see* **ANTHRAX**). *See also* **COSHH, PRESCRIBED DISEASE; INDUSTRIAL INJURIES DISABLEMENT BENEFIT**.

**occupational health service (OHS)** a scheme by which employers provide a mainly preventive health service for employees. Specially trained doctors and nurses advise management on hazardous situations at work. Advice is also given to management to ensure that people with ill health or disability are not prevented from taking up employment and on the potential for rehabilitating employees with prolonged or repeated sickness absence. Instruction may be given to the workforce on simple first aid procedures, and

**\*health promotion** programmes may be offered in relation to nutrition, physical activity, and stress. With the approval of the **\*Health and Safety Executive**, the OHS may conduct routine tests on employees working with potentially hazardous substances, such as lead. *See also* **COSHH**.

**occupational mortality** rates and causes of death in relation to different jobs, occupational and socioeconomic groups, or social class. Because some occupations have older incumbents than others (e.g. judges) allowance for age bias is made by comparing either **\*standardized mortality ratios** for those aged 15–64 years or related but less familiar indices, such as **comparative mortality figures** or **proportional mortality ratios**.

**occupational therapy** the treatment of physical and psychiatric conditions by encouraging patients to undertake specific selected activities that will help them to reach their maximum level of function and independence in all aspects of daily life. These activities are designed to make the best use of the patient's capabilities and are based on individual requirements. They range from woodwork, metalwork, and printing to pottery and other artistic activities, household management, social skills, and leisure activities. Occupational therapy also includes assessment for mechanical aids and adaptations in the home.

**OCD** *see* **OBSESSIVE—COMPULSIVE DISORDER**.

**ochronosis** *n.* the presence of brown-black pigment in the skin, cartilage, and other tissues due to the abnormal accumulation of homogentisic acid that occurs in the metabolic disease **\*alcaptonuria**.

**ocriplasmin** *n.* a recombinant protease with activity against components of the interface between the retina and the vitreous humour, used for treatment of symptomatic vitreomacular adhesion. It works by dissolving the proteins that link the vitreous to the macula in this condition, thus preventing posterior detachment of the vitreous from the retina (*see* **RETINAL DETACHMENT**).

**OCT** *see* **OPTICAL COHERENCE TOMOGRAPHY**.

**oct-** (**octa-**, **octi-**, **octo-**) *combining form denoting* eight.

**octreotide** *n.* a somatostatin analogue (*see* **SOMATOSTATIN**).

**ocular** *adj.* of or concerned with the eye or vision.

**ocular hypertension (OHT)** a constantly raised intraocular pressure (greater than 21 mmHg by Goldmann applanation *\*tonometry*) registered on two or more occasions in one or both eyes with the absence of evidence of optic nerve damage or visual field defect. Intraocular pressure increases slowly with age and OHT can increase the risk of developing glaucoma. It is treated with eye drops and surgery if indicated.

**oculist** *n.* a former name for an *\*ophthalmologist*.

**oculo-** *combining form denoting* the eye(s).

**oculogyric** *adj.* causing or concerned with movements of the eye.

**oculogyric crisis** a spasmodic deviation of the eyes upwards with head tilted backwards, which may last minutes or hours. It occurs in patients with postencephalitic *\*parkinsonism* and in patients taking phenothiazine drugs. Treatment is with antimuscarinic drugs.

**oculomotor** *adj.* concerned with eye movements.

**oculomotor nerve** the third *\*cranial nerve* (III), which is composed of motor fibres distributed to muscles in and around the eye. Fibres of the parasympathetic system are responsible for altering the size of the pupil and the lens of the eye. Fibres outside the eye run to the upper eyelid and to muscles that turn the eyeball in different directions.

**oculonasal** *adj.* concerned with the eye and nose.

**oculoplastics** *n.* a surgical specialty concerned with reconstructive and cosmetic surgery around the eye (including the orbit, eyelids, lacrimal apparatus, and other accessory structures).

**oculoplethysmography** *n.* measurement of the pressure inside the eyeball. A rising or above-normal pressure is an important indication of the presence of *\*glaucoma*.

**odds ratio** a measure of the association between an exposure and an outcome, calculated by comparing the odds of the outcome of interest in those who are given and those who are not given exposure with the outcome of interest. It is most commonly used in *\*case control studies*.

**odont-** (**odonto-**) *combining form denoting a tooth.* Example: **odontalgia** (toothache).

**odontoblast** *n.* one of the cells in the pulp of a tooth that form dentine. Odontoblasts line the pulp and have small processes that extend into the dentine. The process of dentine formation is known as **\*dentinogenesis**.

**odontogenic tumour** any one of a group of neoplasm tumour-like malformations arising from odontogenic tissues or their remnants. The most important example is the **\*ameloblastoma**.

**odontoid process** a toothlike process from the upper surface of the axis vertebra. *See* **CERVICAL VERTEBRAE**.

**odontology** *n.* the study of the teeth.

**odontome** *n.* an abnormal mass of calcified dental tissue, which usually represents a developmental abnormality. *Compare* **HAMARTOMA**.

**-odynia** *combining form denoting pain in (a specified part).*

**odynophagia** *n.* painful swallowing. This may be due to severe inflammation of the gullet (*see* **OESOPHAGITIS**) or infection as by such as cytomegalovirus, candidiasis, or herpes simplex virus in an immunocompromised patient. Other causes include neuromuscular disease, such as **\*achalasia**, foreign bodies, such as impacted fish bones, and malignancy.

**oedema** *n.* excessive accumulation of fluid in the body tissues: historically known as **dropsy**. The resultant swelling may be local, as with an injury or inflammation, or more general, as in heart or kidney failure. In generalized oedema there may be collections of fluid within the chest cavity (**pleural effusions**), abdomen (*see* **ASCITES**), or within the air spaces of the lung (**pulmonary oedema**). It may result from heart or kidney failure, cirrhosis of the liver, acute nephritis, the nephrotic syndrome, starvation, allergy, or drugs (e.g. cortisone steroids). In such cases the kidneys can usually be stimulated to get rid of the excess fluid by the administration of **\*diuretic** drugs. **Subcutaneous oedema** commonly occurs in the legs and ankles due to the influence of gravity and (in women) before menstruation; the swelling subsides with rest and elevation of the legs. —**oedematous** *adj.*

**Oedipus complex** in **\*Freudian** theory, repressed sexual feelings of a child for its opposite-sexed parent, combined with rivalry towards the same-sexed parent: said to be a normal stage of development. The end of the Oedipus complex in children is marked by a loss of sexual feelings towards the opposite-sexed parent and an increase in identification with the same-sexed parent. Arrest of development at the Oedipal stage is said to be responsible for sexual deviations and other neurotic behaviour.

**oesophag-** (**oesophago-**) *combining form denoting the oesophagus.*  
Example: **oesophagectomy** (surgical removal of).

**oesophageal ulcer** *see* **PEPTIC ULCER**; **OESOPHAGITIS**.

**oesophageal varices** dilated veins in the lower oesophagus due to **\*portal hypertension**. Varices have a high risk of bleeding, resulting in life-threatening **\*haematemesis**. Bleeding may be arrested by **band ligation** (or banding): an endoscopic technique in which rubber bands are applied to the base of a bleeding varix. Injection of sclerosants into bleeding varices is an older technique not now widely used. Failure to stop variceal bleeding at endoscopy may require the insertion of a Sengstaken-Blakemore tube (a compression balloon). Nonendoscopic treatments for variceal bleeding include antibiotics and vasoactive agents (such as **\*terlipressin** or octreotide).

**oesophagitis** *n.* inflammation of the oesophagus (gullet). Frequent regurgitation of acid and peptic juices from the stomach causes **reflux oesophagitis**, the commonest form, which may be associated with a hiatus **\*hernia**. The main symptoms are heartburn, acid regurgitation, **\*odynophagia**, and sometimes difficulty in swallowing (**\*dysphagia**). Complications include bleeding, **\*stricture** formation, and **\*Barrett's oesophagus**. It is treated with antacids and by maintaining an upright position, using more pillows at night, eating the evening meal earlier in the day, weight loss, and dietary restraint. In severe cases **\*fundoplication** surgery may be required. **Corrosive oesophagitis** is caused by the ingestion of caustic acid or alkali. It is often severe and may lead to perforation of the oesophagus and extensive stricture formation. Immediate treatment includes food avoidance and antibiotics; later, stricture dilatation is often needed. **Infective oesophagitis** is most commonly due to a fungus (*Candida*) infection in debilitated or

immunocompromised patients, especially those being treated with antibiotics, corticosteroids, and immunosuppressant drugs, but is occasionally due to viruses (such as cytomegalovirus or herpesvirus). **Eosinophilic oesophagitis** is a poorly understood condition characterized by infiltration of the oesophageal lining by excess *\*eosinophils*. Autoimmune disease and food allergy are two commonly proposed causes. Treatment is directed towards exclusion of allergens and oral or inhaled steroids.

**oesophagocele** *n.* protrusion of the lining (mucosa) of the oesophagus (gullet) through a tear or weakness in its muscular wall.

**oesophagogastroduodenoscopy (OGD)** *n.* endoscopic examination of the upper gastrointestinal tract using a fiberoptic or video instrument. *See also* **GASTROSCOPE**.

**oesophagoscope** *n.* an illuminated optical instrument used to inspect the interior of the oesophagus (gullet), dilate strictures, obtain material for biopsy, or remove a foreign body. It may be a rigid metal tube or a flexible fiberoptic or video-camera instrument (*see* **GASTROSCOPE**). — **oesophagoscopy** *n.*

**Oesophagostomum** *n.* a genus of parasitic nematodes occurring in Brazil, Africa, and Indonesia. It is a rare intestinal parasite of humans, producing symptoms of dysentery in cases of heavy infection. The worms may also invade the tissues of the gut wall, giving rise to abscesses. The worms can be eliminated with anthelmintics.

**oesophagostomy** *n.* a surgical operation in which the oesophagus (gullet) is opened onto the neck. It is usually performed after operations on the throat as a temporary measure to allow feeding.

**oesophagotomy** *n.* surgical opening of the oesophagus (gullet) in order to inspect its interior or to remove or insert something.

**oesophagus** *n.* the gullet: a muscular tube, about 23 cm long, that extends from the pharynx to the stomach. It is lined with mucous membrane, whose secretions lubricate food as it passes from the mouth to the stomach. Waves of *\*peristalsis* assist the passage of food.

Diseases of the oesophagus include *\*achalasia*, carcinoma, hiatus hernia, *\*oesophageal varices*, *\*oesophagitis*, and *\*peptic ulcer*. — **oesophageal** *adj.*

**oestradiol** *n.* the major female sex hormone produced by the ovary. *See* OESTROGEN.

**oestriol** *n.* one of the female sex hormones produced by the ovary. *See* OESTROGEN.

**oestrogen** *n.* one of a group of steroid hormones (including oestriol, oestrone, and oestradiol) that control female sexual development, promoting the growth and function of the female sex organs (*see* MENSTRUAL CYCLE) and female secondary sexual characteristics (such as breast development). Oestrogens are synthesized mainly by the ovary; small amounts are also produced by the adrenal cortex, testes, and placenta. In men excessive production of oestrogen gives rise to *\*feminization*.

Naturally occurring and synthetic oestrogens are used to treat *\*amenorrhoea* and menopausal symptoms (*see* HORMONE REPLACEMENT THERAPY), as well as androgen-dependent cancers (e.g. cancer of the prostate). Synthetic oestrogens are a major constituent of *\*oral contraceptives*. Side-effects of oestrogen therapy may include nausea and vomiting, headache and dizziness, irregular vaginal bleeding, fluid and salt retention, and feminization in men. Oestrogens should not be used in patients with a history of cancer of the breast, uterus, or genital tract. —**oestrogenic** *adj.*

**oestrogen receptor** a specific site on the surface of a cell that binds to *\*oestrogen*; the binding triggers responses of the cell to the hormone (*see* RECEPTOR). Oestrogen receptors occur on all target cells normally responsive to oestrogen (e.g. in the uterus) and are also found on some cancer cells, particularly in breast cancer. Oestrogen-receptor-positive cancer cells rely on oestrogen to grow and are therefore susceptible to *\*anti-oestrogen* therapy, which prevents oestrogen from binding to these receptors. This type of cancer tends to have a better prognosis than oestrogen-receptor-negative breast cancer.

**oestrogen-receptor antagonist** *see* ANTI-OESTROGEN.

**oestrone** *n.* one of the female sex hormones produced by the ovary. *See* OESTROGEN.

**Oestrus** *n.* a genus of widely distributed nonbloodsucking flies, occurring wherever sheep and goats are raised. The parasitic larvae of *O. ovis*, the sheep nostril fly, may occasionally and accidentally infect humans. By means of large mouth hooks, it attaches itself to the conjunctiva of the eye, causing a painful **\*myiasis** that may result in loss of sight. This is an occupational disease of shepherds. Larvae can be removed with forceps following anaesthesia.

**Office for National Statistics (ONS)** (in Britain) an executive agency of the Treasury that was formed in 1996. It is responsible for the compilation and publication of statistics relating to national and local populations, including their social and economic situation and contribution to the economy, and the demographic patterns of births, marriages, and deaths (including the medical cause of death). The ONS organizes a national **\*census** at ten-yearly intervals.

<https://www.ons.gov.uk/>

- ONS website

**off-pump CABG** **\*coronary artery bypass grafting** (CABG) performed on a beating heart, i.e. without using **\*cardiopulmonary bypass** (the pump refers to a **\*heart-lung machine**).

**ofloxacin** *n.* a **\*quinolone** antibiotic used to treat urinary-tract and sexually transmitted infections and also infections of the respiratory tract, skin, and eye. Possible side-effects include nausea, vomiting, and skin rashes.

**OGD** *n.* *see* OESOPHAGOGASTRODUODENOSCOPY.

**Ogilvie's syndrome** *see* PSEUDO-OBSTRUCTION.

**ohm** *n.* the **\*SI unit** of electrical resistance, equal to the resistance between two points on a conductor when a constant potential difference of 1 volt applied between these points produces a current of 1 ampere. Symbol:  $\Omega$ .

**OHT** *see* OCULAR HYPERTENSION.

**OI** *see* OSTEOGENESIS IMPERFECTA.

**-oid** *suffix denoting like; resembling.* Example: **pemphigoid** (condition resembling pemphigus).

**ointment** *n.* a greasy preparation, which may or may not contain medication, for use on skin or mucous membranes. Although less pleasant to use than the equivalent **\*cream**, it is more effective since it forms an impermeable layer in the outer layer of the skin, reducing evaporation from the surface.

**olanzapine** *n.* *see* **ANTIPSYCHOTIC**.

**olaparib** *n.* *see* **PARP INHIBITOR**.

**olecranon process** the large process of the **\*ulna** that projects behind the elbow joint.

**oleic acid** *see* **FATTY ACID**.

**oleo-** *combining form denoting oil.*

**oleothorax** *n.* the procedure of introducing paraffin wax extrapleurally so that the lung is allowed to collapse. This was sometimes formerly undertaken to allow closure of tuberculous cavities within the lung.

**oleum** *n.* (in pharmacy) an oil.

**olfaction** *n.* **1.** the sense of smell. **2.** the process of smelling. Sensory cells in the mucous membrane that lines the nasal cavity are stimulated by the presence of chemical particles dissolved in the mucus. *See* **NOSE**. — **olfactory** *adj.*

**olfactory nerve** the first **\*cranial nerve** (I): the special sensory nerve of smell. Fibres of the nerve run upwards from smell receptors in the nasal mucosa high in the roof of the nose, through minute holes in the skull, join to form the olfactory tract, and pass back to reach the brain.

**olig- (oligo-)** *combining form denoting* **1.** few. **2.** a deficiency.

**oligaemia** *n.* *see* **HYPOVOLAEMIA**.

**oligoarthritis** *n.* *see* **ARTHRITIS**.

**oligoclonal bands** immunoglobulin bands found in the cerebrospinal fluid (CSF) taken at **\*lumbar puncture**. Bands isolated only in the CSF and not in the serum indicate local synthesis and are seen in such conditions as multiple sclerosis.

**oligodactylysm** *n.* the congenital absence of some of the fingers and toes.

**oligodendrocyte** *n.* one of the cells of the **\*glia**, responsible for producing the **\*myelin** sheaths of the neurons of the central nervous system and therefore equivalent to the **\*Schwann cells** of the peripheral nerves.

**oligodendroglioma** *n.* a tumour of the central nervous system derived from a type of **\*glia** (the supporting tissue) rather than from the nerve cells themselves. *See also* **GLIOMA**.

**oligodipsia** *n.* a condition in which thirst is diminished or absent.

**oligodontia** *n.* the congenital absence of more than six teeth in the primary or permanent dentition or both. It is usually part of a syndrome and seldom occurs as an isolated entity.

**oligohydramnios** *n.* a decrease in the amount of amniotic fluid surrounding the fetus, which may occur in the second and third trimesters. It is usually associated with restricted fetal growth and may indicate serious fetal kidney abnormalities. *See* **POTTER SYNDROME**. *See also* **ANHYDRAMNIOS**.

**oligomenorrhoea** *n.* menstrual bleeding at intervals of between 35 days and 6 months.

**oligo-ovulation** *n.* infrequent occurrence of ovulation.

**oligospermia** *n.* a reduced number of spermatozoa in the semen (*see* **SEMINAL ANALYSIS**). In oligospermia there are less than 20 million spermatozoa per ml with poor motility (**asthenospermia**) and often including many bizarre and immature forms (**teratospermia**). Treatment is directed to any underlying cause (such as **\*varicocele**). *See also* **ANDROLOGY**; **INFERTILITY**.

**oliguria** *n.* the production of an abnormally small volume of urine. This may be a result of copious sweating associated with intense physical activity

and/or hot weather. It can also be due to kidney disease, retention of water in the tissues (*see* **OEDEMA**), loss of blood, diarrhoea, or poisoning.

**olive** *n.* a smooth oval swelling in the upper part of the medulla oblongata on each side. It contains a mass of nerve cells, mainly grey matter (**olivary nucleus**). —**olivary** *adj.*

**Ollier's disease** *see* **DYSCHONDROPLASIA**. [L. L. X. E. Ollier (1830–1900), French surgeon]

**-ology** *combining form. see* **-LOGY**.

**olsalazine** *n.* a salicylate preparation used to treat mild ulcerative colitis. Possible side-effects include nausea, vomiting, headache, joint pain, and skin rashes.

**om-** (**omo-**) *combining form denoting* the shoulder.

**-oma** *combining form denoting* a tumour. Examples: **hepatoma** (of the liver); **lymphoma** (of the lymph nodes).

**omalizumab** *n.* a **\*monoclonal antibody** used in the prevention of severe allergic asthma that has not responded to standard therapy and is also a highly effective treatment for chronic **\*urticaria**. It is now recommended by NICE as an additional treatment to standard asthma therapy for some people aged six years and over with severe persistent allergic asthma. Omalizumab acts by binding to IgE, an **\*immunoglobulin** that mediates the allergic response.

**omega-3 fatty acids (n-3 fatty acids)** polyunsaturated fatty acids with a double bond at the third carbon atom in the chain. Omega-3 fatty acids are essential for brain development and are also associated with many health benefits, including protection against heart disease and possibly stroke and inflammatory conditions. There are three major types: alpha-linolenic acid (ALA), eicosapentaenoic acid (EPA), and docosahexaenoic acid (DHA). The main source of EPA and DHA is fish oils. Vegetarians rely on EPA and DHA being synthesized by the body from dietary sources of ALA. *See also* **ESSENTIAL FATTY ACIDS**.

**omentectomy** *n.* the surgical removal of all or part of the omentum (the fold of peritoneum between the stomach and other abdominal organs). In **infracolic omentectomy** the lower section of the greater omentum is excised as part of the management of ovarian or bowel cancer. It enables accurate staging and optimal reduction of the cancer.

**omentum (epiploon)** *n.* a double layer of **\*peritoneum** attached to the stomach and linking it with other abdominal organs, such as the liver, spleen, and intestine. The **greater omentum** is a highly folded portion of the omentum, rich in fatty tissue, that covers the intestines in an apron-like fashion. It acts as a heat insulator and prevents friction between abdominal organs. The **lesser omentum** links the stomach with the liver. —**omental** *adj.*

**omeprazole** *n.* a **\*proton-pump inhibitor** used to treat gastric and duodenal ulcers, **\*gastro-oesophageal reflux disease**, and the **\*Zollinger-Ellison syndrome**. Omeprazole can be effective in cases that have failed to respond to H<sub>2</sub>-receptor antagonists, such as **\*ranitidine**. Possible side-effects include nausea, diarrhoea, headache, constipation, and skin rashes.

**Ommaya reservoir** a device inserted into the ventricles of the brain to enable the repeated injection of drugs into the cerebrospinal fluid. It is used, for example, in the treatment of malignant meningitis, particularly in children with leukaemia. It can also be used to allow aspiration of cystic gliomas.

**omphal- (omphalo-)** *combining form denoting* the navel or umbilical cord.

**omphalitis** *n.* inflammation of the navel, especially in newborn infants.

**omphalocele** *n.* an umbilical **\*hernia**.

**omphalus** *n.* *see* **UMBILICUS**.

**Onchocerca** *n.* a genus of parasitic worms (*see* **FILARIA**) occurring in central Africa and central America. The adult worms are found in fibrous nodules within the connective tissues beneath the skin and their presence causes disease (*see* **ONCHOCERCIASIS**). Various species of black fly, in which *Onchocerca* undergoes part of its development, transmit the infective larvae to humans.

**onchocerciasis** *n.* a tropical disease of the skin and underlying connective tissue caused by the parasitic worm *\*Onchocerca volvulus*. Fibrous nodular tumours grow around the adult worms in the skin; these may take several months to appear, and if secondary bacterial infection occurs they may degenerate into abscesses. The skin also becomes inflamed and itches. The migration of the *\*microfilariae* into the eye can cause total or partial blindness – called **river blindness** in Africa. Onchocerciasis occurs in Africa and Central and South America. *\*Ivermectin* is used in treatment; if possible, the nodules are removed as and when they appear.

**onco-** *combining form denoting* **1.** a tumour. **2.** volume.

**oncocyoma** *n.* a usually benign tumour that consists of **oncocytes**, which are abnormal epithelial cells that contain many mitochondria. Oncocytomas commonly occur in the kidney.

**oncofetal antigen** a protein normally produced only by fetal tissue but often produced by certain tumours. An example is *\*carcino-embryonic antigen* (CEA), which has been used as a *\*tumour marker*, especially in colorectal carcinomas.

**oncogene** *n.* a gene in viruses (*v-onc*) and mammalian cells (*c-onc*) that can cause cancer. It results from the mutation of a normal gene (a *\*proto-oncogene*). An oncogene is capable of both initiation and continuation of malignant transformation of normal cells. It probably produces proteins (*\*growth factors*) regulating cell division that, under certain conditions, become uncontrolled and may transform a normal cell to a malignant state.

**oncogenesis** *n.* the development of a new abnormal growth (a benign or malignant tumour).

**oncogenic** *adj.* describing a substance, organism, or environment that is known to be a causal factor in the production of a tumour. Some viruses are considered to be oncogenic; these include the *\*papovaviruses*, the *\*retroviruses*, certain *\*adenoviruses* and *\*herpesviruses*, and the *\*Epstein-Barr virus*. *See also* CARCINOGEN.

**oncology** *n.* the study and practice of treating tumours. It is often subdivided into medical, surgical, clinical, and radiation oncology. —**oncologist** *n.*

**oncolysis** *n.* the destruction of tumours and tumour cells. This may occur spontaneously or, more usually, in response to treatment with drugs or by radiotherapy.

**oncometer** *n.* an instrument for measuring the volume of blood circulating in one of the limbs. *See* **PLETHYSMOGRAPHY**.

**oncosphere (hexacanth)** *n.* the six-hooked larva of a **\*tapeworm**. If ingested by a suitable intermediate host, such as a pig or an ox, the larva will use its hooks to penetrate the wall of the intestine. The larva subsequently migrates to the muscles, where it develops into a **\*cysticercus**.

**oncotic** *adj.* **1.** characterized by a tumour or swelling. **2.** relating to an increase in volume or pressure.

**oncotic pressure** a pressure represented by the pressure difference that exists between the osmotic pressure of blood and that of the lymph or tissue fluid. Oncotic pressure is important for regulating the flow of water between blood and tissue fluid. *See also* **OSMOSIS**.

**ondansetron** *n.* a drug used to control severe nausea and vomiting, especially when it results from chemotherapy and radiotherapy. Ondansetron works by opposing the action of the neurotransmitter **\*serotonin** (5-hydroxytryptamine) at 5HT<sub>3</sub> receptors. Side-effects include constipation, headache, and flushing. Related drugs with similar actions and effects include **granisetron** and **palonosetron**.

**oneir- (oneiro-)** *combining form denoting dreams or dreaming.*

**Onodi cell** a posterior ethmoidal sinus air cell (*see* **PARANASAL SINUSES**). They are surgically important because of their proximity to the optic nerve and internal carotid artery. [A. Onodi (1857–1919), Hungarian rhinolaryngologist]

**on-off phenomenon** the rapid alternation between jerky uncontrolled movements (on) and very limited or no movement (off) most often seen in patients with Parkinson's disease who have been undergoing long-term treatment with levodopa.

**ONS** *see* **OFFICE FOR NATIONAL STATISTICS**.

**ontogeny** *n.* the history of the development of an individual from the fertilized egg to maturity.

**onych-** (**onycho-**) *combining form denoting the nail(s).*

**onychogryphosis** *n.* gross thickening and hardening of a nail, which becomes elongated and deformed. It may be caused by poor blood supply, injury to the matrix, fungal infection, diabetes, and/or malnutrition.

**onycholysis** *n.* separation or loosening of part or all of a nail from its bed. The condition may occur due to **\*psoriasis**, fungal infections of the skin/nail bed, trauma, or drugs. It is commoner in women and may return to normal spontaneously.

**onychomycosis** *n.* fungus infection of the nails caused by **\*dermatophytes** or **\*Candida**. The nails become discoloured, opaque, and thickened. *See also* RINGWORM.

**O'nyong nyong fever (joint-breaker fever)** a disease of Africa and Malaysia, caused by an **\*arbovirus** and transmitted by mosquitoes of the genus **\*Anopheles**. It is similar to **\*dengue** and symptoms include rigor, severe headache, an irritating rash, fever, and pains in the joints. The patient is given drugs to relieve the pain and fever.

**Onyx** *n. Trademark.* an **\*embolization** agent that can be used to block any blood vessel. It was initially used in embolization of arteriovenous malformations in the brain but is now used elsewhere in the body.

**oo-** *combining form denoting an egg; ovum.*

**oocyst** *n.* a spherical structure, 50–60 µm in diameter, that develops from the zygote (*see* OOKINETE) of the malarial parasite (*Plasmodium*) on the outer wall of the mosquito's stomach. The oocyst steadily grows in size and its contents divide repeatedly to form **\*sporozoites**, which are released into the body cavity of the mosquito when the oocyst bursts.

**oocyte** *n.* a cell in the ovary that undergoes **\*meiosis** to form an ovum. **Primary oocytes** develop from **\*oogonia** in the fetal ovary as they enter the early stages of meiosis. Only a fraction of the primary oocytes survive until puberty, and even fewer will be ovulated. At ovulation the first meiotic division is completed and a **secondary oocyte** and a **polar body** are formed.

Fertilization stimulates the completion of the second meiotic division, which produces a second polar body and an ovum.

**oocyte donation (egg donation)** the transfer of secondary \*oocytes from one woman to another. Possible recipients include women with primary or secondary ovarian failure or severe genetic disorders, and women in whom ovulation has been suppressed as an incidental result of drug treatment for another condition (e.g. cancer). Pregnancy rates are higher than with \*in vitro fertilization.

**oogenesis** *n.* the process by which mature ova (egg cells) are produced in the ovary (see illustration). Primordial germ cells multiply to form \*oogonia, which start their first meiotic division to become \*oocytes in the fetus. This division is not completed until each oocyte is ovulated. The second division is only completed on fertilization. Each meiotic division is unequal, so that one large ovum is produced with a much smaller polar body.

### Oogenesis.

**oogonium** *n.* (*pl.* **oogonia**) a cell produced at an early stage in the formation of an ovum (egg cell). Primordial germ cells that have migrated to the embryonic ovary multiply to form numerous small oogonia. After the fifth

month of pregnancy they enter the early stages of the first meiotic division to form the *\*oocytes*. *See also* [OOGENESIS](#).

**ookinete** *n.* the motile elongated *\*zygote* of the malarial parasite (*\*Plasmodium*), formed after fertilization of the *\*macrogamete*. The ookinete bores through the lining of the mosquito's stomach and attaches itself to the outer wall, where it later forms an *\*oocyst*.

**oophor-** (**oophoro-**) *combining form denoting the ovary.*

**oophorectomy (ovariectomy)** *n.* surgical removal of an ovary, performed, for example, when the ovary contains tumours or cysts or is otherwise diseased. *See also* [OVARICTOMY](#).

**oophoritis (ovaritis)** *n.* inflammation of an ovary, either on the surface or within the organ. Oophoritis may be associated with infection of the Fallopian tubes (*see* [SALPINGITIS](#)) or the lower part of the abdominal cavity. **Follicular oophoritis** is inflammation of the ovarian (Graafian) follicles. A bacterial infection usually responds to antibiotics.

**oophoropexy** *n.* the stitching of a displaced ovary to the wall of the pelvic cavity.

**operant** *adj.* (in psychology) describing a unit of behaviour that is defined by its effect on the environment. *See* [CONDITIONING](#).

**operating microscope** a binocular microscope commonly in use for microsurgery. The field of operation is illuminated through the objective lens by a light source within the microscope (*see* illustration). Many models incorporate a beam splitter and a second set of eyepieces, to enable the surgeon's assistant to view the operation.

**An operating microscope.**

**operculum** *n.* (*pl.* **opercula**) **1.** a plug of mucus that blocks the cervical canal of the uterus in a pregnant woman. When the cervix begins to dilate at the start of labour, the operculum, slightly stained with blood, comes away as a discharge ('show'). **2.** (in embryology) a plug of fibrin and blood cells that develops over the site at which a developing fertilized ovum has become embedded in the wall of the uterus. **3.** (in neurology) one of the folded and overlapping regions of cerebral cortex that conceal the *\*insula* on each side

of the brain. **4.** (in dentistry) a flap of gingival tissue that overlies the crown of a partially erupted tooth.

**operon** *n.* a group of closely linked genes that regulate the production of enzymes in bacteria. An operon is composed of one or more **structural genes**, which determine the nature of the enzymes made, and **operator** and **promoter genes**, which control the working of the structural genes. The operator is itself controlled by a **regulator gene**, which is not part of the operon.

**ophthalm-** (**ophthalmo-**) *combining form denoting the eye or eyeball.* Examples: **ophthalmectomy** (surgical removal of); **ophthalmorrhexis** (rupture of); **ophthalmotomy** (incision into).

**ophthalmia** *n.* inflammation of the eye, particularly the conjunctiva (*see* **CONJUNCTIVITIS**). **Sympathetic ophthalmia** is a granulomatous **\*uveitis** affecting all parts of the uveal tract of both eyes that may develop after perforating trauma or (more rarely) after intraocular surgery.

**ophthalmia neonatorum** conjunctivitis occurring in newborn infants. The two most common infections are gonorrhoea and *Chlamydia* (*see* **INCLUSION CONJUNCTIVITIS**); the infection may be contracted as the baby passes through an infected birth canal. If left untreated, it may cause lasting damage to the eye. Diagnosis should be confirmed with microbiological studies, and both baby and mother treated with appropriate antibiotics.

**ophthalmic** *adj.* concerned with the eye.

**ophthalmic nerve** the smallest of the three branches of the **\*trigeminal nerve**. It supplies sensory fibres to the eyeball, conjunctiva, and lacrimal gland, to a small region of the nasal mucous membrane, and to the skin of the nose, brows, and scalp.

**ophthalmitis** *n.* inflammation of the eye. *See* **CONJUNCTIVITIS**; **UVEITIS**.

**ophthalmodynamometry** *n.* measurement of the blood pressure in the vessels of the retina of the eye. A small instrument is pressed against the eye until the vessels are seen (through an **\*ophthalmoscope**) to collapse. The pressure recorded by the instrument reflects the pressure within the vessels of the retina. In certain disorders of the blood circulation to the eye, the

pressure in the vessels is reduced and the vessels can be made to collapse by a lower than normal pressure on the eyeball.

**ophthalmologist** *n.* a doctor who specializes in the diagnosis and treatment of eye diseases.

**ophthalmology** *n.* the branch of medicine that is devoted to the study and treatment of eye diseases. —**ophthalmological** *adj.*

**ophthalmometer** *n.* *see* KERATOMETER.

**ophthalmoplegia** *n.* paralysis of the muscles of the eye. **Internal ophthalmoplegia** affects the muscles inside the eye: the iris (which controls the size of the pupil) and also the ciliary muscle (which is responsible for *\*accommodation*). **External ophthalmoplegia** affects the muscles moving the eye. **Chronic progressive external ophthalmoplegia** is a progressive disease of the extrinsic eye muscles leading to *\*ptosis* and then paralysis of the muscles; eye movements become increasingly frozen in the primary position. Ophthalmoplegia may accompany *\*exophthalmos* due to thyrotoxicosis. **Internuclear ophthalmoplegia** (INO), due to a lesion in the brainstem, is seen, for example, in patients with multiple sclerosis or stroke.

**ophthalmoscope** *n.* an instrument for examining the interior of the eye. There are two types. The **direct ophthalmoscope** enables a fine beam of light to be directed into the eye and at the same time allows the examiner to see the spot where the beam falls inside the eye. Examiner and subject are very close together. In the **indirect ophthalmoscope** an image of the inside of the eye is formed between the subject and the examiner; it is this image that the examiner sees. The examiner and subject are almost an arm's length apart. A **scanning laser ophthalmoscope** uses a scanning camera, rather than a human observer, to view the inside of the eye. —**ophthalmoscopy** *n.*

**ophthalmotonometer** *n.* *see* TONOMETER.

**-opia** *combining form denoting* a defect of the eye or of vision. Example: **asthenopia** (eyestrain).

**opiate** *n.* strictly, one of a group of drugs derived from opium, including *\*morphine*, *\*codeine*, and *\*heroin* (diacetylmorphine). The term may be used more loosely to include, in addition, synthetic drugs with similar effects,

such as *\*methadone* and *\*buprenorphine*; in this case the term **opioid** is usually preferred. Opiates depress the central nervous system: they relieve pain, induce feelings of euphoria, suppress coughing, and stimulate vomiting. Because prolonged use can lead to *\*tolerance* and *\*dependence*, opioid *\*analgesics* are reserved for the relief of moderate or severe pain; other side-effects include drowsiness, nausea and vomiting, constipation, and depression of breathing.

**opisth-** (**opistho-**) *combining form denoting* **1.** dorsal; posterior. **2.** backwards.

**opisthorchiasis** *n.* a condition caused by the presence of the parasitic fluke *\*Opisthorchis* in the bile ducts. The infection is acquired through eating raw or undercooked fish that contains the larval stage of the parasite. Heavy infections can lead to considerable damage of the tissues of the bile duct and liver, progressing in advanced cases to *\*cirrhosis*. Symptoms may include loss of weight, abdominal pain, indigestion, and sometimes diarrhoea. The disease is treated with praziquantel.

**Opisthorchis** *n.* a genus of parasitic flukes occurring in E Europe, Russia, India, Japan, and SE Asia. *O. felineus* is normally a parasite of fish-eating mammals but humans can become infected after eating raw or undercooked fish. The adult flukes, which live in the bile ducts, can cause *\*opisthorchiasis*.

**opisthotonos** *n.* the position of the body in which the head, neck, and spine are arched backwards. It is assumed involuntarily by patients with tetanus and strychnine poisoning.

**opium** *n.* an extract from the poppy *Papaver somniferum*, which contains a number of alkaloids, principally morphine (which accounts for its analgesic, euphoric, and addictive effects: *see* **OPIATE**) with smaller amounts of codeine, papaverine, and others.

**opponens** *n.* one of a group of muscles in the hand that bring the digits opposite to other digits. For example, the **opponens pollicis** is the principal muscle causing opposition of the thumb.

**opportunistic** *adj.* denoting a disease that occurs when the patient's immune system is impaired by, for example, an infection, another disease, or drugs.

The infecting organism, which is also described as opportunistic, rarely causes the disease in healthy persons. Opportunistic infections, such as *\*Pneumocystis* pneumonia and that caused by the MAI complex (see **MYCOBACTERIUM**), are common in patients with AIDS.

**opposition** *n.* (in anatomy) the position of the thumb in relation to the other fingers when it is moved towards the palm of the hand.

**-opsia** *combining form denoting* a condition of vision. Example: **erythropsia** (red vision).

**opsoclonus** *n.* a series of erratic eye movements, resembling a large-amplitude fast *\*nystagmus* and developing spontaneously, that is seen in people with disease of the cerebellum or other parts of the brain.

**opsonin** *n.* a serum *\*complement* component that attaches itself to invading bacteria and apparently makes them more attractive to *\*phagocytes* and thus more likely to be engulfed and destroyed.

**opsonization** *n.* the process by which opsonins render foreign organisms or particles more attractive to *\*phagocytes* by attaching to their outer surfaces and changing their physical and chemical composition. Phagocytic leucocytes express receptors for these opsonins and thereby engulf and digest foreign organisms or particles.

**opt- (opto-)** *combining form denoting* vision or the eye.

**optic** *adj.* concerned with the eye or vision.

**optical activity** the property possessed by some substances of rotating the plane of polarization of polarized light. A compound that rotates the plane to the left is described as **laevorotatory** (or l-); one that rotates the plane to the right is described as **dextrorotatory** (or d-).

**optical coherence tomography (OCT)** a class of optical tomographic techniques that allows extremely high-quality micrometre-resolution three-dimensional images to be obtained from within optical scattering media (e.g. biological tissue). OCT is proving valuable in ophthalmology, for noninvasive imaging of the ocular structures, and in cardiology for visualizing the interior of coronary arteries using a specialized *\*catheter*. See also **SPECTRAL DOMAIN OPTICAL COHERENCE TOMOGRAPHY**.

**optic atrophy** degeneration of the optic nerve. It may be secondary to disease within the eye or it may follow damage to the nerve itself resulting from injury or inflammation. It is visible as pallor of the optic nerve as viewed inside the eye with an ophthalmoscope.

**optic chiasm (optic commissure)** the X-shaped structure formed by the two optic nerves, which pass backwards from the eyeballs to meet in the midline beneath the brain, near the pituitary gland (see illustration). Nerve fibres from the nasal side of the retina of each eye cross over to join fibres from the lateral side of the retina of the opposite eye. The optic tracts resulting from the junction pass backwards to the occipital lobes.

**optic cup** either of the paired cup-shaped outgrowths of the embryonic brain that form the retina and iris of the eyes.

**optic disc (optic papilla)** the start of the optic nerve, where nerve fibres from the rods and cones leave the eyeball. *See* **BLIND SPOT**.

**optic foramen** the groove in the top of the **\*orbit** that contains the optic nerve and the ophthalmic artery.

**optician (dispensing optician)** *n.* a person who is trained to make and fit glasses. *Compare* **OPTOMETRIST**.

**optic nerve** the second **\*cranial nerve** (II), which is responsible for vision. Each nerve contains about one million fibres that receive information from the rod and cone cells of the retina. It passes into the skull behind the eyeball to reach the **\*optic chiasm**, after which the **visual** (or **optic**) **pathway** continues to the cortex of the occipital lobe of the brain on each side (see illustration).

**Optic nerve.** The visual (or optic) pathway.

**optic neuritis** *see* RETROBULBAR NEURITIS.

**opticokinetic** *adj.* relating to the movements of the eye.

**optometer (refractometer)** *n.* an instrument for measuring the \*refraction of the eye. An **autorefractor** calculates the required spectacle lens correction automatically. Because the design and use of optometers is very complex, errors of refraction are usually determined using a \*retinoscope.

**optometrist (ophthalmic optician)** *n.* a health specialist qualified to examine the eyes for eye diseases and visual defects and prescribe corrective lenses. Optometrists must be registered with the General Optical Council, having obtained a degree in optometry and one year's preregistration experience. *Compare* OPTICIAN.

**optotype** *n.* a capital letter in charts used for testing visual acuity.

**oral** *adj.* **1.** relating to the mouth. **2.** taken by mouth: applied to medicines, etc.

**oral cavity** the mouth.

**oral contraceptive** a tablet containing one or more synthetic female sex hormones, taken by women to prevent conception. Most oral contraceptives are combined pills, consisting of an **\*oestrogen**, which blocks the normal process of ovulation, and a **\*progestogen**, which acts on the pituitary gland to block the normal control of the menstrual cycle. Progestogens also alter the lining of the uterus and the viscosity of mucus in its outlet, the cervix, so that conception is less likely should ovulation occur. These pills are taken every day for three weeks and then stopped for a week, during which time menstruation occurs. Side-effects may include headache, weight gain, nausea, skin changes, and depression. There is also a small risk that blood clots may form in the veins, especially those of the legs (which may lead to **\*pulmonary embolism**), or that prolonged use of hormonal contraceptives may reduce fertility. The unwanted pregnancy rate is less than 1 per 100 woman-years. With progestogen-only pills (sometimes known as **minipills**) the unwanted pregnancy rate is slightly higher (1–2 per 100 woman-years) but there are fewer side-effects (due to the absence of oestrogen).

Other hormonal contraceptives include injections and implants (*see* CONTRACEPTION). *See also* POSTCOITAL CONTRACEPTION.

**oral hypoglycaemic drug (oral antihyperglycaemic drug)** one of the group of drugs that reduce the level of glucose in the blood and are taken by mouth for the treatment of type 2 **\*diabetes mellitus**. They include the **\*sulphonylurea** group (e.g. glibenclamide, gliclazide), metformin (a **\*biguanide**), **\*alpha-glucosidase inhibitors**, **\*meglitinides**, **\*thiazolidinediones**, **\*DPP-IV inhibitors**, and **\*SGLT-2 inhibitors**.

**oral medicine** *see* STOMATOLOGY.

**oral rehabilitation** the procedure of rebuilding a dentition that has been mutilated as a result of disease, wear, or trauma.

**oral rehydration therapy (ORT)** the administration of an isotonic solution of various sodium salts, potassium chloride, glucose, and water to treat acute diarrhoea, particularly in children. In developing countries, it is the mainstay

of treatment for cholera. Once the diarrhoea has settled, normal feeding is gradually resumed.

**orbicularis** *n.* either of two circular muscles of the face. The **orbicularis oris**, around the mouth, closes and compresses the lips. The **orbicularis oculi**, around each orbit, is responsible for closing the eye.

**orbit** *n.* the cavity in the skull that contains the eye. It is formed from parts of the frontal, sphenoid, zygomatic, lacrimal, ethmoid, palatine, and maxillary bones. —**orbital** *adj.*

**orbitotomy** *n.* surgical removal of part of the orbital bones to gain access to the orbital space.

**orchi-** (**orchido-**, **orchio-**) *combining form denoting* the testis or testicle. Example: **orchioplasty** (plastic surgery of).

**orchidalgia** *n.* pain in the testicle, often due to a **\*varicocele**, **\*orchitis**, or **\*torsion** of the testis. The pain may also be caused by a hernia in the groin or the presence of a stone in the lower ureter.

**orchidectomy** *n.* surgical removal of a testis. A **radical orchidectomy**, using an incision in the inguinal region, is performed for malignant tumours within the testis (usually germ-cell tumours, such as **\*seminoma** or **\*teratoma**). Orchidectomy may also be performed for **\*infarction** of the testis. Removal of both testes (**bilateral orchidectomy**: *see* **CASTRATION**) causes sterility and reduces levels of testosterone by 90%, which is an effective treatment for advanced prostate cancer.

**orchidometer** *n.* a calliper device for measuring the size of the testicles. The **Prader orchidometer** consists of a collection of testicle-shaped beads of different sizes, each of known volume, for direct comparison to and sizing of the testicles. It enables the precise charting of testicular growth.

**orchidopexy** *n.* the operation of mobilizing an undescended testis in the groin and fixing it in the scrotum. The operation should be performed ideally before two years of age to allow the testis every chance of normal development (*see* **CRYPTORCHIDISM**).

**orchidotomy** *n.* an incision into the testis, usually done to obtain **\*biopsy** material for histological examination, particularly in men with few or no sperm in their semen (see **AZOOSPERMIA**; **OLIGOSPERMIA**). See also **tesa**.

**orchitis** *n.* inflammation of the testis. This causes pain, redness, and swelling of the scrotum, and may be associated with inflammation of the epididymis (**epididymo-orchitis**). The condition may affect one or both testes; it is usually caused by infection spreading down the vas deferens but can develop in mumps. Mumps orchitis affecting both testes after puberty may result in reduced testicular size and abnormalities in semen analysis, although sterility is rare. Treatment of epididymo-orchitis is by local support and by administration of analgesics and antibiotics; mumps orchitis often responds to **\*corticosteroids**.

**orf** *n.* an infectious disease of sheep and goats caused by a parapoxvirus. Those bottle-feeding infected lambs may develop a painful nodule, 2–3 cm across, on the fingers or hands; it resolves spontaneously.

**organ** *n.* a part of the body, composed of more than one tissue, that forms a structural unit responsible for a particular function (or functions). Examples are the heart, lungs, and liver.

**organelle** *n.* a structure within a cell that is specialized for a particular function. Examples of organelles are the nucleus, endoplasmic reticulum, Golgi apparatus, lysosomes, and mitochondria.

**organic** *adj.* **1.** relating to any or all of the organs of the body. **2.** describing chemical compounds containing carbon, found in all living systems.

**organic disorder** a disorder associated with changes in the structure of an organ or tissue. Compare **FUNCTIONAL DISORDER**.

**organism** *n.* any living thing, which may consist of a single cell (see **MICROORGANISM**) or a group of differentiated but interdependent cells.

**organo-** *combining form denoting organ or organic.* Examples: **organogenesis** (formation of); **organopathy** (disease of).

**organ of Corti (spiral organ)** the sense organ of the **\*cochlea** of the inner ear, which converts sound signals into nerve impulses that are transmitted to

the brain via the cochlear nerve. [A. Corti (1822–88), Italian anatomist]

**organ of Jacobson (vomeronasal organ)** a small blind sac in the wall of the nasal cavity. In humans it never develops properly and has no function, but in lower animals (e.g. snakes) it is one of the major organs of olfaction. [L. L. Jacobson (1783–1843), Danish anatomist]

**organotrophic** *adj.* see **HETEROTROPHIC**.

**orgasm** *n.* the climax of sexual excitement, which – in men – occurs simultaneously with **\*ejaculation**. In women its occurrence is much more variable, being dependent upon a number of physiological and psychological factors.

**oriental sore (Baghdad boil, Delhi boil, Aleppo boil)** a skin disease, occurring in tropical and subtropical Africa and Asia, caused by the parasitic protozoan *Leishmania tropica* (see **LEISHMANIASIS**). The disease commonly affects children and takes the form of a slow-healing open sore or ulcer, which sometimes becomes secondarily infected with bacteria. Antibiotics are administered to combat the infection.

**orientation** *n.* (in psychology) awareness of oneself in time, space, and place. Orientation may be disturbed in such conditions as organic brain disease, toxic drug states, mental illness, and concussion.

**origin** *n.* (in anatomy) **1.** the point of attachment of a muscle that remains relatively fixed during contraction of the muscle. *Compare* **INSERTION**. **2.** the point at which a nerve or blood vessel branches from a main nerve or blood vessel.

**orlistat** *n.* a drug that reduces the absorption of fat in the stomach and small intestine by inhibiting the action of pancreatic **\*lipases**. It is administered by mouth in the treatment of clinical **\*obesity**, in conjunction with appropriate dietary measures. Side-effects include the production of copious oily stools and flatulence.

**ornithine** *n.* an **\*amino acid** produced in the liver as a by-product during the conversion of ammonia to **\*urea**.

**Ornithodoros (Ornithodoros)** *n.* a genus of soft **\*ticks**, a number of species of which are important in various parts of the world in the transmission of

*\*relapsing fever.*

**ornithosis** *n.* *see* PSITTACOSIS.

**oro-** *combining form denoting the mouth.*

**oroantral fistula** a connection between the mouth and the maxillary sinus (antrum), usually as a sequel to tooth extraction. It may resolve or require surgical closure.

**oropharyngeal airway** a curved tube designed to be placed in the mouth of an unconscious patient, behind the tongue, to create a patent airway. *See also* NASOPHARYNGEAL AIRWAY.

**oropharynx** *n.* the part of the *\*pharynx* that lies between the level of the junction of the hard and soft palates above, the hyoid bone below, and the arch of the soft palate in front. It contains the *\*tonsils* and connects the oral cavity and *\*nasopharynx* to the *\*hypopharynx*. —**oropharyngeal** *adj.*

**Oroya fever** *see* BARTONELLOSIS.

**orphenadrine** *n.* an *\*antimuscarinic* drug that relieves spasm in muscle, used to treat parkinsonism induced by antipsychotic drugs. Side-effects may include dry mouth, sight disturbances, and difficulty in urination.

**ORT** *see* ORAL REHYDRATION THERAPY.

**ortho-** *combining form denoting* **1.** straight. Example: **orthograde** (having straight posture). **2.** normal. Example: **orthocrasia** (normal reaction to drugs).

**orthochromatic** *adj.* describing or relating to a tissue specimen that stains normally.

**orthodontic appliance** an appliance used to move teeth as part of orthodontic treatment. A **fixed appliance** is fitted to the teeth by stainless steel bands or brackets that hold a special archwire, to perform complex tooth movements; it is used by dentists with specialist training (**orthodontists**). A **removable appliance** is a dental plate with appropriate retainers and springs to perform simple tooth movements; it is removed from the mouth for cleaning by the patient.

**orthodontics** *n.* the branch of dentistry concerned with the growth and development of the face and jaws and the treatment of irregularities of the teeth. See **ORTHODONTIC APPLIANCE**. —**orthodontic** *adj.*

**orthognathic surgery** surgical correction of severe **\*malocclusion**, in which development of one or both jaws is abnormal, to improve facial appearance. It needs to be carried out in combination with orthodontic treatment and may involve surgery to one or both jaws.

**orthokeratology** *n.* the use of contact lenses designed to reshape the cornea in the treatment of refractive errors, such as myopia (short sight).

**orthopaedics** *n.* the science or practice of correcting deformities caused by disease of or damage to the bones and joints of the skeleton. This specialized branch of surgery may involve operation, manipulation, traction, **\*orthoses**, or **\*prostheses**. —**orthopaedic** *adj.*

**orthophoria** *n.* the condition of complete balance between the alignment of the two eyes, such that perfect alignment is maintained even when one eye is covered. This theoretically normal state is in fact rarely seen, since in most people there is a minimal tendency for the eyes to deviate (see **HETEROPHORIA**).

**orthopnoea** *n.* breathlessness that prevents the patient from lying down, so that he has to sleep propped up in bed or sitting in a chair. —**orthopnoeic** *adj.*

**orthoptics** *n.* the practice of using nonsurgical methods, particularly eye exercises, to treat abnormalities of vision and of coordination of eye movements (most commonly strabismus (squint) and amblyopia). Orthoptics also includes the detection and measurement of the degree of any such abnormalities. —**orthoptic** *adj.* —**orthoptist** *n.*

**orthoptoscope** *n.* see **AMBLYOSCOPE**.

**orthosis** *n.* (*pl.* **orthoses**) a surgical appliance that exerts external forces on part of the body to support joints or correct deformity. —**orthotic** *adj.*

**orthostatic** *adj.* relating to the upright position of the body: used when describing this posture or a condition caused by it. See **HYPOTENSION**.

**orthotics** *n.* the science and practice of fitting an **\*orthosis** to improve the mechanical functioning of a limb, part of a limb, or the trunk.

**orthotopic transplantation** transplantation of a donor organ or tissue (usually the liver) into a recipient at the site where the recipient's organ has been removed. In contrast, **heterotopic transplantation** involves the preservation of the recipient's organ in its natural site and the addition of the donor organ at another site.

**Ortolani manoeuvre** a test for **\*congenital dislocation of the hip** in which, with the baby lying supine and the pelvis steadied with one hand, the examiner attempts to relocate a dislocated hip by gently abducting the hip while simultaneously pushing upwards on the greater trochanter. If the hip is dislocated, it will relocate with a detectable and sometimes audible clunk. [M. Ortolani (20th century), Italian orthopaedic surgeon]

**os<sup>1</sup>** *n.* (*pl.* **ossa**) a bone.

**os<sup>2</sup>** *n.* (*pl.* **ora**) the mouth or a mouthlike part.

**OSA** *see* **OBSTRUCTIVE SLEEP APNOEA**.

**OSAS** obstructive sleep apnoea syndrome (*see* **OBSTRUCTIVE SLEEP APNOEA**).

**OSCE** *see* **OBJECTIVE STRUCTURED CLINICAL EXAMINATION**.

**osche-** (**oscheo-**) *combining form denoting* the scrotum. Example: **oscheocele** (a scrotal hernia).

**oscilloscope** *n.* a cathode-ray tube designed to display electronically a wave form corresponding to the electrical data fed into it. Oscilloscopes are used to provide a continuous record of many different measurements, such as the activity of the heart and brain. *See* **ELECTROCARDIOGRAPHY**; **ELECTROENCEPHALOGRAPHY**.

**osculum** *n.* (in anatomy) a small aperture.

**oseltamivir** *n.* an antiviral drug that acts by inhibiting the action of the enzyme **\*neuraminidase** in viruses, which reduces their replication in host cells. Oseltamivir is administered orally for the prevention and treatment of

influenza A and B. To be effective, the drug must be taken within 48 hours of exposure to influenza (for prophylaxis) or onset of symptoms (for treatment).

**Osgood–Schlatter disease** inflammation and swelling at the site of insertion of the patellar tendon at the tibial tuberosity, just below the knee (*see* **APOPHYSITIS**), resulting in a prominent painful lump. It occurs in adolescence, as a result of excessive physical activity, and most cases resolve with time and rest. [R. B. Osgood (1873–1956), US orthopaedist; C. Schlatter (1864–1934), Swiss surgeon]

**-osis** *suffix denoting* **1.** a diseased condition. Examples: **nephrosis** (of the kidney); **leptospirosis** (caused by *Leptospira* species). **2.** any condition. Example: **narcosis** (of stupor). **3.** an increase or excess. Example: **leucocytosis** (of leucocytes).

**Osler–Rendu–Weber disease (hereditary haemorrhagic telangiectasia)** a hereditary (autosomal **\*dominant**) disorder characterized by thinning of the blood vessel walls, resulting in abnormally wide and fragile blood vessels. Patients may develop telangiectasia (*see* **TELANGIECTASIS**), nosebleeds, and arteriovenous malformations (*see* **ANGIOMA**). It is caused by mutations in the endoglin (*ENG*) gene or the activin receptor-like kinase (*ALK-1*) gene. [Sir W. Osler (1849–1919), Canadian physician; H. J. M. Rendu (1844–1902), French physician; F. P. Weber (1863–1962), British physician]

**Osler’s nodes** purplish nodes on the finger pulp or the **\*thenar** or **\*hypothear** eminence. They are usually tender and a sign of bacterial **\*endocarditis**. [Sir W. Osler]

**osm- (osmo-)** *combining form denoting* **1.** smell or odour. **2.** osmosis or osmotic pressure.

**osmic acid** *see* **OSMIUM TETROXIDE**.

**osmiophilic** *adj.* describing a tissue that stains readily with osmium tetroxide.

**osmium tetroxide (osmic acid)** a colourless or faintly yellowish compound used to stain fats or as a **\*fixative** in the preparation of tissues for microscopical study. Osmium tetroxide evaporates readily, the vapour having a toxic action on the eyes, skin, and respiratory tract.

**osmolality** *n.* the concentration of body fluids (e.g. plasma, urine) measured in terms of the amount of dissolved substances per unit mass of water. It is usually given in units of  $\text{mOsm kg}^{-1}$  or  $\text{Osm/l}$ . Symbol: Os or osmol.

**osmolar gap** the difference between the measured serum osmolality and the calculated osmolality using the following formula:

$$\text{calculated osmolality} = 2[\text{Na}^+ (\text{in mmol / l}) + \text{glucose}(\text{in mmol / l}) + \text{urea}(\text{in mmol / l})]$$

It is an aid to the diagnosis of severe **\*anion** gap acidoses. The normal range for the difference is  $\pm 10 \text{ mOsm/kg}$ . A high osmolar gap is normally due to the presence of acetone, mannitol, or an alcohol.

**osmole** *n.* a unit of osmotic pressure equal to the molecular weight of a solute in grams divided by the number of ions or other particles into which it dissociates in solution.

**osmoreceptor** *n.* a group of cells in the **\*hypothalamus** that monitor blood concentration. Should this increase abnormally, as in dehydration, the osmoreceptors send nerve impulses to the hypothalamus, which then increases the rate of release of **\*vasopressin** from the posterior pituitary gland. Loss of water from the body in the urine is thus restricted until the blood concentration returns to normal.

**osmosis** *n.* the passage of a solvent from a less concentrated to a more concentrated solution through a **\*semipermeable membrane**. This tends to equalize the concentrations of the two solutions. In living organisms the solvent is water and cell membranes function as semipermeable membranes, and the process of osmosis plays an important role in controlling the distribution of water. The **osmotic pressure** of a solution is the pressure by which water is drawn into it through the semipermeable membrane; the more concentrated the solution (i.e. the more solute molecules it contains), the greater its osmotic pressure. —**osmotic** *adj.*

**osseointegration** *n.* the process by which certain materials, such as titanium, may be introduced into living bone without producing a foreign-body reaction. This allows a very tight and strong joint between the two structures. Osseointegration is used, for example, to fix certain types of dental **\*implants** and **\*bone-anchored hearing aids**.

**osseous** *adj.* bony: applied to the bony parts of the inner ear (cochlea, semicircular canals, labyrinth).

**ossicle** *n.* a small bone. The **auditory ossicles** are three small bones (the incus, malleus, and stapes) in the middle *\*ear*. They transmit sound from the outer ear to the labyrinth (inner ear).

**ossification (osteogenesis)** *n.* the formation of *\*bone*, which takes place in three stages by the action of special cells (osteoblasts). A meshwork of collagen fibres is deposited in connective tissue, followed by the production of a cementing polysaccharide. Finally the cement is impregnated with minute crystals of calcium salts. The osteoblasts become enclosed within the matrix as **osteocytes (bone cells)**. In **intracartilaginous** (or **endochondral**) **ossification** the bone replaces cartilage. This process starts to occur soon after the end of the second month of embryonic life. **Intramembranous ossification** is the formation of a *\*membrane bone* (e.g. a bone of the skull). This starts in the early embryo and is not complete at birth (*see FONTANELLE*).

**ost- (oste-, osteo-)** *combining form denoting bone.* Examples: **ostalgia** (pain in); **osteocarcinoma** (carcinoma of); **osteonecrosis** (death of); **osteoplasty** (plastic surgery of).

**ostectomy** *n.* the surgical removal of a bone or a piece of bone. *See also* **OSTEOTOMY**.

**osteitis** *n.* inflammation of bone, due to infection, damage, or metabolic disorder. **Osteitis fibrosa cystica** refers to the characteristic cystic changes that occur in bones during long-standing *\*hyperparathyroidism*. *See also* **PAGET'S DISEASE**.

**osteo-** *combining form. see* **OST-**.

**osteoarthritis (osteoarthrosis)** *n.* a degenerative disease of joints resulting in loss of the articular cartilage, remodelling of adjacent bone, and inflammation. It can be primary or it can occur secondarily to abnormal load to the joint or damage to the cartilage from inflammation or trauma. The joints become painful and stiff with restricted movement. Osteoarthritis is recognized on X-ray by narrowing of the joint space (due to loss of cartilage)

and the presence of *\*osteophytes*, *\*osteosclerosis*, and cysts in the bone. The condition is treated with analgesics, by reducing the load to the joint by weight loss or the use of a walking stick, or surgically by *\*osteotomy*, *\*arthrodesis*, or *\*arthroplasty*.

**osteoarthritis** *n.* any disease of the bone and cartilage adjoining a joint. **Hypertrophic osteoarthritis** is characterized by the formation of new bony tissue and occurs as a complication of chronic diseases of the chest, including pulmonary abscess, mesothelioma, and lung cancer.

**ostearthrosis** *n.* *see* **OSTEOARTHRITIS**.

**ostearthrotomy** *n.* surgical excision of the bone adjoining a joint.

**osteoblast** *n.* a cell, originating in the mesoderm of the embryo, that is responsible for the formation of *\*bone*. *See also* **OSSIFICATION**.

**osteochondritis (osteochondrosis)** *n.* any one of a group of conditions affecting areas of growth at the *\*epiphyses* and *\*apophyses* of bones before skeletal maturity. Symptoms of localized pain and swelling are most common during periods of rapid growth in early adolescence. There are three types of osteochondritis: **crushing** (*see* **KÖHLER'S DISEASE**; **KIENBÖCK'S DISEASE**; **LEGG-CALVÉ-PERTHES DISEASE**; **SCHEUERMANN'S DISEASE**); **splitting** (*see* **OSTEOCHONDRITIS DISSECANS**); and **pulling** (*see* **OSGOOD-SCHLATTER DISEASE**; **SEVER'S DISEASE**).

**osteochondritis dissecans** the development of a small area of avascular bone on the surface of a joint, most commonly the knee, which typically occurs in males aged between 10 to 20 years. Sometimes the area with its overlying articular cartilage can become loose and may eventually detach. Symptoms include activity-related pain, localized tenderness, stiffness, and swelling. In children, spontaneous healing may occur, but adults usually require surgery to reattach or remove the fragment.

**osteochondroma** a bony protuberance covered by a cap of cartilage arising usually from the end of a long bone, most commonly around the knee or shoulder. It is due to overgrowth of cartilage at the edge of the *\*physis* (growth plate) of growing bones. The protuberance may be flattened (**sessile**) or stalklike (*see* **EXOSTOSIS**) and usually appears before the age of 30, with

patients complaining of either pain or a lump. There is a small incidence (1–2% in solitary lesions, higher if multiple) of malignant transformation of the cartilage cap into a **\*chondrosarcoma**. If the lump causes symptoms or continues to grow in an adult, it should be excised.

**osteochondrosis** *n.* *see* **OSTEOCHONDRITIS**.

**osteoclasia (osteoclasia)** *n.* **1.** (**osteoclasty**) the deliberate breaking of a malformed or malunited bone, carried out by a surgeon to correct deformity. **2.** dissolution of bone through disease (*see* **OSTEOLYSIS**).

**osteoclasia** *n.* **1.** remodelling of bone by **\*osteoclasts**, during growth or the healing of a fracture. **2.** *see* **OSTEOCLASIA**.

**osteoclast** *n.* **1.** a large multinucleate cell that resorbs calcified bone. Osteoclasts are only found when bone is being resorbed and may be seen in small depressions on the bone surface. **2.** a device for fracturing bone for therapeutic purposes.

**osteoclastoma** *n.* a rare tumour of bone, caused by proliferation of **\*osteoclast** cells.

**osteocyte** *n.* a bone cell: an **\*osteoblast** that has ceased activity and has become embedded in the bone matrix.

**osteodystrophy** *n.* any generalized bone disease resulting from a metabolic disorder. In **renal osteodystrophy** chronic kidney failure leads to diffuse bone changes resulting from a number of factors, including osteomalacia, secondary **\*hyperparathyroidism** stimulated by hypocalcaemia and hyperphosphataemia, acidosis from the renal failure, and metastatic calcification related to high levels of calcium and phosphate in the blood. *See also* **ALBRIGHT'S HEREDITARY OSTEODYSTROPHY**.

**osteogenesis** *n.* *see* **OSSIFICATION**.

**osteogenesis imperfecta (OI, fragilitas ossium, brittle bone disease)** a congenital disorder of connective tissue formation that affects bone, teeth, and soft tissues. It has an estimated incidence of 1 in 20,000 and there are at least eight types, of varying severity, the worst being lethal at birth. Most types are inherited as autosomal **\*dominant** characteristics. In all types the

bones are brittle and fracture easily; the *\*sclerae* may be blue and teeth are often deformed. *See also* **DENTINOGENESIS** (IMPERFECTA).

**osteogenic** *adj.* arising in, derived from, or composed of any of the tissues that are concerned with the production of bone. An **osteogenic sarcoma** (*see* **OSTEOSARCOMA**) affects bone-producing cells.

**osteology** *n.* the study of the structure and function of bones and related structures.

**osteolysis (osteoclasia)** *n.* dissolution of bone through disease, commonly by infection or by loss of the blood supply (ischaemia) to the bone. In **acro-osteolysis** the terminal bones of the fingers or toes are affected: a common feature of some disorders involving blood vessels (including *\*Raynaud's disease*), *\*scleroderma*, and systemic *\*lupus erythematosus*.

**osteoma** a benign bone tumour, of which there are two types. An **osteoid osteoma** most commonly occurs in the shaft of the femur or tibia. It is small, solitary, and relatively common; its characteristic feature is that it causes nocturnal pain that is relieved by aspirin. Treatment is by surgical excision. A **compact osteoma (ivory exostosis)** is a slow-growing tumour-like mass that usually causes no symptoms. Such tumours are relatively uncommon, occurring usually in the skull and facial bones. If they do cause symptoms, usually from local compression, they may be excised.

**osteomalacia** *n.* softening of the bones due to inadequate mineralization: it is the adult counterpart of *\*rickets*. Causes include insufficient calcium absorption from the intestine due to dietary deficiency or vitamin D deficiency, the latter resulting from lack of sunshine, intestinal malabsorption, liver or kidney disease, or anticonvulsant medication. The most common symptoms are bone pain, backache, and muscle weakness. The characteristic X-ray finding is a thin transverse radiolucent band (a **Looser zone**) in an otherwise normal-looking bone. Treatment usually involves large doses of vitamin D.

**osteomeatal complex** *see* **OSTIOMEATAL COMPLEX**.

**osteomyelitis** *n.* inflammation of bone due to infection. **Acute osteomyelitis** occurs when bacteria enter the bone via the bloodstream and is more

common in children. There is severe pain, tenderness, and redness over the involved bone, accompanied by general illness and high fever. Treatment is by antibiotics, and surgical drainage and curettage are often required. **Chronic osteomyelitis** may develop from partially treated acute osteomyelitis or after open fractures or surgery during which the bone is contaminated; tuberculosis is an occasional cause. Osteomyelitis can cause fracture and deformity of the bone.

**osteonecrosis** *n.* death of bony tissue, usually adjacent to a joint surface where it is enclosed by avascular cartilage. It is usually caused by loss of blood supply (**avascular necrosis**) due to trauma and is a definitive feature in a variety of conditions, including **\*Legg-Calvé-Perthes disease**, **\*sickle-cell disease**, **\*Gaucher's disease**, epiphyseal infection and fractures, alcohol abuse, and high-dosage corticosteroids. Sites that are particularly susceptible include the head of the femur, the scaphoid and lunate bones of the wrist, the **\*capitulum** of the humerus, and the talus and navicular bones of the ankle. In its earliest stages there is localized pain without any changes visible on X-ray examination; a **\*bone scan** or MRI will assist with diagnosis.

**osteopathy** *n.* a system of diagnosis and treatment based on the theory that many diseases are associated with disorders of the musculoskeletal system. Diagnosis and treatment of these disorders involve palpation, manipulation, and massage. Osteopathy provides relief for many disorders of bones and joints, especially those producing back pain. —**osteopath** *n.* —**osteopathic** *adj.*

**osteopenia** *n.* a condition in which bone mineral density is lower than normal, but less severe than **\*osteoporosis** (see **T SCORE**). It may be generalized or localized, due to inflammation.

**osteopetrosis (Albers-Schönberg disease, marble-bone disease)** *n.* a congenital abnormality in which bones become abnormally dense and brittle and tend to fracture. Affected bones appear unusually opaque to X-rays. In severe forms, which are inherited as autosomal **\*recessive** characteristics, the bone marrow is obliterated, causing anaemia and infections. Mild forms show autosomal **\*dominant** inheritance. Treatment is by bone marrow transplantation. *See also* **OSTEOSCLEROSIS**.

**osteophyte** *n.* a projection of bone, usually shaped like a rose thorn, that occurs at sites of cartilage degeneration or destruction near joints and intervertebral discs. Osteophyte formation is an X-ray sign of **\*osteoarthritis** but is not a cause of symptoms in itself.

**osteoporosis** *n.* a bone disease characterized by a decrease in bone mineral density and bone mass, resulting in bones that are liable to fracture. Infection, injury, and **\*synovitis** can cause localized osteoporosis of adjacent bone. Generalized osteoporosis is common in older people, and in women it often follows the menopause. It is also a feature of **\*Cushing's syndrome** and prolonged steroid therapy. Osteoporosis can be detected by **\*quantitative digital radiography**, ultrasound, and **\*DEXA** scans. A diet with adequate calcium, together with exercise, are preventative, and several drugs, including **\*bisphosphonates**, parathyroid hormone (PTH), and **\*denosumab**, can be used to reduce the risk of fracture.

**osteosarcoma (osteogenic sarcoma)** *n.* a highly malignant tumour arising from within a bone, usually in the **\*metaphysis** of the long bones of the body and especially around the knee and the proximal end of the humerus. It is usually seen in children and adolescents but can occur in adults of all ages, occasionally in association with **\*Paget's disease** of bone. In children the usual site for the tumour is the leg, particularly the femur. Secondary growths (metastases) are common, most frequently in the lungs (though other sites, such as the liver, may also be involved). The symptoms are usually pain and swelling at the site of the tumour and there is often a history of preceding trauma, although it is doubtful whether this contributes to the cause. Treatment of disease localized to the primary site was traditionally by amputation of the limb; limb-sparing surgery is now possible after **\*neoadjuvant chemotherapy**, with replacement of the diseased bone by a metal prosthesis. Many centres also give **\*adjuvant therapy** in an attempt to kill any microscopic tumour that might have already spread. The drugs used include doxorubicin, cisplatin, vincristine, cyclophosphamide, and methotrexate.

**osteosclerosis** *n.* an abnormal increase in the density of bone, as a result of poor blood supply, chronic infection, or tumour. The affected bone is more opaque to X-rays than normal bone. *See also* **OSTEOPETROSIS**.

**osteotome** *n.* a surgical chisel designed to cut bone (see illustration).

**An osteotome.**

**osteotomy** *n.* a surgical operation to cut a bone into two parts, followed by realignment of the ends to allow healing. The operation is performed to reduce pain and disability in an arthritic joint, by changing the biomechanics of the joint, for cases in which conservative treatment has failed. Osteotomy of the jaws is performed to improve severe discrepancies in jaw relation.

**ostiomeatal complex (osteomeatal complex)** the part of the **\*paranasal sinuses** where the frontal, maxillary, and anterior ethmoid sinuses communicate with the interior of the nose, which is affected in chronic **\*rhinosinusitis**. **\*Endoscopic sinus surgery** is often aimed at improving the function of this region.

**ostium** *n.* (*pl. ostia*) (in anatomy) an opening. The **ostium abdominale** is the opening of the Fallopian tube into the abdominal cavity.

**-ostomy** *combining form. see -STOMY.*

**ot- (oto-)** *combining form denoting the ear.* Example: **ototomy** (surgical incision of).

**otalgia** *n.* pain in the ear. Apart from local causes it may be due to diseases of the jaw joints, neck, throat, or teeth.

**otapostasis** *see PROTRUDING EARS.*

**OTC drug** *see OVER-THE-COUNTER DRUG.*

**otic** *adj.* relating to the ear.

**otic capsule** the cup-shaped cartilage in the head of an embryo that later develops into the bony **\*labyrinth** of the ear.

**otitis** *n.* inflammation of the ear. **Otitis externa** is inflammation of the canal between the eardrum and the external opening of the ear (the external auditory meatus). **Myringitis** is inflammation of the eardrum, often due to viral infection. **Acute otitis media** is inflammation, usually due to viral or bacterial infection, of the middle ear (the chamber lying behind the eardrum

and containing the three bony ossicles that conduct sound to the inner ear). Symptoms include pain and a high fever. Treatment is with antibiotics and sometimes also by surgical drainage (*\*myringotomy*). **Secretory otitis media** (or **otitis media with effusion**) is a chronic accumulation of fluid in the middle ear, causing hearing loss (*see* **BLUE EAR**). **Chronic otitis media** (COM) is chronic inflammation of the middle ear associated with perforations of the eardrum and in some instances with *\*cholesteatoma*. The treatment involves surgical repair of perforations (*\*myringoplasty*) or removal of the air cells in the mastoid bone (*\*mastoidectomy*). Chronic otitis media was previously known as **chronic suppurative otitis media** but the terminology was changed as the formation of pus is not an inevitable part of the condition. *See also* **LABYRINTHITIS**.

**otoacoustic emissions** (OAE, **Kemp echoes**) tiny sounds that emerge from the inner ear either spontaneously (**spontaneous otoacoustic emissions, SOAE**) or shortly after the ear is exposed to an external sound (**evoked otoacoustic emissions, EOAE**). An objective test of hearing has been developed using otoacoustic emissions. The test equipment creates a small sound and then detects any response from the ear. This can be done using a click stimulus (**transient otoacoustic emissions, TOAE**) or two separate tones (**distortion product otoacoustic emissions, DPOAE**). A normal response suggests that the ear is functioning and that hearing is satisfactory. All newborn children in the UK are now screened using this technique.

**otoconium** *n. see* **OTOLITH**.

**otocyst** *n.* a small cavity in the mesoderm of the head of an embryo that later develops into the membranous *\*labyrinth* of the ear.

**otolaryngology** *n.* the study of diseases of the ears and larynx.

**otolith (otoconium)** *n.* one of the small particles of calcium carbonate associated with a macula in the *\*sacculle* or *\*utricle* of the inner ear.

**otology** *n.* the study of diseases of the ear.

**-otomy** *combining form. see* **-TOMY**.

**otomycosis** *n.* a fungus infection of the ear, causing irritation and inflammation of the canal between the eardrum and the external opening of

the ear (external auditory meatus). It is one of the causes of *\*otitis externa*.

**otoplasty (pinnaplasty)** *n.* surgical repair or reconstruction of the ears after injury or in the correction of a congenital defect (such as protruding ears).

**otopostasis** *see* **PROTRUDING EARS**.

**otorhinolaryngology** *n.* the study of ear, nose, and throat diseases (i.e. ENT disorders).

**otorrhagia** *n.* bleeding from the ear.

**otorrhoea** *n.* any discharge from the ear, commonly a purulent discharge in chronic middle ear infection (*\*otitis media*).

**otosclerosis (otospongiosis)** *n.* a disorder causing conductive *\*deafness* in adult life. An overgrowth of the bone of the inner ear leads to the third ear ossicle (the stapes) becoming fixed to the fenestra ovalis, which separates the middle and inner ears, so that sounds cannot be conducted to the inner ear. Deafness is progressive and may become very severe, but treatment by surgery is usually highly effective (*see* **FENESTRATION**; **STAPEDECTOMY**). Nonsurgical treatments include fluoride tablets and the provision of suitable *\*hearing aids*.

**otoscope** *n. see* **AURISCOPE**.

**otospongiosis** *n. see* **OTOSCLEROSIS**.

**ototoxic** *adj.* having a toxic effect on the organs of balance or hearing in the inner ear or on the vestibulocochlear nerve. Ototoxic drugs may be used in the treatment of *\*Ménière's disease*. —**ototoxicity** *n.*

**outbreeding** *n.* the production of offspring by parents who are not closely related. *Compare* **INBREEDING**.

**outer ear** the pinna and the external auditory meatus of the *\*ear*.

**out-of-hours** (in general practice) denoting the period from 6.30 pm to 8.00 am on weekdays and the whole of weekends, bank holidays, and public holidays. Most GPs use a deputizing service to provide health-care services during the out-of-hours period. *See* **GENERAL PRACTITIONER**.

**out-of-body experience** a form of *\*derealization* in which there is a sensation of leaving one's body, sometimes accompanied by visions of travel. It typically occurs after anaesthesia or severe illness and is often attributed to *\*anoxia* of the brain.

**out-patient** *n.* a patient who receives treatment at a hospital, either at a single attendance or at a series of attendances, but is not admitted to a bed in a hospital ward. Large hospitals have *\*clinics* at which out-patients with various complaints can be given specialist treatment. *Compare* **IN-PATIENT**.

**out-toe gait (out-toeing)** a foot deformity in which the forefoot points outward, usually presenting in the first or second year of life. Most children are born with external rotation contractures of the hips and this resolves shortly after walking begins. In some children out-toeing is caused by outward twisting of the tibia or femur; this is more common in children with neuromuscular abnormalities.

**oval window** *see* **FENESTRA**.

**ovari- (ovario-)** *combining form denoting* the ovary.

**ovarian cancer** a malignant tumour of the ovary, usually a carcinoma. Because of its wide-ranging pathology and an imperfect understanding of its causes, ovarian cancer is not readily detected in the early stages of development, when the tumour is small and produces few suspicious symptoms. Increased susceptibility to the disease is associated with raised serum levels of *\*CA125* (*see also* **RISK OF MALIGNANCY INDEX**; **BRCA1 AND BRCA2**). Diagnosis is based on the finding of a solid or cystic mass arising from the pelvis; there may be associated *\*ascites*. The incidence of ovarian cancer reaches a peak in postmenopausal women; treatment involves surgery and most cases also require combined chemotherapy and/or radiotherapy.

**ovarian cyst** a benign tumour of the ovary, of which there are many varieties. The most common is a **follicular cyst**, resulting from growth of a *\*Graafian follicle* that fails to ovulate or from involution of a mature follicle. It may rupture, causing pain. A **luteal cyst** occurs after an egg has been released from a follicle, which then becomes a *\*corpus luteum*; instead of breaking down if a pregnancy does not occur, it fills with blood or fluid. Two-thirds

of luteal cysts involve the right ovary and rupture occurs most commonly between days 20 and 28. The symptoms are not severe and settle spontaneously. Although most ovarian cysts are not malignant, they may reach a very large size, causing gross swelling of the abdomen and pressure on surrounding organs. The cyst may rotate on its stalk, thus cutting off its blood supply and causing severe abdominal pain and vomiting (ovarian torsion). In this case the cyst requires urgent surgical removal. Ovarian cysts that do become malignant may not be recognized until the tumour has advanced to a stage where treatment may be unsuccessful in eradicating the cancer. Screening programmes, based on ultrasound techniques, and **\*CA125** estimation, have been introduced in some areas to assist with the early detection of ovarian cysts and tumours.

**ovarian hyperstimulation syndrome** a potentially life-threatening condition classically associated with ovarian stimulation using gonadotrophins in assisted conception procedures, such as in vitro fertilization (*see* **SUPEROVULATION**). It is characterized by gross enlargement of the ovaries resulting in pain, bloating, nausea, vomiting, **\*haemoconcentration**, and **\*ascites**. The most severe cases require intensive care due to the high risk of thromboembolism and acute respiratory distress.

**ovariectomy** *n. see* **OOPHORECTOMY**.

**ovariotomy** *n.* literally, incision of an ovary. However, the term commonly refers to surgical removal of an ovary (**\*oophorectomy**).

**ovaritis** *n. see* **OOPHORITIS**.

**ovary** *n.* the main female reproductive organ, which produces ova (egg cells) and steroid hormones in a regular cycle (*see* **MENSTRUAL CYCLE**) in response to hormones (**\*gonadotrophins**) from the anterior pituitary gland. There are two ovaries, situated in the lower abdomen, one on each side of the uterus (*see* **REPRODUCTIVE SYSTEM**). Each ovary contains numerous **follicles**, within which the ova develop (*see* illustration), but only a small proportion of them reach maturity (*see* **GRAAFIAN FOLLICLE**; **OOGENESIS**). The follicles secrete **\*oestrogen** and small amounts of androgen. After ovulation a **\*corpus luteum** forms at the site of the ruptured follicle and

secretes progesterone. Oestrogen and progesterone regulate the changes in the uterus throughout the menstrual cycle and pregnancy. —**ovarian** *adj.*

**Ovary.** A section of the ovary showing ova in various stages of maturation.

**overactive bladder syndrome** *see* DETRUSOR.

**overbite** *n.* the vertical overlap of the upper incisor teeth over the lower ones.

**overcompensation** *n.* (in psychology) the situation in which a person tries to overcome a disability by making greater efforts than are required. This may result in the person becoming extremely efficient in what he (or she) is trying to achieve; alternatively, excessive overcompensation may be harmful to the person.

**overdiagnosis** *n.* making more diagnoses in an individual case than is necessary or appropriate. As few people are in absolutely perfect health, it is usually possible to find a notional extra condition. This is considered to be bad medicine and ethically questionable.

**overjet** *n.* the horizontal overlap of the upper incisor teeth in front of the lower ones.

**overt** *adj.* plainly to be seen or detected: applied to diseases with observable signs and symptoms, as opposed to those whose presence may not be suspected for years despite the fact that they cause insidious damage. An infectious disease becomes overt only at the end of an incubation period.

**over-the-counter drug (OTC drug)** a drug that may be purchased directly from a pharmacist without a doctor's prescription. Current government policy is to extend the range of OTC drugs: a number have already been derestricted (e.g. ibuprofen, ranitidine) and this trend is increasing, which will place an additional advisory responsibility on pharmacists.

**overtube** *n.* a semirigid plastic tube (25–45 cm long) designed to fit over the shaft of an **\*endoscope** in order to minimize the risk of trauma. It can be used with a **\*gastroscope**, **\*cholangioscope**, **\*enteroscope**, or colonoscope (*see* COLONOSCOPY). An overtube is placed over the shaft of an endoscope prior to its insertion; once the endoscope is in the desired place, the overtube is lubricated and slid into position over the shaft. It is commonly used in combination with a gastroscope for the removal of ingested foreign bodies (especially those with sharp or serrated edges that may cause significant trauma as they are being extracted).

**ovi- (ovo-)** *combining form denoting an egg; ovum.*

**oviduct** *n.* *see* FALLOPIAN TUBE.

**ovulation** *n.* the process by which an ovum is released from a mature **\*Graafian follicle**. The fluid-filled follicle distends the surface of the ovary until a thin spot breaks down and the ovum floats out surrounded by a cluster of follicle cells (the cumulus oophorus) and starts to travel down the Fallopian tube to the uterus. Ovulation is stimulated by the secretion of **\*luteinizing hormone** by the anterior pituitary gland.

**ovum (egg cell)** *n.* the mature female sex cell (*see* GAMETE). The term is often applied to the secondary **\*oocyte** although this is technically incorrect. The final stage of meiosis occurs only when the oocyte has been activated by fertilization.

**A mature ovum (magnification about  $\times 600$ ).**

**oxalic acid** an extremely poisonous acid,  $C_2H_2O_4$ . It is a component of some bleaching powders and is found in many plants, including sorrel and the leaves of rhubarb. Oxalic acid is a powerful local irritant; when swallowed it produces burning sensations in the mouth and throat, vomiting of blood, breathing difficulties, and circulatory collapse. Treatment is with calcium lactate or other calcium salts, lime water, or milk.

**oxaliplatin** *n.* a third-generation analogue of **\*cisplatin** that is useful in the treatment of gastrointestinal malignancies, particularly advanced colorectal cancer. Administered in combination with fluorouracil and folinic acid, it has less toxic side-effects than cisplatin, although it can cause a typical **\*peripheral neuropathy** exacerbated by cold temperatures.

**oxalosis** *n.* an inborn defect of metabolism causing deposition of oxalate in the kidneys and elsewhere and eventually leading to renal failure.

**oxaluria** *n.* the presence in the urine of oxalic acid or oxalates, especially calcium oxalate. Excessive amounts of oxalates are excreted in **\*oxalosis**.

**oxazepam** *n.* a **\*benzodiazepine** drug used for the short-term relief of severe anxiety and tension. It may cause drowsiness. *See also* **ANXIOLYTIC**.

**oxidant** *n.* (in biological systems) a molecule that serves as an electron acceptor. In human disease oxidants are derived from normal intracellular processes and released by inflammatory cells. They are counteracted by **\*antioxidants**, such as beta-carotene.

**oxidase** *n.* *see* **OXIDOREDUCTASE**.

**oxidoreductase** *n.* one of a group of enzymes that catalyse oxidation-reduction reactions. This class includes the enzymes formerly known either as **dehydrogenases** or as **oxidases**.

**oximeter** *n.* an instrument for measuring the proportion of oxygenated haemoglobin (oxyhaemoglobin) in the blood.

**oxprenolol** *n.* a drug that controls the activity of the heart (*see* **BETA BLOCKER**), used mainly to treat angina, high blood pressure, and abnormal heart rhythm. Side-effects may include dizziness, drowsiness, headache, and digestive upsets.

**oxybutynin** *n.* an **\*antimuscarinic** drug used to reduce frequency and urgency of passing urine associated with an instability of the **\*detrusor** muscle of the bladder wall. It acts by reducing spontaneous detrusor activity and decreasing detrusor pressure. Side-effects include a dry mouth, loss of appetite, constipation, and blurred vision.

**oxycephaly (turriccephaly)** *n.* a deformity of the bones of the skull giving the head a pointed appearance. *See* **CRANIOSYNOSTOSIS**. —**oxycephalic** *adj.*

**oxycodone** *n.* an opioid analgesic (*see* **OPIATE**) used to treat moderate or severe pain, primarily in terminally ill patients. Common side-effects include drowsiness, dizziness, nausea, and constipation.

**oxygen** *n.* an odourless colourless gas that makes up one-fifth of the atmosphere. Oxygen is essential to most forms of life in that it combines chemically with glucose (or some other fuel) to provide energy for metabolic processes. It is absorbed into the blood from air breathed into the lungs. Oxygen is administered therapeutically in various conditions in which the tissues are unable to obtain an adequate supply through the lungs (*see* **OXYGENATOR**; **TENT**). Symbol: O.

**oxygenator** *n.* a machine that oxygenates blood outside the body. It is used together with pumps to maintain the patient's circulation while he or she is undergoing open heart surgery (*see* **HEART-LUNG MACHINE**) or to improve the circulation of a patient with heart or lung disorders that lower the amount of blood oxygen.

**oxygen deficit** a physiological condition that exists in cells during periods of temporary oxygen shortage. During periods of violent exertion the body requires extra energy, which is obtained by the breakdown of glucose in the absence of oxygen, after the available oxygen has been used up. The breakdown products are acidic and cause muscle pain. The oxygen required to get rid of the breakdown products (called the oxygen deficit) must be made available after the exertion stops.

**oxygen tent** *see* **TENT**.

**oxyhaemoglobin** *n.* the bright-red substance formed when the pigment **\*haemoglobin** in red blood cells combines reversibly with oxygen. Oxyhaemoglobin is the form in which oxygen is transported from the lungs to the tissues, where the oxygen is released. *Compare* **METHAEMOGLOBIN**.

**oxyntic cells** *see* **PARIETAL CELLS**.

**oxytetracycline** *n.* an antibiotic used to treat infections caused by a wide variety of bacteria, including *Chlamydia* and mycoplasmas, and acne. Side-effects are those of the other **\*tetracyclines**.

**oxytocic** *n.* any agent that induces or accelerates labour by stimulating the muscles of the uterus to contract. *See also* **OXYTOCIN**.

**oxytocin** *n.* a hormone, released by the pituitary gland, that causes contraction of the uterus during labour and stimulates milk flow from the breasts by causing contraction of muscle fibres in the milk ducts. Intravenous infusions or injections of oxytocin are used to induce labour and to control or prevent postpartum haemorrhage. Combined with **\*ergometrine**, oxytocin is used to control bleeding after incomplete miscarriage or abortion, or for active management of the third stage of labour.

**oxyuriasis** *n.* *see* **ENTEROBIASIS**.

**Oxyuris** *n.* *see* **THREADWORM**.

**ozaena** *n.* a disorder of the nose in which the mucous membranes inside the nose become atrophied, with the production of an offensive discharge and crusts.

**ozone** *n.* a poisonous gas containing three oxygen atoms per molecule. Ozone is a very powerful oxidizing agent and is formed when oxygen or air is subjected to electric discharge. Ozone in the troposphere (the atmospheric layer closest to the earth's surface), as found in photochemical smog, can cause health problems. Ozone at very high altitudes (the **ozone layer**) is responsible for absorbing a large proportion of the sun's ultraviolet radiation. Without this absorption by ozone the earth would be subjected to a lethal amount of ultraviolet radiation.

**p53** *n.* a tumour-suppressor gene located on chromosome 17. *p53* protein binds DNA, which stimulates genes involved in suppressing division and inducing *\*apoptosis*. Mutations of *p53* result in uncontrolled division of cells and formation of tumours; they occur in breast, skin, and various other cancers.

**PA** *see* POSTEROANTERIOR.

**Pacchionian body** *see* ARACHNOID VILLUS. [A. Pacchioni (1665–1726), Italian anatomist]

**pacemaker** *n.* **1.** a device used to produce and maintain a normal heart rate in patients who have *\*bradycardia*. The unit consists of a battery that stimulates the heart through one or more insulated electrode wires (*\*leads*) attached to the surface of the ventricle (**epicardial pacemaker**) or lying in contact with the lining of the heart (**endocardial pacemaker**). The pacemaker senses when the natural heart rate falls below a predetermined value and then stimulates the heart (**demand pacemaker**). A pacemaker may be used as a temporary measure with an external battery or it may be permanent, when the whole apparatus is surgically implanted under the skin. In most cases the right atrium and right ventricle are paced (**dual-chamber pacing**), but in a proportion of patients only right ventricular (**single-chamber**) **pacing** is required. **2.** the part of the heart that regulates the rate at which it beats: the *\*sinoatrial node*.

**pachy-** *combining form denoting* **1.** thickening of a part or parts. **2.** the dura mater.

**pachydactyly** *n.* abnormal enlargement of the fingers and toes, occurring either as a congenital abnormality or as part of an acquired disease (such as

**\*acromegaly**).

**pachyglossia** *n.* abnormal thickness of the tongue.

**pachymeningitis** *n.* inflammation of the dura mater, one of the membranes (meninges) covering the brain and spinal cord (*see* **MENINGITIS**).

**pachymeninx** *n.* the **\*dura** mater, outermost of the three meninges.

**pachymeter** *n.* an instrument used to measure the thickness of the cornea. —  
**pachymetry** *n.*

**pachyonychia congenita** a rare genetically determined skin disorder (*see* **GENODERMATOSIS**) characterized by thickening of the nails together with other ectodermal abnormalities.

**pachysomia** *n.* thickening of parts of the body, which occurs in certain diseases.

**pachytene** *n.* the third stage of the first prophase of **\*meiosis**, in which **\*crossing over** begins.

**Pacinian corpuscles** sensory receptors for touch in the skin, consisting of sensory nerve endings surrounded by capsules of membrane in ‘onion-skin’ layers. They are especially sensitive to changes in pressure and so detect vibration particularly well. [F. Pacini (1812–83), Italian anatomist]

**pack** *n.* a pad of folded moistened material, such as cotton-wool, applied to the body or inserted into a cavity.

**packed cell volume (haematocrit)** the volume of the red cells (erythrocytes) in blood, expressed as a fraction of the total volume of the blood. The packed cell volume is determined by centrifuging blood in a tube and measuring the height of the red-cell column as a fraction of the total. Automated instruments calculate packed cell volume as the product of the erythrocyte count and the measured mean red cell volume (**mean corpuscular volume**; MCV).

**pack years** a measure of a person’s cumulative cigarette consumption over a long period of time. It is expressed as the number of packs (assuming 20 cigarettes in a pack) smoked per day multiplied by the number of years of smoking:

number of pack years = (packs [or cigarettes/20] smoked per day) × (years smoking).

For example, a patient who has smoked 15 cigarettes a day for 40 years has a  $(15/20) \times 40 = 30$  pack-year smoking history.

**paclitaxel** *n.* a **\*cytotoxic** anticancer drug (*see* **TAXANE**). It is used mainly to treat ovarian cancer, breast cancer, and **\*non-small-cell lung cancer**. Typical side-effects include damage to bone marrow (*see* **MYELOSUPPRESSION**), loss of hair, and peripheral neuropathy.

**PACS (picture archiving and communication system)** a technology that enables the storage and transfer of digital images for display on high-resolution monitors. Images can be viewed at multiple sites simultaneously. The system also allows the manipulation of images on screen. *See* **DIGITAL RADIOGRAPHY**; **COMPUTERIZED RADIOGRAPHY**; **COMPUTERIZED TOMOGRAPHY**; **DIGITIZATION**.

**pad** *n.* cotton-wool, foam rubber, or other material used to protect a part of the body from friction, bruising, or other unwanted contact.

**Paddington alcohol test** a three-question tool designed to uncover any connection between an individual's attendance at an A & E department and alcohol-related problems, thereby creating the potential for intervention and referral.

**paed- (paedo-)** *combining form denoting children.*

**paediatric dentistry** the branch of dentistry concerned with the oral health care of children and adolescents.

### **Paediatric reference values**

**paediatrics** *n.* the general medicine of childhood. Handling the sick child requires a special approach at every age from birth (or preterm birth) to adolescence and also a proper understanding of parents. It also requires detailed knowledge of genetics, obstetrics, psychological development, management of disabilities at home and in school, and effects of social conditions on child health. The preventive measures associated with all these aspects of paediatrics are the concern of **\*public health consultants** and

\*community paediatricians. See also CHILD HEALTH CLINIC. —  
paediatrician *n*.

<http://www.actionforsickchildren.org/>

- Website of Action for Sick Children

**paedophilia** *n*. sexual attraction to children (of either sex) that may cause deviant behaviour. Sexual activity with any children under the age of 16 is illegal in the UK for adults. Paedophiles who have been arrested may be forced to undergo treatment: \*behaviour therapy can be used, although evidence of its efficacy is controversial. Occasionally, the offender's sexual drive can be reduced by drug treatment. —**paedophile** *n*. —**paedophilic** *adj*.

**Paget's disease 1.** a chronic disease of bones, occurring in the elderly and most frequently affecting the skull, backbone, pelvis, and long bones. Affected bones become thickened and their structure disorganized: X-rays reveal patchy \*sclerosis. There are often no symptoms, but pain, deformity, and fracture can occur; when the skull is affected, blindness and deafness can occur due to nerve compression. There is a very small (1%) risk of malignant change (\*osteosarcoma). Treatment is with \*bisphosphonates. Medical name: **osteitis deformans**. **2.** a malignant condition of the nipple, resembling eczema in appearance, associated with underlying infiltrating cancer of the breast. See also BREAST CANCER. **3.** an uncommon condition of the vulva characterized by an epithelial lesion that histologically resembles the lesion of Paget's disease of the nipple. It may be associated with locally invasive \*adenocarcinomas of the surrounding skin, as well as tumours at other sites. [Sir J. Paget (1814–99), British surgeon]

**pain** *n*. an unpleasant sensation ranging from mild discomfort to agonized distress, associated with real or potential tissue damage. Pain is a response to impulses from the peripheral nerves in damaged tissue, which pass to nerves in the spinal cord, where they are subjected to a gate control. This gate modifies the subsequent passage of the impulses in accordance with descending controls from the brain. Because attention is a crucial component of pain, distraction can act as a basis for pain therapy. On the other hand, anxiety and depression focus the attention and exaggerate the pain. If the

nerve pathways are damaged, the brain can increase the amplification in the pathway, maintaining the sensation as a protective mechanism.

**pain clinic** a clinic that specializes in the management and relief of pain. Pain clinics are usually directed by anaesthetists.

**painful bruising syndrome** *see* **GARDNER–DIAMOND SYNDROME**.

**paint** *n.* (in pharmacy) a liquid preparation that is applied to the skin or mucous membranes. Paints usually contain antiseptics, astringents, caustics, or analgesics.

**palaeo-** *combining form denoting* **1.** ancient. **2.** primitive.

**palaeocerebellum** *n.* the anterior lobe of the cerebellum. In evolutionary terms it is one of the earliest parts of the hindbrain to develop in mammals.

**palaeopathology** *n.* the study of the diseases of humans and other animals in prehistoric times, from examination of their bones or other remains. By examining the bones of specimens of Neanderthal man it has been discovered that spinal arthritis was a disease that existed at least 50,000 years ago.

**palaeostriatum** *n.* *see* **PALLIDUM**.

**palaeothalamus** *n.* the anterior and central part of the **\*thalamus**, older in evolutionary terms than the lateral part, the neothalamus, which is well developed in apes and humans.

**palatal myoclonus** rhythmical contraction of the palatal muscles. There are two forms, ordinary and essential. **Ordinary palatal myoclonus** is idiopathic and can result in **\*pulsatile tinnitus**. **Essential palatal myoclonus** has no link to pulsatile tinnitus but may be associated with lesions of the brainstem.

**palate** *n.* the roof of the mouth, which separates the mouth from the nasal cavity and consists of two portions. The **hard palate**, at the front of the mouth, is formed by processes of the maxillae and palatine bones and is covered by mucous membrane. The **soft palate**, further back, is a movable fold of mucous membrane that tapers at the back of the mouth to form a fleshy hanging flap of tissue – the **uvula**. —**palatal** *adj.*

**palatine bone** either of a pair of approximately L-shaped bones of the face that contribute to the hard *\*palate*, the nasal cavity, and the orbits. See *SKULL*.

**palato-** *combining form denoting* **1.** the palate. **2.** the palatine bone.

**palatoplasty** *n.* surgery to alter the shape or physical characteristics of the palate. This can be plastic surgery of the roof of the mouth, usually to correct cleft palate or other defects present at birth. Other palatoplasty operations are carried out under local or general anaesthesia to shorten and/or stiffen the palate in the treatment of snoring or obstructive sleep apnoea. They may use conventional surgical techniques (*\*uvulopalatopharyngoplasty*), laser (*\*laser-assisted uvulopalatoplasty*), insertion of stiffening materials, or injection of sclerosants. It is also possible to use radiofrequency energy in a process called **radiofrequency palatal myoplasty (RPM)**, also known as **somnoplasty**.

**palatorrhaphy** *n.* see *STAPHYLORRHAPHY*.

**pali- (palin-)** *combining form denoting* repetition or recurrence.

**palilalia** *n.* a disorder of speech in which a word spoken by the individual is rapidly and involuntarily repeated. It is seen, with other tics, in *\*Tourette's*. It is also encountered when encephalitis or other processes damage the *\*extrapyramidal system* of the brain.

**palindromic** *adj.* relapsing: describing diseases or symptoms that recur or get worse.

**paliphrasia** *n.* repetition of phrases while speaking: a form of *\*stammering* or a kind of *\*tic*.

**palliative** **1.** *adj.* providing relief from the symptoms of a disease but without effecting a cure. Although not curative, palliative chemotherapy may significantly extend life expectancy. Palliative care is used in the treatment of terminal illness where cure is impossible and many previously administered treatments have become burdensome to the patient. **2.** *n.* a palliative medicine.

**pallidotomy (pallidectomy)** *n.* a neurosurgical operation to destroy or modify the effects of the globus pallidus (*see* **BASAL GANGLIA**), formerly used for the relief of **\*parkinsonism** and other conditions in which involuntary movements are prominent before the advent of modern drug therapies. The development of more accurate techniques to localize the globus pallidus has led to a revival in its use: in the modern form of pallidotomy, a lesion is made in the globus pallidus by stereotactic surgery (*see* **STEREOTAXY**). New techniques achieving better results involve the implantation of stimulators (pallidal stimulation).

**pallidum (palaeostriatum)** *n.* one of the dense collections of grey matter, deep in each cerebral hemisphere, that go to make up the **\*basal ganglia**.

**pallium** *n.* the outer wall of the cerebral hemisphere as it appears in the early stages of evolution of the mammalian brain. In the modern brain it corresponds to the **\*cerebral cortex**.

**pallor** *n.* abnormal paleness of the skin, due to reduced blood flow or lack of normal pigments. Pallor may be associated with an indoor mode of life; it may also indicate shock, anaemia, cancer, or other diseases.

**palmar erythema** reddening of the palms. This may be a variant of normal or a feature of pregnancy. It is also associated with chronic liver disease, connective tissue disease (such as rheumatoid arthritis), endocrine disorders (such as diabetes mellitus and thyrotoxicosis), certain infections, drugs, and smoking. There is no specific management for this condition.

**Palmer's point** an entry site for minimal-access surgery (*see* **LAPAROSCOPY**), especially when there is an increased risk from previous abdominal surgery. It is located in the left upper quadrant (*see* **ABDOMEN**), 3 cm below the middle of the left costal margin. *See* **VERESS NEEDLE**.

**palmitic acid** *see* **FATTY ACID**.

**palmoplantar erythrodysesthesia (hand-foot syndrome)** a skin reaction marked by redness, numbness, and desquamation of the palms of the hands and soles of the feet. It can be caused by many chemotherapy drugs, particularly fluorouracil and capecitabine, and tyrosine kinase inhibitors. Treatment requires cessation of the drug.

**palpation** *n.* the process of examining part of the body by careful feeling with the hands and fingertips. Using palpation it is possible, in many cases, to distinguish between swellings that are solid and those that are cystic (*see* **FLUCTUATION**). Palpation is also used to discover the presence of a fetus in the uterus (*see* **BALLOTTEMENT**).

**palpebral** *adj.* relating to the eyelid (palpebra).

**palpitation** *n.* an awareness of the heartbeat. This is normal with fear, emotion, or exertion. It may also be a symptom of neurosis, arrhythmias, heart disease, and overactivity of the circulation (as in thyrotoxicosis).

**PALS** *see* **PATIENT ADVICE AND LIAISON SERVICE**.

**palsy** *n.* paralysis. This archaic word is retained in compound terms, such as *\*Bell's palsy*, *\*cerebral palsy*, and *\*Todd's paralysis* (or palsy).

**paludism** *n.* *see* **MALARIA**.

**pamidronate disodium** a *\*bisphosphonate* drug used to treat malignant *\*hypercalcaemia*, breast cancer that has spread to the bones, and Paget's disease. Side-effects include flulike symptoms, nausea, and vomiting.

**pan-** (**pant(o)-**) *combining form denoting* all; every: hence (in medicine) affecting all parts of an organ or the body; generalized.

**panacea** *n.* a medicine said to be a cure for all diseases and disorders, no matter what their nature. Unfortunately panaceas do not exist, despite the claims of many patent medicine manufacturers.

**pancarditis** *n.* *see* **ENDOMYOCARDITIS**.

**Pancoast syndrome** pain and paralysis involving the lower branches of the brachial plexus due to infiltration by a malignant tumour of the apical region of the lung. *\*Horner's syndrome* may also be present. [H. K. Pancoast (1875–1939), US radiologist]

**pancreas** *n.* a compound gland, about 15 cm long, that lies behind the stomach. One end lies in the curve of the duodenum; the other end touches the spleen. It is composed of clusters (**acini**) of cells that secrete *\*pancreatic juice*. This contains a number of enzymes concerned in digestion. The juice

drains into small ducts that open into the **pancreatic duct**. This unites with the common **\*bile duct** and the secretions pass into the duodenum. Interspersed among the acini are the **\*islets of Langerhans** – isolated groups of cells that secrete the hormones **\*insulin** and **\*glucagon** into the bloodstream.

**pancreas divisum** a congenital abnormality in which the pancreas develops in two parts draining separately into the duodenum, the small ventral pancreas through the main ampulla and the larger dorsal pancreas through an accessory papilla. In rare instances this is associated with recurrent abdominal pain, probably due to inadequate drainage of the dorsal pancreas. Diagnosis is made by CT imaging, magnetic resonance cholangiopancreatography (MRCP), or **\*ERCP**.

**pancreatectomy** *n.* surgical removal of the pancreas. **Total pancreatectomy (Whipple's operation)** involves excision of the entire gland and part of the duodenum. In **subtotal pancreatectomy** most of the gland is removed, usually leaving a small part close to the duodenum. In **partial pancreatectomy** only a portion of the gland is removed. Such operations are performed to remove tumours or tissue damaged by chronic or relapsing **\*pancreatitis**. After total or subtotal pancreatectomy it is necessary to administer pancreatic enzymes with food to aid its digestion and insulin injections to replace that normally secreted by the gland.

**pancreatic enzyme replacement therapy (PERT)** a therapeutic approach using supplements of the digestive enzymes lipase, amylase, and protease (**Creon, Pancrex**), which are given when there is insufficient endogenous production of pancreatic enzymes: for example, to patients with pancreatic cancer or cystic fibrosis. The capsules must be taken with all meals and snacks to be effective. PERT treats the symptoms of **\*steatorrhoea**.

**pancreatic juice** the digestive juice secreted by the **\*pancreas**. Its production is stimulated by hormones secreted by the duodenum, which in turn is stimulated by contact with food from the stomach. If the duodenum produces the hormone **\*secretin** the pancreatic juice contains a large amount of sodium bicarbonate, which neutralizes the acidity of the stomach contents. Another hormone (*see* **CHOLECYSTOKININ**) stimulates the production of a juice rich in digestive enzymes, including trypsinogen and chymotrypsinogen (which

are converted to *\*trypsin* and *\*chymotrypsin* in the duodenum), *\*amylase*, *\*lipase*, and *\*maltase*.

**pancreatic polypeptide** a hormone released from the D cells of the *\*islets of Langerhans* of the pancreas in response to protein in the small intestine. Its actions are to inhibit pancreatic bicarbonate and protein enzyme secretion and to relax the gall bladder. It belongs to a family of similar hormones that have actions on appetite and food metabolism.

**pancreatin** *n.* an extract obtained from the *\*pancreas*, containing the pancreatic enzymes. Pancreatin is administered to treat conditions in which pancreatic secretion is deficient; for example, in pancreatitis.

**pancreatitis** *n.* inflammation of the pancreas. **Acute pancreatitis** is a sudden illness in which the patient experiences severe abdominal pain that radiates to the back. In severe cases, there is rapid deterioration with shock. Serum amylase levels are high. Its cause is not always discovered, but it may be associated with gallstones, alcoholism, drugs, infection, autoimmune disease, or recent interventions (such as ERCP). Complications include the formation of *\*pseudocysts*, abscesses, necrosis (**necrotizing pancreatitis**), and haemorrhage (**haemorrhagic pancreatitis**). Treatment consists of restricting oral intake, intravenous hydration, and antibiotics if infected necrosis is present. In severe cases, *\*pancreatectomy* may be required to remove necrosed tissue. **Relapsing pancreatitis**, in which the above symptoms are recurrent and less severe, may be associated with gallstones or alcoholism; prevention is by removal of gallstones and avoidance of alcohol and fat. **Chronic pancreatitis** may produce symptoms similar to relapsing pancreatitis or may be painless; it can lead to endocrine failure causing *\*malabsorption* and *\*diabetes mellitus*. The pancreas often becomes calcified, producing visible shadowing on X-rays. **Autoimmune pancreatitis** is a recently described condition in which an autoimmune process leads to inflammation and swelling of the pancreas. Although abdominal pain is minimal or absent, jaundice is usually present. Radiologically it is characterized by diffuse 'sausage-shaped' enlargement of the pancreas and narrowing of the main pancreatic duct. The presence of raised serum IgG4 is a serological marker. Treatment involves immunosuppressant agents (e.g. corticosteroids or azathioprine). Autoimmune pancreatitis is associated with other autoimmune disorders.

**pancreatogram** *n.* a radiographic image of the pancreatic ducts obtained by injecting contrast material into them by direct puncture under ultrasound guidance. It has largely been replaced by noninvasive techniques involving MRCP (*see* [CHOLANGIOGRAPHY](#)).

**pancreatotomy** *n.* surgical incision of the pancreatic duct to inspect the duct, to join the duct to the intestine, or to inject contrast material in order to obtain X-ray pictures of the duct system.

**pancreozymin** *n.* the name originally given to the fraction of the hormone [\\*cholecystokinin](#) that acts on the pancreas.

**pancuronium** *n.* *see* [MUSCLE RELAXANT](#).

**pancytopenia** *n.* a simultaneous decrease in the numbers of red cells ([\\*anaemia](#)), white cells ([\\*neutropenia](#)), and platelets ([\\*thrombocytopenia](#)) in the blood. It occurs in a variety of disorders, including aplastic [\\*anaemias](#), [\\*hypersplenism](#), and tumours of the bone marrow. It may also occur after chemotherapy or total body irradiation.

**panda sign** a sign of bilateral periorbital [\\*haematoma](#) associated with injury to the anterior cranial fossa, the front of the skull cavity that supports the frontal lobes of the brain. The name derives from its similarity in appearance to the black eye patches of a panda.

**pandemic** *n.* an [\\*epidemic](#) so widely spread that vast numbers of people in different countries are affected. For example, a variant of the influenza A virus, H1N1, emerged in North America in 2009 and quickly spread to affect over 200 countries around the globe by August 2010. There was a low level of immunity among the human population, flu vaccines were ineffective, and up to 200,000 people are thought to have died.

**panic disorder** a condition featuring recurrent episodes of acute distress, mental confusion, and fear of impending death or disaster. The core symptoms of anxiety are often present in an acute **panic attack** (palpitations, sweating, and tremor). Overbreathing (hyperventilation) often makes the attack worse and can cause tingling in the hands and arms and giddiness. These attacks last ten minutes or less and usually self-terminate; they are especially common in people with [\\*agoraphobia](#). Treatment is with

\*antidepressant drugs and \*cognitive behavioural therapy. \*Anxiety management can also be helpful.

**panmixis** *n.* random mating within a population, i.e. when there is no selection of partners on religious, racial, social, or other grounds.

**panniculitis** *n.* inflammation of the layer of fat beneath the skin, leading to multiple tender nodules in the legs and trunk. There are many clinical patterns (including \*erythema nodosum) and many causes.

**panniculus** *n.* a membranous sheet of tissue. For example, the **panniculus adiposus** is the fatty layer of tissue underlying the skin.

**pannus** *n.* vascularized \*granulation tissue in the superficial layers of the cornea, growing in from the conjunctiva. It is seen as a result of inflammation of the cornea or conjunctiva, particularly in \*trachoma.

**panophthalmitis** *n.* inflammation involving the whole of the interior of the eye.

**Panstrongylus** *n.* a genus of large bloodsucking bugs (see REDUVIID). *P. megistus* is important in transmitting \*Chagas' disease to humans in Brazil.

**pant-** (**panto-**) *combining form.* see PAN-.

**pantaloon hernia** a double sac comprising the sac of an indirect (external) and a direct (internal) inguinal \*hernia on the same side.

**Panton–Valentine leukocidin** a cytotoxin responsible for increased virulence of \**Staphylococcus aureus* (see LEUKOCIDIN). It may cause fatal necrotizing pneumonia or, more commonly, deep skin abscesses that tend to recur frequently. [Sir P. N. Panton (1877–1950) and F. C. Valentine (20th century), British pathologists]

**pantoprazole** *n.* see PROTON-PUMP INHIBITOR.

**pantothenic acid** a B vitamin that is a constituent of \*coenzyme A. It plays an important role in the transfer of acetyl groups in the body. Pantothenic acid is widely distributed in food and a deficiency is therefore unlikely to occur.

**pantropic** *adj.* describing a virus that can invade and affect many different tissues of the body, for example the nerves, skin, or liver, without showing a

special affinity for any one of them.

**papain** *n.* a preparation that contains one or more protein-digesting enzymes. It is obtained from the pawpaw fruit and is used as a digestant.

**Papanicolaou test (Pap test)** *see* **CERVICAL SCREENING**. [G. N. Papanicolaou (1883–1962), Greek physician, anatomist, and cytologist]

**papaverine** *n.* an alkaloid, derived from opium, that relaxes smooth muscle. In combination with **\*morphine** and **\*codeine**, it is administered for relief of postoperative pain and severe chronic pain, but is now rarely used. It may cause abnormal heart rate. Papaverine may also be given by injection into the corpora cavernosa of the penis to treat erectile dysfunction.

**papilla** *n.* (*pl.* **papillae**) any small nipple-shaped protuberance. Several different kinds of papillae occur on the **\*tongue**, in association with the taste buds. The **optic papilla** is an alternative name for the **\*optic disc**.

**papillary** *adj.* nipple-like. Papillary epithelial neoplasms are composed of slender fronds of epithelial cells supported by fine fibrovascular cores. *See* **PAPILLOMA**.

**papillitis** *n.* inflammation of the first part of the optic nerve (the optic disc or optic papilla), i.e. where the nerve leaves the eyeball.

**papilloedema** *n.* swelling of the first part of the optic nerve (the optic disc or optic papilla) when viewed through an ophthalmoscope. It can be a sign of raised intracranial pressure or inflammation of the optic nerve (papillitis).

**papilloma** *n.* a benign tumour of nonglandular and nonsecretory epithelium forming a nipple-like growth on the surface of the skin or a mucous membrane. Examples include **bladder papillomas**. —**papillomatous** *adj.*

**papillomatosis** *n.* a condition in which many **\*papillomas** grow on an area of skin or mucous membrane.

**papillotomy** *n.* the operation of cutting the **\*ampulla** of Vater to widen its outlet in order to improve biliary drainage and allow the passage of stones from the common bile duct. It is usually performed using a diathermy wire through a **\*duodenoscope** during **\*ERCP**.

**papovavirus** *n.* one of a group of small DNA-containing viruses producing tumours in animals (subgroup **polyomaviruses**) and in animals and humans (subgroup **papillomaviruses**). *See also* **HUMAN PAPILLOMAVIRUS**.

**PAPP-A** pregnancy-associated plasma protein A: a plasma protein in the serum of pregnant women that is used as a marker for Down's syndrome (levels are decreased in comparison to normal pregnancies). Measurement of PAPP-A and **\*human chorionic gonadotrophin** (hCG) can be combined in a **\*prenatal screening** test during the first 12 weeks of pregnancy.

**Pappataci fever** *see* **SANDFLY FEVER**.

**papule** *n.* a small raised spot on the skin, often dome-shaped, less than 5 mm in diameter.

**papulo-** *combining form denoting a papule or pimple.*

**papulosquamous** *adj.* describing a rash that is both papular and scaly.

**para-** *combining form denoting* **1.** beside or close to. Example: **paranasal** (near the nasal cavity). **2.** resembling. Example: **paradysentery** (a mild form of dysentery). **3.** abnormal. Example: **paralalia** (abnormal speech).

**paracentesis** *n.* tapping: the process of drawing off fluid from a part of the body through a hollow needle or **\*cannula**. In ophthalmology, it involves an incision into the anterior chamber of the eye.

**paracetamol (acetaminophen)** *n.* an **\*analgesic** drug that also reduces fever. It is widely used to treat mild or moderate pain, such as headache, toothache, and dysmenorrhoea, and as an antipyretic in colds, influenza, etc. Side-effects are rare, but overdosage causes liver damage.

**Paracoccidioides** *n.* a genus of yeast-like fungi causing infection of the skin and mucous membranes. The species *P. brasiliensis* causes a chronic skin disease, South American **\*blastomycosis**.

**paracrine** *adj.* describing a hormone that is secreted by an endocrine gland and affects the function of nearby cells, rather than being transported distally by the blood or lymph.

**paracusis** *n.* any distortion of hearing.

**paradidymis** *n.* the vestigial remains of part of the embryonic **\*mesonephros** that are found near the testis of the adult. Some of the mesonephric collecting tubules persist as the functional **\*vasa efferentia** but the rest degenerate almost completely. A similar vestigial structure (the **paroophoron**) is found in females.

**paradox** *n.* (in **\*family therapy**) a surprising interpretation or suggestion made in the course of therapy in order to demonstrate the relationship between a psychological symptom and a system of family relationships.

**paradoxical breathing** breathing movements in which the chest wall moves in on inspiration and out on expiration, in reverse of the normal movements. It may be seen in children with respiratory distress of any cause, which leads to indrawing of the intercostal spaces during inspiration. Patients with chronic airways obstruction also show indrawing of the lower ribs during inspiration, due to the distorted action of a depressed and flattened diaphragm. Crush injuries of the chest, with fractured ribs and sternum, can lead to a severe degree of paradoxical breathing.

**paraesthesia** *n.* a spontaneously occurring tingling sensation, sometimes described as **pins and needles**. It may be due to partial and temporary damage to a peripheral nerve, such as that caused by external pressure on the affected part, but can also result from damage to sensory fibres in the spinal cord or from peripheral vascular disease. *Compare* **DYSAESTHESIA**.

**paraffin** *n.* one of a series of hydrocarbons derived from petroleum. **Paraffin wax (hard paraffin)**, a whitish mixture of solid hydrocarbons melting at 45–60°C, is used in medicine mainly as a base for ointments and in microscopy for **\*embedding** specimens. **Liquid paraffin** is a mineral oil formerly used as a laxative; combined with **soft paraffin** (white or yellow), it is used as an emollient, as a lubricating ointment for treating dry eyes, and to impregnate gauze dressings to prevent the fibres from sticking.

**paraganglioma** *n.* a tumour, related to **\*phaeochromocytoma**, arising from **\*paraganglion** cells. Such tumours can occur around the aorta, the carotid artery (carotid body tumour), and the cervical portion of the vagus nerve (**\*glomus tumour**), as well as in the abdomen and the eye. They are usually benign and treated by surgery, but occasionally can be malignant, requiring systemic treatment.

**paraganglion** *n.* one of the small oval masses of cells found in the walls of the ganglia of the sympathetic nervous system, near the spinal cord. They are **\*chromaffin** cells, like those of the adrenal gland, and may secrete adrenaline.

**parageusia (parageusis)** *n.* abnormality of the sense of taste.

**paragonimiasis (endemic haemoptysis)** *n.* a tropical disease that occurs principally in Asia, caused by the presence of the fluke **\*Paragonimus westermani** in the lungs or other organs. The infection is acquired by eating inadequately cooked shellfish. Early symptoms include fever, cough, chest pain, fatigue, and sweating. Later symptoms vary depending on which organs are affected: in the case of the lungs, symptoms resemble those of tuberculosis. Paragonimiasis is treated with praziquantel.

**Paragonimus** *n.* a genus of large tropical parasitic **\*flukes** that are particularly prevalent in the Far East. The adults of *P. westermani* live in the human lungs, where they cause destruction and bleeding of the tissues (see **PARAGONIMIASIS**). However, they may also be found in other organs of the body. Eggs are passed out in the sputum and the larvae undergo their development in two other hosts, a snail and a crab.

**paragranuloma** *n.* a former name for one of the types of **\*Hodgkin's disease**. It is now known as **lymphocyte-predominant Hodgkin's disease** and has the best prognosis of all the types.

**parainfluenza viruses** a group of large RNA-containing viruses that cause infections of the respiratory tract producing mild influenza-like symptoms. They are included in the paramyxovirus group (see **MYXOVIRUS**).

**paralysis** *n.* muscle weakness that varies in its extent, its severity, and the degree of spasticity or flaccidity according to the nature of the underlying disease and its distribution in the brain, spinal cord, peripheral nerves, or muscles. See **FLACCID**; **SPASTIC PARALYSIS**. See also **DIPLEGIA**; **HEMIPLEGIA**; **PARAPLEGIA**; **POLIOMYELITIS**. —**paralytic** *adj.*

**paramedian** *adj.* situated close to or beside the **\*median** plane.

**paramedical** *adj.* describing or relating to the professions closely linked to the medical profession and working in conjunction with them. See **ALLIED**

HEALTH PROFESSIONAL.

**paramesonephric duct** *see* **MÜLLERIAN DUCT**.

**parameter** *n.* (in medicine) a measurement of some factor, such as blood pressure, pulse rate, or haemoglobin level, that may have a bearing on the condition being investigated.

**parametric test** *see* **SIGNIFICANCE**.

**parametritis (pelvic cellulitis)** *n.* inflammation of the loose connective tissue and smooth muscle around the uterus (the parametrium). The condition may be associated with **\*puerperal infection**.

**parametrium** *n.* the layer of connective tissue surrounding the uterus.

**paramnesia** *n.* a distorted memory, such as **\*confabulation** or **\*déjà vu**.

**paramyotonia congenita** a rare disorder in which prolonged contraction of muscle fibres (*see* **MYOTONIA**) is precipitated by cold and exercise. It is due to a mutation in the sodium-channel gene.

**paramyxovirus** *n.* *see* **MYXOVIRUS**.

**paranasal sinuses** the air-filled spaces, lined with mucous membrane, within some of the bones of the skull. They open into the nasal cavity, via the meatuses, and are named according to the bone in which they are situated. They comprise the **frontal sinuses** and the **maxillary sinuses** (one pair of each), the **ethmoid sinuses** (consisting of many spaces inside the ethmoid bone), and the two **sphenoid sinuses**. See illustration.

**Paranasal sinuses (projected to the surface).**

**paraneoplastic syndrome** signs or symptoms occurring in a patient with cancer that result from antibodies or **\*ectopic hormones** produced by the cancer and are not due directly to local effects of the cancer cells. Examples are **\*myasthenia gravis** secondary to a tumour of the thymus, a cerebellar syndrome in patients with lung cancer (due to anti-**\*Purkinje cell** antibody), and a peripheral neuropathy in patients with breast cancer. Removal of the cancer usually leads to resolution of the problem.

**paranoia** *n.* **1.** a mental illness or a symptom of a mental illness characterized by **\*delusions**, sometimes organized into a system. The person believes him- or herself to be a target of persecution or the victim of a conspiracy. **\*Antipsychotic** medication is often beneficial. **2.** a state of mind in which the individual has a strong belief that he or she is persecuted by others and therefore displays behaviour marked by suspiciousness. Severe paranoia can lead to the diagnosis of **\*personality disorder**. —**paranoid** *adj.*

**paraparesis** *n.* weakness of both legs, resulting from disease of the nervous system.

**parapharyngeal space (lateral parapharyngeal space)** the region at the side of the **\*pharynx**. Infection in this space can result in a **parapharyngeal abscess**. It is also a site where tumours can develop.

**paraphasia** *n.* a disorder of language in which unintended syllables, words, or phrases are interpolated in the patient's speech. A severe degree of paraphasia results in speech that is a meaningless jumble of words and sounds, called **jargon aphasia**.

**paraphimosis** *n.* retraction and constriction of the foreskin behind the glans penis. This occurs in some patients with **\*phimosis** on erection of the penis or in patients who have a urethral catheter in place: the tight foreskin cannot be drawn back over the glans and becomes painful and oedematous. In most cases manual compression, under local or general anaesthesia, allows replacement of the foreskin. Alternatively, a small needle can be used to puncture holes in the oedematous foreskin, followed by gentle but firm pressure allowing reduction of the paraphimosis. **\*Circumcision** may be required to prevent a recurrence.

**paraphrenia** *n.* a former name for **\*late-onset schizophrenia**.

**paraplegia** *n.* **\*paralysis** of both legs, usually due to disease or injury of the spinal cord. It is often accompanied by loss of sensation below the level of the injury and disturbed bladder function. —**paraplegic** *adj., n.*

**paraprotein** *n.* an abnormal protein of the **\*immunoglobulin** series. Paraproteins appear in malignant disease of the spleen, bone marrow, liver, etc. Examples of paraproteins are **\*myeloma** globulins, **\*Bence-Jones protein**, and **\*macroglobulin**.

**parapsoriasis** *n.* an obsolete name for the earliest phase of **\*mycosis fungoides**.

**parapsychology** *n.* the study of extrasensory perception, psychokinesis, and other mental abilities that appear to defy natural law.

**Paraquat** *n. Trademark.* the chemical compound dimethyl dipyridilium, widely used as a weed-killer. When swallowed it exerts its most serious effects upon the lungs, the tissues of which it destroys after a few days. Paraquat poisoning is almost invariably fatal.

**parasite** *n.* any living thing that lives in (*see* **ENDOPARASITE**) or on (*see* **ECTOPARASITE**) another living organism (*see* **HOST**). The parasite, which may spend all or only part of its existence with the host, obtains food and/or

shelter from the host and contributes nothing to its welfare. Some parasites cause irritation and interfere with bodily functions; others destroy host tissues and release toxins into the body, thus injuring health and causing disease. Human parasites include fungi, bacteria, viruses, protozoa, and worms. *See also* [COMMENSAL](#); [SYMBIOSIS](#). —**parasitic** *adj.*

**parasiticide** *n.* an agent that destroys parasites (excluding bacteria and fungi). *See also* [ACARICIDE](#); [ANTHELMINTIC](#); [TRYPANOCIDE](#).

**parasitology** *n.* the study and science of parasites.

**parasternal** *adj.* situated close to the sternum. The **parasternal line** is an imaginary vertical line parallel to and midway between the lateral margin of the sternum and the vertical line through the nipple.

**parastomal** *adj.* relating to the area around a [\\*stoma](#), which often appears as a hernia or bulge. Following surgery, muscle structure is interrupted making it weaker and prone to stretching. Straining can cause intestinal contents to herniate through the weakened spot.

**parasympathetic nervous system** one of the two divisions of the [\\*autonomic nervous system](#), having fibres that leave the central nervous system from the brain and the lower portion of the spinal cord and are distributed to blood vessels, glands, and the majority of internal organs. The system works in balance with the [\\*sympathetic nervous system](#), the actions of which it frequently opposes.

**parasympatholytic** *adj.* opposing the effects of the [\\*parasympathetic nervous system](#). [\\*Antimuscarinic](#) drugs have this effect by preventing acetylcholine from acting as a neurotransmitter.

**parasympathomimetic** *n.* a drug that has the effect of stimulating the [\\*parasympathetic nervous system](#). The actions of parasympathomimetic drugs are **cholinergic** (resembling those of [\\*acetylcholine](#)) and include stimulation of skeletal muscle, [\\*vasodilatation](#), depression of heart rate, increasing the tension of smooth muscle, increasing secretions (such as saliva), and constricting the pupil of the eye. They are used in the treatment of [\\*myasthenia gravis](#) (*see* [ANTICHOLINESTERASE](#)) and glaucoma (*see* [MIOTIC](#)).

**paratenon** *n.* the tissue of a tendon sheath that fills up spaces round the tendon.

**parathion** *n.* an organic phosphorus compound, used as a pesticide, that causes poisoning when inhaled, ingested, or absorbed through the skin. Like several other organic phosphorus compounds, it attacks the enzyme **\*cholinesterase** and causes excessive stimulation of the parasympathetic nervous system. The symptoms are headache, sweating, salivation, lacrimation, vomiting, diarrhoea, and muscular spasms. Treatment is by administration of **\*atropine**.

**parathormone** *n.* *see* **PARATHYROID HORMONE**.

**parathyroidectomy** *n.* surgical removal of one or more of the **\*parathyroid glands**, usually as part of the treatment of **\*hyperparathyroidism**.

**parathyroid glands** two pairs of yellowish-brown **\*endocrine glands** that are situated behind, or sometimes embedded within, the **\*thyroid gland**. They are stimulated to produce **\*parathyroid hormone** by a decrease in the amount of calcium in the blood.

**parathyroid hormone (parathormone)** a hormone, synthesized and released by the parathyroid glands, that controls the distribution of calcium and phosphate in the body. A high level of the hormone causes transfer of calcium from the bones to the blood; a deficiency lowers blood calcium levels, causing **\*tetany**. This condition may be treated by injections of calcium gluconate. *Compare* **CALCITONIN**.

Recombinant parathyroid hormone (Preotact) is given by subcutaneous injection to treat postmenopausal osteoporosis.

**parathyroid hormone-related protein (PTH-RP)** a protein that is secreted by certain malignant tumours and is the main cause of malignant **\*hypercalcaemia**. PTH-RP, which has effects similar to **\*parathyroid hormone**, stimulates generalized bone resorption and excessive calcium reabsorption in the kidney tubules. It is most commonly produced by lung tumours, squamous-cell carcinomas of other organs, melanomas, and tumours of the breast, liver, pancreas, bladder, and prostate.

**paratyphoid fever** an infectious disease caused by the bacterium *Salmonella paratyphi* A, B, or C. Bacteria are spread in the faeces of patients or

carriers, and outbreaks occur as a result of poor sanitation or unhygienic food-handling. After an incubation period of 1–10 days, symptoms, including diarrhoea, mild fever, and a pink rash on the chest, appear and last for about a week. Treatment with chloramphenicol is effective. The **\*TAB vaccine** provides temporary immunity against paratyphoid A and B.

**pareidolia** *n.* misperception of random stimuli as real things or people, as when faces are vividly seen in the flames of a fire.

**parenchyma** *n.* the functional part of an organ, as opposed to the supporting tissue (**stroma**).

**parental order** *see* **SECTION 30 ORDER**.

**parental responsibility** the legal status that requires adults to act in the interests of a child's welfare. A birth mother always has parental responsibility unless it is removed by an adoption order, as has the father if married to the birth mother or named on the birth certificate. Same-sex parents, if civil partners, both have parental responsibility. In medical ethics, a person with parental responsibility can consent to, or refuse, treatment on behalf of a child who is too young to have capacity to make his or her own decisions about health care. However, the entitlement to act on behalf of a child is limited to the extent to which a person with parental responsibility is acting in the child's best interests. *See also* **GILICK COMPETENCE**.

<https://www.gov.uk/parental-rights-responsibilities/who-has-parental-responsibility/>

- UK government guidance on parental responsibility

**parenteral** *adj.* administered by any way other than through the mouth: applied, for example, to the introduction of drugs or other agents into the body by injection.

**paresis** *n.* muscular weakness caused by disease of the nervous system. It implies a lesser degree of weakness than **\*paralysis**, although the two words are often used interchangeably.

**paries** *n.* (*pl.* **parietes**) **1.** the enveloping or surrounding part of an organ or other structure. **2.** the wall of a cavity.

**parietal** *adj.* **1.** of or relating to the inner walls of a body cavity, as opposed to the contents: applied particularly to the membranes lining a cavity (*see* **PERITONEUM**; **PLEURA**). **2.** of or relating to the parietal bone.

**parietal bone** either of a pair of bones forming the top and sides of the cranium. *See* **SKULL**.

**parietal cells (oxyntic cells)** cells of the **\*gastric glands** that secrete hydrochloric acid in the fundic region of the stomach.

**parietal lobe** one of the major divisions of each cerebral hemisphere (*see* **CEREBRUM**), lying behind the frontal lobe, above the temporal lobe, and in front of the occipital lobe. It is thus beneath the crown of the skull. It contains the **\*sensory cortex** and **\*association areas**.

**parity** *n.* a term used to indicate the number of pregnancies a woman has had that have each resulted in the birth of an infant capable of survival, as distinct from gravidity (*see* **GRAVID**). *See also* **GRAND MULTIPARITY**.

**parkinsonism (akinetic rigid syndrome)** *n.* a clinical picture characterized by tremor, rigidity, slowness of movement, and postural instability. The commonest symptom is tremor, which often affects one hand, spreading first to the leg on the same side and then to the other limbs. It is most pronounced in resting limbs, interfering with such actions as holding a cup. The patient has an expressionless face, an unmodulated voice, an increasing tendency to stoop, and a shuffling walk. Parkinsonism is a disease process affecting the basal ganglia of the brain and associated with a deficiency of the neurotransmitter **\*dopamine**. Sometimes a distinction is made between **Parkinson's disease**, a degenerative disorder, and parkinsonism due to other causes. For example, it may be induced by the long-term use of **\*antipsychotic** drugs and uncommonly it can be attributed to the late effects of **\*encephalitis** or coal-gas poisoning, or to **\*Wilson's disease**, or to multiple strokes (vascular parkinsonism). Other syndromes of which parkinsonism is a feature are **\*multiple system atrophy** and **\*progressive supranuclear palsy**. Relief of the symptoms may be obtained with **\*antimuscarinic** drugs, dopamine-receptor agonists (*see* **DOPAMINE**), **\*levodopa**, and subcutaneous

\***apomorphine** injections and infusions. New surgical treatments include stereotactic \***pallidotomy** and pallidal stimulation. The latter procedure involves placing an electronic stimulator in the globus pallidus that can be controlled by an external switch or control panel. [J. Parkinson (1755–1824), British physician]

<https://www.parkinsons.org.uk/>

- Website of the Parkinson's Disease Society

**Parliamentary and Health Service Ombudsman** (in England) an official responsible to Parliament and appointed to protect the interests of patients in relation to administration of and provision of health care by the \***National Health Service**. He or she can investigate complaints about the NHS when they cannot be resolved locally. In Scotland, and in Wales, this role is undertaken by a **Public Services Ombudsman**.

<https://www.ombudsman.org.uk/>

- Website of the Parliamentary and Health Service Ombudsman (England)

<https://www.spsso.org.uk/>

- Website of the Scottish Public Services Ombudsman

<https://www.ombudsman-wales.org.uk/>

- Website of the Public Services Ombudsman for Wales

**paronychia (whitlow)** *n.* an inflamed swelling of the \***nail** folds. **Acute paronychia** is usually caused by infection with *Staphylococcus aureus*. **Chronic paronychia** occurs mainly in those who habitually engage in wet work; it is associated with secondary infection with \**Candida albicans*. It is vital to keep the hands dry in order to control chronic paronychia.

**paroophoron** *n.* the vestigial remains of part of the Wolffian duct (*see* **MESONEPHROS**) in the female, situated next to each ovary. It is associated with a similar structure, the **epoophoron**. Both are without known function.

**parosmia** *n.* any disorder of the sense of smell.

**parotid gland** one of a pair of **\*salivary glands** situated in front of each ear. The openings of the parotid ducts (**Stensen's ducts**) are on the inner sides of the cheeks, opposite the second upper molar teeth.

**parotitis** *n.* inflammation of the parotid salivary glands. *See* **MUMPS**.

**parous** *adj.* having given birth to one or more children.

**paroxetine** *n.* an antidepressant drug that acts by prolonging the action of the neurotransmitter serotonin (5-hydroxytryptamine) in the brain (*see* **SSRI**). It is taken by mouth for the treatment of depression, obsessive–compulsive disorder, panic disorder, post-traumatic stress disorder, and some other anxiety disorders; side-effects may include nausea, indigestion, abdominal pain, diarrhoea, and rash. Because of its short half-life paroxetine is often associated with **\*discontinuation syndrome** upon stopping.

**paroxysm** *n.* **1.** a sudden violent attack, especially a spasm or convulsion. **2.** the abrupt worsening of symptoms or recurrence of disease. —**paroxysmal** *adj.*

**paroxysmal nocturnal haemoglobinuria** (PNH) a type of acquired haemolytic **\*anaemia** that results from an abnormality of the red blood cell membrane. It is due to a defect in the formation of glycosylphosphatidylinositol (GPI), whose role is to anchor proteins to the lipid framework of the membrane. This leads to increased **\*complement**-mediated destruction of red blood cells, which results in the release of haemoglobin in the circulation and then in the urine, giving the latter a reddish colour. Some patients may develop blood clots.

**PARP inhibitor** a drug that blocks the action of the PARP enzyme, which is required for **\*DNA repair** in cancer cells with faulty **\*BRCA1** and **BRCA2** genes. These drugs are used in the treatment of cancer in patients with **BRCA1** or **BRCA2** mutations. They are also undergoing trials to see if they are useful in the treatment of other cancers.

**parrot disease** *see* PSITTACOSIS.

**pars** *n.* a specific part of an organ or other structure, such as any of parts of the pituitary gland.

**pars plana** part of the **\*uvea**, one of the three layers that comprise the eye. As a part of the **\*ciliary body**, it is about 4 mm long, located near the point where the iris and sclera touch, and is scalloped in appearance. It is a good site of entry for intraocular surgery.

**Part 2A order** (in England) a legal order made by a magistrate on application by the local authority, in accordance with The Health Protection (Part 2A Orders) Regulations 2010, to exercise powers over a person, place, or thing that presents a risk to public health for a period of up to 28 days. Typically, fewer than ten such orders are issued annually. They may be used, for example, to detain an individual with infectious drug-resistant tuberculosis against their will in a setting with appropriate infection-control measures, or to seize equipment used by unregistered tattooists with poor infection-control practices.

**Part III accommodation** residential accommodation provided by local authorities, under the terms of Part III of the National Assistance Act 1948, for adults who, because of age, disability, illness, or any other reason, are in need of care and support.

**parthenogenesis** *n.* reproduction in which an organism develops from an unfertilized ovum. It is common in plants and occurs in some lower animals (e.g. aphids).

**partial volume artifact** an apparent decrease in the visibility of a structure in a **\*cross-sectional imaging** technique, such as CT or MRI, when either the thickness of the object is much less than that of the slice being used to make the image, or the object is only partially imaged within the slice. *See* ARTIFACT.

**participatory action research (PAR)** a radical approach to public health issues that actively involves communities in collaboration, reflection, data collection, and activities that empower them to improve their own health. *See* EMPOWERMENT.

**particularism** *n.* a school of moral thought proposing that attention to the specifics and details of a situation is required to determine the preferred course of action. Such an approach is contrary to theories that depend on universal norms or principles, such as *\*Kantian ethics*.

**partogram** *n.* a graphic record of the course of labour, designed to monitor its progress and enable early recognition of any problems. It includes information on the mother's blood pressure, heart rate, and temperature; length, frequency, and strength of contractions; and heart rate and amniotic fluid in the baby.

**parturition** *n.* childbirth. *See* *LABOUR*.

**parulis** *n.* *see* *EPULIS*.

**parvi- (parvo-)** *combining form denoting small size.*

**parvovirus** *n.* any member of a genus of small DNA-containing viruses. **Human parvovirus B19** (now known as **erythrovirus**) is the only member to cause disease in humans. It destroys red blood cells and is responsible for severe anaemia in patients with sickle-cell disease. Infection during pregnancy may adversely affect the fetus, resulting in *\*hydrops fetalis*. The virus is also the causative agent of the childhood infection *\*erythema infectiosum*.

**pascal** *n.* the *\*SI unit* of pressure, equal to 1 newton per square metre. Symbol: Pa.

**Paschen bodies** particles that occur in the cells of skin rashes in patients with *\*cowpox* or *\*smallpox*; they are thought to be the virus particles. [E. Paschen (1860–1936), German pathologist]

**PASI** *see* *PSORIASIS AREA SEVERITY INDEX*.

**passive movement** movement not brought about by a patient's own efforts. Passive movements are induced by manipulation of the joints by a physiotherapist. They are useful in maintaining function when a patient has nerve or muscle disorders that prevent voluntary movement.

**passivity** *n.* (in psychiatry) a *\*Schneiderian first-rank symptom* in which a patient has the impression that his or her feelings or actions are those of

another or others, usually an unknown outside power.

**paste** *n.* (in pharmacy) a medicinal preparation of a soft sticky consistency, which is applied externally.

**Pasteurella** a genus of small rodlike Gram-negative bacteria that are parasites of animals and humans. The species *P. multocida* usually infects animals but may be transmitted to humans through bites or scratches.

**pasteurization** *n.* the treatment of milk by heating it to 65°C for 30 minutes, or to 72°C for 15 minutes, followed by rapid cooling, to kill such bacteria as those of tuberculosis and typhoid.

**pastille** *n.* a medicinal preparation containing gelatine and glycerine, usually coated with sugar, that is dissolved in the mouth so that the medication is applied to the mouth or throat.

**Patau syndrome** a chromosome disorder in which there are three no. 13 chromosomes (instead of the usual two), causing abnormal brain development, severe learning disabilities, and defects in the heart, kidney, and scalp. Affected individuals rarely survive. [K. Patau (20th century), US geneticist]

**patch test** a specialist test to discover which allergen is responsible for contact **\*dermatitis** in a patient. Very low (validated) concentrations of potentially relevant allergens are applied under patches on the back. These are removed after two days and the underlying skin is examined then, and again after a further two days. International criteria exist for interpreting results. A positive test will show an eczematous reaction, although differentiating allergic from irritant reactions is sometimes difficult. The commonest allergens are nickel (e.g. from costume jewellery), fragrances (from toiletries), preservatives, and hair dye chemicals. Establishing the relevance of the reactions is critical.

**patella** *n.* the lens-shaped bone that forms the kneecap. It is situated in front of the knee in the tendon of the quadriceps muscle of the thigh. *See also* **SESAMOID BONE**.

**patellar reflex (knee jerk)** reflex contraction of the quadriceps (thigh) muscle so that the leg kicks, elicited in a patient sitting with one knee crossed

over the other by sharply tapping the tendon of the muscle below the kneecap. The reflex is mediated through nerves emanating from the third and fourth lumbar spinal levels (*see* [SPINAL NERVES](#)). This is a test of the connection between the sensory nerves attached to stretch receptors in the muscle, the spinal cord, and the motor neurons running from the cord to the thigh muscle, all of which are involved in the reflex. The patellar reflex is reduced or absent when there is disease or damage of the spinal cord at or below the level of the reflex and exaggerated in disorders above the level of the reflex.

**patency** *n.* the relative openness or lack of obstruction in a tube or vessel, such as an artery or Fallopian tube.

**patent ductus arteriosus** *see* [DUCTUS ARTERIOSUS](#).

**patent foramen ovale** failure of the *\*foramen* ovale to close shortly after birth resulting in an *\*atrial septal defect*. A patent foramen ovale is present in everyone before birth but closes off in about 80% of people. It usually causes no symptoms; an isolated patent foramen ovale without any other structural heart defect is usually of no haemodynamic significance.

**paternalism** *n.* an attitude or policy that overrides a person's own wishes (*\*autonomy*) in pursuit of his or her *\*best interests*. The classic argument against paternalism of the philosopher John Stuart Mill is that intervention is justified only when trying to prevent a person from causing harm to others, not to himself. However, a form of paternalism may be justified when a person lacks the capacity to make decisions for him- or herself, assuming there is no valid *\*advance directive, decision, or statement* or a proxy with *\*power of attorney* to represent the patient's wishes. *See also* [THERAPEUTIC PRIVILEGE](#). —**paternalistic** *adj.*

**path- (patho-)** *combining form denoting disease*. Example: **pathophobia** (morbid fear of).

**pathogen** *n.* a microorganism, such as a bacterium, yeast, or virus that parasitizes an animal (or plant) or a human and produces a disease.

**pathogenic** *adj.* capable of causing disease. The term is applied to a parasitic microorganism (especially a bacterium) in relation to its host. —**pathogenicity** *n.*

**pathognomonic** *adj.* describing a symptom or sign that is characteristic of or unique to a particular disease. The presence of such a sign or symptom allows positive diagnosis of the disease.

**pathological** *adj.* relating to or arising from disease.

**pathological fracture** a fracture through diseased or abnormal bone, usually resulting from a force insufficient to fracture a normal bone. Tumour, infection, congenital bone defects, and osteoporosis are among the causes.

**pathology** *n.* the study of disease processes with the aim of understanding their nature and causes. This is achieved by observing samples of blood, urine, faeces, and diseased tissue obtained from the living patient or at autopsy, by the use of X-rays, and by many other techniques. (See **BIOPSY**.)

**Clinical pathology** is the application of the knowledge gained to the treatment of patients. —**pathologist** *n.*

**-pathy** *combining form denoting* **1.** disease. Examples: **nephropathy** (of the kidney); **neuropathy** (of nerves). **2.** therapy. Example: **osteopathy** (by manipulation).

**Patient Advice and Liaison Service (PALS)** (in England) a confidential service provided by each NHS trust to support patients, their families, and carers by giving advice and information in response to questions and concerns about local NHS services. *See also* **ADVOCACY**.

**Patient Health Questionnaire** *see* **PHQ-9**.

**Patient Protection and Affordable Care Act (PPACA)** *see* **AFFORDABLE CARE ACT 2010**.

**patulous** *adj.* open or distended. A **patulous Eustachian tube** is abnormally open. Air passing the nasal end of the tube sucks air from the middle ear. This creates symptoms including a flapping sensation, **\*autophony**, and a paradoxical sensation that the ear is blocked.

**pauciarthrititis** *n. see* **ARTHRITIS**.

**pavementation (pavementing)** *n.* the sticking of white blood cells to the linings of the finest blood vessels (capillaries) when inflammation occurs.

**PCA3** a gene that is expressed (i.e. manifests its effects) 60–100 times more in cancerous prostate tissue than in benign prostate tissue. A test for *PCA3* can be performed on urine passed just after a digital rectal examination of the prostate; **uPM3** – the first such test to be developed – is a far more specific indicator of the presence of prostate cancer than tests for *\*prostate specific antigen* (PSA), increased amounts of which are produced in both malignant and nonmalignant prostate tissue. However, the test is not as sensitive as PSA in detecting the presence of prostate cancer.

**PCI** *see* PERCUTANEOUS CORONARY INTERVENTION.

**PCNL** *see* PERCUTANEOUS NEPHROLITHOTOMY.

**PCO** *see* POLYCYSTIC OVARY.

**PCOS** *see* POLYCYSTIC OVARY SYNDROME.

**PCP** *Pneumocystis jiroveci* (formerly *Pneumocystis carinii*) pneumonia. Although the causative organism has been reclassified and renamed, the original abbreviation continues to be used for this type of pneumonia. *See* PNEUMOCYSTIS.

**PCR** *see* POLYMERASE CHAIN REACTION.

**PDGF** platelet-derived growth factor (*see* GROWTH FACTOR).

**peak expiratory flow rate (PEFR)** the maximum rate at which a person can forcibly expel air from the lungs at any time, expressed usually in litres per minute (occasionally in litres per second). A low value can help diagnose asthma in the correct clinical context, and differences between the morning and evening values can also be a feature of poor control of asthma. There is a place for PEFR in the monitoring of acute exacerbations of chronic pulmonary obstructive disease (COPD) but not in the diagnosis of COPD.

**peau d'orange** a dimpled appearance of the skin over a breast tumour, resembling the surface of an orange. The skin is thickened and the openings of hair follicles and sweat glands are enlarged.

**pecten** *n.* **1.** the middle section of the anal canal, below the anal valves (*see* ANUS). **2.** a sharp ridge on the upper branch of the pubis (part of the hip

bone). —**pectineal** *adj.*

**pectoral** *adj.* relating to the chest.

**pectoral girdle** *see* **SHOULDER GIRDLE**.

**pectoral muscles** the chest muscles (see illustration). The **pectoralis major** is a large fan-shaped muscle that works over the shoulder joint, drawing the arm forward across the chest and rotating it medially. Beneath it, the **pectoralis minor** depresses the shoulder and draws the scapula down towards the chest.

**Pectoral muscles.**

**pectoriloquy** *n.* abnormal transmission of the patient's voice sounds through the chest wall so that they can be clearly heard through a stethoscope. Whispered sounds (**whispering pectoriloquy**) can be heard over the lung of a patient with pneumonia.

**pectus** *n.* the chest or breast.

**pectus carinatum** *see* **PIGEON CHEST**.

**pectus excavatum** *see* **FUNNEL CHEST**.

**pedicle** *n.* **1.** the narrow neck of tissue connecting some tumours to the normal tissue from which they have developed. **2.** (in plastic surgery) a narrow folded tube of skin by means of which a piece of skin used for grafting remains attached to its original site. A pedicle graft is used when the recipient site is unsuited to take an independent skin graft (for example, because of poor blood supply). *See also* **FLAP**; **SKIN GRAFT**. **3.** (in anatomy) any slender stemlike process.

**pediculicide** *n.* an agent that kills lice; examples include **\*dimeticone**, **\*malathion**, and **\*permethrin**.

**Pediculoides (Pyemotes)** *n.* a genus of widely distributed tiny predaceous mites. *P. ventricosus* occasionally attacks humans and causes an allergic dermatitis called **grain itch**. This complaint most usually affects those people coming into contact with stored cereal products, such as hay and grain.

**pediculosis** *n.* an infestation with lice, which causes intense itching; continued scratching by the patient may result in secondary bacterial infection of the skin. **Head lice** (**pediculosis capitis**; *see* **PEDICULUS**) are quite common in schoolchildren and do not indicate poor hygiene; they may be treated with **\*malathion** or other pediculicide lotions and/or by the use of a fine-toothed nit comb. By contrast, **body lice** (**pediculosis corporis**) often affect the homeless and others without access to washing facilities. **Pubic** (or **crab**) **lice** (**\*Phthirus pubis**) are commonly sexually transmitted and respond to the same treatment as head lice.

**Pediculus** *n.* a widely distributed genus of lice. There are two varieties of the species affecting humans: *P. humanus capitis*, the head louse; and *P. humanus corporis*, the body louse. The presence of these parasites can

irritate the skin (*see* [PEDICULOSIS](#)), and in some parts of the world body lice are involved in transmitting *\*relapsing fever* and *\*typhus*.

**pedometer** *n.* a small portable device that records the number of paces walked, and thus the approximate distance covered. A pedometer is usually attached to the leg or hung at the belt.

**peduncle** *n.* a narrow process or stalklike structure, serving as a support or a connection. For example, the **middle cerebellar peduncle** connects the pons and cerebellum.

**pedunculated** *adj.* having a stalk or stemlike attachment to an epithelial surface. Pedunculated tumours are commonly, but not invariably, benign.

**PEFR** *see* [PEAK EXPIRATORY FLOW RATE](#).

**PEG** percutaneous endoscopic gastrostomy: *see* [GASTROSTOMY](#).

**pegaptanib** *n.* *see* [RANIBIZUMAB](#).

**peginterferon alfa** *n.* *see* [INTERFERON](#).

**peg lateral (peg tooth)** an upper lateral incisor that is abnormally small. This is a common form of *\*microdontia*.

**pegvisomant** *n.* *see* [GROWTH HORMONE](#).

**pellagra** *n.* a nutritional disease due to a deficiency of *\*nicotinic acid* (a B vitamin). Pellagra results from the consumption of a diet that is poor in either nicotinic acid or the amino acid tryptophan, from which nicotinic acid can be synthesized in the body. It is common in maize-eating communities. The symptoms of pellagra are scaly dermatitis on exposed surfaces, diarrhoea, and depression.

**pellicle** *n.* a thin layer of skin, membrane, or any other substance.

**pelvic-floor muscle training** *see* [KEGEL EXERCISES](#).

**pelvic girdle (hip girdle)** the bony structure to which the bones of the lower limbs are attached. It consists of the right and left *\*hip bones*.

**pelvic inflammatory disease (PID)** an acute or chronic condition in which the uterus, Fallopian tubes, and ovaries are infected. It is usually the result of infection ascending from the vagina; *\*Chlamydia trachomatis* and *\*Neisseria gonorrhoeae* have been identified as causative agents. PID may be associated with lower abdominal pain, irregular vaginal bleeding, and vaginal discharge. An acute infection may respond to treatment with antibiotics, but in the chronic state, when pelvic *\*adhesions* have developed, surgical removal of the diseased tissue may be necessary. Blocking of the Fallopian tubes is a common result of pelvic inflammatory disease; this can lead to *\*ectopic pregnancy* or infertility.

**pelvimetry** *n.* measurement of the four internal diameters of the pelvis (transverse, anteroposterior, left oblique, and right oblique) on an X-ray image or by means of CT or MR scanning. Pelvimetry may be used to determine if a vaginal delivery will be possible, but it is an unreliable predictor of obstetric outcome and its use is outmoded. **Clinical pelvimetry** is a means of assessing pelvic capacity through a vaginal examination; it is subjective and its results must be used with caution.

**pelvis** *n.* (*pl.* **pelves**) **1.** the bony structure formed by the *\*hip bones*, *\*sacrum*, and *\*coccyx*: the bony pelvis (see illustration overleaf). The hip bones are fused at the back to the sacrum to form a rigid structure that protects the organs of the lower abdomen and provides attachment for the bones and muscles of the lower limbs. The female pelvis may be one of four shapes (see illustration overleaf). In the **android** pelvis the cavity is funnel-shaped with a contracted outlet; the **anthropoid** pelvis is long, narrow, and oval. The classical shape, **gynaecoid**, has a transversely oval outlet and a roomy pelvic cavity; the **platypelloid** pelvis is wide and flattened at the brim, with the promontory of the sacrum pushed forward. **2.** the lower part of the abdomen. **3.** the cavity within the bony pelvis. **4.** any structure shaped like a basin, e.g. the expanded part of the ureter in the kidney (**renal pelvis**). — **pelvic** *adj.*

The male pelvis (ventral view).

The female pelvis.

**pemetrexed** *n.* an **\*antimetabolite** used for treating pleural **\*mesothelioma** and advanced **\*non-small-cell lung cancer**. Side-effects include **\*myelosuppression**, gastrointestinal symptoms, and skin disorders.

**pemphigoid (bullous pemphigoid)** *n.* a chronic itchy blistering disorder most common in the elderly. The blisters most commonly occur on the limbs and may persist, unlike those of **\*pemphigus**. Pemphigoid is an **\*autoimmune disease** and responds to treatment with corticosteroids or immunosuppressant drugs. **Ocular pemphigoid** is a potentially blinding disease in which there is dryness, blistering, and scarring of the conjunctiva, leading to shortening of the **\*fornices** due to adhesions (**\*symblepharon**).

**pemphigoid gestationalis (pemphigoid gestationis)** a rare autoimmune condition (1 in 10,000–1 in 60,000 pregnancies) that usually starts in the second trimester with itching preceding a widespread **\*polymorphic eruption** with vesicles and blisters. It is associated with **\*intrauterine growth restriction** and preterm delivery.

**pemphigus (pemphigus vulgaris)** *n.* a rare but serious type of **\*autoimmune disease** marked by successive outbreaks of blisters. The blisters are superficial and do not remain intact for long; the mouth and other mucous membranes, as well as the skin, are usually affected. Oral pemphigus often precedes skin lesions; it is more prevalent in women and without treatment is potentially fatal. A number of milder variants of the disease exist. Systemic immunosuppressant treatment is required.

**Pena operation** a recommended surgical treatment of congenital anal malformation.

**Pendred's syndrome** goitre associated with congenital deafness due to deficiency of **\*peroxidase**, an enzyme that is essential for the utilization of iodine. [V. Pendred (1869–1946), British physician]

**penectomy** *n.* surgical removal of the penis, most commonly performed for penile cancer. It may be partial or total, depending on the degree of local tumour invasion.

**penetrance** *n.* the frequency with which the characteristic controlled by a gene is seen in the individuals possessing it. Complete penetrance occurs when the characteristic is seen in all individuals known to possess the gene. If a percentage of individuals with the gene do not show its effects, penetrance is incomplete. In this way a characteristic in a family may appear to 'skip' a generation.

**-penia** combining form denoting lack or deficiency. Example: **neutropenia** (of neutrophils).

**penicillamine** *n.* a drug that binds metals and therefore aids their excretion (see **CHELATING AGENT**). It is used to treat **\*Wilson's disease** and severe rheumatoid arthritis (see **DISEASE-MODIFYING ANTIRHEUMATIC DRUG**). It may cause blood disorders (blood counts should be carried out during treatment); other side-effects include nausea, loss of taste, and rashes.

**penicillin** *n.* an **\*antibiotic** that was derived from the mould *Penicillium rubrum* and first became available for treating bacterial infections in 1941. Since then, a number of naturally occurring penicillins have been developed to treat a wide variety of infections, notably **benzylpenicillin (penicillin G)** and **phenoxymethylpenicillin (penicillin V)**. There are few serious side-effects, but some patients are allergic to penicillin and develop such reactions as skin rashes and potentially fatal **\*anaphylaxis**. Many antibiotics are derived from the penicillins, including **\*amoxicillin**, **\*ampicillin**, and **\*ticarcillin**; these are known as **semisynthetic penicillins**. All penicillins except **\*flucloxacillin** are **\*beta-lactam antibiotics** and are sensitive to penicillinase.

**penicillinase** *n.* an enzyme, produced by some bacteria, that is capable of antagonizing the antibacterial action of penicillin and other **\*beta-lactam antibiotics**. Purified penicillinase may be used to treat reactions to penicillin. It is also used in diagnostic tests to isolate microorganisms from the blood of patients receiving penicillin.

**Penicillium** *n.* a genus of mouldlike fungi that commonly grow on decaying fruit, bread, or cheese. The species *P. rubrum* is the major natural source of the antibiotic **\*penicillin**. Some species of *Penicillium* are pathogenic to humans, causing diseases of the skin and respiratory tract.

**penile fracture** the traumatic rupture of the **\*tunica** albuginea of the erect penis (the fibrous covering of the spongy tissue of the penis).

**penile intraepithelial neoplasia (PIN)** cellular changes affecting the glans, prepuce, or penile shaft that precede the invasive stages of cancer of the penis. There are three stages (PIN I, II, or III) based on the degree of

**\*dysplasia**. The pathological features of PIN III indicate **\*carcinoma** in situ, known as **\*erythroplasia** of Queyrat and Bowen's disease.

**penile pearly papules** pale or skin-coloured papules that cluster around the corona of the glans penis in young uncircumcised men. They are asymptomatic but may be mistaken for viral warts.

**penile prosthesis** *see* **PROSTHESIS**.

**penis** *n.* the male organ that carries the **\*urethra**, through which urine and semen are discharged (see illustration). Most of the organ is composed of erectile tissue (see **CORPUS CAVERNOSUM**; **CORPUS SPONGIOSUM**), which becomes filled with blood under conditions of sexual excitement, causing an erection. The erect penis can enter the vagina and ejaculate semen. *See also* **GLANS**; **PREPUCE**.

**The penis (median section).**

**pent-** (**penta-**) *combining form denoting five.*

**pentamidine** *n.* a drug effective against protozoans and used in the treatment of **\*Pneumocystis** pneumonia in AIDS patients, **\*leishmaniasis**, and trypanosomiasis. Possible side-effects include low blood pressure, heart irregularity, low blood sugar (hypoglycaemia), low white blood cell count, and kidney damage.

**pentose** *n.* a simple sugar with five carbon atoms: for example, ribose and xylose.

**pentostatin** *n.* a **\*cytotoxic drug** that is used in treating **\*hairy cell** leukaemia; it works by interfering with the action of the enzyme adenosine deaminase. Side-effects, which may be severe, include **\*myelosuppression**.

**pentosuria** *n.* an inborn defect of sugar metabolism causing abnormal excretion of pentose in the urine. There are no serious ill-effects.

**peppermint oil** an **\*antispasmodic** that relieves pain and distension in irritable bowel syndrome and diverticular disease.

**pepsin** *n.* an enzyme in the stomach that begins the digestion of proteins by splitting them into peptones (*see* **PEPTIDASE**). It is produced by the action of hydrochloric acid on **pepsinogen**, which is secreted by the gastric glands. Once made, pepsin itself can act on pepsinogen to produce more pepsin.

**pepsinogen** *n.* *see* **PEPSIN**.

**peptic** *adj.* **1.** relating to pepsin. **2.** relating to digestion.

**peptic ulcer** a breach in the lining (mucosa) of the digestive tract caused by the actions of gastric acid and pepsin. This may occur due to abnormally high levels of gastric acid or pepsin or when the mucosa has been damaged by chronic **\*Helicobacter pylori** infection or by aspirin or NSAID use. A peptic ulcer may be found in the oesophagus (**oesophageal ulcer**, associated with reflux **\*oesophagitis**); the stomach (*see* **GASTRIC ULCER**); duodenum (*see* **DUODENAL ULCER**); jejunum (**jejunal ulcer**, usually in the **\*Zollinger-Ellison syndrome**); in a Meckel's **\*diverticulum**; and close to a **\*gastroenterostomy** (**stomal ulcer, anastomotic ulcer, marginal ulcer**).

**peptidase** *n.* one of a group of digestive enzymes that split proteins in the stomach and intestine into their constituent amino acids. The group is divided into the **\*endopeptidases** and **\*exopeptidases**.

**peptide** *n.* a molecule consisting of two or more **\*amino acids** linked by bonds between the amino group (–NH) and the carboxyl group (–CO). This bond is known as a **peptide bond**. *See also* **POLYPEPTIDE**.

**peptide receptor radionuclide therapy (PRRT)** a type of radiotherapy used to treat neuroendocrine tumours (NETs; *see* **NEUROENDOCRINE SYSTEM**). A **\*radionuclide** is combined with a relevant **\*peptide** to create a so-called **radiopeptide**, which is injected into the patient's bloodstream. Because NETs have an overexpression of peptide receptors, the radiopeptide binds to the tumour, delivering a high dose of radiation directly to the cancer cells. The chief merit of PRRT is this ability to target delivery of radionuclides for highly localized treatment. A similar technique, using a gamma emitter as the radionuclide, can be used for locating and imaging NETs.

**peptone** *n.* a large protein fragment produced by the action of enzymes on proteins in the first stages of protein digestion.

**peptonuria** *n.* the presence in the urine of **\*peptones**, intermediate compounds formed during the digestion of proteins.

**perception** *n.* the process by which information about the world, as received by the senses, is analysed and made meaningful. Abnormalities of perception include **\*hallucinations**, **\*illusions**, and **\*agnosia**.

**percussion** *n.* the technique of examining part of the body by tapping it with the fingers or an instrument (**plessor**) and sensing the resultant vibrations. With experience it is possible to detect the presence of abnormal solidification or enlargement in different organs and the presence of fluid, for example in the lungs.

**percutaneous** *adj.* through the skin: often applied to the route of administration of drugs in ointments, etc., which are absorbed through the skin.

**percutaneous coronary intervention (PCI)** treatment of coronary artery disease delivered by cardiac **\*catheterization**. This usually means **\*coronary angioplasty** followed by insertion of a coronary **\*stent**, but also includes more specialized procedures, such as rotational **\*atherectomy** (rotablation). **Primary PCI** refers to the use of PCI as the first-line treatment to relieve coronary obstruction in S-T elevation **\*myocardial infarction**, rather than **\*thrombolysis**. **Rescue PCI** is used in the event of unsuccessful thrombolysis.

**percutaneous epididymal sperm aspiration** *see* **PESA**.

**percutaneous nephrolithotomy (PCNL)** a technique of removing stones from the kidney via a **\*nephroscope** passed into the kidney through a dilated track established from the skin surface into the renal pelvis.

**percutaneous transhepatic cholangiopancreatography** imaging of the bile duct and pancreatic duct. A catheter is carefully manipulated into the ducts via direct puncture through the abdomen under radiological guidance. Contrast material is flushed through the catheter to delineate the ducts (*see also* **CHOLANGIOGRAPHY**). This procedure is often performed in cases of obstructive jaundice prior to insertion of a biliary drain or stent when **\*ERCP** is not possible.

**percutaneous transluminal coronary angioplasty (PTCA)** dilatation of a narrowed coronary artery using a balloon catheter advanced to the heart through a peripheral artery. It is now more commonly referred to as **\*percutaneous coronary intervention** to take into account the fact that a coronary **\*stent** is nearly always also deployed. *See* **ANGIOPLASTY**.

**perforation** *n.* the formation of a hole in a hollow organ. This may occur in the course of a disease (e.g. perforation from a **\*duodenal ulcer**, or stomach cancer), allowing the flow of intestinal contents into the peritoneal cavity, with subsequent inflammation (**\*peritonitis**), severe abdominal pain, and shock. Treatment is usually by surgical repair of the perforation, but conservative treatment with antibiotics may result in spontaneous healing. Perforations may also be caused by instruments – for example a gastroscope may perforate the stomach or a curette may perforate the uterus – or by injury, for example to the eardrum.

**performance status** a scoring system used to quantify a patient's activity level and general wellbeing in order to assess the patient's suitability for chemotherapy or for taking part in a clinical trial. Commonly used systems include the WHO performance scale, scoring from 0 (fully active, feeling well) to 4 or 5 (very ill or near to death), and the Karnofsky scale, scoring from 0 (very ill) to 100 (feeling well).

**perforin** *n.* a protein produced by **\*cytotoxic T cells** and **\*natural killer cells** that are in contact with virus-infected target cells. It creates pores in the target-cell membrane, which facilitates the delivery of **\*granzymes** to the cell to induce cell death (**\*apoptosis**).

**perfusion** *n.* **1.** the passage of fluid through a tissue, especially the passage of blood through the lung tissue to pick up oxygen from the air in the alveoli, which is brought there by *\*ventilation*, and release carbon dioxide. If ventilation is impaired deoxygenated venous blood is returned to the general circulation. If perfusion is impaired insufficient gas exchange takes place. **2.** the deliberate introduction of fluid into a tissue, usually by injection into the blood vessels supplying the tissue.

**perfusion scan** a technique for demonstrating an abnormal blood supply to an organ by injecting a radioactive *\*tracer* or *\*contrast medium*. One of the most common uses, often in conjunction with ventilation scanning (*see VENTILATION-PERFUSION SCANNING*), is to detect obstruction of pulmonary arteries due to embolism by thrombus (*see PULMONARY EMBOLISM*). Particles labelled with radioactive tracer are injected intravenously and become temporarily lodged in the capillaries in the lungs. Areas not being perfused show up as holes on the gamma-camera images. In *\*magnetic resonance imaging* or *\*computerized tomography*, contrast medium is injected and a series of images is obtained. The rate of change of enhancement is an index of the blood supply to the area of interest. This technique can be used to study blood supply to the brain, heart, or kidneys (in particular), to help diagnose arterial strictures or blockages, or tumours in which blood supply may be increased by abnormal vessels.

**pergolide** *n.* a drug that stimulates *\*dopamine* receptors in the brain and is now rarely used in the treatment of Parkinson's disease. Possible side-effects include confusion, hallucinations, sleepiness, heart irregularity, nausea, breathing difficulties, and double vision (*see also BROMOCRIPTINE*).

**peri-** *prefix denoting near, around, or enclosing.* Examples: **perianal** (around the anus); **pericardial** (around the heart); **peritonsillar** (around a tonsil).

**peradenitis** *n.* inflammation of tissues surrounding a gland.

**perianal haematoma (external haemorrhoid)** a painful swelling composed of blood that lies next to the anus. Typically it develops following an episode of straining during defecation or protracted coughing. Perianal haematomas are caused by the rupture of a small vein in the anus. They often heal spontaneously but occasionally rupture. Rarely this is followed by abscess

formation. If severe pain continues, surgical removal may be undertaken. *See also* [HAEMORRHOIDS](#).

**periapical** *adj.* around an apex, particularly the apex of a tooth. The term is applied to bone surrounding the apex and to X-ray views of this area.

**peri-arrest period** the recognized period, either just before or just after a full *\*cardiac arrest*, when the patient's condition is very unstable and care must be taken to prevent progression or regression into a full cardiac arrest.

**periarteritis nodosa** *see* [POLYARTERITIS NODOSA](#).

**periarthritis** *n.* inflammation of tissues around a joint capsule, including tendons and *\*bursae*. **Chronic periarthritis**, which may be spontaneous or follow injury, is a common cause of pain and stiffness of the shoulder; it usually responds to local steroid injections or physiotherapy.

**periarticular** *adj.* around a joint, including the joint margins and surrounding area immediately adjacent to the joint capsule. The term is commonly used to specify fractures, tumours, and types of internal fixation devices. *See also* [EXTRA-ARTICULAR](#); [INTRA-ARTICULAR](#).

**peribulbar** *adj.* (in ophthalmology) denoting the area around the eyeball.

**pericard-** (**pericardio-**) *combining form denoting* the pericardium.

**pericardiectomy** (**pericardectomy**) *n.* surgical removal of the membranous sac surrounding the heart (pericardium). It is used in the treatment of chronic constrictive pericarditis and chronic pericardial effusion (*see* [PERICARDITIS](#)).

**pericardiocentesis** *n.* removal of excess fluid from within the sac (pericardium) surrounding the heart by means of needle *\*aspiration*. *See* [PERICARDITIS](#); [HYDROPERICARDIUM](#).

**pericardiolysis** *n.* the surgical separation of *\*adhesions* between the heart and surrounding structures within the ribcage (**adherent pericardium**). The operation has now fallen into disuse.

**pericardiorrhaphy** *n.* the repair of wounds in the membrane surrounding the heart (pericardium), such as those due to injury or surgery.

**pericardiostomy** *n.* an operation in which the membranous sac around the heart is opened and the fluid within drained via a tube. It is sometimes used in the treatment of septic pericarditis.

**pericardiotomy (pericardotomy)** *n.* surgical opening or puncture of the membranous sac (pericardium) around the heart. It is required to gain access to the heart in heart surgery and to remove excess fluid from within the pericardium.

**pericarditis** *n.* acute or chronic inflammation of the membranous sac (pericardium) surrounding the heart. Pericarditis may be seen alone or as part of pancarditis (*see* **ENDOMYOCARDITIS**). It has numerous causes, including virus infections, uraemia, and cancer. **Acute pericarditis** is characterized by fever, chest pain, and a pericardial friction rub (a harsh scratching noise audible over the anterior chest wall with the aid of a stethoscope). Fluid may accumulate within the pericardial sac (**pericardial effusion**). Rarely, chronic thickening of the pericardium (**chronic constrictive pericarditis**) develops. This interferes with activity of the heart and has many features in common with *\*heart failure*, including oedema, pleural effusions, ascites, and engorgement of the veins. Constrictive pericarditis most often results from tubercular infection.

The treatment of pericarditis is directed to the cause. Pericardial effusions may be aspirated by a needle inserted through the chest wall. Chronic constrictive pericarditis is treated by surgical removal of the pericardium (**pericardiectomy**).

**pericardium** *n.* the membrane surrounding the heart, consisting of two portions. The outer **fibrous pericardium** completely encloses the heart and is attached to the large blood vessels emerging from the heart. The internal **serous pericardium** is a closed sac of *\*serous membrane*: the inner visceral portion (**epicardium**) is closely attached to the muscular heart wall and the outer parietal portion lines the fibrous pericardium. Within the sac is a very small amount of fluid, which prevents friction as the two surfaces slide over one another as the heart beats. —**pericardial** *adj.*

**pericardotomy** *n.* *see* **PERICARDIOTOMY**.

**perichondritis** *n.* inflammation of cartilage and surrounding soft tissues, usually due to chronic infection. A common site is the external ear.

**perichondrium** *n.* the dense layer of fibrous connective tissue that covers the surface of **\*cartilage**.

**pericoronitis** *n.* inflammation of the gingivae around the crown of a tooth, particularly a partially erupted third molar.

**pericranium** *n.* the **\*periosteum** of the skull.

**pericystitis** *n.* inflammation in the tissues around the bladder, causing pain in the pelvis, fever, and symptoms of **\*cystitis**. It usually results from infection in the Fallopian tubes or uterus, but can occasionally arise from severe infection in a **\*diverticulum** of the bladder itself. Treatment of pericystitis is directed to the underlying cause and usually involves antibiotic therapy. Pericystitis associated with a pelvic abscess clears when the abscess is surgically drained.

**periderm** *n.* *see* **EPITRICHUM**.

**perihepatitis** *n.* inflammation of the membrane covering the liver (capsule). It is usually associated with abnormalities of the liver (including liver abscess, cirrhosis, tuberculosis) or chronic peritonitis.

**perikaryon** *n.* *see* **CELL BODY**.

**perilymph** *n.* the fluid between the bony and membranous **\*labyrinths** of the ear.

**perimenopause** *n.* the period of time around the **\*menopause** in which marked changes in the menstrual cycle occur, usually accompanied by hot flushes, and in which no 12 consecutive months of **\*amenorrhoea** have yet occurred.

**perimeter** *n.* an instrument for mapping the extent of the **\*visual field**. The patient fixes his or her gaze on a target in the centre of the inner surface of the hemisphere. Objects are presented on this surface and the patient says if they can be seen. The area of the visual field can be defined and any gaps in the field can be detected. There are several types of perimeter. In the **static perimeter** the movable object is replaced by a system of tiny lights that can

be flashed briefly. A patient with a field defect will fail to see the lights that flash in the area of the defect. Modern visual field testing uses computer-assisted **automated perimeters** to map out and analyse visual fields and thus detect very subtle field defects (**computerized perimetry**). Automated perimeters are commonly used in the diagnosis and follow-up of glaucoma.  
—**perimetry** *n*.

**perimetritis** *n*. inflammation of the membrane on the outer surface of the uterus. The condition may be associated with **\*parametritis**.

**perimetrium** *n*. the **\*peritoneum** of the uterus.

**perimysium** *n*. the fibrous sheath that surrounds each bundle of **\*muscle** fibres.

**perinatal** *adj*. relating to the period starting a few weeks before birth and including the birth and a few weeks after birth.

**perinatal mortality rate** (PNM) the total number of babies born dead after 24 weeks gestation (**\*stillbirths**) and of live-born babies that die in the first week of life, regardless of gestational age at birth (**early neonatal deaths**), per 1000 live births and stillbirths. *See* **INFANT MORTALITY RATE**. *See also* **CONFIDENTIAL ENQUIRIES**.

**perineal descent** abnormal bulging down of the **\*perineum** as a result of weakness of the pelvic floor muscles. It often accompanies problems with defecation and micturition.

**perineal repair** *see* **PERINEORRHAPHY**.

**perineal tear (perineal trauma)** an injury to the perineum, which may be sustained during childbirth. Perineal tears can be classified by degree. First-degree tears involve the perineal skin and vaginal mucosa only. Second-degree tears involve the perineal muscles but not the anal sphincter. Third-degree tears involve the anal sphincter complex: the external anal sphincter (EAS) and internal anal sphincter (IAS). These are subclassified as 3a (less than 50% of EAS thickness torn), 3b (more than 50% of EAS thickness torn), and 3c (IAS torn). Fourth-degree tears involve the anal sphincter complex (EAS and IAS) and the anal epithelium or rectal mucosa. It is vitally

important that these injuries are recognized and repaired by competent personnel. *See also* [OBSTETRIC ANAL SPHINCTER INJURY](#).

**perineoplasty** *n.* an operation designed to enlarge the vaginal opening by incising the hymen and part of the perineum (**Fenton's operation**).

**perineorrhaphy** *n.* the surgical repair of a damaged perineum. The damage is usually the result of a tear in the perineum sustained during childbirth (*see* [PERINEAL TEAR](#)).

**perinephric abscess** a collection of pus around the kidney, usually secondary to [\\*pyonephrosis](#) but also resulting from spread of infection from other sites. It is more likely to occur in individuals who are immunosuppressed or have diabetes mellitus. Percutaneous or open surgical drainage are usually necessary but occasionally nephrectomy may be needed if the kidney is severely infected.

**perinephritis** *n.* inflammation of the tissues around the kidney. This is usually due to spread of infection from the kidney itself (*see* [PYELONEPHRITIS](#); [PYONEPHROSIS](#)). The patient has pain in the loins, fever, and fits of shivering. Prompt treatment of the underlying renal infection is required to prevent progression to an abscess.

**perineum** *n.* the region of the body between the anus and the urethral opening, including both skin and underlying muscle. In females it is perforated by the vaginal opening. —**perineal** *adj.*

**perineurium** *n.* the sheath of connective tissue that surrounds individual bundles (fascicles) of nerve fibres within a large [\\*nerve](#).

**periocular** *adj.* adjacent to the eyeball.

**periodic acid–Schiff reaction (PAS reaction)** a test for the presence of glycoproteins, polysaccharides, certain mucopolysaccharides, glycolipids, and certain fatty acids in tissue sections. The tissue is treated with periodic acid, followed by [\\*Schiff's reagent](#). A positive reaction is the development of a red or magenta coloration.

**periodic fever** *see* [MALARIA](#).

**periodontal** *adj.* denoting or relating to the gums and other tissues surrounding and supporting the teeth.

**periodontal abscess** a localized abscess that arises in the periodontal tissues and is usually an acute manifestation of periodontal disease. It appears as a pocket of pus in the tissues of the gum but not around the apex of the tooth.

**periodontal disease** a disease of the tissues that support and attach the teeth – the gums, periodontal membrane, and alveolar bone. It is caused by the metabolism of bacterial **\*plaque** on the surfaces of the teeth adjacent to these tissues. Periodontal disease includes **\*gingivitis** and the more advanced stage of **periodontitis**, which results in the formation of spaces between the gums and the teeth (**periodontal pockets**), the loss of some fibres that attach the tooth to the jaw, and the loss of bone. The disease is widespread and is the most common cause of tooth loss in older people. Poor oral hygiene is a major contributory factor, but the resistance of the patient also has some influence; for example, the reduced resistance of patients with AIDS may predispose to periodontal disease.

**periodontal membrane (periodontal ligament)** the ligament around a **\*tooth**, by which it is attached to the bone.

**periodontal pocket** a space between the gingival tissues and tooth occurring in periodontitis. *See* **PERIODONTAL DISEASE**.

**periodontium** *n.* the tissues that support and attach the teeth to the jaw: the gums (*see* **GINGIVA**), **\*periodontal membrane**, alveolar bone, and **\*cementum**.

**periodontology** *n.* the branch of dentistry concerned with the tissues that support and attach the teeth and the prevention and treatment of **\*periodontal disease**.

**perioperative** *adj.* denoting the period that extends from the day before to the first few days after surgery, during which drugs (e.g. analgesics, antibiotics, anticoagulants) may need to be administered and **\*vital signs** are monitored.

**periorbital** *adj.* **1.** around the eye socket (**\*orbit**). **2.** relating to the periosteum within the orbit.

**periosteum** *n.* a layer of dense connective tissue that covers the surface of a bone except at the articular surfaces. The outer layer of the periosteum is extremely dense and contains a large number of blood vessels. The inner layer is more cellular in appearance and contains osteoblasts and fewer blood vessels. The periosteum provides attachment for muscles, tendons, and ligaments.

**periostitis** *n.* inflammation of the membrane surrounding a bone (*see* PERIOSTEUM). **Acute periostitis** results from direct injury to the bone and is associated with a **\*haematoma**, which may later become infected. The uncomplicated condition subsides quickly with rest and anti-inflammatory analgesics. **Chronic periostitis** sometimes follows but is more often due to an inflammatory disease, such as tuberculosis or syphilis, or to a chronic ulcer overlying the bone involved. Chronic periostitis causes thickening of the underlying bone, which is evident on X-ray.

**periotome** *n.* a sharp instrument used in dental extractions. It is used to sever the periodontal ligament, thereby enabling an atraumatic extraction with minimal damage to the bony and soft tissue architecture.

**peripheral nervous system** all parts of the nervous system lying outside the central nervous system (brain and spinal cord). It includes the **\*cranial nerves** and **\*spinal nerves** and their branches, which link the receptors and effector organs with the brain and spinal cord. *See also* AUTONOMIC NERVOUS SYSTEM.

**peripheral neuropathy (polyneuropathy, peripheral neuritis)** any of a group of disorders affecting the sensory and/or motor nerves in the peripheral nervous system. They tend to start distally, in the fingers and toes, and progress proximally. Symptoms include pins and needles, stabbing pains and a numbness on the sensory side, and weakness of the muscles. The most common causes of peripheral neuropathy are diabetes, alcohol, certain drugs, and such infections as HIV; genetic causes of peripheral neuropathy include amyloidosis and **\*Charcot-Marie-Tooth disease**. The diagnosis may be established by neurophysiological tests, blood tests, and occasionally a nerve biopsy.

**peripheral parenteral nutrition (PPN)** the delivery of nutrients directly into a peripheral vein (in the arm). Feed solutions must have a low **\*osmolality**

(<1200 mOsm/l), and PPN can be given only for a short period (less than four weeks). There is a risk of *\*phlebitis*. See [ARTIFICIAL NUTRITION AND HYDRATION](#); [TOTAL PARENTERAL NUTRITION](#).

**periphlebitis** *n.* inflammation of the tissues around a vein: seen as an extension of *\*phlebitis*.

**perisalpingitis** *n.* inflammation of the peritoneal membrane on the outer surface of a Fallopian tube.

**perisplenitis** *n.* inflammation of the external coverings of the spleen.

**peristalsis** *n.* a wavelike movement that progresses along some of the hollow tubes of the body. It occurs involuntarily and is characteristic of tubes that possess circular and longitudinal muscles, such as the *\*intestines*. It is induced by distension of the walls of the tube. Immediately behind the distension the circular muscle contracts. In front of the distension the circular muscle relaxes and the longitudinal muscle contracts, which pushes the contents of the tube forward. —**peristaltic** *adj.*

**peritendineum** *n.* the fibrous covering of a tendon.

**peritendinitis** *n.* see [TENOSYNOVITIS](#).

**peritomy** *n.* an eye operation in which an incision of the conjunctiva is made in a complete circle around the cornea.

**peritoneal dialysis (PD)** a form of renal replacement therapy (see [DIALYSIS](#)) that utilizes the peritoneum as the semipermeable membrane separating blood and *\*dialysate*. Peritoneal dialysis can be given as a temporary and emergency treatment using a rigid percutaneous cannula to deliver fluid into the peritoneal cavity; this cannula usually needs removal and/or replacement within a few days. Alternatively, PD can be used as a chronic treatment, either in the form of chronic ambulatory peritoneal dialysis (see [CAPD](#)) or **automated peritoneal dialysis (APD)**, in which case fluid delivery is through a soft silastic catheter that is tunnelled subcutaneously out of the peritoneal cavity and is designed to stay in place for years. In all cases, the dialysis fluid is left within the peritoneal cavity for a period of time during which substances in the bloodstream diffuse into the fluid according to their concentration gradient and the permeability of the peritoneal membrane.

**peritoneoscope** *n.* see LAPAROSCOPE.

**peritoneum** *n.* the **\*serous membrane** of the abdominal cavity (see illustration). The **parietal peritoneum** lines the walls of the abdomen, and the **visceral peritoneum** covers the abdominal organs. See also **MESENTERY**; **OMENTUM**. —**peritoneal** *adj.*

**Peritoneum.** Sagittal section of the abdomen to show arrangement of the peritoneum.

**peritonitis** *n.* inflammation of the **\*peritoneum**. **Primary peritonitis** is caused by bacteria spread via the bloodstream: examples are **pneumococcal peritonitis** and **tuberculous peritonitis**. Symptoms are diffuse abdominal pain and swelling, with fever and weight loss. Fluid may accumulate in the peritoneal cavity (see **ASCITES**) or the infection may complicate existing ascites (see **SPONTANEOUS BACTERIAL PERITONITIS**). **Secondary peritonitis** is due to perforation or rupture of an abdominal organ (for example, a duodenal ulcer, the gall bladder, or the vermiform appendix), allowing access of bacteria and irritant digestive juices to the peritoneum. This produces sudden severe abdominal pain, first at the site of rupture but later becoming generalized. Shock develops, and the abdominal wall becomes rigid; X-ray examination may reveal gas within the peritoneal cavity. Treatment is usually by surgical repair of the perforation, but in some cases conservative treatment using antibiotics and intravenous fluid may be used. **\*Subphrenic abscess** is a possible complication. **Meconium peritonitis**

occurs in newborn infants as a result of a perforated intestine; it is initially a sterile contamination of the peritoneum.

**peritonsillar abscess** *see* QUINSY.

**peritrichous** *adj.* describing bacteria in which the flagella cover the entire cell surface.

**perityphlitis** *n. Archaic.* inflammation of the tissues around the caecum.

**periureteritis** *n.* inflammation of the tissues around a ureter. This is usually associated with inflammation of the ureter itself (**\*ureteritis**) often behind an obstruction caused by a stone or stricture. Treatment is directed to relieving any obstruction of the ureter and controlling the infection with antibiotics.

**periurethral injection** the injection of a bulking agent (e.g. collagen) into the tissues around the urethra, used for the treatment of urodynamic stress **\*incontinence**. Such injections have a low morbidity and are easy to administer, and results are better in women with good bladder-neck support but poor urethral function. The short-term success rates of these procedures are reasonable, but long-term success rates are poor.

**perivascular spaces** *see* VIRCHOW–ROBIN SPACES.

**periventricular haemorrhage (PVH)** a significant cause of morbidity and mortality in infants who are born prematurely in which bleeding occurs from fragile blood vessels around the **\*ventricles** in the brain. Bleeding extending into the lateral ventricles is termed **intraventricular haemorrhage (IVH)** and in severe cases can extend into the brain tissue (cerebral parenchyma). Surviving infants may have long-term neurological deficits, such as cerebral palsy, developmental delay, or seizures.

**periventricular leucomalacia (PVL)** softening of white matter around the ventricles of the brain in preterm infants due to a decreased blood supply to the brain, usually associated with **\*hypoxic-ischaemic encephalopathy**. Diagnosis is by ultrasound, which shows increased density and, later, cysts in the periventricular area. The brain damage can cause visual impairment and cerebral palsy.

**PERLA** pupils equal, react to light and accommodation: used in hospital notes.

**perle** *n.* a soft capsule containing medicine.

**perleche** *n.* dryness and cracking of the corners of the mouth, sometimes with infection. Perleche may be caused by persistent lip licking or by a vitamin-deficient diet.

**permethrin** *n.* a synthetic derivative of the naturally occurring insecticide pyrethrin that is applied externally as a cream to treat pubic lice and scabies.

**pernicious** *adj.* describing diseases that are highly dangerous or likely to result in death if untreated. *See also* **PERNICIOUS ANAEMIA**.

**pernicious anaemia** a form of **\*anaemia** resulting from deficiency of **\*vitamin B<sub>12</sub>**. This is due either to the failure of the body to produce the substance (**\*intrinsic factor**) that facilitates absorption of B<sub>12</sub> from the bowel or to dietary deficiency of the vitamin. Pernicious anaemia is characterized by defective production of red blood cells and the presence of **\*megaloblasts** in the bone marrow. In severe forms the nervous system is affected (*see* **SUBACUTE COMBINED DEGENERATION OF THE CORD**). The condition is treated by injections of vitamin B<sub>12</sub>.

**pernio** *n.* the medical name for a chilblain (*see* **CHILBLAINS**).

**perniosis** *n.* *see* **CHILBLAINS**.

**pero-** *combining form denoting deformity; defect.* Example: **peromelia** (of the limbs).

**peroneal** *adj.* relating to or supplying the outer (fibular) side of the leg.

**peroneus** *n.* one of the muscles of the leg that arises from the fibula. The **peroneus longus** and **peroneus brevis** are situated at the side of the leg and inserted into the metatarsal bones of the foot. They help to turn the foot outwards.

**peroxidase** *n.* an enzyme, found mainly in plants but also present in leucocytes and milk, that catalyses the dehydrogenation (oxidation) of various substances in the presence of hydrogen peroxide (which acts as a hydrogen acceptor, being converted to water in the process).

**peroxisome** *n.* a small structure within a cell that is similar to a **\*lysosome** but contains different enzymes, some of which may take part in reactions involving hydrogen peroxide.

**perphenazine** *n.* a phenothiazine **\*antipsychotic** drug used to treat schizophrenia, mania, anxiety, and severe agitation and to prevent and treat severe nausea and vomiting. Side-effects are similar to those of **\*fluphenazine**.

**perseveration** *n.* **1.** excessive persistence at a task that prevents the individual from turning his or her attention to new situations. It is a symptom of organic disease of the brain and sometimes of obsessive-compulsive disorder. **2.** the phenomenon in which an image continues to be perceived briefly in the absence of the object. This is a potentially serious neurological disorder.

**persistent idiopathic facial pain (atypical facial pain, chronic idiopathic facial pain)** a chronic pain in the face that has no known cause and does not fit the classic presentation of other cranial neuralgias. It may be stress-related, and in some cases appears to be associated with defective metabolism of **\*tyramine**. Treatment may involve the use of antidepressants.

**persistent vegetative state (PVS)** the condition that may be diagnosed after a patient has been in the **\*vegetative state** for more than 4 weeks and is normally regarded as permanent, with little or no hope of recovery, after 12 months. Following the high-profile case of Tony Bland, who was in PVS following injuries sustained in the Hillsborough Football Stadium disaster, the law currently allows medical treatment, such as **\*artificial nutrition and hydration**, to be withdrawn from patients in a permanent vegetative state, but permission must first be granted by the courts.

**personal independence payment (PIP)** a tax-free benefit replacing (from April 2013) **\*disability living allowance** (DLA) for people aged 16–64 (DLA is still paid to children). It has two components – a daily living component (including help with washing, dressing, using the toilet, preparing and eating food, and taking medicines) and a mobility component (for help with walking).

**personality** *n.* (in psychology) an enduring disposition to act and feel in particular ways that differentiate one individual from another. These patterns

of behaviour are sometimes conceptualized as different categories (*see* [PERSONALITY DISORDER](#)) and sometimes as different dimensions (*see* [EXTROVERSION](#); [NEUROTICISM](#)).

**personality disorder** a deeply ingrained and maladaptive pattern of behaviour, persisting over many years. It is usually manifest by the time the individual is adolescent. The abnormality of behaviour must be sufficiently severe that it causes suffering, either to the patient or to other people (or to both). Some individuals with such personalities mature into people who are less debilitated by their personality development. Certain types of psychotherapy are of some therapeutic value, but treatment is mostly aimed at mitigating the worst consequences of the personality disorder rather than cure. The International Classification of Diseases differs slightly from the DSM in its terminology and clustering of personality disorders. *See* [ANTISOCIAL PERSONALITY DISORDER](#); [AVOIDANT](#); [EMOTIONALLY UNSTABLE PERSONALITY DISORDER](#); [HISTRIONIC PERSONALITY DISORDER](#); [SCHIZOTYPAL PERSONALITY DISORDER](#).

**person-centred care** an approach to health care that focuses on the needs of the individual care user, rather than providing a standardized response to their condition. The patient is encouraged to take an active role in discussing a health-care plan that reflects their own needs, circumstances, and values.

**personhood** *n.* a philosophical concept designed to determine which individuals have human rights and responsibilities. Personhood may be distinguished by possession of defining characteristics, such as consciousness and rationality, or in terms of relationships with others. Philosophers disagree on whether all humans are, or all nonhuman animals are not, persons, especially when debating the ethics of abortion, euthanasia, and human uses of animals. In law, corporations can be regarded as having personhood, when identifying their rights and responsibilities.

**perspiration** *n.* **\*sweat** or the process of sweating. **Insensible perspiration** is sweat that evaporates immediately from the skin and is therefore not visible; **sensible perspiration** is visible on the skin in the form of drops.

**PERT** *see* [PANCREATIC ENZYME REPLACEMENT THERAPY](#).

**Perthes' disease** *see* [LEGG–CALVÉ–PERTHES DISEASE](#).

**pertussis** *n.* *see* WHOOPING COUGH.

**pes** *n.* (in anatomy) the foot or a part resembling a foot.

**PESA** (percutaneous epididymal sperm aspiration) a method of assisted conception in which spermatozoa are removed directly from the **\*epididymis** under local anaesthetic. The sperm are then used to fertilize egg cells in vitro (*see* ICSI).

**pes cavus** *see* CLAW-FOOT.

**pes planus** *see* FLAT-FOOT.

**pessary** *n.* **1.** a plastic device, often ring-shaped, that fits into the vagina and keeps the uterus in position: used to treat **\*prolapse**. The usual type is a **ring pessary** but occasionally a **Hodge pessary** is used. **2. (vaginal suppository)** a plug or cylinder of cocoa butter or some other soft material containing a drug that is fitted into the vagina for the treatment of gynaecological disorders (e.g. vaginitis) or for the induction of labour (a Prostin pessary containing prostaglandin).

**pesticide** *n.* a chemical agent used to kill insects or other organisms harmful to crops and other cultivated plants. Some pesticides, such as **\*parathion** and **\*dieldrin**, have caused poisoning in human beings and livestock after accidental exposure.

**PET** *see* POSITRON EMISSION TOMOGRAPHY.

**PET/CT scanning** an imaging system that allows a PET scan (*see* POSITRON EMISSION TOMOGRAPHY) and a CT scan (*see* COMPUTERIZED TOMOGRAPHY) to be performed very close together, with minimal movement of the patient between scans. This means that the images produced can be co-registered (*see* CO-REGISTRATION), giving very accurate anatomical localization (from the CT scan) of areas of increased activity (identified on the PET scan). This is very important for determining the site of disease in order to plan treatment.

**petechiae** *pl. n.* small round flat dark-red spots caused by bleeding into the skin or beneath the mucous membrane. Petechiae occur, for example, in the **\*purpuras**.

**pethidine** *n.* a potent opioid analgesic (*see* **OPIATE**) with mild sedative action, used to relieve moderate or severe pain of short duration (including that associated with childbirth). Side-effects may include nausea, dizziness, and dry mouth.

**petit mal** *see* **EPILEPSY**.

**Petri dish** a flat shallow circular glass or plastic dish with a pillbox-like lid, used to hold solid agar or gelatin media for culturing bacteria. [J. R. Petri (1852–1921), German bacteriologist]

**petrissage** *n.* kneading: a form of **\*massage** in which the skin is lifted up, pressed down and squeezed, and pinched and rolled. Alternate squeezing and relaxation of the tissues stimulates the local circulation and may have a pain-relieving effect in muscular disorders.

**petrositis** *n.* inflammation of the petrous part of the **\*temporal bone** (which encloses the inner ear), usually due to an extension of **\*mastoiditis**.

**petrous bone** *see* **TEMPORAL BONE**.

**Peutz–Jeghers syndrome** a hereditary disorder in which the presence of multiple **\*polyps** in the lining of the small intestine (intestinal **\*polyposis**) is associated with pigmented areas (similar to freckles) around the lips, on the inside of the mouth, and on the palms and soles. The polyps can also occur in the colon and stomach. They may bleed, resulting in anaemia, or may cause obstruction of the bowel. Half of the patients develop malignant tumours (not necessarily of the bowel). [J. L. A. Peutz (1886–1957), Dutch physician; H. J. Jeghers (1904–90), US physician]

**-pexy** *combining form denoting surgical fixation*. Example: **omentopexy** (of the omentum).

**Peyer's patches** oval masses of **\*lymphoid tissue** on the mucous membrane lining the small intestine. [J. C. Peyer (1653–1712), Swiss anatomist]

**Peyronie's disease** a dense fibrous plaque in the penis, which can be felt in the erectile tissue as an irregular hard lump. The penis curves or angulates at this point on erection and pain often results. The cause is unknown. Up to 30–40% of men with Peyronie's disease will also have Dupuytren's contracture. The penis can be straightened surgically by means of **\*Nesbit's operation** or

by incision of the plaque with subsequent grafting. [F. de la Peyronie (1678–1747), French surgeon]

**PGD** *see* **PREIMPLANTATION GENETIC DIAGNOSIS**.

**pH** a measure of the concentration of hydrogen ions in a solution, and therefore of its acidity or alkalinity. A pH of 7 indicates a neutral solution, a pH below 7 indicates acidity, and a pH in excess of 7 indicates alkalinity.

**PHA** *n. see* **PHYTOHAEMAGGLUTININ**.

**phaco-** (**phako-**) *combining form denoting* the lens of the eye.

**phacodonesis** *n.* tremulousness of the lens seen when the eye moves from side to side as a result of partial dislocation of the lens, as can occur after trauma or in **\*Marfan's syndrome**.

**phacoemulsification** (**phakoemulsification**) *n.* the use of a high-frequency **\*ultrasound** probe to break up a cataract so that it can be removed through a very small incision. This is now the most popular method of performing cataract surgery in the developed world.

**phaeochromocytoma** *n.* a small vascular tumour of the inner region (medulla) of the adrenal gland. Many tumours function by their uncontrolled and irregular secretion of the hormones **\*adrenaline** and **\*noradrenaline**. They cause attacks of raised blood pressure, increased heart rate, palpitations, and headache.

**phag-** (**phago-**) *combining form denoting* **1.** eating. **2.** phagocytes.

**phage** *n. see* **BACTERIOPHAGE**.

**-phagia** *combining form denoting* a condition involving eating.

**phagocyte** *n.* a cell that is able to engulf and digest bacteria, protozoa, cells and cell debris, and other small particles. Phagocytes include many white blood cells (*see* **LEUCOCYTE**) and **\*macrophages**, which play a major role in the body's defence mechanism. —**phagocytic** *adj.*

**phagocytosis** *n.* the engulfment and digestion of bacteria and other foreign particles by a cell (*see* **PHAGOCYTE**). *Compare* **PINOCYTOSIS**.

**phakic** *adj.* denoting an eye with the natural crystalline lens still in place, as contrasted with aphakic (see **APHAKIA**) or pseudophakic (see **PSEUDOPHAKIA**).

**phako-** *combining form.* see **PHACO-**.

**phalangeal cells** rows of supporting cells between the sensory hair cells of the organ of Corti (see **COCHLEA**).

**phalangectomy** *n.* surgical removal of one or more of the small bones (phalanges) in the fingers or toes.

**phalanges** *n.* (*sing.* phalanx) the bones of the fingers and toes (digits). The first digit (thumb/big toe) has two phalanges. Each of the remaining digits has three phalanges. —**phalangeal** *adj.*

**phalangitis** *n.* inflammation of a finger or toe, causing swelling and pain. The condition may be caused by infection of the soft tissues, tendon sheaths, bone, or joints or by some rheumatic diseases, such as **\*psoriatic arthritis**. See also **DACTYLITIS**.

**phalanx** *n.* see **PHALANGES**.

**Phalen's sign** a diagnostic sign for **\*carpal tunnel syndrome**. The patient is asked to hold his or her wrists in full flexion with the dorsal surfaces of both hands pushing against each other with fingers pointing downwards for 30–60 seconds. This manoeuvre increases pressure on the median nerve: tingling and numbness or pain in the thumb, index, middle, and ring fingers suggests carpal tunnel syndrome. See also **TINEL'S SIGN**. [G. S. Phalen (1911–98), US orthopaedist]

**phalloplasty** *n.* surgical reconstruction or repair of the penis. It is required for congenital deformity of the penis, as in **\*hypospadias** or **\*epispadias**, and sometimes also following injury to the penis with loss of skin.

**phallus** *n.* the embryonic penis, before the urethral duct has reached its final state of development.

**phanero-** *combining form* denoting visible; apparent.

**phantom limb** the sensation that an arm or leg, or part of an arm or leg, is still attached to the body after it has been amputated. Pain may seem to come from the amputated part. This may arise because of stimulation of the amputation stump, which contains severed nerves that formerly carried messages from the removed portion, but more usually occurs because the neural representation of the limb is still present in the brain and may become activated.

**phantom pregnancy** *see* **PSEUDOCYESIS**.

**phantom tumour** **1.** an accumulation of fluid (pleural effusion) in the lung in patients with heart failure, which resembles a lung tumour on radiological examination. **2.** a swelling in the abdomen or elsewhere, caused by local muscular contraction or the accumulation of gases, that mimics a swelling caused by a tumour.

**pharmaceutical** *adj.* relating to pharmacy.

**pharmacist** *n.* a person who is qualified by examination and registered and authorized to dispense medicines or to keep open a shop for the sale and dispensing of medicines.

**pharmaco-** *combining form denoting* drugs. Example: **pharmacophobia** (morbid fear of).

**pharmacodynamics** *n.* the interaction of drugs with cells. It includes such factors as the binding of drugs to cells, their uptake, and intracellular metabolism.

**pharmacogenomics** *n.* the study of how genes affect the actions of drugs. The enormous growth of knowledge about the human genome, arising from the **\*Human Genome Project**, has revolutionized drug treatment, enabling the precise targeting of drugs against the products of specific mutations causing disease (*see* **TARGETED AGENT**). In addition, it will be possible to identify those genetic variations that affect how drugs are metabolized in the body and their potential for causing adverse effects. Thus analysis of genetic data from individuals will enable safer and more effective treatment.

**pharmacognosy** *n.* the knowledge or study of pharmacologically active principles derived from plants.

**pharmacokinetics** *n.* the study of how drugs are handled within the body, including their absorption, distribution, metabolism, and excretion. It is concerned with such matters as how drug concentration in the body changes with time, how drugs pass across cell membranes, how often they should be given, what the effect of long-term administration may be, how drugs interact with each other, and how individual variations affect all these things.

**pharmacology** *n.* the science of the properties of drugs and their effects on the body. —**pharmacological** *adj.*

**pharmacopoeia** *n.* a book containing a list of the drugs used in medicine, with details of their formulae, methods of preparation, dosages, standards of purity, etc.

**pharmacy** *n.* **1.** the preparation and dispensing of drugs. **2.** premises registered to dispense medicines and sell poisons.

**pharyng-** (**pharyngo-**) *combining form denoting* the pharynx. Example: **pharyngopathy** (disease of).

**pharyngeal arch** (**branchial arch**, **visceral arch**) any of the paired segmented ridges of tissue in each side of the throat of the early embryo that correspond to the gill arches of fish. Each arch contains a cartilage, a cranial nerve, and a blood vessel. Between each arch there is a **\*pharyngeal pouch**.

**pharyngeal cleft** (**branchial cleft**, **visceral cleft**) any of the paired segmented clefts in each side of the throat of the early embryo that correspond to the gills of fish. Soon after they have formed they close to form the **\*pharyngeal pouches**, except for the first cleft, which persists as the external auditory meatus.

**pharyngeal pouch** (**branchial pouch**, **visceral pouch**) any of the paired segmented pouches in the side of the throat of the early embryo. They give rise to the tympanic cavity, the parathyroid glands, the thymus, and probably the thyroid gland.

**pharyngeal reflex** *see* **GAG REFLEX**.

**pharyngectomy** *n.* surgical removal of part of the pharynx.

**pharyngitis** *n.* inflammation of the part of the throat behind the soft palate (pharynx). It produces **\*sore throat** and may be associated with **\*tonsillitis**.

**pharyngocele** *n.* a pouch or cyst opening off the pharynx (see **BRANCHIAL CYST**).

**pharyngoscope** *n.* an **\*endoscope** for the examination of the pharynx.

**pharynx** *n.* a muscular tube, lined with mucous membrane, that extends from the beginning of the oesophagus (gullet) up to the base of the skull. It is divided into the **\*nasopharynx**, **\*oropharynx**, and **\*hypopharynx** (see illustration) and it communicates with the posterior **\*nares**, **\*Eustachian tube**, the mouth, larynx, and oesophagus. The pharynx acts as a passageway for food from the mouth to the oesophagus, and as an air passage from the nasal cavity and mouth to the larynx. It also acts as a resonating chamber for the sounds produced in the larynx. —**pharyngeal** *adj.*

**The pharynx (longitudinal section).**

**PHE** *see* **PUBLIC HEALTH ENGLAND**.

**phenelzine** *n.* *see* **MAO INHIBITOR**.

**phenindione** *n.* an **\*anticoagulant** drug administered to prevent or treat thrombosis in the blood vessels of the heart and limbs. The main adverse effect is bleeding (*see* **WARFARIN**); other side-effects may include rashes and other allergic reactions.

**phenobarbital (phenobarbitone)** *n.* a **\*barbiturate** drug that has been used as an anticonvulsant in the treatment of epilepsy, but is no longer commonly prescribed. Side-effects may include drowsiness and skin sensitivity reactions, and dependence may result from continued use.

**phenol (carbolic acid)** *n.* a strong **\*disinfectant**. Derivatives of phenol (**phenolics**) may be used for disinfecting the skin before surgery. **Oily phenol** is administered by injection for **\*sclerotherapy** of haemorrhoids.

**phenothiazines** *pl. n.* a group of chemically related compounds with various pharmacological actions. Some (e.g. **\*chlorpromazine** and **\*trifluoperazine**) are **\*antipsychotic** drugs that are also effective antiemetics.

**phenotype** *n.* **1.** the observable characteristics of an individual, which result from interaction between the genes he possesses (**\*genotype**) and the environment. **2.** the expression in a person or on a cell of characteristics determined by genes that are not fully defined.

**phenoxybenzamine** *n.* a drug that dilates blood vessels (*see* **ALPHA BLOCKER**). It is used to reduce high blood pressure in patients with **\*phaeochromocytoma**. It may cause dizziness and fast heartbeat.

**phenoxymethylpenicillin (penicillin V)** *n.* *see* **PENICILLIN**.

**phentolamine** *n.* a drug that dilates blood vessels (*see* **ALPHA BLOCKER**) and is used to reduce high blood pressure in patients with **\*phaeochromocytoma**. Side-effects include fast heartbeat and digestive upsets.

**phenylalanine** *n.* an **\*essential amino acid** that is readily converted to tyrosine. Blockade of this metabolic pathway gives rise to **\*phenylketonuria**, which is associated with abnormally large amounts of phenylalanine and phenylpyruvic acid in the blood and retarded mental development.

**phenylephrine** *n.* a drug that constricts blood vessels (*see* SYMPATHOMIMETIC) and may be given to increase blood pressure in the emergency treatment of hypotension. It is also administered in eye drops as a *\*mydriatic*; irritation may occur when applied.

**phenylketonuria** *n.* an inherited defect of protein metabolism (*see* INBORN ERROR OF METABOLISM) causing an excess of the amino acid phenylalanine in the blood, which damages the nervous system and leads to severe learning disabilities. Screening of newborn infants by testing a blood sample for phenylalanine (*see* GUTHRIE TEST) enables the condition to be detected soon enough for dietary treatment to prevent any brain damage: the baby's diet contains proteins from which phenylalanine has been removed. The gene responsible for phenylketonuria is recessive, so that a child is affected only if both parents are carriers of the defective gene.

**phenylthiocarbamide (PTC)** *n.* a substance that tastes bitter to some individuals but is tasteless to others. Response to PTC appears to be controlled by a single pair of genes (*\*alleles*): ability to taste PTC is *\*dominant* to the inability to taste it.

**phenytoin** *n.* an *\*anticonvulsant* drug used to control tonic-clonic and partial epileptic seizures and status epilepticus. Side-effects include nausea and vomiting, confusion, dizziness, headache, tremor, insomnia, and (more rarely) gum hypertrophy, hirsutism, and skin rashes. Overdosage causes unsteadiness and slurred speech.

**phial** *n.* a small glass bottle for storing medicines or poisons.

**Philadelphia chromosome** an abnormal form of chromosome 22 that has a foreshortened long arm due to a reciprocal *\*translocation* with chromosome 9. It is most commonly seen in the marrow cells of patients with chronic *\*myeloid leukaemia*.

**-philia** *combining form denoting* morbid craving or attraction. Example: **nyctophilia** (for darkness).

**phimosis** *n.* narrowing of the opening of the foreskin, which cannot therefore be drawn back over the underlying glans penis. Physiological phimosis is present at birth and is due to congenital adhesions between the foreskin and

glans. Nearly all cases resolve by puberty. Pathological phimosis is usually caused by BXO (see [BALANITIS](#)) and can predispose to inflammation (see also [BALANOPOSTHITIS](#)), which results in further narrowing. Treatment is by surgical removal of the foreskin ([\\*circumcision](#)).

**phleb-** (**phlebo-**) *combining form denoting a vein or veins.* Example: **phlebectopia** (abnormal position of).

**phlebectomy** *n.* the surgical removal of a vein (or part of a vein), sometimes performed for the treatment of varicose veins in the legs (**varicectomy**).

**phlebitis** *n.* inflammation of the wall of a vein, which is most commonly seen in the legs as a complication of [\\*varicose veins](#). A segment of vein becomes painful and tender and the surrounding skin feels hot and appears red. Thrombosis commonly develops (see [THROMBOPHLEBITIS](#)). Treatment consists of elastic support together with drugs, such as NSAIDs, to relieve the inflammation and pain. Anticoagulants are not used (*compare* [PHLEBOTHROMBOSIS](#)). Phlebitis may also complicate sepsis (see [PYLEPHLEBITIS](#)) or cancer, especially of the stomach, bronchus, or pancreas. In pancreatic cancer the phlebitis may affect a variety of veins (**thrombophlebitis migrans**).

**phlebography** *n.* see [VENOGRAPHY](#).

**phlebolith** *n.* a stone-like structure, usually found incidentally on abdominal X-ray, that results from deposition of calcium in a venous blood clot. It appears as a small round white opacity in the pelvic region. It does not produce symptoms and requires no treatment.

**phlebosclerosis** (**venosclerosis**) *n.* a rare degenerative condition, of unknown cause, that affects the leg veins of young men. The vein walls become thickened and feel like cords under the skin. It is not related to arteriosclerosis and needs no treatment.

**phlebothrombosis** *n.* obstruction of a vein by a blood clot, without preceding inflammation of its wall. It is most common within the deep veins of the calf of the leg – **deep vein thrombosis** (DVT) – in contrast to [\\*thrombophlebitis](#), which affects superficial leg veins. Prolonged immobility, heart failure, pregnancy, injury, and surgery predispose to thrombosis by encouraging

sluggish blood flow. Many of these conditions are associated with changes in the clotting factors in the blood that increase the tendency to thrombosis; these changes also occur in some women taking oral contraceptives.

The affected leg may become swollen and tender. The main danger is that the clot may become detached and give rise to *\*pulmonary embolism*. Regular leg exercises help to prevent deep vein thrombosis, and anticoagulant drugs (such as heparin and warfarin) are used in prevention and treatment. Large clots may be removed surgically in the operation of **thrombectomy** to relieve leg swelling.

**Phlebotomus** *n.* see *SANDFLY*.

**phlebotomy (venesection)** *n.* the surgical opening or puncture of a vein in order to remove blood (e.g. in the treatment of *\*polycythaemia*) or to infuse fluids, blood, or drugs in the treatment of many conditions. It may also be required for cardiac *\*catheterization*. A **phlebotomist** is a clinical support worker or assistant health-care scientist who collects blood from patients for diagnostic laboratory testing.

**phlegm** *n.* a nonmedical term for *\*sputum*.

**phlegmon** *n.* *Archaic.* inflammation of connective tissue, leading to ulceration.

**phlycten** *n.* a small pinkish-yellow nodule surrounded by a zone of dilated blood vessels that occurs in the conjunctiva or in the cornea. It develops into a small ulcer that heals without trace in the conjunctiva but produces some residual scarring in the cornea. Phlyctens, which are prone to recur, are thought to be due to a type of allergy to certain bacteria.

**phobia** *n.* a pathologically strong *\*fear* of a particular event or thing. Avoiding the feared situation may severely restrict one's life and cause much suffering. The main kinds of phobia are **specific phobias** (isolated fears of particular things, such as sharp knives), *\*agoraphobia*, *\*claustrophobia*, **social phobias** of encountering people, and **animal phobias**, as of spiders, rats, or dogs (*see also* *PREPAREDNESS*). Treatment is with *\*cognitive behavioural therapy*, *\*desensitization*, *\*graded self-exposure*, or *\*flooding*. Antidepressants are also useful.

**-phobia** *combining form denoting morbid fear or dread.*

**phocomelia** *n.* congenital absence of the upper arm and/or upper leg, the hands or feet or both being attached to the trunk by a short stump. The condition is extremely rare except as a side-effect of the drug **\*thalidomide** taken during early pregnancy.

**pholcodine** *n.* a drug that suppresses coughs and reduces irritation in the respiratory system (*see* **ANTITUSSIVE**). It sometimes causes nausea and drowsiness.

**phon** *n.* a unit of loudness of sound. The intensity of a sound to be measured is compared by the human ear to a reference tone of  $2 \times 10^{-5}$  pascal sound pressure and 1000 hertz frequency. The intensity of the reference tone is increased until it appears to be equal in loudness to the sound being measured; the loudness of this sound in phons is then equal to the number of decibels by which the reference tone has had to be increased.

**phon-** (**phono-**) *combining form denoting* sound or voice.

**phonasthenia** *n.* weakness of the voice, especially when due to fatigue.

**phonation** *n.* the production of vocal sounds, particularly speech.

**phoniatics** *n.* the study of the voice and its disorders.

**phonocardiogram** *n.* *see* **ELECTROCARDIOPHONOGRAPHY**. —

**phonocardiography** *n.*

**phonophobia** *n.* excessive sensitivity to and fear of certain specific sounds irrespective of the level of the sound. *See* **HYPERACUSIS**; **MISOPHONIA**.

**phonosurgery** *n.* surgery performed on the larynx externally or endoscopically to improve or modify the quality of the voice.

**-phoria** *combining form denoting* (in ophthalmology) an abnormal deviation of the eyes or turning of the visual axis. Example: **heterophoria** (tendency to squint).

**Phormia** *n.* a genus of non-bloodsucking flies, commonly known as blowflies. The maggot of *P. regina* normally breeds in decaying meat but it has occasionally been found in suppurating wounds, giving rise to a type of **\*myiasis**.

**phosgene** *n.* a poisonous gas developed during World War I. It is a choking agent, acting on the lungs to produce **\*oedema**, with consequent respiratory and cardiac failure.

**phosphagen** *n.* creatine phosphate (*see* **CREATINE**).

**phosphataemia** *n.* the presence of phosphates in the blood. Sodium, calcium, potassium, and magnesium phosphates are normal constituents.

**phosphatase** *n.* one of a group of enzymes capable of catalysing the hydrolysis of phosphoric acid esters. An example is glucose-6-phosphatase, which catalyses the hydrolysis of glucose-6-phosphate to glucose and phosphate. Phosphatases are important in the absorption and metabolism of carbohydrates, nucleotides, and phospholipids and are essential in the calcification of bone. **Acid phosphatase** is present in kidney, semen, serum, and the prostate gland. **Alkaline phosphatase** occurs in teeth, developing bone, plasma, kidney, and intestine.

**phosphatidylcholine** *n.* *see* **LECITHIN**.

**phosphatidylserine** *n.* a cephalin-like phospholipid containing the amino acid serine. It is found in brain tissue. *See also* **CEPHALIN**.

**phosphaturia (phosphuria)** *n.* the presence of an abnormally high concentration of phosphates in the urine, making it cloudy. The condition may be associated with the formation of stones (calculi) in the kidneys or bladder.

**phosphocreatine** *n.* creatine phosphate (*see* **CREATINE**).

**phosphofructokinase** *n.* an enzyme that catalyses the conversion of fructose-6-phosphate to fructose-1,6-diphosphate. This is an important reaction occurring during the process of **\*glycolysis**.

**phospholipid** *n.* a **\*lipid** containing a phosphate group as part of the molecule. Phospholipids are constituents of all tissues and organs, especially the brain. They are synthesized in the liver and small intestine and are involved in many of the body's metabolic processes. Examples of phospholipids are **\*cephalins**, **\*lecithins**, sphingolipids, plasmalogens, and phosphatidylserine.

**phosphonecrosis** *n.* the destruction of tissues caused by excessive amounts of phosphorus in the system. The tissues likely to suffer in phosphorus poisoning are the liver, kidneys, muscles, bones, and the cardiovascular system.

**phosphorus** *n.* a nonmetallic element. Phosphorus compounds are major constituents in the tissues of both plants and animals. In humans, phosphorus is mostly concentrated in **\*bone**. However, certain phosphorus-containing compounds – for example adenosine triphosphate (**\*ATP**) and **\*creatine phosphate** – play an important part in energy conversions and storage in the body. In a pure state, phosphorus is toxic. Symbol: P.

**phosphorylase** *n.* any enzyme that catalyses the combination of an organic molecule (usually glucose) with a phosphate group (phosphorylation). Phosphorylase is found in the liver and kidney, where it is involved in the breakdown of glycogen to glucose-1-phosphate.

**phot-** (**photo-**) *combining form denoting light.*

**photalgia** *n.* pain in the eye caused by very bright light.

**photoablation** *n.* the use of light or lasers to destroy tissue.

**photochemotherapy** *n.* see **PHOTODYNAMIC THERAPY**; **PUVA**.

**photocoagulation** *n.* the destruction of tissue by heat released from the absorption of light shone on it. In eye disorders the technique is used to destroy diseased retinal tissue, occurring, for example, as a complication of diabetes (diabetic **\*retinopathy**) and **\*macular degeneration**; and to produce scarring between the retina and choroid, thus binding them together, in cases of **\*retinal detachment**. Photocoagulation of the retina is usually done with an **\*argon** or **\*diode laser**.

Photocoagulation is also a method of arresting bleeding by causing coagulation, usually using an infrared light source.

**photodermatitis** *n.* any of various skin diseases caused by exposure to light of varying wavelength (see **PHOTOSENSITIVITY**). The facial prominences and the ‘V’ of the neck are most commonly affected, the shadow areas behind the ears and below the chin being protected. A common photodermatitis is **polymorphous light eruption**, which affects 10% of the population. It

appears with the first sunshine of spring and abates by late summer. The photodermatoses include certain *\*porphyrias*, notably porphyria cutanea tarda.

**photodynamic diagnosis** a technique for improving the sensitivity and specificity of bladder cancer diagnosis at cystoscopy using a light-sensitive agent. This agent is instilled into the bladder, taken up by the epithelial cells, and converted into a porphyrin that accumulates only in malignant and premalignant cells. It fluoresces under light of a specific wavelength and is thus highlighted against normal bladder mucosa.

**photodynamic therapy (PDT, photoradiation therapy, phototherapy, photochemotherapy) 1.** a treatment for some types of superficial cancers. A light-sensitive agent (**porfimer sodium** [Photofrin] or **temoporphin** [Foscan]) is injected into the bloodstream and remains in cancer cells for a longer time than in normal cells. Exposure to laser radiation produces an active form of oxygen that destroys the treated cancer cells. The laser radiation can be directed through a fiberoptic bronchoscope into the airways, through a gastroscope into the oesophagus, or through a cystoscope into the bladder. PDT causes minimal damage to healthy tissue, but as it cannot pass through more than about 3 cm of tissue, it is restricted to treating tumours on or just under the skin or on the lining of internal organs. Photodynamic therapy makes the skin and eyes sensitive to light for six weeks or more after treatment. **2.** a treatment for wet age-related *\*macular degeneration* that involves the intravenous injection of a light-sensitive agent (verteporfin, Visudyne) which passes to the abnormal leaking blood vessels in the retina. The agent is activated when a cold laser light is directed at the macula, sealing the abnormal vessels and thus preventing further leakage and macular damage. The effect is to limit visual loss and stabilize vision.

**photomicrograph** *n.* an enlarged photographic record of an object taken through an optical or electron microscope. *Compare* **MICROPHOTOGRAPH**.

**photomultiplier tube** an electronic device that magnifies the light emitted from a *\*scintillator* by accelerating electrons in a high-voltage field. The resulting signal can be used to display the scintillations on a TV screen. Such devices are commonly used in *\*gamma cameras*.

**photophobia** *n.* discomfort caused by exposure to light. In most cases the light simply aggravates already existing discomfort from eye disease; contraction of the eyelids and other reactions aimed at avoiding the light follow. Photophobia may be associated with dilation of the pupils as a result of eye drops or with migraine, measles, German measles, meningitis, iritis, or disruption of the sensitive corneal epithelium.

**photophthalmia** *n.* inflammation of the eye due to exposure to light. It is usually caused by the damaging effect of ultraviolet light on the cornea, for example in snow blindness or when lying under a sunbed.

**photopic** *adj.* relating to or describing conditions of bright illumination. For example, **photopic vision** is vision in bright light, in which the **\*cones** of the retina are responsible for visual sensation. —**photopia** *n.*

**photopsia** *n.* the sensation of flashes of light caused by mechanical stimulation of the retina of the eye, usually due to traction by the attached vitreous humour when the eye is moved.

**photoradiation** *n.* *see* **PHOTODYNAMIC THERAPY**.

**photorefractive keratectomy (PRK)** *see* **KERATECTOMY**.

**photoretinitis** *n.* damage to the retina of the eye caused by looking at the sun without adequate protection for the eyes. The retina may be burnt by the intense light focused on it; this affects the central part of the visual field, which may be permanently lost (**sun blindness**).

**photoselective vaporization of the prostate (PVP)** a technique to vaporize the prostate by means of a high-energy laser, used to relieve **\*lower urinary tract symptoms** due to benign prostatic hyperplasia (*see* **PROSTATE GLAND**). It is associated with less blood loss and a shorter hospital stay than a traditional TURP (*see* **RESECTION**), but can only be used on smaller prostates.

**photosensitivity** *n.* abnormal reaction of the skin to sunlight. This characterizes certain skin diseases (*see* **PHOTODERMATOSIS**). Photosensitivity reactions may also occur in those taking such drugs as thiazide diuretics, furosemide, amiodarone, and NSAIDs. In these cases the effect may resemble severe sunburn. —**photosensitive** *adj.*

**photosynthesis** *n.* the process whereby green plants and some bacteria manufacture carbohydrates from carbon dioxide and water, using energy absorbed from sunlight by the green pigment chlorophyll. In green plants this complex process may be summarized thus:

**phototaxis** *n.* movement of a cell or organism in response to a stimulus of light.

**phototherapeutic keratectomy** *see* **KERATECTOMY**.

**phototherapy** *n.* **1.** treatment that involves exposure to ultraviolet or infrared radiation. For example, ultraviolet B radiation is used for treating severe psoriasis. *See also* **PUVA**. **2.** *see* **PHOTODYNAMIC THERAPY**.

**phototoxicity** *n.* damage caused by prolonged exposure to light; for example, **retinal phototoxicity** is damage to the retina of the eye as a result of prolonged exposure to light.

**photuria** *n.* the excretion of phosphorescent urine, which glows in the dark, due to the presence of certain phosphorus-containing compounds derived from phosphates.

**PHQ-9 (Patient Health Questionnaire)** a screening tool designed to identify people who may suffer from depression. The instrument's nine questions are based on DSM diagnostic criteria for depression. Each item is scored by the patient from 0 (not at all) to 3 (nearly every day). A PHQ-9 score of  $\geq 10$  indicates a reasonably high likelihood of major depression. It has been validated for use in primary care, in which it is commonly used not only for screening depression but also for monitoring the progress of treatment.

**phren- (phreno-)** *combining form denoting* **1.** the mind or brain. **2.** the diaphragm. **3.** the phrenic nerve.

**-phrenia** *combining form denoting* a condition of the mind. Example: **hebephrenia** (schizophrenia affecting young adults).

**phrenic crush** **1.** damage to the phrenic nerve as a result of trauma. **2.** formerly, surgical crushing of a portion of the *\*phrenic nerve*. This paralyses the diaphragm on the side operated upon, which is then pushed upwards by the abdominal contents, thus pressing on the lung and partially collapsing it. This operation was formerly often combined with *\*pneumoperitoneum* in the treatment of pulmonary tuberculosis but is now obsolete.

**phrenic nerve** the nerve that supplies the muscles of the diaphragm. On each side it arises in the neck from the third, fourth, and fifth cervical spinal roots and passes downwards between the lungs and the heart to reach the diaphragm. Impulses through the nerves from the brain bring about the regular contractions of the diaphragm during breathing.

**phrenology** *n.* the study of the bumps on the outside of the skull in order to determine a person's character. It is based on the mistaken theory that the skull becomes modified over the different functional areas of the cortex of the brain.

**Phrygian cap** the normal radiological appearance of the tip of the gall bladder, seen in a minority of cholecystograms (*see* *CHOLECYSTOGRAPHY*). Its name is derived from its resemblance to the characteristic Balkan headgear.

**PHS** *see* *PUBLIC HEALTH SERVICE*.

**Phthirus** *n.* a widely distributed genus of lice. The crab (or pubic) louse, *P. pubis*, is a common parasite of humans that lives permanently attached to the body hair, particularly that of the pubic or perianal regions but also on the eyelashes and the hairs in the armpits. Crab lice are not known to transmit disease but their bites can irritate the skin (*see* *PEDICULOSIS*). An infestation may be acquired during sexual intercourse or from hairs left on clothing, towels, and lavatory seats.

**phthisis** *n.* **1.** any disease resulting in wasting of tissues. **Phthisis bulbi** is a shrunken eyeball that has lost its function due to disease or damage. **2.** a former name for pulmonary *\*tuberculosis*.

**phycomycosis** *n.* a disease caused by parasitic fungi of the genera *Rhizopus*, *Absidia*, and *Mucor*. The disease affects the sinuses, the central nervous system, the lungs, and the skin tissues. The fungi are able to grow within the

blood vessels of the lungs and nervous tissue, thus causing blood clots which cut off the blood supply (*see* **INFARCTION**). Treatment with the antibiotic **\*amphotericin** has proved effective.

**phylogenesis** *n.* the evolutionary history of a species or individual.

**physi- (physio-)** *combining form denoting* **1.** physiology. **2.** physical.

**physical** *adj.* (in medicine) relating to the body rather than to the mind. For example, a **physical sign** is one that a doctor can detect when examining a patient, such as abnormal dilation of the pupils or the absence of a knee-jerk reflex (*see also* **FUNCTIONAL DISORDER**; **ORGANIC DISORDER**).

**physical medicine** a medical specialty established by the Royal Society of Medicine in 1931. Initially the members pioneered clinics devoted to the diagnosis and management of rheumatic diseases, but later extended their interests to the **\*rehabilitation** of patients with physical disabilities ranging from asthma and hand injuries to back trouble and poliomyelitis. The term has caused confusion in recent years, with many doctors preferring the description **rheumatology and rehabilitation** for this specialist activity. Since 1972, however, when the Royal College of Physicians approved it, physical medicine has become the generally accepted term. *See also* **RHEUMATOLOGY**.

**physician** *n.* a registered medical practitioner who specializes in the diagnosis and treatment of disease by other than surgical means. In the USA the term is applied to any authorized medical practitioner. *See also* **DOCTOR**.

**physiological saline** *see* **SALINE**.

**physiological solution** one of a group of solutions used to maintain tissues in a viable state. These solutions contain specific concentrations of substances that are vital for normal tissue function (e.g. sodium, potassium, calcium, chloride, magnesium, bicarbonate, and phosphate ions, glucose, and oxygen). An example of such a solution is **\*Ringer's solution**.

**physiology** *n.* the science of the functioning of living organisms and of their component parts. —**physiological** *adj.* —**physiologist** *n.*

**physiotherapy** *n.* the branch of treatment that employs physical methods to promote healing, including the use of light, infrared and ultraviolet rays, heat, electric current, ultrasound, massage, manipulation, hydrotherapy, and remedial exercise.

**physis (growth plate)** a horizontal band of tissue located between the ends (**\*epiphyses**) of a long bone and the growing zone (**\*metaphysis**) of the shaft. It is composed of cartilaginous, bony, and fibrous components that combine to allow for longitudinal and latitudinal growth and remodelling of the developing bone (endochondral **\*ossification**). *See also* **SALTER-HARRIS CLASSIFICATION**.

**Physis.** Growth areas of a long bone.

**physo-** *combining form denoting air or gas.*

**phyt- (phyto-)** *combining form denoting plants; of plant origin.*

**phytochemical** *n.* one of a large group of non-nutritive compounds made by plants that have an effect on health. They include **\*antioxidants**, flavonoids, flavanols, flavanones, isoflavones, anthocyanins, carotenoids, polyphenols, phenolic acids, phyto-oestrogens, and others.

**phytohaemagglutinin (PHA)** *n.* a plant-derived alkaloid that stimulates T lymphocytes to divide in the test tube.

**phytomenadione** *n.* a form of **\*vitamin K** occurring naturally in green plants and synthesized for use as an antidote to overdosage with anticoagulant drugs and to prevent **\*haemorrhagic disease of the newborn**. It promotes the production of prothrombin, essential for the normal coagulation of blood.

**phytophotodermatitis** *n.* an eruption of linear blisters occurring after exposure to light in people who have been in contact with certain plants, such as wild parsnip or cow parsley, to which they are sensitive. A particularly dramatic reaction occurs with giant hogweed (*Heracleum mantegazzianum*). The skin often appears brown as the blisters resolve.

**phytotherapy** *n.* medical treatment based exclusively on plant extracts and products. Plants have provided a wide range of important drugs (**\*taxanes** among others) and current research into drugs from plants continues to be fruitful. However, it is essential that any drugs derived directly from plants should be extracted, purified, assayed, and tested before being used as medication. The use of crude plant extracts as medicines can be dangerous because seemingly identical samples of the same plant may contain widely differing amounts of the active ingredient.

**phytotoxin** *n.* any poisonous substance (toxin) produced by a plant, such as any of the toxins produced by fungi of the genus **\*Amanita**.

**pia (pia mater)** *n.* the innermost of the three **\*meninges** surrounding the brain and spinal cord. The membrane is closely attached to the surface of the brain and spinal cord, faithfully following each fissure and sulcus. It contains numerous finely branching blood vessels that supply the nerve tissue within. The subarachnoid space separates it from the arachnoid.

**pian** *n.* *see* **YAWS**.

**PICC line** peripherally inserted central catheter: a long flexible catheter usually inserted via a vein in the arm and the subclavian vein into the superior vena cava. It is used when prolonged intravenous access is required; for example, for infusional chemotherapy and **\*total parenteral nutrition** (TPN).

**Pick's disease** *see* **FRONTOTEMPORAL DEMENTIA**. [A. Pick (1851–1924), Czech psychiatrist]

**pico-** *prefix denoting one million-millionth ( $10^{-12}$ ).*

**picornavirus** *n.* one of a group of small RNA-containing viruses (pico = small; hence pico-RNA-virus). The group includes **\*Coxsackie viruses**, **\*polioviruses**, and **\*rhinoviruses**.

**picric acid (trinitrophenol)** a yellow crystalline solid used as a dye and as a tissue **\*fixative**.

**picture archiving and communication system** *see* **PACS**.

**PICU (psychiatric intensive care unit)** a unit especially designed for nursing the most acutely and severely mentally ill. PICUs are often locked wards with increased staffing levels. Usually patients stay on a PICU ward for the shortest possible period before being transferred to an open psychiatric ward.

**PID 1.** *see* **PELVIC INFLAMMATORY DISEASE**. **2.** *see* **PROLAPSED INTERVERTEBRAL DISC**.

**Pierre Robin syndrome** a congenital disease in which affected infants have a very small lower jawbone (mandible) and a cleft palate. They are susceptible to feeding and respiratory problems. [Pierre Robin (1867–1950), French dentist]

**piezoelectric** *adj.* denoting or relating to an electrically generated pulse or polarity that is caused by pressure.

**pigeon chest** forward protrusion of the breastbone resulting in deformity of the chest. The condition is painless and harmless. Medical name: **pectus carinatum**.

**pigeon toe** *see* **IN-TOE GAIT**.

**pigment** *n.* a substance giving colour. Physiologically important pigments include the blood pigments (especially **\*haemoglobin**), **\*bile pigments**, and retinal pigment (*see* **RHODOPSIN**). The pigment **\*melanin** occurs in the skin

and in the iris of the eye. Important plant pigments include *\*chlorophyll* and the *\*carotenoids*.

**pigmentation** *n.* coloration produced in the body by the deposition of one pigment, especially in excessive amounts. Pigmentation may be produced by natural pigments, such as bile pigments (as in jaundice) or melanin, or by foreign material, such as lead or arsenic in chronic poisoning.

**pigment epitheliopathy** an inflammatory disease of the retinal pigment epithelium (RPE; *see* *RETINA*). Acute posterior multifocal placoid pigment epitheliopathy (APMPPE) is characterized by the presence of multiple cream-coloured irregular lesions scattered in the posterior segment of the eye. The disease occurs in young adults and usually affects both eyes. Visual acuity usually recovers with time.

**pig-tail stents** *see* *STENT*.

**piles** *n. see* *HAEMORRHOIDS*.

**pili (fimbriae)** *pl. n. (sing. pilus, fimbria)* hairlike processes present on the surface of certain bacteria. They are thought to be involved in adhesion of bacteria to other cells and in transfer of DNA during *\*conjugation*.

**pill** *n.* **1.** a small ball of variable size, shape, and colour, sometimes coated with sugar, that contains one or more medicinal substances in solid form. It is taken by mouth. **2.** *see* *ORAL CONTRACEPTIVE*.

**pillar** *n.* (in anatomy) an elongated apparently supportive structure. For example, the **pillars of the fauces** are folds of mucous membrane on either side of the opening from the mouth to the pharynx.

**pilo-** *combining form denoting hair.* Example: **pilosis** (excessive development of).

**pilocarpine** *n.* a *\*parasympathomimetic* drug administered to reduce the pressure inside the eye in angle-closure *\*glaucoma* (*see* *MIOTIC*). It is also used to treat *\*dry mouth* and dry eyes; side-effects may include headache, frequent urination, and sweating.

**pilomatrixoma** *n.* a benign (noncancerous) skin tumour that typically occurs in the head and neck area, including the eyelids. The tumour usually does not

cause any symptoms and is commonest in children.

**pilomotor nerves** sympathetic nerves that supply muscle fibres in the skin, around the roots of hairs. Activity of the sympathetic nervous system causes the muscles to contract, raising the hairs and giving the *\*gooseflesh* effect of fear or cold.

**pilonidal sinus** a short tract leading from an opening in the skin in or near the cleft at the top of the buttocks and containing hairs. The sinus may be recurrently infected, leading to pain and the discharge of pus. Treatment is by surgical opening and cleaning of the sinus.

**pilosebaceous** *adj.* relating to the hair follicles and their associated sebaceous glands.

**pilus** *n.* a hair. *See also* **PILI**.

**pimecrolimus** *n. see* **CALCINEURIN INHIBITORS**.

**pimel- (pimelo-)** *combining form denoting* fat; fatty.

**pimozide** *n.* an *\*antipsychotic* drug used to treat schizophrenia and some delusional disorders. It may cause serious disturbances of heart rhythm.

**pimple** *n.* a small inflamed swelling on the skin that contains pus. It may be the result of bacterial infection of a skin pore that has become obstructed with fatty secretions from the sebaceous glands. Pimples occurring in large numbers on the chest, back, and face are usually described as *\*acne*, a common condition of adolescence.

**PIN 1.** *see* **PROSTATIC INTRAEPITHELIAL NEOPLASIA**. **2.** *see* **PENILE INTRAEPITHELIAL NEOPLASIA**.

**pinard** *n.* an instrument used by midwives to auscultate the fetal heart. *See* **INTERMITTENT AUSCULTATION**.

**pincement** *n.* one of the techniques used in massage, in which pinches of the patient's flesh are taken between finger and thumb and twisted or rolled before release. This is said to improve the tone of the skin, improve circulation, and alleviate underlying pain.

**pineal gland (pineal body)** a pea-sized mass of nerve tissue attached by a stalk to the posterior wall of the third ventricle of the brain, deep between the cerebral hemispheres at the back of the skull. It secretes the hormone **\*melatonin**. The gland becomes calcified as age progresses, providing a useful landmark in X-rays of the skull. Anatomical name: **epiphysis**.

**pinguecula** *n.* a degenerative change in the conjunctiva of the eye, seen most commonly in the elderly and in those who live in hot dry climates. Thickened yellow triangles develop on the conjunctiva at the inner and outer margins of the cornea.

**pink disease** a severe illness of children of the teething age, marked by pink cold clammy hands and feet, heavy sweating, raised blood pressure, rapid pulse, photophobia, loss of appetite, and insomnia. Affected infants are very prone to secondary infection, which may be fatal. It has been suggested that the condition is an allergic reaction to mercury, since it used to occur when teething powders, lotions, and ointments containing mercury were used. Although there is no definite proof of this, the disease has virtually disappeared since all mercury-containing paediatric preparations have been banned. Medical names: **acrodynia, erythroedema, erythromelalgia**.

**pink eye** *see* **CONJUNCTIVITIS**.

**pink puffer** the typical appearance of a patient with chronic obstructive pulmonary disease, who is breathless and flushed. *See also* **BLUE BLOATER**.

**pinna (auricle)** *n.* the flap of skin and cartilage that projects from the head at the exterior opening of the external auditory meatus of the **\*ear** (see illustration). In humans the pinna is largely vestigial but it may be partly concerned with detecting the direction of sound sources.

**The pinna.**

**pinnaplasty** *n.* *see* **OTOPLASTY**.

**pinocytosis** *n.* the intake of small droplets of fluid by a cell by cytoplasmic engulfment. It occurs in many white blood cells and in certain kidney and liver cells. *Compare* **PHAGOCYTOSIS**.

**pins and needles** *see* **PARAESTHESIA**.

**pinta** *n.* a skin disease, prevalent in tropical America, that is caused by the spirochaete *\*Treponema carateum*. The disease is thought to be transmitted either by direct contact between individuals or by flies that carry the infective spirochaetes on their bodies. Symptoms include thickening and eventual loss of pigment of the skin, particularly on the hands, wrists, feet, and ankles. Pinta is treated with penicillin G.

**pinworm** *n.* *see* **THREADWORM**.

**pioglitazone** *n.* *see* **THIAZOLIDINEDIONES**.

**pipelle** *n.* a disposable flexible plastic endometrial sampling device consisting of an inner plunger and a 3-mm outer sheath, which is inserted through the cervix into the endometrial cavity to obtain a blind endometrial biopsy by gentle suction.

**PI-RADS** Prostate Imaging Reporting and Data System: *see* **BI-RADS**.

**pirfenidone** *n.* a drug with antifibrotic and anti-inflammatory properties that is used to treat **\*idiopathic pulmonary fibrosis**. It is thought to reduce fibroblast proliferation, inhibit **\*transforming growth factor- $\beta$** -stimulated collagen production, and reduce the production of fibrogenic mediators. Pirfenidone has also been shown to reduce production of inflammatory mediators, such as **\*tumour necrosis factor** and interleukin 1 (IL-1). Side effects include gastrointestinal upsets.

**piriform fossae** two pear-shaped depressions that lie on either side of the opening to the larynx.

**piroxicam** *n.* a nonsteroidal anti-inflammatory drug (*see* **NSAID**) used to relieve pain and stiffness in osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis. Side-effects, which can be severe, include skin rash and gastrointestinal symptoms.

**pisiform bone** the smallest bone of the wrist (**\*carpus**): a pea-shaped bone that articulates with the triquetral bone and, indirectly by cartilage, with the ulna.

**pit** *n.* (in anatomy) a hollow or depression, such as any of the depressions on the surface of an embryo marking the site of future organs.

**pithing** *n.* the laboratory procedure in which a part or the whole of the central nervous system of an experimental animal (such as a frog) is destroyed, usually by inserting a probe through the foramen magnum, in preparation for physiological or pharmacological experiments.

**pitting** *n.* the formation of depressed scars, as occurs on the skin following acne or (formerly) smallpox. **Pitting oedema** is swelling of the tissues due to excess fluid in which fingertip pressure leaves temporary indentations in the skin.

**pituicyte** *n.* a type of cell found in the posterior lobe of the pituitary gland, similar in appearance to an **\*astrocyte**, with numerous fine branches that end in contact with the lining membrane of the blood channels in the gland.

**pituitary apoplexy** acute intrapituitary haemorrhage, usually into an existing tumour, presenting as severe headache and collapse. It is a medical emergency. Due to the sudden expansion in size of the gland with the

haemorrhage, it is accompanied by lesions of the cranial nerves running close to the pituitary gland, causing paralysis of the muscles of the orbit and occasionally the face. Anterior pituitary insufficiency usually results, but posterior pituitary function survives. Surprisingly, pituitary function usually recovers.

**pituitary gland (hypophysis)** the master endocrine gland: a pea-sized body attached beneath the **\*hypothalamus** in a bony cavity at the base of the skull. It has an anterior lobe (**adenohypophysis**), which secretes **\*thyroid-stimulating hormone**, **\*ACTH** (adrenocorticotrophic hormone), the **\*gonadotrophins**, **\*growth hormone**, **\*prolactin**, **\*lipotrophin**, and **\*melanocyte-stimulating hormone**. The secretion of all these hormones is regulated by specific **releasing hormones**, which are produced in the hypothalamus (*see also* **CORTICOTROPHIN-RELEASING HORMONE**; **GONADOTROPHIN-RELEASING HORMONE**; **THYROTROPHIN-RELEASING HORMONE**). The posterior lobe (**neurohypophysis**) secretes **\*vasopressin** and **\*oxytocin**, which are synthesized in the hypothalamus and transported to the pituitary, where they are stored before release.

**pityriasis** *n.* (originally) any of a group of skin diseases typified by the development of fine branlike scales. The term is now used only with a modifying adjective. **Pityriasis alba** is a common condition in children in which pale scaly patches occur on the face; it is related to atopic **\*eczema**. **Pityriasis rosea** is a common skin rash, believed to be viral in origin, typically starting with a single patch (a **herald patch**) on the trunk and followed by an eruption of oval pink scaly **\*macules**. The spots are often aligned along the ribs. The rash usually clears completely in about eight weeks. **Pityriasis versicolor** is a common chronic infection of the skin caused by the yeast *Malassezia furfur*, which produces a persistent pale or brown scaly rash on the trunk. Treatment with **\*selenium sulphide** shampoo or with oral itraconazole readily kills the organism but the skin may take months to regain its normal colour. *See also* **DANDRUFF**.

**Pityrosporum** *n.* *see* **MALASSEZIA**.

**pivmecillinam** *n.* a **\*penicillin**-type antibiotic used mainly to treat urinary-tract infections caused by many Gram-negative bacteria. Possible side-effects include allergic reactions, nausea, and vomiting.

**pivot joint** *see* TROCHOID JOINT.

**pixel** *n.* short for ‘picture element’, the smallest individual component of an electronically produced image. Numerical values are ascribed to each pixel, which describe its position and relative intensity and/or colour. A two-dimensional **\*matrix** of pixels produces the final image.

**pizotifen** *n.* an antihistamine drug used to prevent severe migraine and cluster headaches. It acts by inhibiting the effects of **\*serotonin**. Possible side-effects include dizziness, drowsiness, and weight gain.

**placebo** *n.* a medicine that is ineffective but may help to relieve a condition because the patient has faith in its powers. New drugs are tested against placebos in clinical trials: the drug’s effect is compared with the **placebo response**, which occurs even in the absence of any pharmacologically active substance in the placebo. Use of placebos in treatment is controversial, with some believing that such treatment compromises the patient’s **\*autonomy** and compromises the virtue of honesty, thereby potentially undermining the doctor–patient relationship.

**placenta** *n.* an organ within the uterus by means of which the embryo is attached to the wall of the uterus. Its primary function is to provide the embryo with nourishment, eliminate its wastes, and exchange respiratory gases. This is accomplished by the close proximity of the maternal and fetal blood systems within the placenta. It also functions as a gland, secreting **\*human chorionic gonadotrophin**, **\*progesterone**, and oestrogens, which regulate the maintenance of pregnancy. *See also* AFTERBIRTH. —**placental** *adj.*

**placenta accreta** a condition in which the placenta is abnormally strongly attached to the wall of the uterus with superficial penetration of chorionic **\*villi** into the underlying **\*myometrium**. Women with **\*placenta praevia** and at least one previous Caesarean delivery are considered to be at high risk for placenta accreta. When placenta accreta is thought to be likely, consultant obstetric and anaesthetic input are vital in planning and conducting the delivery. Radiological input with temporary uterine balloon tamponade may be considered, and methotrexate has been used. The risk of haemorrhage, blood transfusion, and hysterectomy should be discussed. In **placenta increta** the chorionic villi extend into the myometrium; a **placenta percreta**

occurs where the chorionic villi penetrate through the myometrial wall and can invade the bladder. An emergency hysterectomy is usually necessary in these rare cases.

**placental abruption** *see* **ABRUPTIO PLACENTAE**.

**placenta praevia** a condition in which the placenta is situated wholly or partially in the lower and noncontractile part of the uterus. When this becomes elongated and stretched during the last few weeks of pregnancy, and the cervix becomes stretched either before or during labour, placental separation and haemorrhage will occur. The cause is not known. In the more severe degrees of placenta praevia, where the placenta is situated entirely before the presenting part of the fetus, delivery must be by Caesarean section. In lesser degrees of placenta praevia, vaginal delivery may be considered.

**placentography (sonoplacentography)** *n.* imaging of the pregnant uterus by ultrasonography in order to determine the position of the placenta.

**placode** *n.* any of the thickened areas of ectoderm in the embryo that will develop into nerve ganglia or the special sensory structures of the eye, ear, or nose.

**plagiocephaly** *n.* any distortion or lack of symmetry in the shape of the head, usually due to irregularity in the closure of the sutures between the bones of the skull.

**plague** *n.* **1.** any epidemic disease with a high death rate. **2.** an acute epidemic disease of rats and other wild rodents caused by the bacterium *Yersinia pestis*, which is transmitted to humans by rat fleas. **Bubonic plague**, the most common form of the disease, has an incubation period of 2–6 days. Headache, fever, weakness, aching limbs, and delirium develop and are followed by acute painful swellings of the lymph nodes (*see* **BUBO**). In favourable cases the buboes burst after about a week, releasing pus, and then heal. In other cases bleeding under the skin, producing black patches, can lead to ulcers, which may prove fatal (hence the former name **Black Death**). In the most serious cases bacteria enter the bloodstream (**septicaemic plague**) or lungs (**pneumonic plague**); if untreated, these are nearly always fatal. Treatment with tetracycline, streptomycin, and chloramphenicol is effective; vaccination against the disease provides only partial protection.

**plane** *n.* a level or smooth surface, especially any of the imaginary flat surfaces – orientated in various directions – used to divide the body; for example, the **\*coronal** and **\*sagittal** planes.

**planoconcave** *adj.* describing a structure, such as a lens, that is flat on one side and concave on the other.

**planoconvex** *adj.* describing a structure, such as a lens, that is flat on one side and convex on the other.

**plantar** *adj.* relating to the sole of the foot (**planta**). *See also* **FLEXION**.

**plantar arch** the arch in the sole of the foot formed by anastomosing branches of the plantar arteries.

**plantar fasciitis (policeman's heel)** inflammation of the point of attachment of the **\*fascia** in the sole of the foot to the calcaneus (heel bone), causing pain and localized tenderness of the heel. Treatments include heel pads, anti-inflammatory medication, steroid injections, or surgery. The inflammation takes 6–12 months to subside.

**plantar reflex** a reflex obtained by drawing a bluntly pointed object (such as a key) along the outer border of the sole of the foot from the heel to the little toe. The normal **flexor response** is a bunching and downward movement of the toes. An upward movement of the big toe is called an **extensor response** (or **Babinski reflex** or **response**). In all persons over the age of 18 months this is a sensitive indication of damage to the **\*pyramidal system** in either the brain or spinal cord.

**plantar wart** a **\*wart** occurring on the sole of the foot.

**plantigrade** *adj.* walking on the entire sole of the foot: a habit of humans, bears, and some other animals.

**plaque** *n.* **1.** a layer that forms on the surface of a tooth, principally at its neck, composed of bacteria in an organic matrix (**\*biofilm**). Under certain conditions the plaque may cause **\*gingivitis**, **\*periodontal disease**, or **\*dental caries**. The purpose of oral hygiene is to remove plaque. **2.** a raised patch on the skin, formed by **\*papules** enlarging or coalescing to form an area 2 cm or more across. **3.** a deposit, consisting of a fatty core covered with a fibrous cap, that develops on the inner wall of an artery in atherosclerosis (*see*

**ATHEROMA**). **4.** any flat and often raised patch, for example on mucous membrane, resulting from local damage.

**-plasia** *combining form denoting formation; development.* Example: **hyperplasia** (excessive tissue formation).

**plasm- (plasmo-)** *combining form denoting* **1.** blood plasma. **2.** protoplasm or cytoplasm.

**plasma (blood plasma)** *n.* the straw-coloured fluid in which the blood cells are suspended. It consists of a solution of various inorganic salts of sodium, potassium, calcium, etc., with a high concentration of protein (approximately 70 g/l) and a variety of trace substances.

**plasma cells** antibody-producing cells found in blood-forming tissue and also in the epithelium of the lungs and gut. They develop in the bone marrow, lymph nodes, and spleen when antigens stimulate B **\*lymphocytes** to produce the precursor cells that give rise to them. Malignant proliferation of plasma cells results in either a **\*plasmacytoma** or multiple **\*myeloma**.

**plasma coagulation** a type of **\*electrocoagulation** used to arrest haemorrhage or destroy abnormal tissue. A stream of inert gas, such as argon or helium, is ionized, thereby carrying electrical energy to adjacent tissue; there is no physical contact between the plasma coagulation apparatus and the tissue.

**plasmacytoma** *n.* a malignant tumour of plasma cells, often known as a 'solitary myeloma'. Although usually occurring as a single tumour in bone marrow or more rarely soft tissue (**extramedullary plasmacytoma**), it may be multiple, in which case it is classified as a multiple myeloma. All of these tumours may produce the abnormal gammaglobulins that are characteristic of myeloma, and they may progress to widespread myeloma. The soft-tissue tumours often respond to radiotherapy and to such drugs as thalidomide and cyclophosphamide; the bone tumours are typically less responsive.

**plasmalogen** *n.* a phospholipid, found in brain and muscle, similar in structure to **\*lecithin** and **\*cephalin**.

**plasmapheresis** *n.* a procedure for removing a quantity of plasma from the blood. Blood is withdrawn through a vein from the patient and passed

through a machine (a cell separator). Plasma is removed and the rest of the blood is returned to the patient through another vein.

**plasmin (fibrinolysin)** *n.* an enzyme that digests the protein fibrin. Its function is the dissolution of blood clots (*see* **FIBRINOLYSIS**). Plasmin is not normally present in the blood but exists as an inactive precursor, **plasminogen**.

**plasminogen** *n.* a substance normally present in the blood plasma that may be activated to form **\*plasmin**. *See* **FIBRINOLYSIS**; **PLASMINOGEN ACTIVATORS**.

**plasminogen activators** enzymes that convert the inactive substance **\*plasminogen** to the active enzyme **\*plasmin**, which digests blood clots (*see* **FIBRINOLYSIS**). There are two types of plasminogen activators, **\*tissue-type plasminogen activator** (tPA) and urokinase-like plasminogen activator (uPA). *See* **BLOOD COAGULATION**.

**plasmoditrophoblast** *n.* *see* **TROPHOBLAST**.

**Plasmodium** *n.* a genus of protozoans (*see* **SPOROZOA**) that live as parasites within human red blood cells and liver cells. The parasite undergoes its asexual development (*see* **SCHIZOGONY**) in humans and completes the sexual phase of its development (*see* **SPOROLOGY**) in the stomach and digestive glands of a bloodsucking **\*Anopheles** mosquito. Four species cause **\*malaria**: *P. vivax*, *P. ovale*, *P. falciparum*, and *P. malariae*.

**plasmolysis** *n.* a process occurring in bacteria and plants in which the protoplasm shrinks away from the rigid cell wall when the cell is placed in a **\*hypertonic** solution. Plasmolysis is due to withdrawal of water from the cell by **\*osmosis**.

**plaster** *n.* adhesive tape used in shaped pieces or as a bandage to keep a dressing in place.

**plaster model** (in dentistry) an accurate positive cast of the teeth and jaws made from modified plaster of Paris. A pair of models are used to study the dentition, particularly before treatment. Models are also used to construct dentures, orthodontic appliances, and such restorations as crowns.

**plaster of Paris** a preparation of gypsum (calcium sulphate) that sets hard when water is added. It is used in various modified forms in dentistry to make *\*plaster models*. It is also used in orthopaedics for preparing plaster *\*casts*.

**Plastibell device** a plastic device that facilitates *\*circumcision* while protecting the glans penis. It is widely used for circumcisions in newborn boys.

**plastic lymph** a transparent yellowish liquid produced in a wound or other site of inflammation, in which connective tissue cells and blood vessels develop during healing.

**plastic surgery** a branch of surgery dealing with the reconstruction of deformed or damaged parts of the body. It also includes the replacement of parts of the body that have been lost. If performed simply to improve appearances plastic surgery is called **cosmetic surgery** (or **aesthetic plastic surgery**), but most plastic surgery involves the treatment and repair of disfigurement and disability caused by burns, major accidents, and cancer and the correction of congenital defects, such as cleft lip and cleft palate.

**plastron** *n.* the breastbone (*\*sternum*) together with the costal cartilages attached to it.

**-plasty** *combining form denoting plastic surgery.* Example: **labioplasty** (of the lips).

**platelet (thrombocyte)** *n.* a disc-shaped cell structure, 1–2  $\mu\text{m}$  in diameter, that is present in the blood. With *\*Romanowsky stains* platelets appear as fragments of pale-blue cytoplasm with a few red granules. They have several functions, all relating to the arrest of bleeding (*see* **BLOOD COAGULATION**; **PLATELET ACTIVATION**). There are normally  $150\text{--}400 \times 10^9$  platelets per litre of blood. *See also* **THROMBOPOIESIS**.

**platelet activation** the process whereby platelets adhere to collagen released from endothelial cells in damaged blood vessels and aggregate to form a plug. An important metabolic pathway in platelets converts membrane phospholipids to *\*thromboxane A<sub>2</sub>* (TXA<sub>2</sub>), which can activate platelets. ADP, released from platelet granules, and *\*thrombin* are other activators.

The adhesive and aggregation reactions of platelets are mediated through surface membrane glycoproteins (Glp), Glp Ib and Glp IIb/IIIa. Aspirin acts as an *\*antiplatelet drug* by irreversibly inhibiting one of the enzymes of this pathway, cyclo-oxygenase. Clopidogrel inhibits the ADP receptor on platelet membranes, and *\*abciximab* blocks platelet aggregation by inhibiting Glp IIb/IIIa (see illustration overleaf).

**Platelet activation.** The stages of the process and sites of action of antiplatelet drugs.

**platelet-derived growth factor (PDGF)** *see* **GROWTH FACTOR**.

**platy-** *combining form denoting broad or flat.*

**platyhelminth** *n. see* **FLATWORM**.

**platysma** *n.* a broad thin sheet of muscle that extends from below the collar bone to the angle of the jaw. It depresses the jaw.

**pledget** *n.* a small wad of dressing material, such as lint, used either to cover a wound or sore or as a plug. It is also used during operations, mounted on an instrument, to wipe away blood or other fluids.

**-plegia** *combining form denoting paralysis.* Example: **hemiplegia** (of one side of the body).

**pleio- (pleo-)** *combining form denoting* **1.** multiple. **2.** excessive.

**pleiotropy** *n.* a situation in which a single gene is responsible for more than one effect in the **\*phenotype**. The mutation of such a gene will therefore have multiple effects. —**pleiotropic** *adj.*

**pleocytosis** *n.* the presence of an abnormally large number of lymphocytes in the cerebrospinal fluid, which bathes the brain and spinal cord.

**pleomastia (polymastia)** *n.* multiple breasts or nipples. These are usually symmetrically arranged along a line between the mid point of the collar bone and the pelvis (the nipple line).

**pleomorphism** *n.* **1.** the condition in which an individual assumes a number of different forms during its life cycle. The malarial parasite (*Plasmodium*) displays pleomorphism. **2.** a feature of malignant neoplastic cells, which show a marked variation in the shapes of individual cells and cell nuclei.

**pleoptics** *n.* special techniques practised by orthoptists (*see* **ORTHOPTICS**) for developing normal function of the macula (the most sensitive part of the retina), in people whose macular function has previously been disturbed because of strabismus (squint).

**plerocercoid** *n.* a larval stage of certain tapeworms, such as **\*Diphyllbothrium latum**. It differs from the **\*cysticercus** (another larval form) in being solid and in lacking a cyst or bladder.

**plessimeter (pleximeter)** *n.* a small plate of bone, ivory, or other material pressed against the surface of the body and struck with a **\*plessor** in the technique of **\*percussion**.

**plessor (plexor)** *n.* a small hammer used to investigate nervous reflexes and in the technique of **\*percussion**.

**plethora** *n.* any excess of any bodily fluid, especially blood (*see* **HYPERAEMIA**). —**plethoric** *adj.*

**plethysmography** *n.* the process of recording the changes in the volume of a limb caused by alterations in blood pressure. The limb is inserted into a fluid-filled watertight casing (**oncometer**) and the pressure variations in the fluid are recorded.

**pleur-** (**pleuro-**) *combining form denoting* **1.** the pleura. **2.** the side of the body.

**pleura** *n.* the covering of the lungs (**visceral pleura**) and of the inner surface of the chest wall (**parietal pleura**). (See illustration.) The covering consists of a closed sac of **\*serous membrane**, which has a smooth shiny moist surface due to the secretion of small amounts of fluid. This fluid lubricates the opposing visceral and parietal surfaces so that they can slide painlessly over each other during breathing. —**pleural** *adj.*

**The pleura.**

**pleural cavity** the space between the visceral and parietal **\*pleura**, which is normally very small as the pleural membranes are in close contact. The introduction of fluid (**pleural effusion**) or gas separates the pleural surfaces and increases the volume of the pleural space.

**pleurectomy** *n.* surgical removal of part of the **\*pleura**, which is sometimes done to prevent further recurrences of spontaneous **\*pneumothorax** or to remove diseased areas of pleura.

**pleurisy** *n.* inflammation of the **\*pleura**, often due to pneumonia in the underlying lung. The normally shiny and slippery pleural surfaces lose their sheen and become slightly sticky, so that there is pain on deep breathing and a characteristic ‘rub’ can be heard through a stethoscope. Pleurisy is always associated with some other disease in the lung, chest wall, diaphragm, or abdomen.

**pleurocele** *n.* herniation of the pleura. *See* **HERNIA**.

**pleurocentesis (thoracentesis, thoracocentesis)** *n.* the insertion of a hollow needle into the **\*pleural cavity** through the chest wall in order to withdraw fluid, blood, pus, or air.

**pleurodesis** *n.* the artificial production of pleurisy by chemical or mechanical means to obliterate the **\*pleural cavity**, in order to prevent recurrent, usually malignant, pleural effusions.

**pleurodynia** *n.* severe paroxysmal pain arising from the muscles between the ribs. It is often thought to be of rheumatic origin.

**pleurolysis (pneumolysis)** *n.* surgical stripping of the parietal **\*pleura** from the chest wall to allow the lung to collapse. The procedure was used to help tuberculosis to heal, before the advent of effective antituberculous drugs.

**pleuropneumonia** *n.* inflammation involving both the lung and pleura. *See* **PLEURISY**; **PNEUMONIA**.

**pleurotyphoid** *n.* **\*typhoid fever** involving the lungs.

**pleximeter** *n.* *see* **PLESSIMETER**.

**plexor** *n.* *see* **PLESSOR**.

**plexus** *n.* a network of nerves or blood vessels. *See* **BRACHIAL PLEXUS**.

**plica** *n.* a fold of tissue; for example, the **plica sublingualis**, the mucous fold in the floor of the mouth. —**plicate** *adj.*

**plication** *n.* a surgical technique in which the size of a hollow organ or weakened and stretched tissue is reduced by taking tucks or folds in the walls. The posterior wall of the inguinal canal can be plicated with sutures as part of a hernia repair.

**ploidy** *n.* the condition of having multiple the normal number of chromosomes for the species. An increase in ploidy in the cells of a malignant tumour usually indicates greater aggressiveness and ability to invade.

**plombage** *n.* **1.** a technique used in surgery for the correction of retinal detachment. A small piece of silicone plastic is sewn on the outside of the eyeball to produce an indentation over the retinal hole or tear to allow the retina to reattach. **2.** the insertion of plastic balls into the pleural cavity to cause collapse of the lung. This was done in the days before effective antituberculous drugs to help tuberculosis to heal.

**plugged biopsy** an **\*interventional radiology** technique in which, after taking a sample of tissue (biopsy) to check for cancer cells or abnormality, the tract of the biopsy needle is plugged with materials to prevent bleeding at the site. It is mostly used for liver and renal biopsies.

**plumbism** *n.* lead poisoning. See **LEAD**<sup>1</sup>.

**Plummer's disease** a hyperfunctioning, usually benign, **\*adenoma** of the thyroid gland, which can be palpated and appears as a 'hot nodule' on radioactive thyroid scanning. Treatment is to control the nodule with antithyroid drugs and then remove it surgically or destroy it permanently with radioactive iodine. [H. S. Plummer (1874–1937), US physician]

**Plummer–Vinson syndrome** a syndrome of **\*dysphagia** with iron-deficiency anaemia that is associated with congenital anomalies in the oesophagus. [H. S. Plummer (1874–1937) and P. P. Vinson (1880–1959), US physicians]

**pluri-** *combining form denoting* more than one; several.

**pluripotent** *adj.* see **STEM CELL**.

**PMS** see **PREMENSTRUAL SYNDROME**.

**pneo-** *combining form denoting* breathing; respiration.

**pneum-** *combining form.* see **PNEUMO-**.

**pneumat-** (**pneumato-**) *combining form denoting* **1.** the presence of air or gas. **2.** respiration.

**pneumatization** *n.* the presence of air-filled cavities in bone, such as the sinuses of the skull.

**pneumatocele** *n.* herniation of lung tissue. See **HERNIA**.

**pneumatosis** *n.* the occurrence of gas cysts in abnormal sites in the body. **Pneumatosis cystoides intestinalis** is the occurrence of multiple gas-containing cysts in the intestinal wall. Its cause is unknown; it can be treated by **\*hyperbaric oxygenation**.

**pneumaturia** *n.* the presence in the urine of bubbles of air or other gas, due to the formation of gas by bacteria infecting the urinary tract or to an abnormal connection (fistula) between the urinary tract and bowel.

**pneumo-** (**pneum-**) *combining form denoting* **1.** the presence of air or gas. Example: **pneumocolon** (within the colon). **2.** the lung(s). Example: **pneumogastric** (relating to the lungs and stomach). **3.** respiration.

**pneumocephalus** (**pneumocele**) *n.* the presence of air within the skull, usually resulting from a fracture passing through one of the air sinuses. There may be a leak of cerebrospinal fluid at the site of the fracture, manifested as a watery discharge from the nose. Pneumocephalus can be detected by plain X-rays of the skull, which show air and a fluid level inside a cavity, or by CT and MRI scanning.

**pneumococcal vaccine** a vaccine that protects against infection by the bacterium **\*Streptococcus pneumoniae**, which can cause serious diseases, including pneumonia, septicaemia, and **\*meningitis**. Children under 2 years of age and adults over 65 years are at particular risk. Since September 2006, the pneumococcal vaccine has become part of the childhood **\*immunization** programme. It is also offered to people over the age of 65 as a single vaccination that will protect for life.

**pneumococcus** *n.* (*pl.* pneumococci) the bacterium **\*Streptococcus pneumoniae**, which is associated with pneumonia and pneumococcal meningitis. —**pneumococcal** *adj.*

**pneumoconiosis** *n.* a group of lung diseases caused by inhaling dust. The dust particles must be less than 0.5 µm in diameter to reach the depths of the lung and there is usually a long period after initial exposure before shadows

appear on the chest X-ray and breathlessness develops. In practice industrial exposure to coal dust (see **COAL-WORKER'S PNEUMOCONIOSIS**), silica (see **SILICOSIS**), and asbestos (see **ASBESTOSIS**) produces most of the cases of pneumoconiosis. In Britain such cases are examined by the Medical Boarding Centres (Respiratory Diseases), on whose advice statutory compensation for industrial injury may be awarded.

**Pneumocystis** *n.* a genus of protozoans. The species *P. jiroveci* (formerly *carinii*) causes pneumonia in immunosuppressed patients, usually following intensive chemotherapy. *Pneumocystis jiroveci* (*carinii*) pneumonia (PCP) is fatal in 10–30% of cases if untreated, but it can be overcome with high doses of **\*co-trimoxazole** or **\*pentamidine**.

**pneumocyte** *n.* a type of cell that lines the walls separating the air sacs (see **ALVEOLUS**) in the lungs. Type I pneumocytes are flat and inconspicuous. Type II pneumocytes are cuboidal and secrete **\*surfactant**.

**pneumoencephalography** *n.* a technique used in the X-ray diagnosis of disease within the skull. Air is introduced into the cavities (ventricles) of the brain to displace the cerebrospinal fluid, thus acting as a **\*contrast medium**. X-ray photographs show the size and disposition of the ventricles and the subarachnoid spaces. The technique has largely been superseded by CT and MRI scanning.

**pneumograph** *n.* an instrument used to record the movements made during respiration.

**pneumolysis** *n.* see **PLEUROLYSIS**.

**pneumomediastinum** *n.* air in the mediastinum visible on chest X-ray. It can be a complication of surgical **\*emphysema** due to pneumothorax, but the air can originate from the upper airways or the upper gastrointestinal tract. A rare cause is gas-forming organisms. See **HAMMAN'S SIGN**.

**pneumon-** (**pneumono-**) *combining form denoting* the lung(s). Example: **pneumonopexy** (surgical fixation to the chest wall).

**pneumectomy** *n.* surgical removal of a lung, usually for cancer.

**pneumonia** *n.* inflammation of the lung caused by bacteria, in which the air sacs (\***alveoli**) become filled with inflammatory cells and the lung becomes solid (see **CONSOLIDATION**). The symptoms include those of any infection (fever, malaise, headaches, etc.), together with cough and chest pain. Pneumonias may be classified in different ways.

(1) According to the X-ray appearance. **Lobar pneumonia** affects whole lobes and is usually caused by *Streptococcus pneumoniae*, while **lobular pneumonia** refers to multiple patchy shadows in a localized or segmental area. When these multiple shadows are widespread, the term **bronchopneumonia** is used. In bronchopneumonia, the infection starts in a number of small bronchi and spreads in a patchy manner into the alveoli. **Interstitial pneumonia** is the result of an inflammatory process centred within the alveolar walls rather than the alveolar airspaces. It may be due to a variety of factors, including certain infections, drugs, inhalation of fumes, and exposure to high concentrations of oxygen.

(2) According to the infecting organism. The most common organism is *Streptococcus pneumoniae*, but *Haemophilus influenzae*, *Staphylococcus aureus*, *Legionella pneumophila*, and *Mycoplasma pneumoniae* (among others) may all be responsible for the infection. See also **ATYPICAL PNEUMONIA**; **VIRAL PNEUMONIA**.

(3) According to the clinical and environmental circumstances under which the pneumonia is acquired. These infections are divided into **community-acquired pneumonia**, **hospital-acquired (nosocomial) pneumonia**, and pneumonias occurring in immunocompromised subjects (including those with AIDS). The organisms responsible for community-acquired pneumonia are totally different from those in the other groups.

Appropriate antibiotic therapy, based on the clinical situation and on microbiological studies, will result in complete recovery in the majority of patients.

**pneumonitis** *n.* inflammation of the lung that is confined to the walls of the air sacs (alveoli) and often caused by viruses or unknown agents. It may be acute and transient or chronic, leading to increasing respiratory disability. It does not respond to antibiotics but corticosteroids may be helpful. Compare **PNEUMONIA**.

**pneumopericardium** *n.* the presence of air within the membranous sac surrounding the heart. See **HYDROPNEUMOPERICARDIUM**.

**pneumoperitoneum** *n.* air or gas in the peritoneal or abdominal cavity, usually due to a perforation of the stomach or bowel. It is diagnosed by X-ray of the erect chest or by CT or ultrasound imaging. Pneumoperitoneum may be induced for diagnostic purposes (e.g. **\*laparoscopy**). A former treatment of tuberculosis was the deliberate injection of air into the peritoneal cavity to allow the tuberculous lung to be rested (**artificial pneumoperitoneum**); this was frequently combined with **\*phrenic crush**.

**pneumoretinopexy** *n.* a surgical technique in which an inert gas bubble is injected into the eye to press and seal breaks in the retina. When the retina is flat, a laser beam or **\*cryoretinopexy** is applied to cause scarring and permanently seal the tear.

**pneumothorax** *n.* air in the **\*pleural cavity**. Any breach of the lung surface or chest wall allows air to enter the pleural cavity, causing the lung to collapse. The leak can occur without apparent cause, in otherwise healthy people (**spontaneous pneumothorax**), or result from injuries to the chest (**traumatic pneumothorax**). In **tension pneumothorax** a breach in the lung surface acts as a valve, admitting air into the pleural cavity when the patient breathes in but preventing its escape when he breathes out. This air must be let out by surgical incision.

A former treatment for pulmonary tuberculosis – **artificial pneumothorax** – was the deliberate injection of air into the pleural cavity to collapse the lung and allow the tuberculous areas to heal.

**pneumotonometer (noncontact tonometer)** *n.* an instrument that blows a puff of air at the cornea to cause flattening and hence measure intraocular pressure. It is commonly used by optometrists in tests for glaucoma.

**PNH** *see* **PAROXYSMAL NOCTURNAL HAEMOGLOBINURIA**.

**PNM** *see* **PERINATAL MORTALITY RATE**.

**-pnoea** *combining form denoting* a condition of breathing. Example: **dyspnoea** (breathlessness).

**pock** *n.* a small pus-filled eruption on the skin characteristic of **\*chickenpox** and **\*smallpox** rashes. *See also* **PUSTULE**.

**pocket** *n.* (in dentistry) *see* **PERIODONTAL POCKET**.

**pocket resuscitation mask** a compressible and easily carried mask, which can be expanded and fitted over the mouth and nose of a nonbreathing patient in order to perform mouth-to-mouth resuscitation through a small valve without contact between the mouth of the rescuer and that of the patient.

**pod-** *combining form denoting* the foot.

**podagra** *n.* gout of the foot, especially the big toe.

**podalic version (internal podalic version)** a procedure in which the position of a fetus in the uterus is altered so that its feet will emerge first at birth. It is used mainly to deliver a second twin that is presenting transversely or obliquely. *See also* **CEPHALIC VERSION**.

**podiatry (chiropody)** *n.* the study and care of the foot, including its normal structure, its diseases, and their treatment. The main role of a **podiatrist (chiropodist)** is to assess, diagnose, and treat abnormalities and diseases of the foot and to give advice on proper foot care and the prevention of foot problems.

**podocyte** *n.* an epithelial cell in the **\*glomerulus** that spreads over the capillary basement membrane and has branching tentacle-like processes that interdigitate with adjacent cells. The podocytes leave gaps or thin filtration slits. The slits are covered by slit diaphragms, which are composed of a number of cell-surface proteins including **\*nephrin**, podocalyxin, and P-cadherin, which ensure that large molecules, such as albumin and gammaglobulin, are not filtered. Podocytes are damaged in **\*minimal change nephropathy** and a major target of injury in **\*HIVAN**.

**podopompholyx** *n.* *see* **POMPHOLYX**.

**POEMS syndrome** a syndrome, mostly reported in Japanese males, consisting of polyneuropathy (*see* **PERIPHERAL NEUROPATHY**), organomegaly, endocrine failure, *M* protein (immunoglobulins) in the plasma, and skin changes, such as thickening, hirsutism, or excess sweating. Each of

the components occurs with varying consistency. The cause is not known but it is not thought to be autoimmune in nature.

**-poiesis** *combining form denoting* formation; production. Example: **haemopoiesis** (of blood cells).

**poikilo-** *combining form denoting* variation; irregularity.

**poikilocyte** *n.* an abnormally shaped red blood cell (**\*erythrocyte**). Poikilocytes may be classified into a variety of types on the basis of their shape; for example elliptocytes (ellipsoid) and schistocytes (semilunar). *See also* **POIKILOCYTOSIS**.

**poikilocytosis** *n.* the presence of abnormally shaped red cells (**\*poikilocytes**) in the blood. Poikilocytosis is particularly marked in **\*myelofibrosis** but can occur to some extent in almost any blood disease.

**poikiloderma** *n.* a combination of pale and darkened skin with telangiectasia (see **TELANGIECTASIS**) and atrophy (wrinkled thin skin). This may be a sign of **\*cutaneous T-cell lymphoma**.

**poikilothermic** *adj.* cold-blooded: being unable to regulate the body temperature, which fluctuates according to that of the surroundings. Reptiles and amphibians are cold-blooded. *Compare* **HOMOIOTHERMIC**. — **poikilothermy** *n.*

**pointillage** *n.* a procedure in massage in which the therapist's fingers are pressed, fingertip first, deep into the patient's skin. This is done to manipulate underlying structures and break up adhesions that may have formed following injury.

**poison** *n.* any substance that irritates, damages, or impairs the activity of the body's tissues. In large enough doses almost any substance acts as a poison, but the term is usually reserved for substances, such as arsenic, cyanide, and strychnine, that are harmful in relatively small amounts.

**polar body** one of the small cells produced during the formation of an ovum from an **\*oocyte** that does not develop into a functional egg cell.

**pole** *n.* (in anatomy) the extremity of the axis of the body, an organ, or a cell.

**poli- (polio-)** *combining form denoting the grey matter of the nervous system.*

**policeman's heel** *see* **PLANTAR FASCIITIS**.

**polioencephalitis** *n.* a virus infection of the brain causing particular damage to the **\*grey matter** of the cerebral hemispheres and the brainstem. The term is now usually restricted to infections of the brain by the poliomyelitis virus.

**polioencephalomyelitis** *n.* any virus infection of the central nervous system affecting the grey matter of the brain and spinal cord. **\*Rabies** is the outstanding example.

**poliomyelitis (infantile paralysis, polio)** *n.* an infectious virus disease affecting the central nervous system. The virus is excreted in the faeces of an infected person and the disease is therefore most common where sanitation is poor. However, epidemics may occur in more hygienic conditions, where individuals have not acquired immunity to the disease during infancy. Symptoms commence 7–12 days after infection. In most cases paralysis does not occur: in **abortive poliomyelitis** only the throat and intestines are infected and the symptoms are those of a stomach upset or influenza; in **nonparalytic poliomyelitis** these symptoms are accompanied by muscle stiffness, particularly in the neck and back. **Paralytic poliomyelitis** is much less common. The symptoms of the milder forms of the disease are followed by weakness and eventual paralysis of the muscles: in **bulbar poliomyelitis** the muscles of the respiratory system are involved and breathing is affected. *See also* **POST-POLIO SYNDROME**.

There is no specific treatment, apart from measures to relieve the symptoms: cases of bulbar polio may require the use of a **\*ventilator**. Immunization, using the **\*Sabin vaccine** (taken orally) or the **\*Salk vaccine** (injected), is highly effective.

**poliovirus** *n.* one of a small group of RNA-containing viruses causing **\*poliomyelitis**. They are included within the **\*picornavirus** group.

**pollex** *n.* (*pl.* **pollices**) the thumb.

**pollinosis** *n.* a more precise term than **\*hay fever** for an allergy due to the pollen of grasses, trees, or shrubs.

**poly-** *combining form denoting* **1.** many; multiple. **2.** excessive. **3.** generalized; affecting many parts.

**polyarteritis nodosa (periarteritis nodosa)** a disease of unknown cause in which there is necrotizing inflammation of the walls of small and medium sized arteries, not associated with **\*ANCA** (antineutrophil cytoplasmic antibodies). Common manifestations are weight loss, testicular pain, myalgia, neuritis, skin rashes, hypertension, and renal disease. Treatment is with corticosteroids and immunosuppressant drugs (such as cyclophosphamide).

**polyarthritis** *n.* disease involving several to many joints, either together or in sequence, causing pain, stiffness, swelling, tenderness, and loss of function. **\*Rheumatoid arthritis** is the most common cause.

**polychromasia (polychromatophilia)** *n.* the presence of certain blue red blood cells (**\*erythrocytes**) seen in blood films stained with **\*Romanowsky stains**, as well as the normal pink cells. The cells that appear blue are juvenile erythrocytes (*see* **RETICULOCYTE**).

**polyclinic** *n.* *see* **HEALTH CENTRE**.

**polycoria** *n.* a rare congenital abnormality of the eye in which there are one or more holes in the iris in addition to the pupil.

**polycystic disease of the kidneys** either of two inherited disorders in which renal cysts are a common feature. **Autosomal recessive polycystic kidney disease (ARPKD)** occurs in about 1 in 20,000 live births. It is due to a single mutation on chromosome 6 for the gene encoding the protein fibrocystin. The majority of cases are diagnosed before or at birth. The most severely affected fetuses have enlarged kidneys and **\*oligohydramnios** due to poor fetal renal output. These fetuses develop the 'Potter' phenotype with characteristic facies, pulmonary hypoplasia, and deformities of the spine and limbs. Those surviving the neonatal period (50–70%) develop varying degrees of renal impairment but this may not proceed to end-stage until early adulthood.

**Autosomal dominant polycystic kidney disease (ADPKD)** affects between 1 in 400 and 1 in 1000 individuals and is one of the most common hereditary diseases. Two types have been defined. ADPKD 1 is the

commonest and responsible for about 85% of cases. It is due to a mutation in the PKD1 gene on chromosome 16, which encodes **polycystin 1**, an [\\*ion-channel](#)-regulating protein. ADPKD2 is due to a mutation in the PKD2 gene on chromosome 4, which encodes the protein **polycystin 2**, a calcium-release channel. ADPKD2 tends to be a milder disease with later presentation.

ADPKD is a multisystem disorder that is also associated with cyst formation in other organs (particularly the liver), cardiovascular disorders, and colonic diverticular disease. Renal disease presents in early adult life with haematuria, loin pain, urinary tract infection, hypertension, renal stone disease, or the finding of a mass in the abdomen. Other cases are identified by family contact tracing; the findings of a few cysts on renal ultrasonography in a young adult with a family history of ADPKD is highly suggestive of the disease. Renal disease is progressive and about 50% of patients will have reached end-stage by the time they enter their seventh decade. The progress of the renal failure can be slowed by good blood pressure control. In the UK, patients with ADPKD are responsible for 5–10% of the total on renal replacement therapy.

There are a number of separate rare autosomal dominant conditions other than ADPKD1 and ADPKD 2 that can present with polycystic kidneys. These include [\\*von Hippel-Lindau disease](#) and [\\*tuberous sclerosis](#).

**polycystic ovary (PCO)** the presence of more than 12 follicles in each ovary (2–9 mm in diameter), or increased ovarian volume (>10 ml), or both. The presence of enlarged ovaries with multiple small cysts and a hypervascularized androgen-secreting stroma (connective tissue) is associated with signs of androgen excess (see [POLYCYSTIC OVARY SYNDROME](#)).

**polycystic ovary syndrome (PCOS, Stein–Leventhal syndrome)** a heterogeneous disorder characterized by [\\*hyperandrogenism](#) (clinical hirsutism, biochemical hyperandrogenism, or both) and ovarian dysfunction (with [\\*polycystic ovaries](#)), which results in amenorrhoea or oligomenorrhoea (absent or infrequent menstrual periods) and is associated with subfertility (from lack of ovulatory menstrual cycles). The condition is associated with obesity and [\\*insulin resistance](#), which increase the risk of type 2 [\\*diabetes](#) mellitus, endometrial cancer, and cardiovascular disease. Treatment is based on dietary and exercise advice, [\\*metformin](#), hormones to

regulate the menstrual cycle, and in cases of subfertility, *\*clomifene* to induce ovulation; the hyperandrogenism usually responds to *\*anti-androgens*.

**polycystin** *n.* *see* POLYCYSTIC DISEASE OF THE KIDNEYS.

**polycythaemia** *n.* an increase in the *\*packed cell volume* (haematocrit) in the blood. This may be due either to a decrease in the total volume of the plasma (**relative polycythaemia**) or to an increase in the total volume of the red cells (**absolute polycythaemia**). The latter may occur as a primary disease (*see* POLYCYTHAEMIA VERA) or as a secondary condition in association with various respiratory or circulatory disorders that cause deficiency of oxygen in the tissues and with certain tumours, such as carcinoma of the kidney.

**polycythaemia vera** (**polycythaemia rubra vera**, **Vaquez–Osler disease**) a disease in which the number of red cells in the blood is greatly increased (*see also* POLYCYTHAEMIA). There is often also an increase in the numbers of white blood cells and platelets. Symptoms include headache, thromboses, *\*cyanosis*, *\*plethora*, and itching. Polycythaemia vera may be treated by blood-letting, but more severe cases may need to be treated with cytotoxic drugs. The cause of the disease is not known.

**polydactylysm** *n.* *see* HYPERDACTYLISM.

**polydipsia** *n.* abnormally intense thirst, leading to the drinking of large quantities of fluid. This is a symptom typical of *\*diabetes mellitus* and *\*diabetes insipidus* but it can occur in the absence of any metabolic abnormality (**psychogenic polydipsia**). *See also* WATER-DEPRIVATION TEST.

**polygene** *n.* one of a number of genes that together control a single characteristic in an individual. Each polygene has only a slight effect and the expression of a set of polygenes is the result of their combined interaction. Characteristics controlled by polygenes are usually of a quantitative nature, e.g. height. *See also* MULTIFACTORIAL. —**polygenic** *adj.*

**polyhydramnios** (**hydramnios**) *n.* an increase in the amount of *\*amniotic fluid* surrounding the fetus, which occurs usually in the third *\*trimester* and

may be associated with maternal diabetes, multiple pregnancy, any fetal anomaly causing impaired swallowing, or placental abnormality.

**polymastia** *n.* *see* **PLEOMASTIA**.

**polymer** *n.* a substance formed by the linkage of a large number of smaller molecules known as **monomers**. An example of a monomer is glucose, whose molecules link together to form glycogen, a polymer. Polymers may have molecular weights from a few thousands to many millions. Polymers made up of a single type of monomer are known as **homopolymers**; those of two or more monomers as **heteropolymers**.

**polymerase chain reaction (PCR)** a technique of molecular genetics in which a particular sequence of DNA can be isolated and amplified sufficiently to enable genetic analysis. The technique may be utilized, for example, in the identification of viruses in tissue samples, e.g. human papillomavirus in cervical smears.

**polymorph (polymorphonuclear leucocyte)** *n.* a type of white blood cell with a lobed nucleus. *See* **BASOPHIL**; **EOSINOPHIL**; **NEUTROPHIL**.

**polymorphic eruption of pregnancy (PEP)** intensely itchy papules and weals on the abdomen (except the umbilicus), upper limbs, and buttocks, usually within the **\*striae** gravidarum; it is also known as PUPPP (pruritic urticarial papules and plaques of pregnancy). It occurs in 1 in 250 first pregnancies late in the third trimester. This condition is harmless to mother and baby, but can be very annoying. It lasts an average of 6 weeks and resolves spontaneously 1–2 weeks after delivery. The most severe itching normally lasts for no more than a week.

**polymorphism** *n.* (in genetics) the occurrence of a chromosome or a genetic character in more than one form, resulting in the coexistence of more than one morphological type in the same population.

**polymorphous light eruption** *see* **PHOTODERMATOSIS**.

**polymyalgia rheumatica** a rheumatic disease causing aching and progressive stiffness of the muscles of the shoulders and hips after inactivity. These symptoms are typically associated with loss of appetite, fatigue, night sweats, and a raised **\*ESR**. The condition is most common in the elderly,

rarely occurring before the age of 50. The symptoms respond rapidly and effectively to corticosteroid treatment, which must usually be continued for several years. It is sometimes associated with temporal *\*arteritis*.

**polymyositis** *n.* an autoimmune disease of the muscles that may be acute or chronic. It particularly affects the muscles of the shoulder and hip girdles, which are weak and tender to the touch. Microscopic examination of the affected muscles shows diffuse inflammatory changes; treatment is with *\*corticosteroids* and other immunosuppressant drugs. The skin may be reddened and atrophic. *See also* DERMATOMYOSITIS.

**polymyxin B** an *\*antibiotic* used to treat severe infections caused by Gram-negative bacteria. Formulated with other drugs, it is administered for ear, eye, and skin infections.

**polyneuritis** *n.* *see* PERIPHERAL NEUROPATHY.

**polyneuropathy** *n.* *see* PERIPHERAL NEUROPATHY.

**polynucleotide** *n.* a long chain of linked *\*nucleotides*, of which molecules of DNA and RNA are made.

**polyopia** *n.* the sensation of multiple images of one object. It is sometimes experienced by people with early cataract. *See also* DIPLOPIA.

**polyorchidism** *n.* a congenital abnormality resulting in more than two testes.

**polyp (polypus)** *n.* a growth, usually benign, protruding from a mucous membrane. Polyps are commonly found in the nose and sinuses, giving rise to obstruction, chronic infection, and discharge. They are often present in patients with allergic rhinitis, in whom they may develop in response to long-term antigenic stimulation. Other sites of occurrence include the ear, the stomach, and the colon. Colonic polyps in the adult population are commonly seen in patients above the age of 50 and approximately 25% are multiple. Adenomatous colonic polyps (especially if large) have malignant potential, particularly so in larger polyps. Colonoscopy helps to detect and remove colonic polyps. **Juvenile polyps** occur in the intestine (usually colon or rectum) of infants or young people; sometimes they are multiple (**juvenile polyposis**). In the latter form there is a risk of malignant change (25% of cases) but most juvenile polyps are benign (*see also* POLYPOSIS; PEUTZ-

**JEGHERS SYNDROME**). Polyps are usually removed endoscopically (see **POLYPECTOMY**); polyps that are large, difficult to remove endoscopically, or malignant require surgery.

**polypectomy** *n.* the endoscopic or surgical removal of a **\*polyp**. The technique used depends upon the site and size of the polyp. Endoscopically, polyps can be removed by various methods. A **hot biopsy** involves coagulation of a small polyp using a diathermy current passed through biopsy forceps, which obtains a sample for analysis at the same time. **Cold biopsy** involves removal of a polyp using forceps alone, thereby decreasing the perforation risk. **Snare polypectomy** uses a wire loop (snare) to cut through the base of the polyp. This is performed with or without a diathermy current (**hot snare** vs. **cold snare**); the current reduces the risk of bleeding by coagulating local blood vessels as the snare cuts through the polyp. **Endoscopic mucosal resection** (EMR) involves lifting a flat polyp by injecting a hypertonic solution into the submucosa beneath the polyp followed by snare polypectomy with diathermy. Nasal polyps may be removed using **\*endoscopic sinus surgery** techniques, sometimes utilizing a **\*microdebrider**.

**polypeptide** *n.* a molecule consisting of three or more amino acids linked together by **\*peptide** bonds. **\*Protein** molecules are polypeptides.

**polyphagia** *n.* excessive eating.

**polypharmacy** *n.* treatment of a patient with more than one type of medicine.

**polyphyletic** *adj.* describing a number of individuals, species, etc., that have evolved from more than one ancestral group. *Compare* **MONOPHYLETIC**.

**polyploid** *adj.* describing cells, tissues, or individuals in which there are three or more complete sets of chromosomes. *Compare* **DIPLOID**; **HAPLOID**.  
—**polyploidy** *n.*

**polypoid** *adj.* having the appearance of a **\*polyp**.

**polyposis** *n.* a condition in which numerous **\*polyps** form in an organ or tissue. **Familial adenomatous polyposis** (FAP) is a hereditary disease (caused by a defective dominant gene) in which multiple **\*adenomas** develop in the intestine, usually the large bowel or rectum, at an early age. As these

polyps almost invariably become malignant, patients are usually advised to undergo total removal of the affected bowel. *See also* **PEUTZ-JEGHERS SYNDROME**. *Compare* **HEREDITARY NONPOLYPOSIS COLORECTAL CANCER**; **PSEUDOPOLYPOSIS**.

**polypus** *n. see* **POLYP**.

**polyradiculitis (polyradiculopathy)** *n.* any disorder of the peripheral nerves (*see* **NEUROPATHY**) in which the brunt of the disease falls on the nerve roots where they emerge from the spinal cord. An abnormal allergic response in the nerve fibres is thought to be one cause of this condition; the **\*Guillain-Barré syndrome** is an example. Other causes include infections (such as syphilis), herpesviruses, and tumours (such as lymphoma or other forms of cancer).

**polyribosome** *n. see* **POLYSOME**.

**polysaccharide** *n.* a **\*carbohydrate** formed from many monosaccharides joined together in long linear or branched chains. Polysaccharides have two important functions: (1) as storage forms of energy; for example **\*glycogen** in animals and **\*starch** in plants, and (2) as structural elements; for example **\*mucopolysaccharides** in animals and **\*cellulose** in plants.

**polyserositis** *n.* inflammation of the membranes that line the chest, abdomen, and joints, with accumulation of fluid in the cavities. Commonly the condition is inherited and intermittent and is termed **familial Mediterranean fever**. If complicated by infiltration of major organs by a glycoprotein (*see* **AMYLOIDOSIS**) the disease usually proves fatal. Regular administration of colchicine will prevent the attacks in 95% of patients.

**polysome (polyribosome)** *n.* a structure that occurs in the cytoplasm of cells and consists of a group of **\*ribosomes** linked together by **\*messenger RNA** molecules: formed during protein synthesis.

**polysomnograph** *n.* a record of measurements of various bodily parameters during sleep. It is used in the diagnosis of sleep disorders, such as **\*obstructive sleep apnoea**.

**polyspermia** *n.* **1.** excessive formation of semen. **2.** *see* **POLYSPERMY**.

**polyspermy (polyspermia)** *n.* fertilization of a single ovum by more than one spermatozoon: the development is abnormal and the embryo dies.

**polythelia** *n.* a congenital excess of nipples (*see* **PLEOMASTIA**).

**polyuria** *n.* the production of large volumes of urine, which is dilute and of a pale colour. The phenomenon may be due simply to excessive liquid intake or to disease, particularly diabetes mellitus, diabetes insipidus, and kidney disorders.

**pomalidomide** *n.* a derivative of **\*thalidomide** with similar properties. It is taken in the treatment of relapsed or refractory myeloma. The main side-effects include lethargy, low blood counts, and thromboembolism; this drug should not be used in women who are pregnant or capable of becoming pregnant.

**pompholyx** *n.* **\*eczema** of the hands (*see also* **CHEIROPOMPHOLYX**) and feet (**podopompholyx**). Because the horny layer of the skin in these parts is so thick, the vesicles typical of eczema cannot rupture; they therefore persist in the skin, looking like sago grains. There is intense itching until the skin eventually peels. There may be secondary infection due to scratching. Pompholyx is commonest in early adulthood and attacks occur suddenly, lasting some weeks. The disease may be recurrent or persist as a chronic condition.

**pons** *n.* **1.** (**pons Varolii**) the part of the **\*brainstem** that links the medulla oblongata and the thalamus, bulging forwards in front of the cerebellum, from which it is separated by the fourth ventricle. It contains numerous nerve tracts between the cerebral cortex and the spinal cord and several nuclei of grey matter. From its front surface the **\*trigeminal nerves** emerge. **2.** any portion of tissue that joins two parts of an organ.

**pontic** *n.* (in dentistry) *see* **BRIDGE**.

**popliteus** *n.* a flat triangular muscle at the back of the knee joint, between the femur and tibia, that helps to flex the knee. —**popliteal** *adj.*

**porcelain** *n.* (in dentistry) a ceramic material that is used to construct tooth-coloured crowns, inlays, or veneers.

**pore** *n.* a small opening; for example, **sweat pores** are the openings of the sweat glands on the surface of the skin.

**porencephaly** *n.* an abnormal communication between the lateral **\*ventricle** and the surface of the brain. This is usually a consequence of brain injury or cerebrovascular disease; uncommonly it may be a developmental defect, when it would most likely affect both lateral ventricles.

**porfimer sodium** *see* **PHOTODYNAMIC THERAPY**.

**porocephaliasis** *n.* a rare infestation of the nasal cavities, windpipe, lungs, liver, or spleen by the nymphs of the parasitic arthropod **\*Porocephalus**. Humans become infected on consumption of water or uncooked vegetables contaminated with the parasite's eggs. There may be some abdominal pain while the parasite is in the gut but in many cases there are no symptoms.

**Porocephalus** *n.* a genus of wormlike arthropods occurring mainly in tropical Africa and India. The legless adults are parasites in the lungs of snakes. The eggs, which are ejected with the snake's bronchial secretions, may be accidentally swallowed by humans. The larva bores through the gut wall and usually migrates to the liver, where it develops into a nymph (*see* **POROCEPHALIASIS**).

**porphin** *n.* a complex nitrogen-containing ring structure and parent compound of the **\*porphyrins**.

**porphobilinogen** *n.* a pigment that appears in the urine of individuals with acute **\*porphyria**, causing it to darken if left standing.

**porphyria** *n.* one of a group of rare disorders due to **\*inborn errors of metabolism** in which there are deficiencies in the enzymes involved in the biosynthesis of haem. The accumulation of the enzyme's substrate gives rise to symptoms of the disorder. The defect may be primarily in the liver (**hepatic porphyria**) or in the bone marrow (**erythropoietic porphyria**) or both. The prominent features include the excretion of **\*porphyrins** and their derivatives in the urine, which may change colour on standing (*see* **PORPHOBILINOGEN**); sensitivity of the skin to sunlight causing chronic inflammation or blistering; inflammation of the nerves (neuritis); mental disturbances; and attacks of abdominal pain. The commonest porphyria is **porphyria cutanea tarda**, which affects up to 1 in 5000 people in some

countries. It is a hereditary or acquired hepatic porphyria in which light-exposed areas of the skin become blistered and fragile. **Acute intermittent porphyria** is a hereditary hepatic porphyria characterized by recurrent attacks of acute abdominal pain, severe constipation, and psychotic behaviour. Factors triggering attacks include alcohol and many drugs.

**porphyrin** *n.* one of a number of pigments derived from **\*porphin**, which are widely distributed in living things. All porphyrins form chelates with iron, magnesium, zinc, nickel, copper, and cobalt. These chelates are constituents of **\*haemoglobin**, **\*myoglobin**, the **\*cytochromes**, and chlorophyll, and are thus important in many oxidation/reduction reactions in all living organisms. *See also* **PROTOPORPHYRIN IX**.

**porphyrinuria** *n.* the presence in the urine of breakdown products of the red blood pigment haemoglobin (porphyrins), sometimes causing discoloration. *See* **PORPHYRIA**; **PORPHOBILINOGEN**.

**porta** *n.* the aperture in an organ through which its associated vessels pass. Such an opening occurs in the liver (**porta hepatis**).

**portable** *adj.* (in radiography) referring to images obtained by the bedside of the patient using light-weight equipment, rather than in the radiography department. The quality of portable radiographs is usually limited due to compromises in the equipment design to keep it light and movable, which is necessary when patients cannot easily be moved (for example, on intensive therapy units).

**portacaval anastomosis (portacaval shunt)** **1.** a surgical technique in which the hepatic portal vein is joined to the inferior vena cava. Blood draining from the abdominal viscera is thus diverted past the liver. It is no longer widely used in the treatment of **\*portal hypertension**. **2.** any of the natural communications between the branches of the hepatic portal vein in the liver and the inferior vena cava.

**portal** *adj.* **1.** relating to the portal vein or system. **2.** relating to a porta.

**portal hypertension** a state in which the pressure within the hepatic **\*portal vein** is increased, causing enlargement of the spleen, development of **\*oesophageal varices** (with increased risk of bleeding), and accumulation of fluid in the peritoneal cavity (**\*ascites**). The commonest cause is liver

**\*cirrhosis**, but other diseases of the liver or thrombosis of the portal vein may precipitate portal hypertension. Treatment includes **\*diuretics**, band ligation or beta blockers for varices, and **transjugular intrahepatic portosystemic shunt (TIPSS)**. This involves the radiological implantation of a stent that bridges the portal and hepatic veins, thus decompressing the portal system. TIPSS has largely replaced **\*portacaval anastomosis**.

**portal image** an electronic image taken during radiotherapy treatment to verify the position of radiation beams.

**portal system** a vein or group of veins that terminates at both ends in a capillary bed. The best known is the **hepatic portal system**, which consists of the **\*portal vein** and its tributaries (see illustration). Blood is drained from the spleen, stomach, pancreas, and small and large intestines into veins that merge to form the portal vein leading to the liver. Here the portal vein branches, ending in many small capillaries called **\*sinusoids**. These permit the passage into the liver cells of nutrients absorbed by blood from the intestines.

**The hepatic portal system.**

**portal vein** a short vein, about 8 cm long, forming part of the hepatic **\*portal system**. It receives many tributaries, including the splenic vein from the spleen and pancreas, the gastric vein from the stomach, the mesenteric vein

from the small and large intestines, and the rectal vein from the rectum and anus.

**port-wine stain** *see* [NAEVUS](#).

**positive** *adj. see* [NORMATIVE](#).

**positive-pressure ventilation** *see* [NONINVASIVE VENTILATION](#).

**positive symptoms** (in psychiatry) symptoms of schizophrenia characterized by a distortion of some aspect of functioning, such as delusions, hallucinations, or disordered speech. *Compare* [NEGATIVE SYMPTOMS](#).

**positron** *n.* an electrically charged particle released in some radioactive decays, notably fluorine-18 or nitrogen-13, that has the same mass as an electron but opposite charge. It has a very short lifetime as it quickly reacts with an electron (annihilation) to produce a pair of [\\*gamma rays](#), which are emitted in diametrically opposite directions. The energy of each gamma ray is always 511 keV.

**positron emission tomography (PET)** a technique in nuclear medicine for [\\*cross-sectional imaging](#) that enables a noninvasive assessment and localization of metabolic activity to be made. Originally used to study activity in the brain, PET is now also used for investigating the chest and abdomen. Emission of a [\\*positron](#) by a radioisotope results in annihilation of the positron on collision with an electron, and the creation of two gamma rays of known energy travelling in exactly opposite directions. The PET scanner has detectors on each side of the patient to detect the simultaneous arrival of the gamma rays. Images are created using reconstruction [\\*algorithms](#) similar to CT scanning. [\\*Fluorodeoxyglucose](#), labelled with fluorine-18, is used to examine glucose metabolism, and ammonia, labelled with nitrogen-13, gives information on perfusion. Carbon-11 and oxygen-15 can also be used as radioisotopes for PET scanning. Some diseases result in decreased uptake of the radio-labelled material due to decreased function; others show increased glucose metabolism and concentrate the isotope avidly. In this way functional activity of the tissues can be compared with anatomical images obtained by CT or MRI scanning (*see* [PET/CT SCANNING](#)). Localized areas of increased glucose uptake revealed by PET scans can sometimes signify functional activity of malignant cells, which use

more glucose than normal cells, although other processes, such as infection, can produce similar scans. PET scans can help to localize metastatic disease (see **METASTASIS**) that is not identified by other scanning techniques. See also **TOMOGRAPHY**. Compare **COMPUTERIZED TOMOGRAPHY**.

**posology** *n.* the science of the dosage of medicines.

**posset** *n.* a small amount of milk that is regurgitated, usually with some wind, by many babies after feeding.

**Possum** *n.* a device that enables severely paralysed patients to use typewriters, adding machines, telephones, and a wide variety of other machines. Modern Possums are operated by micro-switches that require only the slightest movement in any limb. The original device worked by blowing and sucking a mouthpiece. The name derives from **Patient-Operated Selector Mechanism (POSM)**.

**POSSUM scoring** physiological and operative severity score for the enumeration of morbidity and mortality: a tool used by anaesthetists in the perioperative period to determine the risks associated with surgery in an individual patient. This can be used to guide such decisions as the appropriateness of surgery and the requirement for intensive care postoperatively.

**post-** *prefix denoting* **1.** following; after. Example: **postoperative** (after an operation). **2.** (in anatomy) behind. Example: **postoral** (behind the mouth).

**postcentral** *adj.* **1.** situated behind any centre. **2.** situated behind the central fissure of the brain.

**postcibal** *adj.* occurring after eating.

**postcoital bleeding** genital-tract bleeding occurring after sexual intercourse. This is an important symptom and may be caused by sexually transmitted infections, vaginal candidiasis, atrophic **\*vaginitis**, cervical **\*ectropion**, cervical polyp, or cervical cancer.

**postcoital contraception (emergency contraception)** prevention of pregnancy after intercourse has taken place. This can be achieved by two methods, which aim to prevent implantation of the fertilized ovum in the uterus: (1) an oral dose of **\*levonorgestrel** or **\*ulipristal** taken within 72

hours and 120 hours, respectively, of unprotected intercourse; and (2) insertion of an **\*IUCD** within five days of unprotected intercourse.

**postcoital test** a test used in the investigation of infertility. A specimen of cervical mucus, taken 6–24 hours after coitus, is examined under a microscope. The appearance of 10 or more progressively motile spermatozoa per high-power field in the specimen indicates that there is no abnormal reaction between spermatozoa and mucus. The test should be undertaken in the postovulatory phase of the menstrual cycle.

**posterior** *adj.* situated at or near the back of the body or an organ. The **posterior chamber** of the eye is the rear section, behind the lens, which is filled with vitreous humour.

**posterior capsular opacification** progressive clouding of the posterior lens capsule due to **\*Elschnig pearls** and proliferation of lens fibres following extracapsular **\*cataract extraction** by **\*phacoemulsification**. This can lead to clouding of vision and is treated with YAG laser **\*capsulotomy**.

**postero-** *combining form denoting* posterior. Example: **posterolateral** (behind and at the side of).

**posteroanterior (PA)** *adj.* from the back to the front. In radiography it refers to the direction of the X-ray beam (i.e. from the back to the front of the patient); thus a PA radiograph is taken with the X-ray film in front of the patient. Normally, a chest radiograph will be PA: since the heart is in the front of the chest, its size can be most accurately assessed if the X-ray film is in front of the chest. *Compare* **DECUBITUS**; **ANTEROPosterior**.

**postganglionic** *adj.* describing a neuron in a nerve pathway that starts at a ganglion and ends at the muscle or gland that it supplies. In the sympathetic nervous system, postganglionic fibres are **\*adrenergic**, unlike those in the parasympathetic system, which are **\*cholinergic**. *Compare* **PREGANGLIONIC**.

**postgastrectomy syndrome** *see* **DUMPING SYNDROME**.

**posthitis** *n.* inflammation of the foreskin. This usually occurs in association with inflammation of the glans penis (**balanitis**; *see* **BALANOPOSTHITIS**). Pain, redness, and swelling of the foreskin occurs due to bacterial infection.

Treatment is by antibiotic administration, and subsequent [\\*circumcision](#) prevents further attacks.

**posthumous birth** **1.** delivery of a child by [\\*Caesarean section](#) after the mother's death. **2.** birth of a child after the father's death.

**postictal phase** the recovery phase that follows immediately after an epileptic seizure (see [EPILEPSY](#)). It may last anything from a few minutes to several hours and is typically characterized by drowsiness, confusion, loss of memory, and feelings of sadness or anxiety. See [ICTUS](#).

**postmature** *adj.* describing a baby born after 42 weeks of gestation (calculated from the first day of the last menstrual period). Such a birth can be associated with maternal diabetes or with [\\*anencephaly](#) in the fetus. — **postmaturity** *n.*

**postmenopausal bleeding (PMB)** bleeding from the female genital tract occurring more than 12 months after the last menstrual period. Atrophic [\\*vaginitis](#) is a common cause. Endometrial cancer occurs in up to 10% of cases, and PMB may also be a marker of ovarian, cervical, or more rarely vaginal or vulval cancer.

**postmenopause** *n.* the period of a woman's life after the [\\*menopause](#), i.e. following 12 months after her last menstrual period. The term 'menopause' is often used in reference to the postmenopausal period.

**postmicturition dribble** a [\\*lower urinary tract symptom](#) in which a dribble occurs after voiding has been completed, often after leaving the toilet. It is quite common in men but is not caused by benign prostatic hyperplasia.

**post mortem** Latin: after death. See [AUTOPSY](#).

**postnasal space** see [NASOPHARYNX](#).

**postnatal depression** [\\*depression](#) that starts after childbirth. [\\*Bonding](#) between the mother and child can be impaired (particularly in the case of male children), leading to [\\*attachment disorders](#) if the illness is not diagnosed and treated. Postnatal depression occurs in about 10% of women (in the UK women are routinely screened for it after childbirth) and responds to the treatment strategies used for other forms of depression, such as

**\*antidepressant** medication and **\*cognitive behavioural therapy**; in rare cases hospital admission is needed, ideally to a mother-and-baby unit. *Compare* **BABY BLUES**; **PUERPERAL PSYCHOSIS**.

**postoperative** *adj.* following surgery: referring to the condition of a patient or to the treatment given at this time.

**postpartum** *adj.* relating to the period of a few days immediately after birth.

**postpartum blues** *see* **BABY BLUES**.

**postpartum haemorrhage (PPH)** excessive bleeding (>500 ml) from the genital tract after delivery. Primary PPH occurs within 24 hours of delivery; secondary PPH occurs after 24 hours. Major (or atonic) PPH, in which blood loss exceeds 1000 ml, is due to failure of the uterus to contract after delivery. It may be caused by retained products of conception or may occur after a long labour, trauma (e.g. from cervical or vaginal tears), or thrombin deficiency. An emergency hysterectomy may be required. *See also* **B-LYNCH BRACE SUTURE**; **RUSCH CATHETER**.

**postpartum sepsis** *see* **SEPSIS**.

**post-polio syndrome** insidious numbness in muscles that develops 15–20 years after an attack of **\*poliomyelitis**; the muscles may or may not have been previously affected. It may be caused by loss of nerve cells that have been under greater strain than normal as a result of the polio; there is no evidence of reactivation of the poliovirus. The syndrome also includes other symptoms, such as fatigue and pain, which may be due to secondary mechanical causes.

**postprandial** *adj.* occurring after eating.

**post-processing** *n.* (in radiology) the electronic manipulation of digitally acquired images (*see* **DIGITIZATION**) following an examination in order to improve diagnostic accuracy or to improve and optimize visualization.

**postresuscitation care** medical care given to an individual who has survived a **\*cardiac arrest**. This will usually consist of a 12-lead electrocardiogram (*see* **LEAD<sup>2</sup>**), a chest X-ray, a number of venous and

arterial blood tests, and transfer to a high-dependency or coronary care unit for further intensive monitoring and drug administration.

**post-term pregnancy** a pregnancy that has gone beyond 42 weeks gestation or 294 days from the first date of the last menstrual period.

**post-traumatic stress disorder (PTSD)** an anxiety disorder caused by a major physical or emotional trauma, such as an injury, assault, rape, or exposure to warfare or a disaster involving many casualties. The onset is at least one month after the traumatic event. The patient experiences the persistent recurrence of images or memories of the event, together with nightmares, insomnia, a sense of isolation, guilt, irritability, and loss of concentration. Emotions may be flat and depression may develop. The condition usually settles with time, but support and skilled counselling may be needed. More severe cases may be treated by *\*eye movement desensitization and reprocessing therapy* (EMDR), *\*cognitive behavioural therapy*, *\*antidepressants*, and in severe cases also with *\*antipsychotics*.

**postural hypotension** *see* HYPOTENSION.

**postural muscles (antigravity muscles)** muscles (principally extensors) that serve to maintain the upright posture of the body against the force of gravity.

**posturing** *n.* (in psychiatry) voluntarily assuming and maintaining bizarre or inappropriate postures. It is a feature of *\*catatonia*.

**postviral fatigue syndrome** *see* CFS/ME/PVF.

**potassium** *n.* a mineral element and an important constituent of the human body. It is the main base ion of intracellular fluid. Together with *\*sodium*, it helps to maintain the electrical potential of the nervous system and is thus essential for the functioning of nerve and muscle. Normal blood levels are between 3.5 and 5 mmols/litre. High concentrations occur particularly in kidney failure and may lead to *\*arrhythmia* and finally to cardiac arrest. Low values result from fluid loss, e.g. due to vomiting or diarrhoea, and this may lead to general muscle paralysis. A diet high in potassium can help to lower blood pressure; good sources are fruit, vegetables, and wholegrain cereals. Symbol: K.

**potassium-channel activator** any one of a class of drugs that enhance the movement of potassium ions through the **\*ion** channels in cell membranes. In the case of smooth muscle cells, such as those in the walls of arteries, their sensitivity to the normal stimuli to contract is reduced. The result is relaxation of the muscle fibres and widening of the arteries. Potassium-channel activators are used for improving the blood supply to the heart muscle in angina pectoris. Possible side-effects include headache, flushing, vomiting, dizziness, and weakness. A currently available member of the class is **nicorandil**.

**potassium chloride** a salt of potassium used to prevent and treat potassium deficiency, especially during treatment with digoxin or anti-arrhythmic drugs. Some irritation in the digestive system may occur. Severe potassium deficiency may be treated by intravenous infusion.

**potassium permanganate** a salt of potassium having antiseptic and astringent properties. Potassium permanganate solution is applied to the skin to treat weeping eczema. It irritates mucous membranes and is poisonous if taken into the body.

**Potter syndrome** a congenital condition characterized by absence of kidneys, resulting in decreased amniotic fluid (*see* **OLIGOHYDRAMNIOS**) and compression of the fetus. Babies have poorly developed lungs, a characteristic wrinkled and flattened facial appearance, and leg deformities and do not usually survive. [E. L. Potter (20th century), US pathologist]

**Pott's disease** **\*tuberculosis** of the backbone. Untreated, it can lead to a hunchback deformity. Treatment is antituberculous chemotherapy and occasionally surgery. [P. Pott (1714–88), British surgeon]

**pouch** *n.* **1.** (in anatomy) a small sac-like structure, especially occurring as an outgrowth of a larger structure. The **pouch of Douglas** is a pouch of peritoneum occupying the space between the rectum and uterus. **2.** (in surgery) a sac created from a loop of intestine and used to replace a section of rectum that has been surgically removed, for example in the treatment of ulcerative colitis (*see* **ILEAL POUCH**), or to replace the bladder after **\*cystectomy**.

**poultice (fomentation)** *n.* a preparation of hot moist material applied to any part of the body to increase local circulation, alleviate pain, or soften the skin to allow matter to be expressed from a boil. Poultices containing kaolin retain heat for a considerable period during use.

**Poupart's ligament** *see* **INGUINAL LIGAMENT**. [F. Poupart (1661–1708), French anatomist]

**poverty of speech** brief hesitant speech using few words (often monosyllables) and lacking spontaneity. It can be observed in patients with schizophrenia, dementia, and depression.

**powder** *n.* (in pharmacy) a medicinal preparation consisting of a mixture of two or more drugs in the form of fine particles.

**power of attorney** authority given by an individual to another person (a proxy) to take decisions on their behalf, either immediately or after they lose mental *\*capacity* in relation to their financial affairs, or only after they lose capacity in relation to their personal welfare and health care. In the UK the proxy has responsibility for representing the patient's *\*best interests*, but he or she can refuse life-sustaining treatment for the patient only if express written provision for such a decision was made by the patient in advance (*see* **ADVANCE DIRECTIVE, DECISION, OR STATEMENT**). The only circumstances in which the wishes of the proxy need not be followed is where clinicians believe that he or she is not acting in the patient's best interests. *See also* **ADVOCACY; PROXY DECISION; SUBSTITUTED JUDGMENT**.

<https://www.gov.uk/power-of-attorney>

- An overview of power of attorney

**pox** *n.* **1.** an infectious disease causing a skin rash. **2.** a rash of pimples that become pus-filled, as in *\*chickenpox* and *\*smallpox*.

**poxvirus** *n.* one of a group of large DNA-containing viruses including those that cause *\*smallpox* (variola) and *\*cowpox* (vaccinia) in humans, and pox and tumours in animals.

**PPH** *see* POSTPARTUM HAEMORRHAGE.

**PPN** *see* PERIPHERAL PARENTERAL NUTRITION.

**PPROM** preterm prelabour (or premature) rupture of membranes: spontaneous rupture of fetal membranes prior to 37 weeks gestation in the absence of regular painful contractions. This can be monitored for any signs of infection (*\*chorioamnionitis*). *Compare* PROM.

**practice development** a policy of actively and continuously improving patient care, with an emphasis on interprofessional collaboration and the integration of evidence-based practice with *\*person-centred care*.

**practice manager** the person responsible for running a doctor's surgery, whose role involves managing staff, accounts, and medical records as well as developing the practice's business strategy. Practice managers also liaise with external bodies, such as local NHS trusts and social service departments, to ensure efficient communication between the various organizations.

**practice nurse** a trained nurse caring for the patients of one or more general practitioners in the consulting room and on domiciliary consultations. In Britain, practice nurses are usually employed directly by GPs. However, they may also be employed by clinical commissioning groups as practice nurses or *\*district nurses*.

**Practitioner Performance Advice** part of *\*NHS* Resolution that provides advice and support to NHS trusts and health authorities in England, Wales, and Northern Ireland regarding concerns about the performance of individual doctors, dentists, and pharmacists. The emphasis of the service is on local resolution. It was formerly known as the **National Clinical Assessment Service (NCAS)**.

<https://resolution.nhs.uk/services/practitioner-performance-advice/>

- Information from the NHS Resolution website

**Prader orchidometer** *see* ORCHIDOMETER.

**Prader–Willi syndrome (Prader–Willi–Labhart syndrome)** a congenital condition that is inherited as an autosomal **\*dominant** trait and is due to an abnormality of chromosome 15 (see **IMPRINTING**). It is marked by pathological overeating and resulting obesity (affected children often subsequently develop type 2 diabetes), lethargy, short stature, a characteristic facial expression, learning disabilities, and underactivity of the testes or ovaries (**\*hypogonadism**) due to lack of pituitary gonadotrophins. It is a cause of delayed puberty. [A. Prader, H. Willi, and A. Labhart (20th century), Swiss paediatricians]

**prasugrel** *n.* see **ANTIPLATELET DRUG**.

**pravastatin** *n.* a drug used to reduce abnormally high levels of cholesterol and other lipids in the blood (see **STATIN**). Its actions and side-effects are similar to those of **\*atorvastatin**.

**praziquantel** *n.* an **\*anthelmintic** drug used to eliminate tapeworms and schistosomes. Possible side-effects include nausea, abdominal discomfort, fever, sweating, and drowsiness.

**prazosin** *n.* a drug used in the treatment of high blood pressure (hypertension) and also to relieve urinary retention due to benign enlargement of the **\*prostate gland** (see **ALPHA BLOCKER**). Common side-effects include dizziness, headache, palpitations, and nausea.

**pre-** *prefix denoting* **1.** before; preceding. Example: **premenstrual** (before menstruation); **prenatal** (before birth). **2.** (in anatomy) in front of; anterior to.

Example: **precardiac** (in front of the heart); **prepatellar** (in front of the patella).

**pre-agonal** *adj.* relating to the phenomena that precede the moment of death. See also **AGONAL**.

**prebiotics** *pl. n.* nondigestible constituents of food, such as inulin and fructo-oligosaccharides, which stimulate the growth of ‘good’ bacteria in the colon (see **PROBIOTICS**).

**precancerous** *adj.* describing a nonmalignant condition that is known to become malignant if left untreated. **\*Leukoplakia** of the vulva is known to be

a precancerous condition. *See also* [METAPLASIA](#).

**precipitin** *n.* any antibody that combines with its antigen to form a complex that comes out of solution and is seen as a precipitate. The antibody-antigen reaction is specific; the precipitin reaction is therefore a useful means of confirming the identity of an unknown antigen or establishing that a serum contains antibodies to a known disease. This test may be performed in watery solution or in a semisolid medium such as agar gel. *See also* [AGGLUTINATION](#).

**precipitinogen** *n.* any antigen that is precipitated from solution by a [\\*precipitin](#).

**precision attachment** (in dentistry) a machined joint that aids the retention of certain types of removable partial [\\*dentures](#). The attachment is in two parts, one fixed to the denture (usually the 'female' part) and the other fixed to a crown (usually the 'male' part) on one of the teeth abutting the denture.

**precocious puberty** the development at an early age of the physical and physiological changes associated with [\\*puberty](#). In girls this is usually taken as development of breasts or pubic hair before the age of six or menstruation before the age of eight. In boys development of pubic hair or other adult sexual features below the age of nine is considered to be precocious. In girls 90% of cases have no underlying abnormalities, but in boys approximately half have a serious underlying cause, of which malignant testicular tumours and malignant adrenal tumours are the most common.

**precordial thump** a thump delivered directly to the chest wall over the heart as the first stage in treatment of a [\\*cardiac arrest](#) if the arrest has been witnessed (i.e. just happened) and monitored (i.e. diagnosis is immediately confirmed). The shock in that early stage can depolarize enough of the heart muscle to allow the normal [\\*pacemaker](#) systems within the heart to take over and restore normal cardiac output.

**precordium** *n.* the region of the thorax immediately over the heart. — **precordial** *adj.*

**precuneus** *n.* an area of the inner surface of the cerebral hemisphere on each side, above and in front of the [\\*corpus callosum](#). *See* [CEREBRUM](#).

**prediabetes** *n.* *see* [GLUCOSE TOLERANCE TEST](#).

**predisposition** *n.* a tendency to be affected by a particular disease or kind of disease. Such a tendency may be hereditary or may arise because of such factors as lack of vitamins, food, or sleep. *See also* [DIATHESIS](#).

**prednisolone** *n.* a synthetic [\\*corticosteroid](#) used to treat rheumatic diseases, inflammatory and allergic conditions (e.g. inflammatory bowel disease and severe asthma), and some cancers (e.g. leukaemia, lymphoma). Side-effects are those of [\\*cortisone](#).

**pre-eclampsia** *n.* the combination of [\\*pregnancy-induced hypertension](#) and [\\*proteinuria](#) (>0.3 g in 24 hours) with or without oedema. The condition usually resolves after delivery, but the risk of [\\*eclampsia](#) remains for up to the eleventh day postpartum. *See also* [ECLAMPSIA](#); [HELLP SYNDROME](#).

**pre-excitation** *n.* premature electrical activation of the heart ventricles due to the presence of an [\\*accessory pathway](#) between atria and ventricles that conducts faster than the [\\*atrioventricular node](#). *See also* [ATRIOVENTRICULAR RECIPROCATING TACHYCARDIA](#); [WOLFF–PARKINSON–WHITE SYNDROME](#).

**prefrontal lobe** the region of the brain at the very front of each cerebral hemisphere (*see* [FRONTAL LOBE](#)). The functions of the lobe are concerned with emotions, memory, learning, and social behaviour. Nerve tracts in the lobe are cut during the operation of prefrontal [\\*leucotomy](#).

**pregabalin** *n.* *see* [GABAPENTIN](#).

**preganglionic** *adj.* describing fibres in a nerve pathway that end in a ganglion, where they form synapses with [\\*postganglionic](#) fibres that continue the pathway to the effector organ, muscle or gland.

**pre-gangrene** *n.* the penultimate stage of vascular insufficiency before [\\*gangrene](#) sets in; the term is usually applied to [\\*ischaemia](#) of the lower limb.

**pregestational diabetes** Pre-existing diabetes mellitus in a woman who becomes pregnant. Pregnancy has profound effects on diabetic control and insulin requirements, which are almost doubled, and hypoglycaemia is more

common. There is an increased risk of many complications, including fetal *\*macrosomia* and *\*shoulder dystocia*, and pre-eclampsia is twice as common in diabetic pregnancies. *\*Polyhydramnios* and preterm labour are also more common. Even in well-controlled cases, delivery is normally indicated approximately two weeks before the estimated date due to the size of the baby and falling insulin requirements with late gestation, which can affect the uteroplacental flow.

**pregnancy** *n.* the period during which a woman carries a developing fetus, normally in the uterus (*compare* **ECTOPIC PREGNANCY**). Pregnancy lasts for approximately 266 days, from *\*conception* until the baby is born, or 280 days from the first day of the last menstrual period (*see* **NAEGELE RULE**). During pregnancy menstruation is absent, there may be a great increase in appetite, and the breasts increase in size; the woman may also experience *\*morning sickness*. These and other changes are brought about by a hormone (*\*progesterone*) produced at first by the ovary and later by the *\*placenta*. Definite evidence of pregnancy is provided by various *\*pregnancy tests*, by the detection of the heartbeat of the fetus, and by ultrasound. Medical name: **cyesis**. *See also* **PSEUDOCYESIS**. —**pregnant** *adj.*

**pregnancy epulis (pregnancy tumour, granuloma gravidarum)** a benign growth on the gums caused by inflammation of the gingivae during pregnancy. This type of *\*epulis* may not need any specific treatment as it often shrinks post-partum.

**pregnancy-induced hypertension (PIH)** raised blood pressure (>140/90 mmHg) developing in a woman during the second half of pregnancy. It usually resolves within six weeks of delivery and is associated with a better prognosis than *\*pre-eclampsia*.

**pregnancy of unknown location (PUL)** a positive pregnancy test when no fetus can be seen on an ultrasound scan, which is due to a very early ongoing pregnancy, an early failing pregnancy, or an ectopic pregnancy not located on scan.

**pregnancy test** any of several methods used to demonstrate whether or not a woman is pregnant. Most pregnancy tests are based on the detection of a hormone, *\*human chorionic gonadotrophin* (hCG), in the urine. The sample of urine is mixed with serum containing antibodies to hCG and marker particles

(sheep red cells or latex particles) coated with hCG. In the absence of pregnancy, the antibodies will cause **\*agglutination** of the marker particles. If the urine is from a pregnant woman, the antibodies will be absorbed and no agglutination will occur. These tests may be positive for pregnancy as early as 30 days after the date of the last normal period and are 98% accurate. Newer tests using **\*monoclonal antibodies (beta hCG)** are more easily interpreted. When carried out on serum rather than urine, these tests give even earlier positive results.

**pregnanediol** *n.* a steroid that is formed during the metabolism of the female sex hormone **\*progesterone**. It occurs in the urine during pregnancy and certain phases of the menstrual cycle.

**pregnenolone** *n.* a steroid synthesized in the adrenal glands, ovaries, and testes. Pregnenolone is an important intermediate product in steroid hormone synthesis and can – depending on the pathways followed – be converted to corticosteroids (glucocorticoids or mineralocorticoids), androgens, or oestrogens.

**preictal phase** *see* **AURA**.

**preimplantation genetic diagnosis (PGD)** a diagnostic procedure carried out on embryos at the earliest stage of development, before implantation in the uterus. Access to these early embryos requires the **\*in vitro fertilization** of egg cells: three days after fertilization one or two cells are aspirated from the six-cell embryo; alternatively, tissue is removed from an embryo at five or six days, when it has reached the **\*blastocyst** stage. Isolated cells can then be genetically analysed, allowing the transfer of selected embryos to the mother. One of the major applications of PGD is for the detection (using the **\*FISH** technique) of chromosomal abnormalities, especially **\*aneuploidies** (e.g. Down's syndrome); the procedure is used mainly in women who have had repeated miscarriages or have failed to achieve pregnancy after several IVF treatment cycles, which could be due to the presence of such abnormalities in the embryo. PGD can also be used to detect defective genes responsible for hereditary disorders (e.g. the commonest form of cystic fibrosis, Huntington's disease) and genes associated with susceptibility to certain cancers. When a defect is detected, **\*genetic counselling** is offered.

**premature beat** *see* **ECTOPIC BEAT**.

**premature birth** *see* **PRETERM BIRTH**.

**premature ejaculation** persistent or recurrent emission of semen (and consequent loss of erection) with minimal stimulation before insertion of the penis into the vagina or immediately afterwards. Patients are treated with behavioural or pharmacological therapy or a combination of both.

**premature ovarian failure** menopause occurring before the age of 40. It may be caused by autoimmunity, chemotherapy, radiotherapy, or genetic factors, for example a mutation in the FSH receptor gene causing excess secretion of gonadotrophins and small underdeveloped ovaries. Treatment is by hormone replacement, either with the contraceptive pill or HRT. **\*Oocyte donation** should be discussed if the patient wishes for assisted conception.

**premature rupture of membranes** *see* **PROM**; **PPROM**; **LABOUR**.

**premedication** *n.* drugs administered to a patient before an operation (usually one in which an anaesthetic is used). Premedication usually comprises injection of a sedative (such as a **\*benzodiazepine**, to calm the patient down, together with a drug, such as **\*hyoscine**, to dry up the secretions of the lungs (which might otherwise be inhaled during anaesthesia).

**premenstrual syndrome (PMS)** a group of symptoms experienced in varying degrees by women of reproductive age up to two weeks before menstruation. These include altered mental stability, fatigue, bloating, breast tenderness, and headaches. Premenstrual symptoms that are more severe and have a substantial impact on many aspects of a woman's life are classified in DSM-5 as **premenstrual dysphoric disorder** and may include more psychological symptoms (e.g. depression, extreme anxiety, and tension). Treatment for mild cases includes support, reassurance, dietary guidance, and stress reduction. More severe cases may require hormone therapy (gonadorelin analogues, combined oral contraceptives, progestogens), diuretics, and SSRIs.

**premolar (bicuspid)** *n.* either of the two teeth on each side of each jaw behind the canines and in front of the molars in the adult **\*dentition**. There are no premolars in the primary (deciduous) dentition.

**premyelocyte** *n.* *see* **PROMYELOCYTE**.

**prenatal diagnosis (antenatal diagnosis)** diagnostic procedures carried out on pregnant women in order to detect the presence of genetic or other abnormalities in the developing fetus. Ultrasound scanning (*see* **ULTRASONOGRAPHY**) remains the cornerstone of prenatal diagnosis. Other procedures include chromosome and enzyme analysis of fetal cells obtained by *\*amniocentesis* or, at an earlier stage of pregnancy, by *\*chorionic villus sampling* (CVS). **Noninvasive prenatal diagnosis** involves a blood test to analyse cell-free fetal DNA in maternal blood. It can be performed during the first trimester and is used for fetal rhesus (Rh) determination in Rh-negative mothers, fetal sex determination in pregnancies at risk of sex-linked disorders, and for some single-sex gene disorders (e.g. achondroplasia). *Compare* **PRENATAL SCREENING**.

**prenatal screening** *\*screening tests* carried out to estimate the risk of chromosomal or other abnormalities being present in a developing fetus. They include blood tests to measure levels of *\*human chorionic gonadotrophin* (hCG), *\*PAPP-A*, *\*alpha-fetoprotein* (AFP), inhibin (*see* **ACTIVIN**), and *\*unconjugated oestriol* (uE<sub>3</sub>) (*see also* **TRIPLE TEST**) and also ultrasound scanning for the presence of soft markers (*see* **ULTRASOUND MARKER**; **NUCHAL TRANSLUCENCY SCANNING**). If the results indicate a high risk of abnormalities being present, a diagnosis may be confirmed by more invasive procedures (*see* **PRENATAL DIAGNOSIS**).

**preneoplastic** *adj.* preceding the formation of a benign or malignant tumour (neoplasm). Preneoplastic lesions have the potential to give rise to tumours at that site. For example, mammary ductal epithelial *\*hyperplasia* can give rise to *\*ductal carcinoma in situ*. Preneoplastic conditions may result in tumours at that site or elsewhere. For example, ulcerative colitis predisposes to the development of colorectal *\*adenocarcinoma* and *\*cholangiocarcinoma*.

**preoperative** *adj.* before operation: referring to the condition of a patient or to treatment, such as sedation, given at this time.

**preparedness** *n.* (in psychology) a quality of some stimuli that makes them much more likely to trigger a pathological fear. For example, animals or high places are much more likely to become the subject of a *\*phobia* than are plants or clothes. One theory is that individuals are genetically predisposed

to **\*conditioning** of fear to objects that have been a biological threat during human evolution.

**prepatellar bursitis** *see* **HOUSEMAID'S KNEE**.

**prepubertal** *adj.* relating to or occurring in the period before puberty.

**prepuce (foreskin)** *n.* the fold of skin that grows over the end (glans) of the penis. On its inner surface modified sebaceous glands (**preputial glands**) secrete a lubricating fluid over the glans. The accumulation of this secretion is known as **\*smegma**. The foreskin is often surgically removed in infancy (*see* **CIRCUMCISION**). The fold of skin that surrounds the clitoris is also called the prepuce. —**preputial** *adj.*

**preputial glands** modified sebaceous glands on the inner surface of the **\*prepuce**.

**preputioplasty (prepuceplasty)** *n.* an alternative to circumcision to correct a tight foreskin (prepuce). The procedure involves a short longitudinal incision into the narrowed end of the prepuce that allows easy retraction. The inner and outer layers of the prepuce are then sutured together transversely to widen the preputial opening.

**prepyramidal** *adj.* **1.** situated in the middle lobe of the cerebellum, in front of the **\*pyramid**. **2.** describing nerve fibres in tracts that descend from the cerebral cortex to the spinal cord, before the crossing over that occurs at the pyramid of the medulla oblongata.

**presby- (presbyo-)** *combining form denoting* old age.

**presbyacsis** *n.* the progressive sensorineural **\*deafness** that occurs with age.

**presbyopia** *n.* difficulty in reading at the usual distance (about one foot from the eyes) and in performing other close work, due to the decline with age in the ability of the eye to alter its focus to see close objects clearly. This is caused by gradual loss of elasticity of the lens of the eye which thus becomes progressively less able to increase its curvature in order to focus on near objects.

**prescribed disease** one of a number of **\*occupational diseases** for which benefits are payable. These diseases arise as a result of employment requiring close contact with a hazardous substance or circumstance. Prescribed diseases are categorized by cause: physical, biological, chemical, or other. Examples include poisoning by such chemicals as mercury or benzene, decompression sickness in divers, and infections such as **\*anthrax** in those handling wool. Some diseases that occur widely in the population may be prescribed in relation to a specific occupation (e.g. deafness in those working with pneumatic drills or tuberculosis in mortuary attendants). *See also* **COSHH**.

**prescription** *n.* a written direction from a registered medical practitioner to a pharmacist for preparing and dispensing a drug.

**presenility** *n.* premature ageing of the mind and body, so that a person shows the reduction in mental and physical abilities normally found only in old age. *See also* **DEMENTIA**; **PROGERIA**. —**presenile** *adj.*

**present** *vb.* **1.** (of a patient) to come forward for examination and treatment because of experiencing specific symptoms (**presenting symptoms**). **2.** (in obstetrics) *see* **PRESENTATION**.

**presentation** *n.* the part of the fetus that is closest to the birth canal and can be felt on inserting a finger into the vagina. Normally the back of the head (vertex) presents, the most favourable position for delivery being occipital anterior (*see* **OCCIPUT**). However, the buttocks may present (*see* **BREECH PRESENTATION**) or, if the fetus lies transversely across the uterus, the shoulder or arm may present (*see* **MALPRESENTATION**). These abnormal presentations may cause complications during childbirth, and attempts may be made to correct them. *See also* **DENOMINATOR**.

**pressor** *n.* an agent that raises blood pressure. *See* **VASOCONSTRICTOR**.

**pressure index (PI)** the ratio of the pressure in the posterior tibial artery to that in the brachial artery, which reflects the degree of arterial obstruction in the artery of the lower limb.

**pressure point** a point at which an artery lies over a bone on which it may be compressed by finger pressure, to arrest haemorrhage beyond. For example,

the femoral artery may be compressed against the pelvic bone in the groin.

**pressure sore (bedsore, decubitus ulcer)** an ulcerated area of skin caused by continuous pressure on part of the body: a hazard to be guarded against in all bedridden (especially unconscious) patients. Healing is hindered by the reduced blood supply to the area, and careful nursing is necessary to prevent local gangrene. The patient's position should be changed frequently (pressure-relieving mattresses are extremely helpful), and the buttocks, heels, elbows, and other regions at risk kept dry and clean.

**presymptomatic** *adj.* describing or relating to a symptom that occurs before the typical symptoms of a disease. *See also* **PRODROMAL**.

**presystole** *n.* the period in the cardiac cycle just preceding systole.

**preterm birth (premature birth)** birth of a baby before 37 weeks (259 days) of gestation (calculated from the first day of the mother's last menstrual period); a birth at less than 23 weeks is at present incompatible with life. Such factors as **\*pre-eclampsia**, multiple pregnancies (e.g. twins), maternal infection, and **\*cervical incompetence** may all result in preterm births, but in the majority of cases the cause is unknown. Conditions affecting preterm babies may include **\*respiratory distress syndrome**, feeding difficulties, inability to maintain normal body temperature, **\*apnoea**, infection, **\*necrotizing enterocolitis**, and brain haemorrhages. Supportive treatment is provided in an incubator in a neonatal unit; many infants survive with no residual impairment but the shorter the gestation period, the more serious are the problems to be overcome.

**prevalence** *n.* a measure of morbidity based on current levels of disease in a population, estimated either at a particular time (**point prevalence**) or over a stated period (**period prevalence**). It can be expressed either in terms of affected people (persons) or episodes of sickness per 1000 individuals at risk. *Compare* **INCIDENCE RATE**.

**preventive dentistry** the branch of dentistry concerned with the prevention of dental disease and the promotion and maintenance of oral health. It includes dietary counselling, advice on oral hygiene, and the application of **\*fluoride** and **\*fissure sealants** to the teeth.

**preventive medicine** the branch of medicine whose main aim is the prevention of disease. This is a wide field, in which workers tackle problems ranging from the immunization of persons against infectious diseases, such as diphtheria or whooping cough, to finding methods of eliminating *\*vectors*, such as malaria-carrying mosquitoes. See **PRIMARY PREVENTION**; **SECONDARY PREVENTION**; **TERTIARY PREVENTION**. See also **WORLD HEALTH ORGANIZATION**.

**preventive resin restoration** a hybrid between a *\*fissure sealant* and a conventional *\*filling* that is used to treat early dental caries involving dentine.

**priapism** *n.* a prolonged (greater than four hours) and usually painful erection of the penis. **Ischaemic priapism** is associated with blood disorders (such as sickle-cell disease or leukaemia) or haemodialysis or it can result from administration of drugs used to treat erectile dysfunction, such as *\*papaverine* or intracorporeal *\*alprostadil*. It requires urgent decompression by draining the blood from the corpora cavernosa of the penis with a 19 SWG butterfly needle and instilling a *\*vasoconstrictor* (e.g. phenylephrine). If aspiration fails surgical shunts may be necessary. An unrelieved ischaemic priapism results in eventual complete fibrosis of the spongy tissue of the corpora and no further erections are possible. A penile *\*prosthesis* may be appropriate in this situation. **Nonischaemic priapism** is usually caused by perineal trauma resulting in an arteriovenous *\*fistula*. This does not result in tissue damage. *\*Embolization* of the site of vascular injury is usually necessary.

**prickle cells** cells with cytoplasmic processes that form intercellular bridges. The germinative layer of the *\*epidermis* is sometimes called the prickle cell layer.

**prickly heat** an itchy rash of small raised red spots. It occurs usually on the face, neck, back, chest, and thighs. Infants and obese people are susceptible to prickly heat, which is most common in hot moist weather. It is caused by blockage of the sweat ducts and the only treatment is removal of the patient to a cool (air-conditioned) place. Medical name: **miliaria rubra**.

**prilocaine** *n.* a local *\*anaesthetic* used particularly in dentistry. High doses of the drug may cause methaemoglobinaemia and cyanosis. Prilocaine is also

a constituent of [\\*EMLA cream](#).

**prima facie** a principle that, at first sight, must be conformed with unless it conflicts with an equally important principle. Because each of the [\\*four principles](#) in medical ethics is prima facie, no one of them has overriding priority.

**primaquine** *n.* a drug used in the treatment of benign [\\*malarias](#). It is administered after treatment with [\\*chloroquine](#). High doses may cause blood disorders (such as methaemoglobinaemia or haemolytic anaemia) and digestive upsets.

**primary care** health care provided by [\\*general practitioners](#) or other health professionals to whom patients seeking medical treatment have direct access and to whom they can usually self-refer. Primary care services provided by the NHS include general practices, general dental and ophthalmic services, together with [\\*NHS walk-in centres](#) and other community services outside the hospital service. Some primary care services are also available in the private sector. *See also* [COMMUNITY HEALTH](#); [DOMICILIARY SERVICES](#); [GENERAL DENTAL SERVICES](#); [HEALTH CENTRE](#); [NHS 111](#). *Compare* [SECONDARY CARE](#); [TERTIARY CARE](#).

**primary care trust (PCT)** formerly, one of a group of free-standing statutory bodies within the National Health Service that had responsibility for the health-care needs of their local community; their aim was to improve the health of and address [\\*health inequalities](#) in their communities. In 2013, PCTs and SHAs were abolished. Their commissioning responsibilities passed to [\\*clinical commissioning groups](#) and [\\*NHS England](#); their public health responsibilities passed to local authorities and [\\*Public Health England](#).

**primary prevention** avoidance of the onset of disease by behaviour modification or treatment. For example, limiting alcohol intake reduces the risk of developing cirrhosis, and routine childhood [\\*immunization](#) prevents the development of infections of childhood. *See also* [PREVENTIVE MEDICINE](#); [SECONDARY PREVENTION](#); [TERTIARY PREVENTION](#).

**primary teeth (deciduous teeth, milk teeth)** the first set of teeth, which develop in infancy. These teeth are normally shed just before the eruption of

their permanent successors. In the absence of permanent successors they can remain functional for many years. *See* [DENTITION](#).

**prime** *vb.* (in chemotherapy) to administer small doses of a [\\*cytotoxic drug](#) prior to high-dose chemotherapy and/or radiotherapy. This causes proliferation of the primitive bone marrow cells and aids subsequent regeneration of the bone marrow.

**prime mover** *see* [AGONIST](#).

**primidone** *n.* an [\\*anticonvulsant](#) drug used to treat major and partial epilepsy and essential tremor. Common side-effects, which are usually transient, include drowsiness, muscle incoordination, nausea, and sight disturbances.

**primigravida** *n.* a woman experiencing her first pregnancy.

**primipara** *n.* a woman who has given birth to one infant capable of survival.

**primitive streak** the region of the embryo that proliferates rapidly, producing mesoderm cells that spread outwards between the layers of ectoderm and endoderm.

**primordial** *adj.* (in embryology) describing cells or tissues that are formed in the early stages of embryonic development.

**primum non nocere** Latin for ‘first do no harm’, a traditional medical aphorism, similar to the Greek for ‘abstain from doing harm’ in the Hippocratic Oath and also to the [\\*prima facie](#) principle of [\\*nonmaleficence](#). It is a reminder to first consider whether a proposed medical intervention risks causing more harm than good. *See also* [RISK–BENEFIT ANALYSIS](#).

**P–R interval** the interval on an [\\*electrocardiogram](#) between the onset of atrial activity and ventricular activity. It represents the time required for the impulse from the [\\*sinoatrial node](#) to reach the ventricles.

**prion** *n.* an abnormal form of a constituent protein (PrP) of brain cells. The abnormal proteins are very stable: they are not removed by the normal cellular processes of degradation and are resistant to radiation and sterilization (therefore surgical instruments need first to undergo [\\*decontamination](#)). They are believed to interact with normal PrP in such a way as to convert it to the abnormal form, which accumulates in the brain.

Prions are now widely accepted as being the causal agents of a range of serious diseases including *\*Creutzfeldt–Jakob disease*, *\*Gerstmann–Straussler–Scheinker syndrome*, and *\*kuru*, all of which are *\*spongiform encephalopathies*. Different mutations in the *PrP* gene are believed to be responsible for the different forms of these so-called **prion disorders**.

**privacy** *n.* the condition of being apart from public view. The law recognizes privacy as a *\*human right* by virtue of the Human Rights Act 1998, although there are occasions when this right may be overridden (for example, in legal proceedings). In medical ethics, the concept is associated with maintaining a patient's dignity and *\*autonomy* and with the doctor's duty of *\*confidentiality*.

**PRK** photorefractive keratectomy (*see* **KERATECTOMY**).

**pro-** *prefix denoting* **1.** before; preceding. **2.** a precursor. **3.** in front of.

**proarrhythmia** *n.* the paradoxical triggering of new heart rhythm disturbances by a drug given with the intention of inhibiting an *\*arrhythmia*.

**probability** *n.* *see* **SIGNIFICANCE**.

**proband** *n.* *see* **PROPOSITUS**.

**probang** *n.* a long flexible rod with a small sponge, ball, or tuft at the end, used to remove obstructions from the larynx or oesophagus (gullet). A probang is also used to apply medication to these structures.

**probe** *n.* **1.** a thin rod of pliable metal, such as silver, with a blunt end. The instrument is used for exploring cavities, wounds, fistulae, and sinus channels. **2. (dental probe)** a hand instrument designed for specific exploratory examination procedures (e.g. for dental caries, endodontics, or periodontics). **3. (ultrasound probe)** *see* **ULTRASOUND**; **TRANSDUCER**. **4. (gene probe)** a radioactively labelled cloned section of DNA that is used to detect identical sections of nucleic acid by means of pairing between complementary bases. *See* **NORTHERN BLOT ANALYSIS**; **SOUTHERN BLOT ANALYSIS**.

**probenecid** *n.* a drug that reduces the level of uric acid in the blood (*see* **URICOSURIC DRUG**). It is administered to prevent the toxic effects on the

kidney of the antiviral drug cidofovir, used in treating severe cytomegalovirus eye infection in AIDS patients. Mild side-effects, such as digestive upsets, dizziness, and frequent urination, may occur.

**probing depth** a measurement of the depth of a periodontal pocket (*see* PERIODONTAL DISEASE).

**probiotics** *pl. n.* **1.** bacteria (e.g. *\*Lactobacillus*) or other microorganisms that are said to be beneficial to the human body and occur in or are added to certain foods (e.g. yoghurt) and supplements. **2.** the foods or supplements containing these microorganisms, which are often given to patients who are taking antibiotics to help prevent antibiotic-induced diarrhoea. —**probiotic** *adj.*

**procarbazine** *n.* a drug that inhibits growth of cancer cells by preventing cell division and is used to treat such cancers as Hodgkin's disease. Side-effects may include loss of appetite, nausea, *\*myelosuppression*, and rash.

**procarcinogen** *n.* a chemical substance that does not itself cause cancer but which can be converted by enzymatic action to another substance that can cause cancer (the ultimate *\*carcinogen*).

**process** *n.* **1.** (in anatomy) a thin prominence or protuberance; for example, any of the processes of a vertebra. **2.** the steps by which a decision is reached or an outcome attained. Although good medical practice is largely recognized by its good outcomes, the process by which these outcomes were reached is also seen as important in assessing the standard of care.

**prochlorperazine** *n.* a phenothiazine *\*antipsychotic* drug used to treat schizophrenia and other psychoses and severe vertigo, nausea, and vomiting. Possible side-effects include drowsiness and dry mouth, and high doses may cause tremors and abnormal muscle movements.

**prolapsed** *n.* the complete downward displacement (*\*prolapse*) of an organ, especially the uterus (**uterine prolapsed**), which protrudes from the vaginal opening. Uterine prolapsed may result from injury to the floor of the pelvic cavity, invariably the result of childbirth.

**proct-** (**procto-**) *combining form denoting the anus and/or rectum.*

**proctalgia (proctodynia)** *n.* pain in the rectum or anus. In **proctalgia fugax** sudden severe pain affects the rectum and may last for seconds to minutes; the pain resolves fully with no ongoing symptoms, and attacks may be days or months apart. There is no structural disease and the pain is probably due to muscle spasm (*see* **IRRITABLE BOWEL SYNDROME**). Relief is sometimes obtained from a bowel action, inserting a finger into the rectum, or from a hot bath. It may be prevented by measures used in treating the irritable bowel syndrome.

**proctatresia** *n.* *see* **IMPERFORATE ANUS**.

**proctectasia** *n.* enlargement or widening of the rectum, usually due to long-standing constipation (*see* **DYSCHIZIA**).

**proctectomy** *n.* surgical removal of the rectum. It is usually performed for cancer of the rectum and may require the placement of a stoma (*see* **COLOSTOMY**). If the anus is left, an **\*ileal pouch** can be constructed to replace the rectum.

**proctitis** *n.* inflammation of the rectum. Symptoms are ineffective straining to empty the bowels (**\*tenesmus**), urgency, rectal pain, diarrhoea, and the discharge of blood or mucus. Proctitis is invariably present in **\*ulcerative colitis** and sometimes in **\*Crohn's disease** and a sexually transmitted infection (particularly in those who practise anal intercourse). Rarer causes include damage by irradiation (**radiation proctitis**), or after a colostomy has rendered the rectum nonfunctional (**diversion proctitis**).

**proctocele** *n.* *see* **RECTOCELE**.

**proctocolectomy** *n.* a surgical operation in which the rectum and colon are removed. In **panproctocolectomy** the entire rectum and colon are removed, necessitating either a permanent opening of the ileum (*see* **ILEOSTOMY**) or the construction of an **\*ileal pouch**. This is usually performed for **\*ulcerative colitis**.

**proctocolitis** *n.* inflammation of the rectum and colon, usually due to **\*ulcerative colitis**. *See also* **PROCTITIS**.

**proctodeum** *n.* the site of the embryonic anus, marked by a depression lined with ectoderm. The membrane separating it from the hindgut breaks down in the third month of gestation. *Compare* **STOMODEUM**.

**proctodynia** *n.* *see* **PROCTALGIA**.

**proctogram** *n.* an X-ray of the rectum taken after contrast material has been infused into it using a catheter. A **defecating proctogram** is a series of X-ray or MR images captured during defecation to highlight any abnormalities.

**proctology** *n.* the study of disorders of the rectum and anus.

**proctorrhaphy** *n.* a surgical operation to stitch tears or lacerations of the rectum or anus.

**proctoscope** *n.* an illuminated instrument that allows inspection of the distal rectum and the anus for the presence of haemorrhoids, rectal polyps or masses, anal fissures, and inflammation. Minor procedures (such as banding of haemorrhoids) may be performed during **proctoscopy**.

**proctosigmoiditis** *n.* inflammation of the rectum and the sigmoid (lower) colon. *See also* **PROCTOCOLITIS**.

**proctotomy** *n.* incision into the rectum or anus to correct **\*stricture** (narrowing) of the canal or to open an **\*imperforate anus**.

**procyclidine** *n.* an **\*antimuscarinic** drug used to reduce muscle tremor and rigidity in parkinsonism. Common side-effects include dry mouth, blurred vision, and giddiness.

**prodromal** *adj.* relating to the period of time between the appearance of the first symptoms of an infectious disease and the development of a rash or fever. A **prodromal rash** is one preceding the full rash of an infectious disease.

**prodrome** *n.* a symptom indicating the onset of a disease.

**prodrug** *n.* a drug that requires metabolism in the liver before becoming biologically active. Examples are **\*carbimazole**, which is metabolized to the pharmacologically active compound methimazole; and **\*capecitabine**, which is metabolized to **\*fluorouracil**.

**proenzyme (zymogen)** *n.* the inactive form in which certain enzymes (e.g. digestive enzymes) are originally produced and secreted. The existence of this inactive form prevents the enzyme from breaking down the cells in which it was made. Once the proenzyme has been secreted it is converted to the active form.

**proerythroblast** *n.* the earliest recognizable precursor of the red blood cell (erythrocyte). It is found in the bone marrow and has a large nucleus and a cytoplasm that stains deep blue with **\*Romanowsky stains**. *See also* **ERYTHROBLAST**; **ERYTHROPOIESIS**.

**professionalism** *n.* possession of a high level of intellectual and technical expertise with a commitment to public service and the ability to practise autonomously within the regulations of the discipline. It calls for a special set of **\*values**, behaviours, and relationships including respect and care for oneself as well as patients and others, honesty, **\*integrity**, reliability, **\*responsibility**, communication, collaboration, **\*compassion**, **\*empathy**, altruism, and **\*advocacy** – but also self-awareness and a knowledge of limits (see **BURNOUT**). Major shortcomings might be reported to a professional body (such as the **\*General Medical Council** for UK doctors).

**profilometer** *n.* a measuring device to quantify the roughness of a surface, such as eroded enamel.

**profunda** *adj.* describing blood vessels that are deeply embedded in the tissues they supply.

**profundaplasty** *n.* surgical enlargement of the junction of the femoral artery and its deep branch, a common operation to relieve narrowing by atherosclerosis at this point.

**progeria** *n.* a very rare condition in which all the signs of old age appear and progress in a child, so that ‘senility’ is reached before puberty.

**progesterone** *n.* a steroid hormone secreted by the **\*corpus luteum** of the ovary, the placenta, and also (in small amounts) by the adrenal cortex and testes. It is responsible for preparing the inner lining (endometrium) of the uterus for pregnancy. If fertilization occurs it maintains the uterus throughout pregnancy and prevents the further release of eggs from the ovary. *See also* **MENSTRUAL CYCLE**; **PROGESTOGEN**.

**progestogen** *n.* one of a group of naturally occurring or synthetic steroid hormones, including **\*progesterone**, that maintain the normal course of pregnancy. Progestogens are used to treat premenstrual tension, **\*amenorrhoea**, and abnormal bleeding from the uterus. Because they prevent ovulation, progestogens are a major constituent of **\*oral contraceptives** and other forms of hormonal **\*contraception**. Synthetic progestogens may be taken by mouth but the naturally occurring hormone must be given by intramuscular injection or subcutaneous implant, as it is rapidly broken down in the liver.

**proglottis** *n.* (*pl.* **proglottids** or **proglottides**) one of the segments of a **\*tapeworm**. Mature segments, situated at the posterior end of the worm, each consist mainly of a branched uterus packed with eggs.

**prognathism** *n.* abnormal protrusion of one or both jaws. — **prognathic** *adj.*

**prognosis** *n.* an assessment of the future course and outcome of a patient's disease, based on knowledge of the course of the disease in other patients together with the general health, age, and sex of the patient.

**progressive lenses** *see* **VARIFOCAL LENSES**.

**progressive supranuclear palsy (Steele–Richardson–Olszewski syndrome)** a progressive neurological disorder resulting from degeneration of the motor neurons, basal ganglia, and brainstem. Starting in late middle age, it is characterized by a staring facial expression due to impaired ability to move the eyes up and down, progressing to difficulties in swallowing, speech, balance, and movement and general spasticity. The condition enters the differential diagnosis of **\*parkinsonism**, with which it is often confused in its early stages.

**proguanil** *n.* a drug that kills malaria parasites and is used in combination with atovaquone for the prevention and treatment of malignant (*falciparum*) **\*malaria**. Alone or (more usually) in combination with **\*chloroquine**, it may be used for the prevention of malaria. It rarely causes side-effects.

**proinsulin** *n.* a substance produced in the pancreas from which the hormone **\*insulin** is derived.

**projection** *n.* (in psychology) the attribution of one's own qualities to other people. In psychoanalysis this is considered to be one of the **\*defence**

**mechanisms**; people who cannot tolerate their own feelings (e.g. anger) may cope by imagining that other people have those feelings (e.g. are angry).

**projective test** (in psychology) a way of measuring aspects of personality, in which the subject is asked to talk freely about ambiguous objects. His responses are then analysed. Examples are the **\*Rorschach test** and the Thematic Apperception Test (in which the subject invents stories about a set of pictures).

**prokinetic agent (prokinetic)** an agent (e.g. **\*domperidone**) that stimulates intestinal peristalsis, thus increasing gastrointestinal motility.

**prolactin (lactogenic hormone, luteotrophic hormone, luteotrophin)** *n.* a hormone, synthesized and stored in the anterior pituitary gland, that stimulates milk production after childbirth and also stimulates production of **\*progesterone** by the **\*corpus luteum** in the ovary. Excessive secretion of prolactin, resulting in raised serum levels of the hormone (**hyperprolactinaemia**), is usually due to the presence of a pituitary adenoma (see **PROLACTINOMA**); other causes include **\*dopamine** receptor antagonists (e.g. antipsychotic drugs) and chronic renal failure.

**prolactinoma** *n.* a benign tumour (an **\*adenoma**) of the pituitary gland that secretes excessive amounts of prolactin. Symptoms include loss of sexual drive, amenorrhoea or impotence, and sometimes production of breast milk in men and women. If the tumour is large enough it may compress and damage adjacent structures. Treatment is with dopamine receptor agonist drugs, such as **\*bromocriptine**, as dopamine inhibits prolactin production and may also shrink and harden the tumour, facilitating later surgical removal.

**prolapse** *n.* downward displacement of an organ or tissue from its normal position, usually the result of weakening of the supporting tissues. Prolapse of the uterus and/or vagina is, in most cases, caused by stretching and/or tearing of the supporting tissues during childbirth. The cervix may be visible at the vaginal opening or the uterus and vagina may be completely outside the opening (procidentia). Treatment is by surgical shortening of the supporting ligaments and narrowing of the vagina and vaginal orifice (see **COLPORRHAPHY**; **COLPOPERINEORRHAPHY**) or by surgical removal of the uterus (vaginal **\*hysterectomy**). In a **rectal prolapse**, the rectum descends to lie outside the anus; it is surgically treated (see **RECTOPEXY**).

**prolapsed intervertebral disc (PID)** a ‘slipped disc’: protrusion of the pulpy inner material of an **\*intervertebral disc** through a tear in the fibrous outer coat, causing pressure on adjoining nerve roots, ligaments, etc. The condition often results from sudden twisting or bending of the backbone or lifting. Pressure on the sciatic nerve root causes **\*sciatica**, and if severe may damage the nerve’s function, leading to abnormalities or loss of sensation, muscle weakness, or loss of tendon reflexes. 70–80% of patients improve with conservative treatment of rest and analgesics, and traction may help. If these fail, the protruding portion of the disc is surgically removed (*see* **DISCECTOMY**; **LAMINECTOMY**; **MICRODISCECTOMY**).

**proline** *n.* an **\*amino acid** found in many proteins.

**PROM** prelabour (or premature) rupture of membranes: spontaneous rupture of membranes prior to the onset of labour. The majority of women who demonstrate this phenomenon will go into active labour spontaneously within the following 48 hours. *Compare* **PPROM**.

**promazine** *n.* a phenothiazine **\*antipsychotic** drug used to relieve agitation, confusion, and restlessness. Common side-effects are drowsiness and dizziness.

**promegakaryocyte** *n.* an immature cell, found in the bone marrow, that develops into a **\*megakaryocyte**.

**promethazine** *n.* a powerful **\*antihistamine** drug used to treat allergic conditions and – because of its sedative action – insomnia; it is also used as a premedication and an **\*antiemetic**. Side-effects include drowsiness, dizziness, and confusion.

**prominence** *n.* (in anatomy) a projection, such as a projection on a bone.

**promontory** *n.* (in anatomy) a projecting part of an organ or other structure.

**promoter** (in oncogenesis) *n.* a substance that, in conjunction with an **\*initiator**, leads to the production of a cancer.

**prompting** *n.* a technique used in **\*behaviour modification** to elicit a response not previously present. The subject is made to engage passively in the required behaviour by instructions or by being physically put through the movements. The behaviour can then be rewarded (*see* **REINFORCEMENT**).

This is followed by **fading**, in which the prompting is gradually withdrawn and the reinforcement maintained.

**promyelocyte (premyelocyte)** *n.* the developmental stage of a **\*granulocyte** (a type of white blood cell) between the **\*myeloblast** and the **\*myelocyte**. It has abundant cytoplasm that, with **\*Romanowsky stains**, appears blue with reddish granules. Promyelocytes are normally found in the blood-forming tissue of the bone marrow but may appear in the blood in a variety of diseases. *See also* **GRANULOPOIESIS**.

**pronation** *n.* the act of turning the hand so that the palm faces downwards. In this position the bones of the forearm (radius and ulna) are crossed. *Compare* **SUPINATION**.

**pronator** *n.* any muscle that causes pronation of the forearm and hand; for example, the **pronator teres**, a two-headed muscle arising from the humerus and ulna, close to the elbow, and inserted into the radius.

**prone** *adj.* **1.** lying with the face downwards. **2.** (of the forearm) in the position in which the palm of the hand faces downwards (*see* **PRONATION**). *Compare* **SUPINE**.

**pronephros** *n.* the first kidney tissue that develops in the embryo. It is not functional and soon disappears. *Compare* **MESONEPHROS**; **METANEPHROS**.

**pronucleus** *n.* (*pl.* **pronuclei**) the nucleus of either the ovum or spermatozoon after fertilization but before the fusion of nuclear material. The pronuclei are larger than the normal nucleus and have a diffuse appearance.

**propantheline** *n.* an **\*antimuscarinic** drug that decreases activity of smooth muscle (*see* **ANTISPASMODIC**) and is used to treat disorders of the digestive system and (in adults) **\*enuresis**. Side-effects include dry mouth and blurred vision.

**properdin** *n.* a group of substances in blood plasma that, in combination with **\*complement** and magnesium ions, is capable of destroying certain bacteria and viruses. The properdin complex occurs naturally, rather than as the result of previous exposure to microorganisms, and its activity is not directed against any particular species. *Compare* **ANTIBODY**.

**prophase** *n.* the first stage of **\*mitosis** and of each division of **\*meiosis**, in which the chromosomes become visible under the microscope. The first prophase of meiosis occurs in five stages (see **LEPTOTENE**; **ZYGOTENE**; **PACHYTENE**; **DIPLTENE**; **DIAKINESIS**).

**prophylactic** *n.* an agent that prevents the development of a condition or disease. Examples are **\*glyceryl trinitrate**, which is used to prevent attacks of angina, and allopurinol, used to prevent gout attacks.

**prophylaxis** *n.* any means taken to prevent disease, such as immunization against diphtheria or whooping cough, or **\*fluoridation** to prevent dental decay in children. —**prophylactic** *adj.*

**propofol** *n.* see **ANAESTHETIC**.

**propositus (proband)** *n.* the first individual who is studied in an investigation of several related patients with an inherited or familial disorder.

**propranolol** *n.* a drug (see **BETA BLOCKER**) used to treat abnormal heart rhythm, angina, and high blood pressure; it is also taken to relieve the symptoms of thyrotoxicosis and anxiety associated with palpitation or tremor and to prevent migraine headaches. Common side-effects include digestive upsets, sleep disturbances, lassitude, and coldness of extremities.

**proprietary name** (in pharmacy) the trade name of a drug: the name assigned to it by the firm that manufactured it. For example, Taxotere and Herceptin are the proprietary names of docetaxel and trastuzumab, respectively.

**proprioceptor** *n.* a specialized sensory nerve ending (see **RECEPTOR**) that monitors internal changes in the body brought about by movement and muscular activity. Proprioceptors located in muscles and tendons transmit information that is used to coordinate muscular activity (see **STRETCH RECEPTOR**; **TENDON ORGAN**). See also **MECHANORECEPTOR**.

**proptometer** *n.* see **EXOPHTHALMOMETER**.

**proptosis** *n.* forward displacement of an organ, especially the eye (see **EXOPHTHALMOS**).

**propylthiouracil** *n.* a **\*thionamide** antithyroid drug that is used to treat **\*thyrotoxicosis** and to prepare patients for surgical removal of the thyroid gland. Side-effects may include rashes and digestive upsets.

**prorennin** *n.* *see* **RENNIN**.

**Proscar** *n.* *see* **FINASTERIDE**.

**prosect** *vb.* to dissect a cadaver (or part of one) for anatomical demonstration. — **prosection** *n.* — **prosector** *n.*

**prosencephalon** *n.* the forebrain.

**prosop-** (**prosopo-**) *combining form denoting the face.* Example: **prosopodynia** (pain in).

**prosopagnosia** *n.* inability to recognize faces, either in person or in photographs, due to damage in the right occipito-temporal area of the brain. Causes include stroke and brain tumours.

**prospective study** **1.** a forward-looking review of a group of individuals in relation to morbidity. **2.** *see* **COHORT STUDY**.

**prostacyclin** *n.* a derivative of **\*prostaglandin** H produced by the endothelium lining blood vessel walls. It inhibits blood clotting by preventing platelet aggregation and causes vasodilatation (*compare* **THROMBOXANE A<sub>2</sub>**). **\*Epoprostenol** is a pharmaceutical preparation of prostacyclin.

**prostaglandin** *n.* one of a group of hormone-like substances present in a wide variety of tissues and body fluids (including the uterus, brain, lungs, kidney, and semen). Prostaglandins have many actions; for example, they cause contraction of smooth muscle (including that of the uterus), dilation of blood vessels, and are mediators in the process of inflammation (aspirin and other **\*NSAIDs** act by blocking their production). They are also involved in the production of mucus in the stomach, which provides protection against acid gastric juice; use of NSAIDs reduces this effect and predisposes to peptic ulceration, the principal side-effect of these drugs. There are nine classes of prostaglandins (PGA–I), within which individual prostaglandins are denoted by numerals (e.g. PGE<sub>1</sub>). Synthetic prostaglandins are used to

induce labour or produce abortion (see [DINOPROSTONE](#); [GEMEPROST](#)) and to treat peptic ulcers (see [MISOPROSTOL](#)), congenital heart disease in newborn babies (see [ALPROSTADIL](#)), and glaucoma (see [LATANOPROST](#)).

**prostate cancer** a malignant tumour ([\\*carcinoma](#)) of the prostate gland, a common form of cancer in elderly men. In most men it progresses slowly over many years and gives symptoms similar to those of benign enlargement of the prostate (see [PROSTATE GLAND](#)). Before it was possible to test for [\\*prostate specific antigen](#) (PSA), the tumour had often invaded locally, spread to regional lymph nodes, and metastasized to bone before clinical presentation. By checking elevated levels of PSA or [\\*PCA3](#), prostate cancer can be detected 5–10 years before the tumour would present symptomatically. If the disease is confined to the prostate, the patient may be offered active surveillance or radical [\\*prostatectomy](#), radical radiotherapy, or [\\*brachytherapy](#); [\\*cryotherapy](#) or [\\*HIFU](#) are available in specialized centres. In elderly patients, it may be enough to monitor the tumour growth. If the disease is outside the prostate, androgen deprivation therapy may be used; this may be achieved by [\\*gonadorelin analogues](#), [\\*anti-androgens](#), surgical castration, or oestrogen therapy.

**prostatectomy** *n.* surgical removal of the prostate gland. The operation is necessary to relieve retention of urine due to enlargement of the prostate or to reduce [\\*lower urinary tract symptoms](#) thought to be due to benign prostatic hyperplasia (see [PROSTATE GLAND](#)). The operation can be performed through the bladder (**transvesical prostatectomy**) or through the surrounding capsule of the prostate (**retropubic prostatectomy**). In the operation of **transurethral prostatectomy** (or **transurethral resection**) some or all the obstructing prostate can be removed through the urethra using a resectoscope (see [RESECTION](#)).

**Radical (or total) prostatectomy** is undertaken for the treatment of prostate cancer that is confined to the gland. It entails removal of the prostate together with its capsule and the seminal vesicles. Continuity of the urinary tract is achieved by anastomosing the bladder to the divided urethra. Radical prostatectomy may be performed by laparoscopy, increasingly with the aid of a robot (**robotic prostatectomy**): the three-armed da Vinci robot can be operated by the surgeon via a console and provides three-dimensional displays of the operation site and surrounding structures.

**prostate gland** a male accessory sex gland that opens into the urethra just below the bladder and vas deferens (see illustration). The prostate is divided into different anatomical regions called **McNeal's zones** (transition, central, peripheral, and anterior fibromuscular zones). During ejaculation it secretes an alkaline fluid that forms part of the **\*semen**. The prostate may become enlarged in elderly men (**benign prostatic hyperplasia**; BPH). This may result in obstruction of the neck of the bladder, impairing urination. The bladder dilates and the increased pressure is transmitted through the ureters to the kidney nephrons, leading to damage and impaired function of the kidneys. Treatment is by transurethral **\*resection** of the prostate (*see also* **PROSTATECTOMY**) or by means of drugs (e.g. **\*finasteride**, alpha blockers).

**The prostate gland and associated structures (median view).**

**prostate specific antigen (PSA)** a protease enzyme produced by the glandular epithelium of the prostate. Its effect is to liquefy the semen within the ejaculate. Overall PSA has a half-life of 2–3 days. Increased quantities are secreted when the gland becomes enlarged or inflamed, and levels of PSA in the blood are significantly elevated in cancer of the prostate. Although there is no clear ‘cut-off’ level for normality, over 4 ng/ml in the blood is associated with a 20% risk of prostate cancer, even in patients with normal-feeling prostates on rectal examination. Age-specific PSA reference ranges are often used. Newer PSA assays can measure free PSA and compare it to the total PSA in the blood. Low free:total PSA ratios indicate a greater risk of prostate cancer and improve the discrimination between cancer and benign disease in men with a PSA in the range 4–10 ng/ml. PSA levels tend to be much higher in advanced prostate cancer and the rate of fall

on treatment (e.g. after radical prostatectomy or radiotherapy) is a good prognostic indicator of response.

**prostatic intraepithelial neoplasia (PIN)** abnormal cells in the prostate that are not cancer, but may be associated with cancer within the prostate. Typically, PIN will be found in prostate biopsies taken because levels of **\*prostate specific antigen** are elevated. Multifocal high-grade PIN (HGPIN) on a prostate biopsy may indicate that another set of prostate biopsies should be taken in the future.

**prostatism** *n.* see **LOWER URINARY TRACT SYMPTOMS**.

**prostatitis** *n.* inflammation of the prostate gland. This may be due to bacterial infection and can be either acute or chronic. In acute prostatitis the patient has all the symptoms of a urinary infection, including pain in the perineal area, temperature, and shivering. Treatment is by antibiotic administration. In chronic prostatitis, patients commonly complain of pain in the area between the scrotum and the anus, accompanied by **\*lower urinary tract symptoms**. Some of these cases are due to bacterial infection, in which case antibiotics are required. In others, no bacterial infection is demonstrated, although there may be evidence of inflammation. Treatment in these cases involves alpha blockers, anti-inflammatory agents, and occasionally antibiotics. In some men, vigorous prostate massage performed under a general anaesthetic can significantly alleviate symptoms.

**prostatorrhoea** *n.* an abnormal discharge of fluid from the prostate gland. This occurs in some patients with acute **\*prostatitis**, who complain of a profuse discharge from the urethra. The discharge is usually thin and watery and is often sterile on culture. The discharge usually subsides when the underlying prostatitis is controlled.

**prosthesis** *n.* (*pl.* **prostheses**) any artificial device that is attached to the body as an aid. Prostheses include bridges, dentures, artificial parts of the face, artificial limbs, hearing aids and cochlear implants, implanted pacemakers, and many other substitutes for parts of the body that are missing or nonfunctional. **Penile prostheses** are malleable, semirigid, or inflatable rods inserted into the corpora cavernosa of the penis to produce rigidity sufficient for vaginal penetration in men with erectile dysfunction. — **prosthetic** *adj.*

**prosthodontics (prosthetic dentistry)** *n.* the branch of dentistry concerned with the provision of **\*dentures**, **\*bridges**, and **\*implant-retained** prostheses.

**protamine** *n.* one of a group of simple proteins that can be conjugated with nucleic acids to form nucleoproteins. **Protamine sulphate** is injected as an antidote to heparin overdosage in oral anticoagulant therapy.

**protanopia** *n.* a defect in colour vision in which affected individuals are insensitive to red light and confuse reds, yellows, and greens. *Compare* **DEUTERANOPIA**; **TRITANOPIA**.

**protease** *n.* any enzyme that catalyses the splitting of a protein. *See also* **PROTEOLYTIC ENZYME**.

**protease inhibitor** any one of a class of drugs used in the treatment of HIV infection and **\*AIDS**. Used in combination with other **\*antiretroviral drugs**, they act by inhibiting the action of protease, an enzyme produced by HIV that cleaves two precursor proteins into smaller fragments. These fragments are required for viral growth, infectivity, and replication. Protease inhibitors include **atazanavir**, **indinavir**, **lopinavir** and **ritonavir** (which are used in combination), **saquinavir**, and **tipranavir**. Side-effects include nausea, vomiting, diarrhoea, and rashes; these drugs are also associated with hyperglycaemia and **\*lipodystrophy**. *See also* **BOCEPREVIR**.

**proteasome** *n.* a multi-enzyme complex in cells that breaks down proteins into short peptides.

**protein** *n.* one of a group of organic compounds of carbon, hydrogen, oxygen, and nitrogen (sulphur and phosphorus may also be present). The protein molecule is a complex structure made up of one or more chains of **\*amino acids**, which are linked by peptide bonds. Proteins are essential constituents of the body; they form the structural material of muscles, tissues, organs, etc., and are equally important as regulators of function, as enzymes and hormones. Proteins are synthesized in the body from their constituent amino acids, which are obtained from the digestion of protein in the diet. Excess protein, not required by the body, can be converted into glucose and used as an energy source (**\*gluconeogenesis**).

**protein kinase** an enzyme that catalyses the transfer of a phosphate group from ATP to a specific amino acid residue of an intracellular protein (usually serine, threonine, or tyrosine), thereby affecting the biological activity of the protein. **Protein kinase inhibitors** are drugs that block the action of protein kinases in tumour cells and are used in the treatment of cancer. They include *\*sorafenib*, *\*sunitinib*, and *\*temsirolimus*. *See also* **TYROSINE KINASE INHIBITOR**.

**proteinuria** *n.* the presence of protein in the urine. This may indicate the presence of damage to, or disease of, the kidneys. *See also* **ALBUMINURIA**.

**proteolysis** *n.* the process whereby complex protein molecules, obtained from the diet, are broken down by digestive enzymes in the stomach and small intestine into their constituent amino acids, which are then absorbed into the bloodstream. *See* **ENDOPEPTIDASE**; **EXOPEPTIDASE**. —**proteolytic** *adj.*

**proteolytic enzyme** a digestive enzyme that causes the breakdown of protein. *See* **ENDOPEPTIDASE**; **EXOPEPTIDASE**.

**proteose** *n.* a product of the hydrolytic decomposition of protein.

**Proteus** *n.* a genus of rodlike Gram-negative flagellate highly motile bacteria common in the intestines and in decaying organic material. All species can decompose urea. Some species may cause disease in humans: *P. vulgaris* can cause urinary tract infections.

**prothrombin** *n.* a substance, present in blood plasma, that is the inactive precursor from which the enzyme *\*thrombin* is derived during the process of *\*blood coagulation*. *See also* **COAGULATION FACTORS**.

**prothrombin time (PT)** the time taken for blood clotting to occur in a sample of blood to which calcium and thromboplastin have been added. A prolonged PT (compared with a control sample) indicates a deficiency of *\*coagulation factors*, which – with calcium and thromboplastin – are required for the conversion of prothrombin to thrombin to occur in the final stages of blood coagulation. Measurement of PT is used to control anticoagulant therapy (e.g. with warfarin). *See* **INR**.

**proto-** *combining form denoting* **1.** first. **2.** primitive; early. **3.** a precursor.

**protodiastole** *n.* the short period in the cardiac cycle between the end of systole and the closure of the **\*aortic valve** marking the start of diastole.

**proton pump** the enzyme system in the **\*parietal cells** of the stomach that stimulates acid secretion into the stomach by exchanging hydrogen ions for potassium ions. *See* **PROTON-PUMP INHIBITOR**.

**proton-pump inhibitor** a drug that reduces gastric acid secretion by blocking the **\*proton pump**. Proton-pump inhibitors include **esomeprazole**, **lansoprazole**, **\*omeprazole**, **pantoprazole**, and **rabeprazole sodium**; they are used for treating gastro-oesophageal reflux disease, peptic ulcer, and acid hypersecretion associated with **\*gastrinoma**.

**proton therapy** a type of radiotherapy that uses a beam of protons. These charged particles are produced by a **\*cyclotron** and penetrate only a predictable distance into the body depending on the proton energy. This is the radiotherapy treatment of choice for many childhood cancers, particularly brain and spinal tumours, as it can avoid more normal tissue and reduce the risk of long-term complications (including secondary malignancy) compared with photon (X-ray) beams.

**proto-oncogene** *n.* a gene in a normal cell that is of identical structure to certain viral genes. Some are important regulators of cell division and damage may change them into **\*oncogenes**.

**protopathic** *adj.* describing the ability to perceive only strong stimuli of pain, heat, etc. *Compare* **EPICRITIC**.

**protoplasm** *n.* the material of which living cells are made, which includes the cytoplasm and nucleus. —**protoplasmic** *adj.*

**protoplast** *n.* a bacterial or plant cell without its cell wall.

**protoporphyrin IX** the most common type of **\*porphyrin** found in nature. It is a constituent of haemoglobin, myoglobin, most of the cytochromes, and the commoner chlorophylls.

**protozoa** *pl. n.* a group of microscopic single-celled organisms. Most protozoa are free-living but some are important disease-causing parasites of

humans; for example, *\*Plasmodium*, *\*Leishmania*, and *\*Trypanosoma* cause *\*malaria*, *\*kala-azar*, and *\*sleeping sickness* respectively. *See also* AMOEBA.

**protozoan** *n.* a microorganism of the group *\*protozoa*.

**protozoology** *n.* the study of *\*protozoa*.

**protruding ears (otapostasis)** external ears that stick out from the head more than average owing to absence of the antihelical fold of the *\*pinna*. This is a normal variant but can be surgically corrected if desired using an *\*otoplasty* operation. It was previously known as bat ears.

**protrusion** *n.* (in dentistry) **1.** forward movement of the lower jaw. **2.** a *\*malocclusion* in which some of the teeth are further forward than usual. *Compare* RETRUSION.

**protuberance** *n.* (in anatomy) a rounded projecting part, e.g. the projecting part of the chin (**mental protuberance**).

**provitamin** *n.* a substance that is not itself a vitamin but can be converted to a vitamin in the body. An example is  $\beta$ -carotene, which can be converted into vitamin A.

**proximal** *adj.* (in anatomy) situated close to the origin or point of attachment or close to the median line of the body. *Compare* DISTAL.

**proxy** *see* DELUSION BY PROXY.

**proxy decision (surrogate decision)** a decision made with or on behalf of a person who lacks full legal capacity to *\*consent* to or refuse medical treatment. *See* BEST INTERESTS; GILICK COMPETENCE; PARENTAL RESPONSIBILITY; POWER OF ATTORNEY; SUBSTITUTED JUDGMENT.

**Prozac** *n. see* FLUOXETINE.

**PRRT** *see* PEPTIDE RECEPTOR RADIONUCLIDE THERAPY.

**prune belly syndrome (Eagle–Barrett syndrome)** a hereditary condition, occurring exclusively in males, characterized by a deficiency of abdominal muscles, complex malformation of the urinary tract, and bilateral

undescended testes. The lungs may be underdeveloped. The name derives from the typically wrinkled appearance of the skin over the abdomen.

**prurigo** *n.* an intensely itchy eruption of small papules. **Besnier's prurigo** is a type of chronic atopic *\*eczema* that is lichenified (*see* **LICHENIFICATION**). **Nodular prurigo** is a condition of unknown cause, although it is usually found in atopic individuals (*see* **ATOPY**). Very severe itching characterizes these nodules, which mostly occur on the distal limbs. **Prurigo of pregnancy** occurs in 1 in 300 women in the middle trimester of pregnancy, affecting mainly the abdomen and the extensor surfaces of the limbs. It may recur in later pregnancies. It is linked to abnormal blood hormone levels, particularly elevated levels of gonadotrophins and lower levels of cortisol and oestrogen. **Pruritic folliculitis of pregnancy** is a similar pruritic eruption, predominantly on the trunk and thighs, consisting of follicular papules and pustules. It usually presents in the latter half of pregnancy and resolves early after delivery.

**pruritus** *n.* itching. Mediated by histamine and other vasoactive chemicals, it is the predominant symptom of atopic *\*eczema*, *\*lichen planus*, and many other skin diseases. It also occurs in the elderly and may be a manifestation of psychological illness or infection (such as scabies). Perineal itching is common: itching of the vulva in women is termed **pruritus vulvae**; itching of the perianal region (**pruritus ani**) is more common in men. Causes of perineal itching include poor hygiene, *\*candidiasis*, *\*threadworms*, and itchy skin diseases (such as eczema). Pruritus also occurs as a symptom of dry skin and of certain systemic disorders, such as chronic renal failure, *\*cholestasis*, and iron deficiency. **Pruritus gravidarum** is generalized itching during pregnancy that starts in the first trimester. It is associated with *\*obstetric cholestasis* and requires monitoring of liver function and bile acids, high levels of which endanger the fetus. Other conditions marked by pregnancy-related pruritus include *\*polymorphic eruption of pregnancy*, *\*prurigo* of pregnancy, pruritic folliculitis of pregnancy, and *\*pemphigoid gestationalis*; all of these are associated with a rash. Treatment of pruritus is determined by the cause.

**prussic acid** *see* **HYDROCYANIC ACID**.

**PSA** *see* **PROSTATE SPECIFIC ANTIGEN**.

**psammoma** *n.* a tumour containing gritty sandlike particles (**psammoma bodies**). It is typical of cancer of the ovary but may also be found in the meninges (the membranes surrounding the brain).

**pseud-** (**pseudo-**) *combining form denoting superficial resemblance to; false.*

**pseudarthrosis (nearthrosis)** *n.* a ‘false’ joint. Congenital pseudarthrosis occurs in childhood, when an apparent fracture in the tibia or clavicle is followed by non-**\*union**. A pseudarthrosis can form in adulthood when a fracture fails to unite and the bone ends are separated by fibrous tissue, which allows some movement across the fracture site.

**pseudoagglutination** *n.* the misleading appearance of clumping that occurs during an antiserum-antigen test as a result of incorrect temperature or acidity of the solutions used.

**pseudoaneurysm** *n.* *see* **ANEURYSM**.

**pseudocholinesterase** *n.* an enzyme found in the blood and other tissues that – like **\*cholinesterase** – breaks down acetylcholine, but much more slowly. Not being localized at nerve endings, it plays little part in the normal breakdown of acetylcholine in synapses and at neuromuscular junctions.

**pseudocoxalgia** *n.* *see* **LEGG–CALVE’–PERTHES DISEASE**.

**pseudocrisis** *n.* a false **\*crisis**: a sudden but temporary change in a condition, such as a fall of temperature in a patient with fever.

**pseudorchidism** *n.* apparent absence of the testes. This is quite common in young boys, who retract their testes into the groin due to involuntary or reflex contraction of the cremasteric muscle of the suspensory cord (also known as retractile testes). The condition is only important in that it needs to be distinguished from true failure of descent of the testes into the scrotum, which requires early surgical treatment (*see* **CRYPTORCHIDISM**).

**pseudocyesis (phantom pregnancy, false pregnancy)** *n.* a condition in which a nonpregnant woman exhibits symptoms of pregnancy, e.g. enlarged abdomen, increased weight, morning sickness, and absence of menstruation. The condition usually has an emotional basis.

**pseudocyst** *n.* a fluid-filled space within an organ that is not enclosed by an epithelial lining. A **pancreatic pseudocyst** may develop in cases of chronic pancreatitis or as a complication of acute pancreatitis. As the pseudocyst expands it may cause abdominal pain accompanied by a rise in the level of pancreatic enzymes in the blood. It may be felt by abdominal examination or identified by radiological imaging. Treatment is by endoscopic or radiological drainage or by surgery (*see* [MARSUPIALIZATION](#)).

**pseudodementia** *n.* a condition in which symptoms of [\\*dementia](#), including memory disorders, are caused by depression rather than organic brain disease. It is most commonly seen in elderly depressed individuals.

**pseudoexfoliation syndrome** the appearance of white dandruff-like deposits on structures in the anterior chamber of the eye, which are especially prominent around the pupil margin and on the anterior lens capsule. It is a sign of zonular weakness and indicates an increased risk of secondary glaucoma.

**pseudogout** *n.* joint pain and swelling, resembling gout, caused by crystals of calcium pyrophosphate in the synovial membrane and fluid (*see* [SYNOVITIS](#)). It commonly affects the knee. X-rays may show signs of [\\*chondrocalcinosis](#). Treatments include NSAIDs and colchicine. Pseudogout is one manifestation of [\\*calcium pyrophosphate deposition disease](#).

**pseudohallucination** *n.* a controversial term, commonly used in [\\*mental](#) state examinations, for an experience described by the patient as a [\\*hallucination](#) but judged by the psychiatrist as not perceived as such by the patient. It may sometimes be seen as an attempt by patients to pretend that they suffer from genuine hallucinations. The term is generally unhelpful because it implies a value judgment.

**pseudohermaphroditism** *n.* a former term for an individual who is genetically male (XY) or female (XX) and has normal internal sex organs but whose external genitalia resemble those of the opposite sex. The term is now considered offensive. *See* [INTERSEX](#).

**pseudohypertrophy** *n.* increase in the size of an organ or structure caused by excessive growth of cells that have a packing or supporting role but do not contribute directly to its functioning. The result is usually a decline in the

efficiency of the organ although it becomes larger. —**pseudohypertrophic** *adj.*

**pseudohypoparathyroidism** *n.* a syndrome of learning disability, restricted growth, and bony abnormalities due to a genetic defect that causes lack of response to the hormone secreted by the **\*parathyroid glands**. Treatment with calcium and vitamin D can reverse most of the features. *See also* **ALBRIGHT'S HEREDITARY OSTEODYSTROPHY**.

**pseudomembrane** *n.* a false membrane, consisting of a layer of exudate on the surface of the skin or a mucous membrane. In diphtheria a pseudomembrane forms in the throat. In **pseudomembranous colitis**, a disease caused by **\*Clostridium difficile** that usually follows antibiotic therapy, pseudomembranes develop in the colon, resulting in profuse diarrhoea.

**pseudomembranous colitis** *see* **CLOSTRIDIUM**; **PSEUDOMEMBRANE**.

**Pseudomonas** *n.* a genus of rodlike motile pigmented Gram-negative bacteria. Most live in soil and decomposing organic matter; they are involved in recycling nitrogen, converting nitrates to ammonia or free nitrogen. The species *P. aeruginosa* is pathogenic to humans, occurring in pus from wounds; it is associated with urinary tract infections. *P. pseudomallei* is the causative agent of **\*melioidosis**.

**pseudomyxoma** *n.* a mucoid tumour of the peritoneum, often seen in association with **\*myxomas** of the ovary. In **pseudomyxoma peritonei** there are recurrent deposits of mucin-producing cells in the abdomen, which can be difficult to clear by surgery and may prove fatal.

**pseudoneuritis** *n.* a condition that resembles **\*retrobulbar neuritis** but is not due to inflammation. The most usual cause is blockage of blood vessels in the optic nerve (**ischaemic optic neuropathy**).

**pseudo-obstruction (Ogilvie's syndrome)** *n.* functional impairment of intestinal peristalsis without evidence of an obstructing lesion (**acute colonic pseudo-obstruction**). It presents with vomiting, marked abdominal distension, and constipation. It commonly occurs in hospitalized patients with serious illness, probably caused by abnormalities in colonic autonomic regulation and often associated with trauma, sepsis, the postoperative state

following abdominal, pelvic, or orthopaedic surgery, or cardiac dysfunction (heart failure, myocardial infarction). Management is usually conservative and involves treatment of the underlying condition, the ‘drip and suck’ approach (*see* [ILEUS](#)), decompression of the colon, and prokinetic agents (such as neostigmine). Surgery is required when the conservative approach fails or in cases of perforation.

**pseudophakia** *n.* the state of the eye after the natural lens has been replaced by a synthetic lens implanted inside the eye, approximately in the position previously occupied by the natural lens. This is the current form of surgery for [\\*cataract](#). —**pseudophakic** *adj.*

**pseudopodium** *n.* (*pl.* **pseudopodia**) a temporary and constantly changing extension of the body of an amoeba or an amoeboid cell (*see* [PHAGOCYTE](#)). Pseudopodia engulf bacteria and other particles as food and are responsible for the movements of the cell.

**pseudopolyposis** *n.* a condition in which the bowel lining (mucosa) is covered by elevated or protuberant plaques (**pseudopolyps**) that are not true [\\*polyps](#) but abnormal growths of inflamed mucosa. It is usually found in patients with longstanding [\\*ulcerative colitis](#) during endoscopy or barium enema examination.

**pseudoprolactinoma** *n.* a mass in the pituitary gland region that is associated with a raised blood prolactin level due to interference of the pituitary stalk (through which the chemical dopamine, the inhibitor of prolactin release, passes from the hypothalamus) rather than to increased prolactin production from a pituitary [\\*prolactinoma](#).

**pseudopseudohypoparathyroidism** *n.* a condition in which all the symptoms of [\\*pseudohypoparathyroidism](#) are present but the patient’s response to parathyroid hormone is normal. It is often found in families affected with pseudohypoparathyroidism.

**pseudo seizure** *see* [NON-EPILEPTIC SEIZURE](#).

**pseudotumour cerebri** *see* [IDIOPATHIC INTRACRANIAL HYPERTENSION](#).

**pseudoxanthoma elasticum** a hereditary disease in which elastic fibres (*see* [ELASTIC TISSUE](#)) become calcified. The skin becomes lax and yellowish

papules develop in affected areas; this is accompanied by degenerative changes in the blood vessels and **\*angioid streaks** in the retina.

**psilosis** *n.* see **SPRUE**.

**psittacosis (parrot disease, ornithosis)** *n.* an endemic infection of birds, especially parrots, budgerigars, canaries, finches, pigeons, and poultry, caused by a small intracellular bacterium, *Chlamydia psittaci*. The birds are often asymptomatic carriers. The infection is transmitted to humans by inhalation from handling the birds or by contact with feathers, faeces, or cage dust, but person-to-person transmission also occurs. The symptoms include fever, dry cough, severe muscle pain, and headache; occasionally a severe generalized systemic illness results. The condition responds to tetracycline or erythromycin.

**psoas (psoas major)** *n.* a muscle in the groin that acts jointly with the iliacus muscle to flex the hip joint (see illustration). A smaller muscle, **psoas minor**, has the same action but is often absent.

**Psoas and iliacus muscles.**

**psoas sign** an indicator of acute **\*appendicitis**. The appendix lies close to the **\*iliopsoas** muscle: if it is inflamed, any movement that involves the right psoas muscle (such as extension of the right thigh) will be painful in the right lower quadrant.

**psoralen** *n.* see **PUVA**.

**psoriasis** *n.* a chronic disease in which scaly pink patches form on the elbows, knees, scalp, and other parts of the body. Psoriasis is one of the commonest skin diseases in Britain, affecting about 2% of the population,

although many mild cases are undiagnosed. The most common time of onset is in adolescence. It may occur in association with arthritis (see **PSORIATIC ARTHRITIS**), and severe psoriasis is associated with a higher risk of diabetes mellitus and cardiovascular disease. The disease may be very severe, affecting much of the skin and causing considerable disability and psychological stress. Psoriasis is partly of genetic origin with polygenic influences. Exacerbations of psoriasis may be associated with streptococcal infection and drugs such as lithium and beta blockers.

There is no cure, but first-line treatments include **\*coal tar**, **\*dithranol**, and topical corticosteroids and vitamin D analogues (e.g. **\*calcipotriol**). Narrow-band UVB or **\*PUVA** can also be effective as can systemic therapies, such as **\*methotrexate**, **\*retinoids**, and **\*ciclosporin**. Biological treatments, such as **\*infliximab**, **\*adalimumab**, and **\*etanercept**, are potent but expensive.

<https://www.psoriasis-association.org.uk/>

- Website of the Psoriasis Association: information on psoriasis, psoriatic arthritis, and treatment options

**psoriasis area severity index (PASI)** a semiobjective severity score for psoriasis, including measurement of surface area affected and the degree of erythema, induration, and scale. It is commonly used in clinical trials and to ration expensive treatments for psoriasis. Severe disease equates to scores over 10 and it is often interpreted with the **\*dermatology** life quality index (DLQI) score.

**psoriatic arthritis** arthritis associated with **\*psoriasis**. It occurs in 5% of patients with psoriasis and may be painful and disabling. It often affects small joints, such as the terminal joints of the fingers and toes, the spine (**\*spondylitis**), and sacroiliac joints (**\*sacroiliitis**), or large joints, such as the knee.

**psych-** (**psycho-**) *combining form denoting* **1.** the mind; psyche. **2.** psychology.

**psyche** *n.* the mind or the soul; the mental (as opposed to the physical) functioning of the individual.

**psychedelic** *adj.* describing drugs that induce an altered state of consciousness or perception. Psychedelic drugs, which include **\*lysergic acid diethylamide** (LSD) and **\*cannabis**, are **\*hallucinogens** and are used legally only for medical or scientific purposes.

**psychiatric intensive care unit** *see* **PICU**.

**psychiatrist** *n.* a medically qualified physician who specializes in the study and treatment of mental disorders. In the UK psychiatrists classically qualify by specialist training for at least six years after medical school and **\*Foundation Programme** years.

**psychiatry** *n.* the study of mental disorders and their diagnosis, management, and prevention. — **psychiatric** *adj.*

**psychic** *adj.* **1.** of or relating to the **\*psyche**. **2.** relating to parapsychological phenomena. **3.** describing a person who is allegedly endowed with extrasensory or psychokinetic powers.

**psychoanalysis** *n.* a school of psychology and a method of treating mental disorders based upon the teachings of Sigmund Freud (1856–1939). Psychoanalysis employs the technique of **\*free association** in the course of intensive **\*psychotherapy** in order to bring repressed fears and conflicts to the conscious mind, where they can be dealt with (*see* **REPRESSION**). It stresses the dynamic interplay of unconscious forces and the importance of sexual development in childhood for the development of personality. — **psychoanalyst** *n.* — **psychoanalytic** *adj.*

**psychodrama** *n.* a form of group psychotherapy in which individuals acquire insight into themselves by acting out situations from their past with other group members. *See* **GROUP THERAPY**.

**psychogenic** *adj.* having an origin in the mind rather than in the body. The term is applied particularly to symptoms and illnesses.

**psychogenic polydipsia** *see* **POLYDIPSIA**.

**psychogenic purpura** *see* **GARDNER–DIAMOND SYNDROME**.

**psychogeriatrics** *n.* the branch of psychiatry that deals with the mental disorders of older people. A **psychogeriatrician** is a psychiatrist who treats

patients over 65 years of age. —**psychogeriatric** *adj.*

**psychologist** *n.* a person who is engaged in the scientific study of the mind. A psychologist studies psychology for at least three years and then may work in a university, in industry, in schools, or in a hospital. A **clinical psychologist** has been trained in aspects of the assessment and treatment of the ill and disabled. He or she usually works in a hospital, often as one of a multidisciplinary team. An **educational psychologist** has been trained in aspects of the cognitive and emotional development of children. He or she usually works in close association with schools and advises on the management of children.

**psychology** *n.* the scientific study of behaviour and its related mental processes. Psychology is concerned with such matters as memory, rational and irrational thought, intelligence, learning, personality, perceptions, and emotions and their relationship to behaviour. Schools of psychology differ in their philosophy and methods. They include the introspectionist Freudian, Jungian, and Adlerian schools and the gestaltist, behaviourist, and cognitive schools; contemporary psychology tends strongly towards the latter (*see* **COGNITIVE PSYCHOLOGY**). Many practical psychologists profess not to belong to any school; some take an eclectic position. The branches of psychology, on the other hand, are functional or professional subspecialties based on practical considerations. They include abnormal, analytic, applied, clinical, comparative, developmental, educational, experimental, geriatric, industrial, infant, physiological, and social psychology. —**psychological** *adj.*

**psychometrics** *n.* the measurement of individual differences in psychological functions (such as intelligence and personality) by means of standardized tests. —**psychometric** *adj.*

**psychomotor** *adj.* relating to muscular and mental activity. The term is applied to disorders in which muscular activities are affected by cerebral disturbance.

**psychomotor epilepsy** *see* **EPILEPSY**.

**psychoneuroimmunology** *n.* the study of the effects of the mind on the functioning of the immune system, especially in relation to the influence of the mind on susceptibility to disease and the progression of a disease.

**psychopath** *n.* a person who behaves in an antisocial way and shows little or no guilt for antisocial acts and little capacity for forming emotional relationships with others. Psychopaths tend to respond poorly to treatment and do not learn from punishment, but many mature as they age. *See also* **ANTISOCIAL PERSONALITY DISORDER**. —**psychopathic** *adj.* —**psychopathy** *n.*

**psychopathology** *n.* **1.** the study of mental disorders, with the aim of explaining and describing aberrant behaviour. *Compare* **PSYCHIATRY**. **2.** the symptoms, collectively, of a mental disorder.

—**psychopathological** *adj.*

**psychopharmacology** *n.* the study of the effects of drugs on mental processes and behaviour, particularly **\*psychotropic** drugs.

**psychophysiology** *n.* the branch of psychology that records physiological measurements, such as the electrical resistance of the skin, the heart rate, the size of the pupil, and the electroencephalogram, and relates them to psychological events. —**psychophysiological** *adj.*

**psychosexual development** the process by which an individual becomes more mature in his or her sexual feelings and behaviour. Gender identity, sex-role behaviour, and choice of sexual partner are the three major areas of development. In Freudian psychoanalysis the phrase is sometimes used specifically for a sequence of stages, supposed by psychoanalytic psychologists to be universal, in which oral, anal, phallic, latency, and genital stages successively occur. These stages reflect the parts of the body on which sexual interest is concentrated during childhood development.

**psychosis** *n.* one of a group of **\*mental illnesses** that feature loss of contact with reality. The psychoses include **\*schizophrenia**, major disorders of affect (*see* **BIPOLAR AFFECTIVE DISORDER**), major **\*paranoid** states, drug intoxication, and organic mental disorders. They can be chronic or transient. Psychotic disorders manifest some of the following: **\*delusions**, **\*hallucinations**, severe thought disturbances, abnormal alteration of mood, poverty of thought, ego disturbances, and inappropriate **\*affect**. Many cases of psychotic illness respond well to **\*antipsychotic** drugs. —**psychotic** *adj.*

**psychosocial assessment** an interviewing technique that combines psychiatric history taking with elements of problem solving in **\*psychotherapy**: after a psychiatric history has been elicited, the interviewer summarizes the patient's difficulties and offers potential solutions. It is often used in patients who have presented with **\*deliberate self-harm**, and research suggests that it offers the possibility of reducing repetition rates in such patients.

**psychosomatic** *adj.* relating to or involving both the mind and body: usually applied to illnesses that are caused by the interaction of mental and physical factors. Certain physical illnesses, including asthma, eczema, and peptic ulcer, are thought to be in part a response to psychological and social stresses. Psychological treatments sometimes have a marked effect, but are usually much less effective than physical treatments for such illnesses.

**psychosurgery** *n.* surgery on the brain to relieve psychological symptoms. The procedure is irreversible and is therefore reserved for the most severe and intractable of symptoms, particularly severe chronic anxiety, obsessive-compulsive disorder, depression, and untreatable pain. Side-effects can be severe but are less common with modern selective operations. In the UK psychosurgery cannot be performed without the patient's specific informed **\*consent** and a second opinion by another psychiatrist. —**psychosurgical** *adj.*

**psychotherapy** *n.* psychological (as opposed to physical) methods for the treatment of mental disorders and psychological problems. There are many different approaches to psychotherapy, including **\*psychoanalysis**, **\*client-centred therapy**, **\*group therapy**, and **\*family therapy**. These approaches share the views that the relationship between therapist and client is of prime importance, that the goal is to help personal development and self-understanding generally rather than only to remove symptoms, and that the therapist does not direct the client's decisions. They have all been very widely applied to differing clinical conditions; in the treatment of **\*mental illness**, various psychotherapeutic approaches are used with success, for example **\*cognitive behavioural therapy** in depression and anxiety and psychosocial interventions in schizophrenia. *See also* **BEHAVIOUR THERAPY**; **COUNSELLING**. —**psychotherapeutic** *adj.* —**psychotherapist** *n.*

**psychoticism** *n.* one of the three traits used by the British psychologist Hans Eysenck in his personality model, the others being extroversion and **\*neuroticism**. Psychoticism is a personality pattern typified by aggressiveness and interpersonal hostility. Eysenck believed that high levels of this trait were linked to increased vulnerability to **\*psychosis** but this has never been verified by subsequent research.

**psychotropic** *adj.* describing drugs that affect mood. **\*Antidepressants**, **\*sedatives**, CNS **\*stimulants**, and **\*antipsychotics** are psychotropic.

**psychro-** *combining form denoting cold.*

**psychrophilic** *adj.* describing organisms, especially bacteria, that grow best at temperatures of 0–25°C. *Compare* **MESOPHILIC**; **THERMOPHILIC**.

**PTA** pure tone **\*audiogram**.

**PTC** **1.** percutaneous transhepatic cholangiography (*see* **CHOLANGIOGRAPHY**). **2.** *see* **PHENYLTHIOCARBAMIDE**.

**pterion** *n.* the point on the side of the skull at which the sutures between the **\*parietal**, **\*temporal**, and **\*sphenoid bones** meet.

**pteroylglutamic acid** *see* **FOLATE**.

**pterygium** *n.* **1.** a triangular overgrowth of the cornea, usually the nasal side, by thickened and degenerative conjunctiva. It is most commonly seen in people from dry hot climates, is caused by prolonged exposure to sunlight, and only rarely interferes with vision. **2.** a triangular overgrowth of nail-fold skin extending onto the nail bed. It may occur as a result of such conditions as **\*lichen planus** and **\*epidermolysis bullosa**.

**pterygo-** *combining form denoting the pterygoid process of the sphenoid bone.* Example: **pterygomaxillary** (of the pterygoid process and the maxilla).

**pterygoid process** either of two large processes of the **\*sphenoid bone**.

**PTH-RP** *see* **PARATHYROID HORMONE-RELATED PROTEIN**.

**ptomaine** *n.* any of various substances produced in decaying foodstuffs and responsible for the unpleasant taste and smell of such foods. These compounds – which include putrescine, cadaverine, and neurine – were

formerly thought to be responsible for food poisoning, but although they are often associated with toxic bacteria they themselves are harmless.

**ptosis (blepharoptosis)** *n.* drooping of the upper eyelid, for which there are several causes. It may be due to a disorder of the third cranial nerve (**\*oculomotor nerve**), in which case it is likely to be accompanied by paralysis of eye movements causing double vision and an enlarged pupil. When part of **\*Horner's syndrome**, ptosis is accompanied by a small pupil and an absence of sweating on that side of the face. It may be due to **\*myasthenia gravis**, in which the ptosis increases with fatigue and is part of a more widespread fatiguable weakness. Ptosis is associated with the severe pain and other symptoms of a **\*cluster headache**. It may also occur as an isolated congenital feature or as part of a disease of the eye muscles, when it is associated with weak or absent eye movements.

**-ptosis** *combining form denoting* a lowered position of an organ or part; prolapse. Example: **colpoptosis** (of the vagina).

**PTSD** *see* **POST-TRAUMATIC STRESS DISORDER**.

**PTTK** partial thromboplastin time with kaolin, also known as activated partial thromboplastin time (**APTT**): a method for estimating the degree of anticoagulation induced by heparin therapy for venous thrombosis.

**ptyal- (ptyalo-)** *combining form denoting* saliva. Example: **ptyalorrhoea** (excessive flow of).

**ptyalin** *n.* an enzyme (an **\*amylase**) found in saliva.

**ptyalism (sialorrhoea)** *n.* the excessive production of saliva: a symptom of certain nervous disorders, poisoning (by mercury, mushrooms, or organophosphates), or infection (rabies). *Compare* **DRY MOUTH**.

**ptyalith** *n.* a stone (**\*calculus**) in a salivary gland or duct.

**ptyalography** *n. see* **SIALOGRAPHY**.

**puberty** *n.* the time at which the onset of sexual maturity occurs and the reproductive organs become functional (*see* **GONADARCHE**). This is manifested in both sexes by the appearance of **\*secondary sexual characteristics** (e.g. deepening of the voice in boys; growth of breasts in

girls) and in girls by the start of *\*menstruation*. These changes are brought about by an increase in sex hormone activity due to stimulation of the ovaries and testes by pituitary hormones. *See also* *ADRENARCHE*; *ANDROGEN*; *OESTROGEN*; *PRECOCIOUS PUBERTY*. —*pubertal* *adj.*

**pubes** *n.* **1.** the body surface that overlies the pubis, at the front of the pelvis. It is covered with **pubic hair**. **2.** *see* *PUBIS*. —*pubic* *adj.*

**pubiotomy** *n.* an operation to divide the pubic bone near the symphysis, the front midline where the left and right pubic bones meet. Pubiotomy is now only rarely performed during childbirth if it is necessary to increase the size of an abnormally small pelvis to allow passage of the child and a Caesarean section is contraindicated. It is occasionally also done to facilitate access to the base of the bladder and the urethra during complex urological procedures (e.g. *\*urethroplasty*).

**pubis** *n.* (*pl.* pubes) a bone forming the lower and anterior part of each side of the *\*hip bone* (*see also* *PELVIS*). The two pubes meet at the front of the pelvis at the **pubic symphysis**. *See also* *PUBES*.

**public access defibrillation programmes** programmes of lay education in the UK that aim to provide training in cardiac resuscitation up to and including *\*defibrillation*. Together with programmes to increase the availability of *\*automated external defibrillators* in public places (e.g. shops and railway stations), they recognize that the best outcomes from cardiac resuscitation are obtained with early defibrillation and good bystander basic life support.

**publication ethics** the standards expected from those who write, publish, and disseminate research. The International Committee on Publication Ethics (COPE), comprising the editors and publishers of most major academic biomedical journals, consults and advises on aspects of publication ethics, such as research misconduct, plagiarism, so-called gift authorship, determination of contribution to research, and peer review processes.

<http://publicationethics.org/>

- A detailed guide to publication ethics from COPE

**public health consultant** (in Britain) a medical consultant with postgraduate training in public health. Formerly known as **community physicians**, such consultants undertake public health functions, either as **\*Directors of Public Health** in local authorities or as consultants in public health in local authorities, **\*Public Health England**, or elsewhere. *See also* **PUBLIC HEALTH SPECIALIST**.

**Public Health England (PHE)** an executive agency of the Department of Health and Social Care with responsibility for providing national leadership on health protection, health improvement, and public health knowledge and information. In addition to the national team, there are four regional offices and nine local centres providing public health support to **\*clinical commissioning groups**, local authorities, and health-care providers. PHE also hosts a network of specialist and reference microbiology laboratories. It was formed as a result of the Health and Social Care Act 2012; it absorbed the functions of a number of abolished bodies, including the **\*Health Protection Agency**, the national network of public health observatories, and the National Treatment Agency for Substance Misuse.

<https://www.gov.uk/government/organisations/public-health-england>

- Public Health England website

**public health ethics** the ethics of population (as opposed to individual) health, including issues related to epidemiology, disease prevention, health promotion, **\*justice**, and **\*equality**. Public health ethics is commonly concerned with the tensions between individual **\*autonomy** and **\*communitarianism** and/or **\*utilitarianism**.

**public health medicine** the specialty concerned with preventing disease and improving health in populations as distinct from individuals. Formerly known as **community medicine** or **social medicine**, it includes **\*epidemiology**, **\*health promotion**, **\*health service planning**, **\*health protection**, and evaluation. *See also* **PUBLIC HEALTH CONSULTANT**.

**Public Health Service (PHS)** the oldest and one of the largest US federal health agencies. Founded in 1798 as a system of hospitals for sailors, the PHS is now the major health service operating division of the **\*Department**

of Health and Human Services and administers eleven agencies, including the \*Food and Drug Administration, the National Institutes of Health, and the Substance Abuse and Mental Health Services Administration. The agency employs tens of thousands of people with a total annual budget well into the billions.

**public health specialist** a public health practitioner with postgraduate training in public health or with demonstrated competence in key areas of public health practice. These specialists perform the same roles as \*public health consultants but do not have medical training.

**public interest disclosure 1.** the expression of concern about performance or competence that is privileged at law by virtue of the Public Interest Disclosure Act 1998. The statute provides that where an employee acts in good faith in questioning the behaviour or performance of another member of staff or an organization, he or she should be protected from such penalties as disciplinary procedures, suspension, or dismissal. *See also* WHISTLE-BLOWING. **2.** circumstances in which \*confidentiality can be breached because there is a serious risk of physical harm to an identifiable individual or individuals. The basis on which confidentiality can be breached in the public interest were defined in the case of *W v Egdell*, in which the court held that the risk had to be of physical harm to identifiable person(s) and must not be merely 'fanciful'. Where there is a serious risk of physical harm to a specific person, there is an entitlement but not a duty to breach confidentiality, and the \*General Medical Council requires that doctors must be prepared to justify their decision either way.

**Public Services Ombudsman** *see* PARLIAMENTARY AND HEALTH SERVICE OMBUDSMAN.

**pubovaginal sling** a band of material inserted directly under the bladder neck as a treatment for women with stress \*incontinence. The sling can be constructed from fascia (connective tissue) obtained from the patient or it can be synthetic. *Compare* TENSION-FREE VAGINAL TAPE.

**pudendal nerve** the nerve that supplies the lowest muscles of the pelvic floor and the anal sphincter. It is often damaged in childbirth, causing incontinence.

**pudendum** *n.* (*pl.* **pudenda**) the external genital organs, especially those of the female (*see* **VULVA**). —**pudendal** *adj.*

**puerperal** *adj.* relating to childbirth or the period that immediately follows it. *See* **PUERPERIUM**.

**puerperal cardiomyopathy** a rare complication of pregnancy, occurring from the sixth month of pregnancy until six months postnatally (usually within six weeks of delivery). It can follow pre-eclampsia. It is characterized by palpitations, dyspnoea, oedema (peripheral and central), and impaired exercise tolerance. The diagnosis is confirmed on echocardiography. It has a high mortality and morbidity. Treatment of heart failure, anticoagulation, and in some cases immunosuppressant therapy is required; in some cases heart transplantation may be considered.

**puerperal infection** infection of the female genital tract arising as a complication of childbirth. *See also* **SEPSIS**.

**puerperal psychosis** a **\*psychosis** that is triggered by childbirth and usually arises in the first two weeks after giving birth. It affects 1 in 200 women; those suffering from bipolar affective disorder or schizophrenia or those who have a history of puerperal psychosis are at particularly high risk. The symptoms develop very rapidly and the patient needs to be hospitalized, ideally in a mother and baby psychiatric unit to avoid separation; most patients respond well to **\*antipsychotic** medication.

**puerperal pyrexia** a temperature of 38°C occurring on any 2 days within 14 days of childbirth or miscarriage. It is an indicator of postpartum **\*sepsis**.

**puerperium** *n.* the period of up to about six weeks after childbirth, during which the mother's body returns to its prepregnant state and her uterus returns to its normal size (i.e. involution takes place).

**Pulex** *n.* a genus of widely distributed **\*fleas**. *P. irritans*, the human flea, is a common parasite whose bite may give rise to intense irritation and bacterial infection. It is an intermediate host for larvae of the tapeworms **\*Hymenolepis** and **\*Dipylidium**, which it can transmit to humans, and it may also be involved in the transmission of plague.

**Pulfrich phenomenon** perception of the lateral motion of an object in the visual field as having a depth component, due to a relative difference in signal timings between the two eyes. It often occurs spontaneously in several diseases affecting the eyes, such as cataract, *\*retrobulbar neuritis*, and multiple sclerosis. [C. Pulfrich (20th century), German physicist]

**pulmo-** (**pulmon(o)-**) *combining form denoting the lung(s).*

**pulmonary** *adj.* relating to, associated with, or affecting the lungs.

**pulmonary artery** the artery that conveys blood from the heart to the lungs for oxygenation: the only artery in the body containing deoxygenated blood. It leaves the right ventricle and passes upwards for 5 cm before dividing into two, one branch going to each lung. Within the lungs each pulmonary artery divides into many fine branches, which end in capillaries in the alveolar walls. *See also* **PULMONARY CIRCULATION**.

**pulmonary capillary wedge pressure (PCWP)** an indirect measurement of the pressure of blood in the left atrium of the heart, which indicates the adequacy of left heart function. It is measured using a catheter wedged in the most distal segment of the pulmonary artery. *See also* **SWAN-GANZ CATHETER**.

**pulmonary circulation** a system of blood vessels effecting transport of blood between the heart and lungs. Deoxygenated blood leaves the right ventricle by the pulmonary artery and is carried to the alveolar capillaries of the lungs. Gaseous exchange occurs, with carbon dioxide leaving the circulation and oxygen entering. The oxygenated blood then passes into small veins leading to the pulmonary veins, which leave the lungs and return blood to the left atrium of the heart. The oxygenated blood can then be pumped around the body via the *\*systemic circulation*.

**pulmonary embolism** obstruction of the *\*pulmonary artery* or one of its branches by an *\*embolus*, usually a blood clot derived from *\*phlebothrombosis* of the leg veins (deep vein thrombosis). Large pulmonary emboli result in acute heart failure or sudden death. Smaller emboli cause death of sections of lung tissue, pleurisy, and haemoptysis (coughing of blood). Minor pulmonary emboli respond to the *\*anticoagulant* drugs heparin and warfarin. Major pulmonary embolism is treated by *\*embolectomy* or by

dissolution of the blood clot with an infusion of *\*streptokinase*. Recurrent pulmonary embolism may result in *\*pulmonary hypertension*.

**pulmonary hypertension** a condition in which there is raised blood pressure within the blood vessels supplying the lungs (the pulmonary artery blood pressure is normally much lower than the pressure within the aorta and its branches). Pulmonary hypertension may complicate pulmonary embolism, *\*septal defects*, heart failure, diseases of the mitral valve, and chronic lung diseases. It may also develop without any known cause (**primary pulmonary hypertension**). The right ventricle enlarges and heart failure, fainting, and chest pain occur. The treatment is that of the cause; drugs used to control *\*hypertension* are ineffective, but some specific drug treatments (e.g. epoprostenol) have recently become available.

**pulmonary regurgitation** leakage of the pulmonary valve in the heart. Mild regurgitation is a common normal finding, but severe congenital pulmonary regurgitation may require surgical correction.

**pulmonary stenosis** congenital narrowing of the outlet of the right ventricle of the heart to the pulmonary artery. The defect may be in the pulmonary valve (**valvular stenosis**) or in the outflow tract of the right ventricle below the valve (**infundibular stenosis**). It may be isolated or combined with other heart defects (e.g. *\*tetralogy of Fallot*). Severe pulmonary stenosis may produce angina pectoris, faintness, and heart failure. The defect is corrected by surgery.

**pulmonary tuberculosis** *see* TUBERCULOSIS.

**pulmonary valve** a valve in the heart lying between the right ventricle and the pulmonary artery. It is a *\*semilunar valve* that prevents blood returning to the ventricle from the pulmonary artery.

**pulmonary vein** a vein carrying oxygenated blood from the lung to the left atrium. *See* PULMONARY CIRCULATION.

**pulp** *n.* **1.** a soft mass of tissue (for example, of the *\*spleen*, in which there is both **red pulp** and **white pulp**). **2.** the mass of connective tissue in the **pulp cavity**, at the centre of a *\*tooth*. It is surrounded by dentine except where it communicates with the rest of the body at the apex. The pulp within the crown portion of the pulp cavity is described as **coronal pulp**; that within the

root canal is the **radicular pulp**. **3.** the fleshy cushion on the flexor surface of the fingertip.

**pulp capping** the procedure of covering an exposed tooth pulp (direct pulp cap) or nearly exposed tooth pulp (indirect pulp cap) following trauma with a medicament (usually based on calcium hydroxide), which is then covered with a temporary or permanent **\*restoration**.

**pulpectomy** *n.* the removal of the entire pulp tissue from the crown to the root of a tooth in order to treat infection. This is an essential part of **\*root canal treatment** and of **\*endodontics** generally.

**pulpitis** *n.* inflammation of the pulp of a tooth: a frequent cause of toothache. Pulpitis may be reversible or irreversible. Irreversible pulpitis often requires **\*root canal treatment**.

**pulpotomy** *n.* a procedure in which part of the pulp of a tooth damaged by trauma or caries is removed and then covered with a medicament and **\*restoration**. The aim is to maintain the vitality of the remaining pulpal tissue.

**pulsatile** *adj.* characterized by regular rhythmical beating.

**pulsatile tinnitus** a form of **\*tinnitus** that has a rhythmical quality. It may be synchronous with the heartbeat, in which case a vascular origin is likely. Pulsatile tinnitus that is not synchronous with the heartbeat may have a muscular origin due to **\*middle ear** muscle myoclonus or **\*palatal myoclonus**. Pulsatile tinnitus may be audible to an observer, in which case it is classified as **objective pulsatile tinnitus**. More often it is inaudible to others and is classified as **subjective pulsatile tinnitus**.

**pulse** *n.* a series of pressure waves within an artery caused by contractions of the left ventricle and corresponding with the **heart rate** (the number of times the heart beats per minute). It is easily detected on such superficial arteries as the radial artery near the wrist and the carotid artery in the neck (see illustration). The average adult pulse rate at rest is 60–80 per minute, but exercise, injury, illness, and emotion may produce much faster rates.

**Peripheral pulses.**

**pulseless disease** *see* **TAKAYASU'S DISEASE**.

**pulseless electrical activity (electromechanical dissociation)** the appearance of normal-looking complexes on the electrocardiogram that are, however, associated with a state of **\*cardiac arrest**. It is usually caused by large pulmonary emboli (*see* **PULMONARY EMBOLISM**), **\*cardiac tamponade**, tension **\*pneumothorax**, severe disturbance of body salt levels, severe haemorrhage, or hypothermia causing severe lack of oxygen to the heart muscle.

**pulsus alternans** alternate variation of the force of the pulse due to variation in force of heart muscle contraction. It is a sign of cardiomyopathy and heart failure.

**pulsus paradoxus** an exaggerated fall in systolic blood pressure and pulse volume when the patient breathes in. It is seen in constrictive **\*pericarditis**, pericardial effusion, and asthma.

**pulvinar** *n.* the expanded posterior end of the **\*thalamus**.

**punch-drunk syndrome** a group of symptoms consisting of progressive **\*dementia**, tremor of the hands, epilepsy, and parkinsonism. It is a consequence of repeated blows to the head that have been severe enough to cause **\*concussion**.

**punctum** *n.* (*pl.* puncta) (in anatomy) a point or small area, especially the **puncta lacrimalia** – the two openings of the tear ducts in the inner corners of the upper and lower eyelids (*see* **LACRIMAL APPARATUS**).

**puncture 1.** *n.* a wound made accidentally or deliberately by a sharp object or instrument. Puncture wounds need careful treatment as a small entry hole in the skin can disguise serious injury in an underlying organ or tissue. Punctures are also performed for diagnostic purposes using a hollow needle, in order to withdraw a sample of tissue or fluid for examination; needle punctures are used especially for obtaining tissue samples for the liver, bone marrow, or breast. *See also* **LUMBAR PUNCTURE**. **2.** *vb.* to pierce a tissue with a sharp instrument or needle. A gall bladder that is tense with bile may need to be punctured while being removed, to make it more amenable to manipulation.

**pupil** *n.* the circular opening in the centre of the **\*iris**, through which light passes into the lens of the eye. — **pupillary** *adj.*

**pupillary reflex (light reflex)** the reflex change in the size of the pupil according to the amount of light entering the eye. Bright light reaching the retina stimulates nerves of the **\*parasympathetic nervous system**, which cause the pupil to contract. In dim light the pupil opens, due to stimulation of the **\*sympathetic nervous system**. *See also* **IRIS**.

**pupilloplasty** *n.* a surgical procedure to alter the shape or function of the pupil. It is usually performed to repair a pupil damaged after trauma.

**PUPPS** *see* **POLYMORPHIC ERUPTION OF PREGNANCY**.

**pure tone audiogram (PTA)** *see* **AUDIOGRAM**.

**purgation** *n.* the use of drugs to stimulate intestinal activity and clear the bowels. *See* **LAXATIVE**.

**purgative** *n.* *see* **LAXATIVE**.

**purine** *n.* a nitrogen-containing compound with a two-ring molecular structure. Examples of purines are adenine and guanine, which form the \***nucleotides** of nucleic acids, and uric acid, which is the end-product of purine metabolism.

**Purkinje cells** nerve cells found in great numbers in the cortex of the cerebellum. The cell body is flask-shaped, with numerous dendrites branching from the neck and extending fanwise among other cells towards the surface and a long axon that runs from the base deep into the cerebellum. [J. E. Purkinje (1787–1869), Bohemian physiologist]

**Purkinje fibres** *see* **ATRIOVENTRICULAR BUNDLE**.

**purpura** *n.* a skin rash resulting from bleeding into the skin from small blood vessels (capillaries); the individual purple spots of the rash are called **petechiae**. Purpura may be due either to defects in the capillaries (**nonthrombocytopenic purpura**) or to a deficiency of blood platelets (**thrombocytopenic purpura**). *See* **HENOCH–SCHÖNLEIN PURPURA**; **IDIOPATHIC THROMBOCYTOPENIC PURPURA**; **THROMBOCYTOPENIA**; **THROMBOTIC THROMBOCYTOPENIC PURPURA**.

**Purtscher's retinopathy** damage to the retina associated with severe head injuries. It can also occur with other types of trauma, such as long-bone fractures, and with several nontraumatic systemic diseases. [O. Purtscher (1852–1927), Austrian ophthalmologist]

**purulent** *adj.* forming, consisting of, or containing pus.

**pus** *n.* a thick yellowish or greenish liquid formed at the site of an established infection. Pus contains dead white blood cells, both living and dead bacteria, and fragments of dead tissue. *See also* **MUCOPUS**; **SEROPUS**.

**push-bang technique** a technique for removing a stone from the ureter. It consists of 'pushing' the stone back into the renal pelvis, where it can be destroyed by \***lithotripsy** ('bang').

**pustule** *n.* a small pus-containing blister on the skin.

**putamen** *n.* a part of the lenticular nucleus (*see* **BASAL GANGLIA**).

**putrefaction** *n.* the process whereby proteins are decomposed by bacteria. This is accompanied by the formation of amines (such as **putrescine** and **cadaverine**) having a strong and very unpleasant smell.

**putrescine** *n.* an amine formed during **\*putrefaction**.

**PUVA (photochemotherapy)** *psoralen + ultraviolet A*: the combination of a **psoralen** (a light-sensitive drug) and exposure to long-wave (315–400 nm) ultraviolet light (UVA). It was used in the East in ancient times, with natural sunlight as the light source, for the treatment of **\*vitiligo**. It is now principally used for treating **\*psoriasis**; a number of other conditions also respond.

**P value** *see* **SIGNIFICANCE**.

**PVP** *see* **PHOTOSELECTIVE VAPORIZATION OF THE PROSTATE**.

**PVS** *see* **PERSISTENT VEGETATIVE STATE**.

**py- (pyo-)** *combining form denoting pus; a purulent condition. Example: pyoureter (pus in a ureter).*

**pyaemia** *n.* blood poisoning by pus-forming bacteria released from an abscess. The widespread formation of abscesses may develop, with fatal results. *Compare* **SAPRAEMIA**; **SEPTICAEMIA**; **TOXAEMIA**.

**pyarthrosis** *n.* an infected joint filled with pus (*see* **SEPTIC ARTHRITIS**).

**pyel- (pyelo-)** *combining form denoting the pelvis of the kidney. Example: pyelectasis (dilation of).*

**pyelitis** *n.* inflammation of the pelvis of the kidney (the part of the kidney from which urine drains into the ureter). This is usually caused by a bacterial infection, which may develop in any condition causing obstruction to the flow of urine. The patient experiences pain in the loins, shivering, and a high temperature. Treatment is by the administration of a suitable antibiotic, together with analgesics and a high fluid intake. Any underlying abnormality of the urinary system must be relieved to prevent further attacks.

**pyelocystitis** *n.* inflammation of the renal pelvis and urinary bladder (*see* **PYELITIS**; **CYSTITIS**).

**pyelogram** *n.* *see* **PYELOGRAPHY**.

**pyelography** *n.* X-ray examination of the renal pelvis using **\*radiopaque** contrast material. **Anterograde pyelography** is performed by puncturing the renal pelvis directly with a needle through the skin and injecting contrast material. **Intravenous pyelography** is usually part of an examination of the whole urinary tract (*see* **INTRAVENOUS UROGRAPHY**). **Retrograde pyelography** is performed after a tube has been inserted through the bladder and up the ureter at cystoscopy. Contrast material is injected up this tube as it is withdrawn and X-ray images taken. All techniques are used to show the anatomy of the renal pelvis and its drainage, as well as to demonstrate the presence of tumours and stones.

**pyelolithotomy** *n.* surgical removal of a stone from the kidney through an incision made in the pelvis of the kidney. The incision is usually made into the posterior surface of the pelvis (**posterior pyelotomy**) to gain access to the stone, which can then be lifted clear.

**pyelonephritis** *n.* bacterial infection of the kidney substance. In **acute pyelonephritis**, the patient has pain in the loins, a high temperature, and shivering fits. Treatment is by the administration of an appropriate antibiotic, and a full urological investigation is conducted to determine any underlying abnormality and prevent recurrence. In **chronic pyelonephritis**, the kidneys become small and scarred and kidney failure ensues. **\*Vesicoureteric reflux** in childhood is one of the causes.

**pyeloplasty** *n.* an operation to relieve obstruction at the junction of the pelvis of the kidney and the ureter. The procedure is often performed laparoscopically. The narrowed segment may be excised and the renal pelvis and ureteric ends anastomosed or a flap of tissue from the renal pelvis may be folded down to widen the narrowing. A ureteric stent is left in place while healing takes place. *See* **HYDRONEPHROSIS**; **DIETL'S CRISIS**.

**pyelotomy** *n.* surgical incision into the pelvis of the kidney. This operation is usually undertaken to remove a stone (*see* **PYELOLITHOTOMY**) but is also necessary when surgical drainage of the kidney is required by a catheter or tube.

**Pyemotes** *n.* *see* **PEDICULOIDES**.

**pyg-** (**pygo-**) *combining form denoting the buttocks.*

**pykno-** *combining form denoting thickness or density.*

**pyknosis** *n.* the process in which the cell nucleus is thickened into a dense mass, which occurs when cells die. —**pyknotic** *adj.*

**pyl-** (**pyle-**) *combining form denoting the portal vein.*

**pylephlebitis (portal pyaemia)** *n.* septic inflammation and thrombosis of the hepatic portal vein. This is a rare result of the spread of infection within the abdomen (as from appendicitis). The condition causes severe illness, with fever, liver abscesses, and **\*ascites**. Treatment is by antibiotic drugs and surgical drainage of abscesses.

**pylethrombosis** *n.* obstruction of the portal vein by a blood clot (*see* **THROMBOSIS**). It can result from infection of the umbilicus in infants, pylephlebitis, cirrhosis of the liver, and liver tumours. **\*Portal hypertension** is a frequent result.

**PYLL** *see* **YEARS OF LIFE LOST**.

**pylor-** (**pyloro-**) *combining form denoting the pylorus.* Example: **pyloroduodenal** (of the pylorus and duodenum).

**pylorectomy** *n.* a surgical operation that involves the removal of the distal part of the stomach (**\*pylorus**). *See* **ANTRECTOMY**; **PYLOROPLASTY**.

**pyloric stenosis** narrowing of the outlet of the stomach (**\*pylorus**). This causes delay in the passage of stomach contents into the duodenum, leading to recurrent vomiting (sometimes of food eaten more than 24 hours earlier), abdominal distension, dehydration, and weight loss. Pyloric stenosis in adults is caused either by a **\*peptic ulcer** adjacent to or within the pylorus or by a tumour invading the pylorus. Stenosis from peptic ulceration may be treated with antisecretory agents, endoscopic balloon dilatation of the pylorus, or by surgical removal or bypass (*see* **GASTROENTEROSTOMY**). Surgery is usually required for cancerous obstruction; in unfit patients and those with metastatic disease a stent can be placed to relieve the obstruction. **Congenital hypertrophic pyloric stenosis** occurs in babies about 3–5 weeks old (particularly boys) in which the thickened pyloric muscle can be felt as a

nodule. Treatment is by the surgical operation of **\*pyloromyotomy** (Ramstedt's operation).

**pyloromyotomy (Ramstedt's operation)** *n.* a surgical operation in which the muscle around the outlet of the stomach (pylorus) is divided down to the lining (mucosa) in order to relieve congenital **\*pyloric stenosis**.

**pyloroplasty** *n.* a surgical operation in which the outlet of the stomach (pylorus) is widened by a form of reconstruction. It is done to allow the contents of the stomach to pass more easily into the duodenum and is commonly combined with a truncal **\*vagotomy** to treat peptic ulcers.

**pylorospasm** *n.* constriction of the pylorus due to muscle spasm, leading to delayed gastric emptying. It is usually associated with duodenal or pyloric ulcers.

**pylorus** *n.* the lower end of the **\*stomach**, which leads to the duodenum. It terminates at a ring of muscle – the **pyloric sphincter** – which contracts to close the opening by which the stomach communicates with the duodenum. — **pyloric** *adj.*

**pyo-** *combining form.* *see* **PY-**.

**pyocele** *n.* a swelling caused by an accumulation of pus in a part of the body.

**pyocolpos** *n.* the presence of pus in the vagina.

**pyocyanin** *n.* an antibiotic substance produced by the bacterium **\*Pseudomonas aeruginosa** and active principally against Gram-positive bacteria.

**pyoderma gangrenosum** an acute destructive ulcerating process of the skin, especially the legs. It may be associated with ulcerative **\*colitis** or **\*Crohn's disease** or with **\*rheumatoid arthritis** or other forms of arthritis affecting many joints. Treatment is with ciclosporin, high doses of corticosteroids, or other immunosuppressants.

**pyogenic** *adj.* causing the formation of pus. Pyogenic bacteria include *Staphylococcus aureus*, *Streptococcus hemolyticus*, and *Neisseria gonorrhoeae*.

**pyogenic arthritis** *see* **SEPTIC ARTHRITIS**.

**pyogenic granuloma** a common rapidly growing nodule on the surface of the skin. Resembling a redcurrant or, if large, a raspberry, it is composed of small blood vessels and therefore bleeds readily after the slightest injury. The nodule never becomes malignant and is treated by **\*curettage** and cautery; it may recur and require excision.

**pyometra** *n.* the presence of pus in the uterus.

**pyometritis** *n.* inflammation of the uterus, with the formation of pus.

**pyomyositis** *n.* bacterial or fungal infection of a muscle resulting in painful inflammation.

**pyonephrosis** *n.* obstruction and infection of the kidney resulting in pus formation. A kidney stone is the usual cause of the obstruction, and the kidney becomes distended by pus and destroyed by the inflammation, which extends into the kidney substance itself and sometimes into the surrounding tissues (see **PERINEPHRITIS**). Treatment is urgent **\*nephrectomy** under antibiotic cover.

**pyopneumothorax** *n.* pus and gas or air in the **\*pleural cavity**. The condition can arise if gas is produced by gas-forming bacteria as part of an **\*empyema** or if air is introduced during attempts to drain the pus from an empyema. Alternatively a **\*hydropneumothorax** may become infected.

**pyorrhoea** *n.* an alternative name for **\*periodontal disease**.

**pyosalpingitis** *n.* inflammation of a Fallopian tube, with the formation of pus.

**pyosalpingo-oophoritis** *n.* inflammation of an ovary and Fallopian tube, with the formation of pus.

**pyosalpinx** *n.* the accumulation of pus in a Fallopian tube.

**pyosis** *n.* the formation and discharge of pus.

**pyothorax** *n.* see **EMPYEMA**.

**pyr- (pyro-)** *combining form denoting* **1.** fire. **2.** a burning sensation. **3.** fever.

**pyramid** *n.* **1.** one of the conical masses that make up the medulla of the **\*kidney**, extending inwards from a base inside the cortex towards the pelvis of the kidney. **2.** one of the elongated bulging areas on the anterior surface of the **\*medulla oblongata** in the brain, extending downwards to the spinal cord. **3.** one of the divisions of the vermis of the **\*cerebellum** in the middle lobe. **4.** a protrusion of the medial wall of the vestibule of the middle ear.

**pyramidal cell** a type of neuron found in the **\*cerebral cortex**, with a pyramid-shaped cell body, a branched dendrite extending from the apex towards the brain surface, several dendrites extending horizontally from the base, and an axon running in the white matter of the hemisphere.

**pyramidal system** a collection of nerve fibres in the central nervous system that extend from the **\*motor cortex** in the brain to the spinal cord and are responsible for initiating movement. In the medulla oblongata the fibres form a **\*pyramid** (hence the name), within which they cross from one side of the brain to the opposite side of the spinal cord; this is called the **decussation of the pyramids**. Damage to the pyramidal system manifests in a specific pattern of weakness in the face, arms, and legs, abnormally brisk reflexes, and an extensor **\*plantar reflex** (Babinski response).

**pyrazinamide** *n.* a drug administered, in conjunction with other drugs, to treat tuberculosis. Side-effects may include digestive upsets, loss of appetite, joint pains, gout, fever, and rashes, and high doses may cause liver damage.

**pyret- (pyreto-)** *combining form denoting fever.*

**pyrexia** *n.* *see* **FEVER**.

**pyridostigmine** *n.* an **\*anticholinesterase** drug used in the treatment of **\*myasthenia gravis**. Side-effects may include nausea, vomiting, abdominal pain, diarrhoea, sweating, and increased salivation.

**pyridoxal phosphate** a derivative of vitamin B<sub>6</sub> that is an important **\*coenzyme** in certain reactions of amino-acid metabolism. *See* **TRANSAMINATION**.

**pyridoxine** *n.* *see* **VITAMIN B<sub>6</sub>**.

**pyrimethamine** *n.* a drug administered in combination with the **\*sulphonamide** sulfadoxine for the treatment of malignant (falciparum) **\*malaria**. It is also used, in combination with **\*sulfadiazine**, in the treatment of toxoplasmosis. Possible side-effects include loss of appetite and vomiting, and prolonged use may interfere with red blood cell production (pyrimethamine is a **\*dihydrofolate reductase inhibitor**).

**pyrimidine** *n.* a nitrogen-containing compound with a ring molecular structure. The commonest pyrimidines are cytosine, thymine, and uracil, which form the **\*nucleotides** of nucleic acids.

**pyrogen** *n.* any substance or agent producing fever. —**pyrogenic** *adj.*

**pyrosis** *n.* another name (chiefly US) for **\*heartburn**.

**pyruvic acid (pyruvate)** a compound, derived from carbohydrates, that may be oxidized via a complex series of reactions in the **\*Krebs cycle** to yield carbon dioxide and energy in the form of ATP.

**pyuria** *n.* the presence of pus in the urine, making it cloudy. This is a sign of bacterial infection in the urinary tract.

# Q

**QALYs** quality-adjusted life years. *See* [QUALITY OF LIFE](#).

**qat** *n.* *see* [KHAT](#).

**Q fever** an acute infectious disease of many animals, including cattle, sheep, goats, deer, and dogs, that is caused by a *\*rickettsia*, *Coxiella burnetii*; it can be transmitted to humans primarily through inhalation of infected particles or consumption of contaminated unpasteurized milk but also via ticks, which can act as vectors. After an incubation period of up to three weeks a severe influenza-like illness develops, sometimes with pneumonia. The disease lasts about two weeks; treatment with tetracyclines or chloramphenicol is effective. *See also* [TYPHUS](#).

**qinghaosu** *n.* *see* [ARTEMISININ](#).

**QOF** *see* [QUALITY AND OUTCOMES FRAMEWORK](#).

**QRISK2** a computer algorithm that estimates the risk of a heart attack or stroke in a person over the next ten years. QRISK2 uses traditional risk factors, such as age, systolic blood pressure, smoking status, and ratio of total cholesterol to high-density lipoprotein, together with additional risk factors, including body mass index and family history of premature ischaemic heart disease. Someone with a QRISK2 score of 20% (or more) is regarded as high risk and should consider lifestyle modification and preventative medication.

**QRS complex** the element of an *\*electrocardiogram* that precedes the *\*S–T segment* and indicates electrical activation of the ventricles.

**Q–T interval** the interval on an \***electrocardiogram** between the beginning of ventricular depolarization (\***Q wave**) and the beginning of \***repolarization** (the T wave). *See also* **LONG QT SYNDROME**.

**quadrantanopia** *n.* absence or loss of one quarter of the \***visual field**, i.e. upper nasal (inner), upper temporal (outer), lower nasal (inner), or lower temporal (outer).

**quadrate lobe** one of the lobes of the \***liver**.

**quadratus** *n.* any of various four-sided muscles. The **quadratus femoris** is a flat muscle at the head of the femur, responsible for lateral rotation of the thigh.

**quadri-** *combining form denoting four.* Example: **quadrilateral** (having four sides).

**quadriceps** *n.* one of the great extensor muscles of the legs. It is situated in the thigh and is subdivided into four distinct portions: the **rectus femoris** (which also flexes the thigh), **vastus lateralis**, **vastus medialis**, and **vastus intermedius** (see illustration).

**Components of the quadriceps femoris.**

**quadriplegia (tetraplegia)** *n.* paralysis affecting all four limbs, which may or may not be total. —**quadriplegic** *adj., n.*

**qualitative research** a type of scientific enquiry, used extensively in the social sciences, that focuses on the why and how of behaviours and opinions. It often involves interviews or focus groups through which the researcher attempts to understand individuals' experiences. The data in qualitative

research are non-numerical, being typically words or descriptions used by research subjects. *Compare* [QUANTITATIVE RESEARCH](#).

**Quality and Outcomes Framework (QOF)** a system, introduced as part of the new general medical services (nGMS) contract (*see* [GENERAL PRACTITIONER](#)), whereby practices are rewarded for implementing good medical practice. There are four main domains: clinical, organizational, patient experience, and additional services. Each domain has various criteria based on best practice, which have a number of points allocated for achievement. The points are collated at the end of the financial year and converted into payment for the practice.

**quality assurance** setting, monitoring, and maintaining standards for the quality of a service. *See* [CLINICAL GOVERNANCE](#).

**quality of life** a measure of a person's wellbeing that is relevant in two ways in medical ethics. **(1)** The experience, burden, and effects of disease as opposed to its duration are often invoked in debates about [\\*abortion](#), [\\*assisted suicide](#), [\\*euthanasia](#), and the withholding or withdrawal of medical treatment. The criteria for determining another person's wellbeing are complex and contested, and some argue that competent adults are the best judges of their own quality of life. **(2)** The formal evaluation of losses and gains is employed to determine who will benefit most from a treatment and, on this basis, who should receive priority where resources are scarce. In such cases a calculation of **quality-adjusted life years** (QALYs) is made, rather than a simpler estimate of how long a successfully treated patient can expect to live. Each expected year of full health is scored 1, each expected year with various degrees of illness or disability less than 1, and death 0. Research priorities are often made on the basis of a related metric, [\\*disability-adjusted life years](#) (DALYs), which seeks to minimize the burden of disease. Both metrics have been criticized for discriminating against those with prior medical conditions, which lower their baseline score, and the elderly, whose longevity is short. *See also* [NEED](#).

**quantitative digital radiography** a method of detecting [\\*osteoporosis](#). A narrow X-ray beam is directed at the area of interest (usually the spine and hip), which enables a measurement to be made of its calcium content

(density). In this way the likelihood of fracture can be assessed and preventive measures considered.

**quantitative research** a type of scientific enquiry that typically relies on statistical, mathematical, or computational tests and techniques. Quantitative research often involves the formulation of a null hypothesis (*see* **SIGNIFICANCE**); the data are typically numerical, such as counts, percentages, or statistical figures. *Compare* **QUALITATIVE RESEARCH**.

**quarantine** *n.* the period for which a person (or animal) is kept in isolation in order to prevent the spread of a contagious disease. The original quarantine was a period of 40 days, but different diseases now have different quarantine periods.

**quartan fever** *see* **MALARIA**.

**quartile** *n.* one of four equal parts into which a rank-ordered data set is divided. The **interquartile** range is the difference between the upper quartile and the lower quartile and gives a clear indication of the central 50% of the values.

**Queckenstedt test** a part of the routine **\*lumbar puncture** procedure. It is used to determine whether or not the flow of cerebrospinal fluid is blocked in the spinal canal. [H. H. G. Queckenstedt (1876–1918), German physician]

**quellung reaction** a reaction in which antibodies against the bacterium *Streptococcus pneumoniae* combine with the bacterial capsule, which becomes swollen and visible to light microscopy.

**quetiapine** *n.* *see* **ANTIPSYCHOTIC**.

**quickening** *n.* the first movement of a fetus in the uterus felt by the mother. Quickening is usually experienced after about 16 weeks of pregnancy, although it may occur earlier.

**quiescent** *adj.* describing a disease that is in an inactive or undetectable phase.

**quinine** *n.* a drug used in the treatment of **\*malaria** due to *Plasmodium falciparum*. Large doses can cause severe poisoning, symptoms of which include headache, fever, vomiting, confusion and damage to sight and hearing

(see **CINCHONISM**). Small doses of quinine are used to treat nocturnal leg cramps.

**quinism** *n.* the symptoms of overdose or prolonged treatment with quinine. See **CINCHONISM**.

**quinolone** *n.* one of a group of chemically related synthetic antibiotics that includes **\*ciprofloxacin**, **\*nalidixic acid**, and **\*ofloxacin**. These drugs act by inactivating an enzyme, DNA gyrase, that is necessary for replication of the microorganisms and are often useful for treating infections with organisms that have become resistant to other antibiotics. Possible side-effects of quinolones include nausea, vomiting, diarrhoea, abdominal pain, headache, dizziness, and itching. Confusion, joint pains, skin troubles, and tendinitis occasionally occur.

**quinsy** *n.* pus in the space between the tonsil and the wall of the pharynx. The patient has severe pain with difficulty opening the mouth (**\*trismus**) and swallowing. Treatment is with antibiotics. Surgical incision of the abscess may be necessary to release the collection of pus. Medical name: **peritonsillar abscess**.

**quotidian fever** *see* **MALARIA**.

**Q wave** the downward deflection on an **\*electrocardiogram** that indicates the beginning of ventricular depolarization. An abnormally deep and wide Q wave is an indication of prior heart muscle damage due to heart attack.

**rabbit fever** *see* TULARAEMIA.

**rabies (hydrophobia)** *n.* an acute virus disease of the central nervous system that affects all warm-blooded animals and is usually transmitted to humans by a bite from an infected dog. Symptoms appear after an incubation period ranging from 10 days to over a year and include malaise, fever, difficulty in breathing, salivation, periods of intense excitement, hallucinations, and painful muscle spasms of the throat induced by swallowing. In the later stages of the disease the mere sight of water induces convulsions and paralysis; death occurs within 4–5 days. Daily injections of rabies vaccine, together with an injection of rabies antiserum, may prevent the disease from developing in a person bitten by an infected animal. —**rabid** *adj.*

**racemose** *adj.* resembling a bunch of grapes. The term is applied particularly to a compound gland the secretory part of which consists of a number of small sacs.

**rachi- (rachio-)** *combining form denoting the spine.*

**rachis** *n. see* BACKBONE.

**rachischisis** *n. see* SPINA BIFIDA.

**rachitic** *adj.* affected with rickets.

**rad** *n.* a former unit of absorbed dose of ionizing radiation. It has been replaced by the \*gray.

**radial** *adj.* relating to or associated with the radius (a bone in the forearm).

**radial artery** a branch of the brachial artery, beginning at the elbow and passing superficially down the forearm to the styloid process of the radius at the wrist. It then winds around the wrist and enters the palm of the hand, sending out branches to the fingers.

**radial keratotomy** an operation for short-sightedness (myopia). Deep cuts into the tissue of the cornea are placed radially around the outer two-thirds of the cornea; this flattens the curvature of the central part of the cornea and reduces the myopia. This procedure is now rarely performed, having been superseded by **\*excimer laser** treatment.

**radial nerve** an important mixed sensory and motor nerve of the arm, forming the largest branch of the **\*brachial plexus**. It extends downwards behind the humerus, supplying muscles of the upper arm, to the elbow, which it supplies with branches, and then runs parallel with the radius. It supplies sensory branches to the base of the thumb and a small area of the back of the hand.

**radial reflex** flexion of the forearm (and sometimes also of the fingers) that occurs when the lower end of the radius is tapped. It is due to contraction of the brachioradialis muscle, which is stimulated by tapping its point of insertion in the radius.

**radiation** *n.* energy in the form of waves or particles, especially **electromagnetic radiation**, which includes (in order of increasing energy) radio waves, microwaves, **\*infrared** rays (radiant heat), visible light, **\*ultraviolet** rays, **\*X-rays**, and **\*gamma rays**. The latter two are described as ionizing radiation due to their effect on other atoms and are potentially harmful. Particle radiation is described as alpha (a helium nucleus), beta (an electron), or **\*positron** emission. Only the latter is commonly used for diagnostic imaging (see **POSITRON EMISSION TOMOGRAPHY**).

**radiation protection** measures designed to limit the dose of harmful radiation to patients and workers. Medical exposure to radiation is governed in the UK by the Department of Health and Social Care under the Ionising Radiation (Medical Exposures) Regulations 2000 (**IRMER**). A guiding theme of protection is the **ALARA principle** (“as low as reasonably achievable”).

**radiation sickness** an acute illness caused by extreme exposure to rays emitted by radioactive substances, e.g. X-rays or gamma rays. Very high doses can cause death within hours. Lower doses, which may eventually prove fatal, cause nausea, vomiting, and diarrhoea followed after a week or more by bleeding and other symptoms of damage to the bone marrow, loss of hair, and bloody diarrhoea. Some of the milder symptoms can occur after *\*radiotherapy* during treatment of cancer.

**radical treatment** vigorous treatment that aims at the complete cure of a disease rather than the mere relief of symptoms. *Compare* **CONSERVATIVE TREATMENT**.

**radicle** *n.* (in anatomy) **1.** a small *\*root*. **2.** the initial fibre of a nerve or the origin of a vein. —**radicular** *adj.*

**radiculitis** *n.* inflammation of the root of a nerve. *See* **POLYRADICULITIS**.

**radio-** *combining form denoting* **1.** radiation. **2.** radioactive substances.

**radioactive iodine therapy** the administration of an estimated amount of the radioactive isotope iodine-131 as a drink in order to treat an overactive thyroid gland (*see* **THYROTOXICOSIS**). The iodine concentrates in the thyroid and thus delivers its beta radiation locally, with little effect on other tissues. The gland will shrink and become euthyroid over the succeeding 8–12 weeks but there is a high incidence of subsequent hypothyroidism (up to 80%), which requires lifetime treatment with thyroxine. The treatment cannot be used if there is any suspicion of pregnancy, and the patient must stay away from young children and pregnant women for around 10 days after administration. Despite these drawbacks, radioactive iodine remains a popular form of treatment for any cause of hyperthyroidism.

**radioactivity** *n.* disintegration of the nuclei of certain elements, leading to the emission of energy in the form of alpha, beta, or gamma rays. As particles are emitted the elements ‘decay’ into other elements. Naturally occurring radioactive elements include radium and uranium. There are many artificially produced isotopes, including iodine-131 and cobalt-60 used in *\*radiotherapy*; technetium-99m is used in *\*nuclear medicine*. *See* **RADIOISOTOPE**. —**radioactive** *adj.*

**radioautography** *n.* *see* [AUTORADIOGRAPHY](#).

**radiobiology** *n.* the study of the effects of radiation on living cells and organisms. Studies of the behaviour of cancer cells exposed to radiation have important applications in [\\*radiotherapy](#), revealing why some tumours fail to respond to the treatment; this has led to the development of new radiotherapy techniques that make tumours more susceptible to treatment by radiation.

**radiodermatitis** *n.* inflammation of the skin after exposure to ionizing radiation. This may occur after a short dose of heavy radiation (radiotherapy or atomic explosions) or prolonged exposure to small doses, as may happen accidentally to X-ray workers. The skin becomes dry, hairless, and atrophied, losing its colouring.

**radioembolization (selective internal radiation therapy; SIRT)** *n.* an [\\*interventional radiology](#) technique used in liver cancers. It is similar to [\\*transarterial chemoembolization](#), but instead of a chemotherapeutic agent yttrium-90 particles are injected into the liver. These emit beta radiation, which kills the cells within 2 mm of their radius. SIRT is a palliative technique.

**radiofrequency ablation (RFA)** the selective destruction of abnormal conducting tissue in the heart by the targeted delivery of radiofrequency energy via a catheter under X-ray and electrocardiographic guidance. It is usually curative in patients with supraventricular re-entrant tachycardia and is the treatment of choice for this condition (*see* [SUPRAVENTRICULAR TACHYCARDIA](#); [WOLFF–PARKINSON–WHITE SYNDROME](#)). It can be used for a variety of other arrhythmias with varying degrees of success. [\\*Cryoablation](#) is an alternative approach that uses freezing to destroy the abnormal tissue.

**radiofrequency palatal myoplasty (RPM)** *see* [PALATOPLASTY](#).

**radiographer** *n.* **1. (diagnostic radiographer)** a person who is trained in the technique of taking X-ray images of parts of the body. In modern practice a radiographer may also perform other imaging techniques, including [\\*magnetic resonance imaging](#), [\\*ultrasound](#), and [\\*nuclear medicine](#). **2. (therapeutic radiographer)** a person who is trained in the technique of treatment by [\\*radiotherapy](#).

**radiography** *n.* diagnostic radiology: traditionally, the technique of examining the body by directing **\*X-rays** through it to produce images (**radiographs**) on photographic film or a fluoroscope. Increasingly radiography involves the production of images by **\*computerized tomography**, **\*magnetic resonance imaging**, and **\*nuclear medicine**. It is used to produce images of disease in all parts of the body, to be interpreted by radiologists for physicians and surgeons. It is also widely used in dentistry for detecting dental caries, periodontal disease, periapical disease, the presence and position of unerupted teeth, and disease of the jaws. *See also* RADIOGRAPHER; RADIOLOGY.

**radioimmunoassay** *n.* a technique using radioactive antibodies as **\*tracers** to estimate the levels of natural substances in a blood sample. The antibodies bind to antigens, and the amount of radioactivity trapped is a measure of the amount of the target antigen present. The technique is widely used in the estimation of hormone levels.

**radioimmunolocalization** *n.* a method of identifying the site of a tumour (e.g. colorectal cancer) that relies on its uptake of radioactive isotopes attached to an appropriate anticancer immune cell. As yet this technique is little used in clinical practice.

**radioimmunotherapy** *n.* treatment in which a radioactive substance is linked to an antibody that attaches to a specific type of tumour cell, thus delivering the radiation to the tumour and limiting damage to healthy cells. *See* MONOCLONAL ANTIBODY.

**radioiodine ablation** the use of radioactive iodine (iodine-131) to destroy any residual thyroid tissue after thyroidectomy for cancer. Subsequent radioiodine treatment may be necessary to treat suspected or known residual thyroid cancer cells. Following ablation, thyroglobulin levels can be used as a **\*tumour** marker.

**radioisotope** *n.* an **\*isotope** of an element that emits alpha, beta, or gamma radiation during its decay into another element. Artificial radioisotopes, produced by bombarding elements with beams of neutrons, are widely used in medicine as **\*tracers** and as sources of radiation for the different techniques of **\*radiotherapy**.

**radiologist** *n.* a physician specializing in the interpretation of X-rays and other imaging techniques for the diagnosis of disease. An **interventional radiologist** specializes in the use of imaging to guide **\*interventional radiology** techniques.

**radiology** *n.* the branch of medicine involving the study of radiographs or other imaging technologies (such as **\*ultrasound** and **\*magnetic resonance imaging**) to diagnose or treat disease. A physician specializing in this field is known as a **\*radiologist**. *See also* **INTERVENTIONAL RADIOLOGY; RADIOGRAPHY**.

**radiology information system (RIS)** a computer database used to keep details of all the patients attending a clinical radiology department. It records patient demographics, imaging procedures done, medications given and dosage, person performing the imaging, and time and place of examination. Radiologist reports interpreting the images will also feature here. The RIS is vital to the functioning of a picture archiving and communications system (*see* **PACS**) and the electronic medical record system.

**radiolucent** *adj.* having the property of being transparent to X-rays (i.e. allowing X-rays to pass through). Radiopacity (blocking X-rays) decreases with atomic number of the element. Radiolucent materials, such as beryllium, are used to construct windows in X-ray tubes to allow the X-rays to escape from the tube. Gases are relatively radiolucent to X-rays and can be used as a negative **\*contrast medium** in X-ray examinations, e.g. in **\*double-contrast** barium examinations of the bowel or carbon dioxide **\*arteriography**.

**radionecrosis** *n.* death (**\*necrosis**) of tissue, commonly bone or skin, caused by exposure to ionizing radiation, as in **\*radiotherapy**. It can be induced by subsequent injury or surgery. *See* **IONIZATION**.

**radionuclide** *n.* a substance containing a radioactive atomic nucleus. Radionuclides can be used as **\*tracers** for diagnosis in **\*nuclear medicine**.

**radiopaque** *adj.* having the property of absorbing, and therefore being opaque to, X-rays. Radiopacity increases with atomic weight. Radiopaque materials, such as those containing iodine or barium, are used as **\*contrast media** in radiography. Metallic foreign bodies in tissues are also radiopaque and can be detected by radiography. Such heavy elements as lead and barium

can be used in shielding to protect people from unnecessary exposure to ionizing radiation. —**radiopacity** *n*.

**radiopeptide** *n.* *see* [PEPTIDE RECEPTOR RADIONUCLIDE THERAPY](#).

**radiosensitive** *adj.* describing certain forms of cancer cell that are particularly susceptible to radiation and are likely to be dealt with successfully by radiotherapy.

**radiosensitizer** *n.* a substance that increases the sensitivity of cells to radiation. The presence of oxygen and other compounds with a high affinity for electrons will increase radiosensitivity. Chemotherapy drugs such as fluorouracil and cisplatin can be used concurrently with radiotherapy as radiosensitizers (*see* [CHEMORADIOTHERAPY](#)).

**radiotherapist** *n.* a doctor who specializes in treatment with radiotherapy.

**radiotherapy** *n.* therapeutic radiology: the treatment of disease with penetrating radiation, such as X-rays, beta rays, or gamma rays, which may be produced by machines or given off by radioactive isotopes. Beams of radiation may be directed at a diseased part from a distance (*see* [TELETHERAPY](#)), or radioactive material, in the form of needles, wires, or pellets, may be implanted in the body (*see* [BRACHYTHERAPY](#)). Many forms of cancer are destroyed by radiotherapy.

**radium** *n.* a radioactive metallic element that emits alpha and gamma rays during its decay into other elements. The gamma radiation was formerly employed in *\*radiotherapy* for the treatment of cancer. Because *\*radon*, a radioactive gas, is released from radium, the metal was enclosed in gas-tight containers during use. Radium is stored in lead-lined containers, which give protection from the radiation. Symbol: Ra.

**radius** *n.* the outer and shorter bone of the forearm (*compare* [ULNA](#)). It partially revolves about the ulna, permitting *\*pronation* and *\*supination* of the hand. The head of the radius articulates with the *\*humerus*. The lower end articulates both with the scaphoid and lunate bones of the *\*carpus* (wrist) and with the ulna (via the **ulnar notch** on the side of the bone). —**radial** *adj.*

**radix** *n.* *see* [ROOT](#).

**radon** *n.* a radioactive gaseous element that is produced during the decay of **\*radium**. Sealed in small capsules called **radon seeds**, it is used in **\*radiotherapy** for the treatment of cancer, but has largely been replaced by newer agents and techniques. It emits alpha and gamma radiation. Symbol: Rn.

**rale** *n.* *see* **CREPITATION**.

**raloxifene** *n.* a drug used to prevent and treat osteoporosis that develops after the menopause. Raloxifene is a **\*selective (o)estrogen receptor modulator** (SERM): it mimics the protective action of oestrogen in the bones without the risk of the adverse effects (e.g. on the breast and uterus) associated with **\*hormone replacement therapy**. However, it does not relieve menopausal symptoms. Side-effects include hot flushes, and there is a risk of **\*thromboembolism** and **\*thrombophlebitis**.

**raltegravir** *n.* an **\*antiretroviral drug** (ARV) used, in combination with other ARVs, for treating refractory HIV infection. It acts by inhibiting integrase, an enzyme required by the virus to replicate and infect other cells. Side-effects include abdominal pain, constipation, and **\*lipodystrophy**.

**Ramsay Hunt syndrome** a form of **\*herpes** zoster affecting the facial nerve, associated with facial paralysis and loss of taste. It also produces pain in the ear and other parts supplied by the nerve. [J. R. Hunt (1872–1937), US neurologist]

**Ramstedt's operation** *see* **PYLOROMYOTOMY**. [W. C. Ramstedt (1867–1963), German surgeon]

**ramus** *n.* (*pl.* **rami**) **1.** a branch, especially of a nerve fibre or blood vessel. **2.** a thin process projecting from a bone, e.g. the rami of the **\*mandible**.

**Randall's plaque** the initial deposit of calcium-loaded material on a renal **\*pyramid** that develops into a kidney stone. [A. Randall (1883–1951), US urologist]

**randomized controlled trial** *see* **INTERVENTION STUDY**.

**random sample** a subgroup of a total population selected by a random process ensuring that each member of the population has an equal chance of

being included in the sample. It is sometimes **stratified** so that separate samples are drawn from each of several layers of the population, usually on the basis of age, sex, and socio-economic group. Selection is sometimes facilitated by identifying, in advance, certain units (e.g. towns or neighbourhoods) that will together represent the whole (a so-called **sampling frame**).

**ranibizumab** *n.* a recombinant *\*monoclonal antibody* fragment used for the treatment of wet age-related *\*macular degeneration*. It inhibits *\*vascular endothelial growth factor* and therefore choroidal *\*neovascularization*. Common side-effects are conjunctival haemorrhage, eye pain, *\*floaters*, increased intraocular pressure, and intraocular inflammation. *\*Aflibercept* and **pegaptanib** have similar uses and effects.

**ranitidine** *n.* an H<sub>2</sub>-receptor antagonist (*see* **ANTI-HISTAMINE**) that is used in the treatment of peptic ulcers and gastro-oesophageal reflux disease. Side-effects include headache, diarrhoea, rash, and drowsiness.

**RANKL inhibitor** *receptor activator of nuclear factor kappa B ligand inhibitor*: an agent that works by inhibiting the development of *\*osteoclasts* and bone resorption, thus minimizing bone loss and the potential for fractures in those with postmenopausal osteoporosis and bone metastases.

**ranula** *n.* a cyst found under the tongue, formed when the duct leading from a salivary or mucous gland is obstructed and distended.

**rapamycin** *n. see* **SIROLIMUS**.

**raphe** *n.* a line, ridge, seam, or crease in a tissue or organ, especially the line that marks the junction of two embryologically distinct parts that have fused to form a single structure in the adult. For example, the **raphe of the tongue** is the furrow that passes down the centre of the dorsal surface of the tongue.

**rarefaction** *n.* thinning of bony tissue sufficient to cause decreased density of bone to X-rays, as in osteoporosis.

**rash** *n.* a temporary eruption on the skin, usually typified by discrete red spots or generalized reddening, that may be accompanied by itching. A rash may be a local skin reaction or the outward sign of a disorder affecting the

body. Rashes commonly occur with infectious diseases, such as chickenpox and measles.

**Rasmussen's encephalitis** a focal encephalitis, found most commonly in children, that results in continual focal seizures (see [EPILEPSY](#)). The underlying cause is unknown but it may be due to a viral infection or an autoimmune process. Patients who are unresponsive to medical (antiepileptic) therapy may undergo surgery of the abnormal brain to try and control the seizures. [G. L. Rasmussen (20th century), US anatomist]

**raspatory** *n.* a filelike surgical instrument used for scraping the surface of bone (see illustration).

**A rib raspatory.**

**raspberry tumour** an [\\*adenoma](#) of the umbilicus.

**rat-bite fever (sodokosis)** a disease, contracted from the bite of a rat, due to infection by either the bacterium *Spirillum minus*, which causes ulceration of the skin and recurrent fever, or by the fungus *Streptobacillus moniliformis*, which causes inflammation of the skin, muscular pains, and vomiting. Both infections respond well to penicillin.

**Rathke's pouch** see [CRANIOPHARYNGIOMA](#).

**rationalization** *n.* (in psychology) the explanation of events or behaviour in terms that avoid giving the true reasons. For example, someone may claim to have been too tired to go to a party whereas in fact he or she was afraid of meeting new people.

**rationing** *n.* the process of allocating health-care resources among a population when demand outstrips supply. Where “first come first served” is not considered an appropriate policy, access to treatment may be rationed on a basis of [\\*need](#), effectiveness, or [\\*quality of life](#). See [EQUALITY](#); [JUSTICE](#); [NICE](#).

**rauwolfia** *n.* the dried root of the shrub *Rauwolfia serpentina*, which contains several alkaloids, including **reserpine**. Rauwolfia and its alkaloids lower blood pressure and depress activity of the central nervous system. They were formerly used as tranquillizers and to treat hypertension, but have been replaced by more effective and reliable drugs.

**Raynaud's disease** a condition of unknown cause in which the arteries of the fingers are unduly reactive and enter spasm (**angiospasm** or **vasospasm**) when the hands are cold. This produces attacks of pallor, numbness, and discomfort in the fingers. A similar condition (**Raynaud's phenomenon**) may result from atherosclerosis, connective-tissue diseases, ingestion of ergot derivatives, or the frequent use of vibrating tools. Gangrene or ulceration of the fingertips may result from lack of blood to the affected part. Warm gloves and peripheral **\*vasodilators** may relieve the condition. In unresponsive cases **\*sympathectomy** is of value. [M. Raynaud (1834–81), French physician]

**RDS** *see* **RESPIRATORY DISTRESS SYNDROME**.

**reaction formation** (in psychoanalysis) a **\*defence mechanism** by which unacceptable unconscious ideas are replaced in consciousness by their opposites. For instance, a man might make an ostentatious show of affection to someone for whom he has an unconscious hatred.

**reactive** *adj.* (in psychiatry) describing mental illnesses thought to be precipitated by events in the psychological environment. *See also* **ENDOGENOUS**.

**reactive arthritis** an inflammatory arthritis that develops after a gastrointestinal or a genitourinary (especially a chlamydial) infection, formerly called **Reiter's syndrome**. In a third of patients the triad of nongonococcal inflammation of the urethra (*see* **URETHRITIS**), **\*conjunctivitis**, and **\*polyarthritis** occurs.

**reactive hypoglycaemia** a condition of postprandial **\*hypoglycaemia**, of varying severity, induced by excessive levels of insulin release from the pancreas. It can be divided into early and late forms, depending on whether the insulin release occurs less than or more than three hours after the meal. The early form is due to the rapid discharge of ingested carbohydrate from

the stomach into the small bowel, immediately triggering hyperinsulinaemia. It can occur without obvious cause but is most commonly associated with upper-bowel surgery. The late form is due to a loss of the early-phase insulin response causing excessive postprandial *\*hyperglycaemia*, which then itself triggers an exaggerated insulin response with subsequent hypoglycaemia.

**reagin** *n.* a type of *\*antibody*, formed against an allergen, that has special affinity for cell membranes and remains fixed in various tissues. Subsequent contact with the allergen causes damage to the tissues when the antigen-antibody reaction occurs. The damaged cells, particularly *\*mast cells*, release histamine and serotonin, which are responsible for the local inflammation of an allergy or the very severe effects of anaphylactic shock (see *ANAPHYLAXIS*). Reagins belong to the IgE class of *\*immunoglobulins*.

**reality orientation** therapy that aims to improve cognitive functioning and behaviour in elderly people with dementia by using repetition and a range of resources to help the memory. It involves regularly reminding the person of such information as the time, date, where he or she is, and planned events for that day. The information is given verbally by a carer or written on boards placed in prominent positions in the person's home.

**real-time imaging** the rapid acquisition and manipulation of ultrasound information from a scanning probe by electronic circuits to enable images to be produced on TV screens almost instantaneously. The operator can place the scanning probe accurately on the region of interest in order to observe its structure and appreciate moving structures within it (see *DOPPLER ULTRASOUND*). Using similar techniques, the instantaneous display of other imaging modalities, such as *\*computerized tomography* scanning and *\*magnetic resonance imaging*, can now be achieved. Real-time imaging is useful in guiding *\*interventional radiology* procedures, for example, allowing a needle to be guided accurately as it is passed into the body. It is also useful for observing dynamic physiological activity.

**reamer** *n.* an instrument used in *\*endodontics* to clean, cut, and prepare the walls of a root canal for *\*root canal treatment*.

**rebase** *n.* see *RELINE*.

**rebound** *n.* the return or increase of a condition after cessation of treatment or other stimulus. **Rebound headache**, which may be worse than the initial headache, may occur after stopping medication, particularly if too much was taken. Similarly, **rebound insomnia** may occur after the cessation of sleeping pills, particularly after long-term treatment.

**reboxetine** *n.* an **\*antidepressant** drug that acts by inhibiting reabsorption of the neurotransmitter **\*noradrenaline**, thus prolonging its action in the brain. Side-effects include dry mouth, constipation, insomnia, and dizziness.

**receptaculum** *n.* the dilated portion of a tubular anatomical part. The **receptaculum** (or **cisterna**) **chyli** is the dilated end of the **\*thoracic duct**, into which lymph vessels from the lower limbs and intestines drain.

**receptor** *n.* **1.** a cell or group of cells specialized to detect changes in the environment and trigger impulses in the sensory nervous system. All sensory nerve endings act as receptors, whether they simply detect touch, as in the skin, or chemical substances, as in the nose and tongue, or sound or light, as in the ear and eye. See **EXTEROCEPTOR**; **INTEROCEPTOR**; **MECHANORECEPTOR**; **PROPRIOCEPTOR**. **2.** a specialized area of a cell membrane, consisting of a specially adapted protein, that can bind with a specific hormone (e.g. **\*oestrogen receptors**), neurotransmitter (e.g. **\*adrenoceptors**), drug, or other chemical, thereby initiating a change within the cell.

**recess** *n.* (in anatomy) a hollow chamber or a depression in an organ or other part.

**recessive** *adj.* describing a gene (or its corresponding characteristic) whose effect is shown in the individual only when its **\*allele** is the same, i.e. when two such alleles are present (the **double recessive** condition). Many hereditary diseases (including cystic fibrosis) are due to the presence of a defective gene as a double recessive. They are said to show **autosomal recessive** inheritance, since the gene is carried on an autosome (any chromosome other than a sex chromosome). Compare **DOMINANT**. — **recessive** *n.*

**recipient** *n.* a person who receives something from a **\*donor**, such as a blood transfusion or a kidney transplant.

**recombinant DNA** DNA that contains genes from different sources that have been combined by the techniques of \*genetic engineering rather than by breeding experiments. Genetic engineering is therefore also known as **recombinant DNA technology**.

**record linkage** the means by which information about health events from several different sources (e.g. hospital attendance, vaccination, and consultation with general practitioners) are all related to a specific individual in a common file or more usually a computerized record. This contrasts with data in which events only are recorded (see **HOSPITAL EPISODE STATISTICS**) and two individuals treated for the same disease cannot be distinguished from one individual treated on two separate occasions.

**recovery position** a first-aid position into which an unconscious but breathing patient can be laid to afford maximum protection to the airway. It involves laying the patient on his or her side, with the uppermost leg bent at the knee and hip and the lower arm behind the back to prevent rolling onto the front or back into a position in which the patient could smother or choke.

**recrudescence** *n.* a fresh outbreak of a disorder in a patient after a period during which its signs and symptoms had died down and recovery seemed to be taking place.

**recruitment** *n.* **1.** (in physiology) the phenomenon whereby an increase in the strength of a stimulus or repetition of the stimulus will stimulate increasing numbers of nerve cells to respond. **2.** (in audiology) the phenomenon in which a person with sensorineural deafness cannot hear quiet sounds but can perceive loud sounds just as loudly as, or even more loudly than, a person with normal hearing.

**rect- (recto-)** *combining form denoting the rectum.* Examples: **rectouterine** (relating to the rectum and uterus); **rectovesical** (relating to the rectum and bladder).

**rectal bleeding** *see* **HAEMATOCHESIA**.

**rectocele (proctocele)** *n.* bulging or pouching of the rectum, usually a forward protrusion of the rectum into the posterior wall of the vagina often in

association with prolapse of the uterus. It is repaired by posterior **\*colporrhaphy**.

**rectopexy** *n.* a surgical procedure to prevent or treat rectal prolapse. An abdominal rather than a perineal approach is used. The rectum is mobilized into its normal pelvic position and internally fixed to the sacrum and anterior structures using sutures and mesh. Rectopexy may be combined with the removal of a small section of large bowel (**resection rectopexy**).

**rectosigmoid** *n.* the region of the large intestine around the junction of the sigmoid colon and the rectum.

**rectum** *n.* the terminal part of the large **\*intestine**, about 12 cm long, which runs from the sigmoid colon to the anal canal. Faeces are stored in the rectum before defecation. —**rectal** *adj.*

**rectus** *n.* any of several straight muscles. The **rectus muscles of the orbit** are some of the extrinsic **\*eye** muscles. **Rectus abdominis** is a long flat muscle that extends bilaterally along the entire length of the front of the abdomen. The rectus muscles acting together serve to bend the trunk forwards; acting separately they bend the body sideways. The **rectus femoris** forms part of the **\*quadriceps**.

**recurrent** *adj.* (in anatomy) describing a structure, such as a nerve or blood vessel, that turns back on its course, forming a loop.

**recurrent miscarriage** *see* **MISCARRIAGE**.

**red blood cell** *see* **ERYTHROCYTE**.

**redia** *n.* (*pl.* **rediae**) the third-stage larva of a parasitic **\*fluke**. Rediae develop within the body of a freshwater snail and undergo a process of asexual reproduction, giving rise to many fourth-stage larvae called **\*cercariae**. *See also* **MIRACIDIUM**; **SPORO CYST**.

**red reflex** the red area seen through the pupil as a result of the reflection of light from the retina. It is usually seen on **\*fundoscopy** and sometimes in photographs taken using a flashlight.

**reduction** *n.* (in surgery) the restoration of a displaced part of the body to its normal position by manipulation or operation. The fragments of a broken

bone are reduced before a splint is applied; a dislocated joint is reduced to its normal seating; or a hernia is reduced when the displaced organ or tissue is returned to its usual anatomical site.

**reduction division** the first division of *\*meiosis*, in which the chromosome number is halved. The term is sometimes used as a synonym for the whole of meiosis.

**reduplication** *n.* doubling of the heart sounds, which may be heard in healthy individuals and shows variation with respiration due to the slightly asynchronous closure of the heart valves.

**reduviid** *n.* any one of a group of winged insects (Reduviidae) whose mouthparts – adapted for piercing and sucking – take the form of a long proboscis that is tucked beneath the head when not in use. Some South American genera, notably *Panstrongylus*, *Rhodnius*, and *Triatoma* – the kissing bugs, are nocturnal bloodsucking insects that transmit the parasite causing *\*Chagas' disease*.

**Reduvius** *n.* a genus of predatory bloodsucking reduviid bugs. *R. personatus*, widely distributed in Europe, normally preys upon insects but occasionally attacks humans. Its bite causes various allergic symptoms, including rash, nausea, and palpitations.

**Reed–Sternberg cell** a large binucleate cell that is characteristic of *\*Hodgkin's disease*. [D. Reed Mendenhall (1874–1964), US pathologist; C. Sternberg (1872–1935), Austrian pathologist]

**re-entry tachycardia** a rapid heart rate due to a self-sustaining circulation of electrical impulses from the atria to the ventricles and back again. This **re-entry circuit** requires the presence of an abnormal second electrical conduction pathway in addition to the usual atrioventricular nodal connection route. The abnormal pathway may be located within the *\*atrioventricular node* (causing *\*atrioventricular nodal re-entry tachycardia*) or it may be an *\*accessory pathway* situated outside the atrioventricular node (causing *\*atrioventricular reciprocating tachycardia*). Medication is often effective and *\*radiofrequency ablation* is usually curative.

**refeeding syndrome** a potentially fatal condition that may affect severely malnourished patients in response to the reintroduction of a protein- and

calorie-rich diet. It is thought to be due to severe fluid and *\*electrolyte* shifts (especially low phosphate, magnesium, and potassium levels in the blood) and related metabolic complications (e.g. raised levels of insulin in the blood). Clinical complications include heart failure, *\*paraesthesia*, muscle weakness, cardiac *\*arrhythmias*, fitting, and death. An assessment to identify at-risk patients before the reinstatement of feeding, regular monitoring, and prompt correction of electrolyte abnormalities helps to prevent this condition.

**referred pain (synalgia)** pain felt in a part of the body other than where it might be expected. An abscess beneath the diaphragm, for example, may cause a referred pain in the shoulder area, while heart disorders may cause pain in the left arm and fingers. The confusion arises because sensory nerves from different parts of the body share common pathways when they reach the spinal cord.

**reflective practice** the process of critically considering one's own professional practice during or after events in order to review one's values and to understand the emotions and reasons behind one's actions and decisions and the effect of those actions and decisions on others. Reflection is seen as essential to developing and maintaining ethical medical practice. See *AUTONOMY*.

**reflex** *n.* an automatic or involuntary activity brought about by relatively simple nervous circuits, without consciousness being necessarily involved. Thus a painful stimulus such as a pinprick will bring about the reflex of withdrawing the finger before the brain has had time to send a message to the muscles involved. See *CONDITIONED REFLEX*; *PATELLAR REFLEX*; *PLANTAR REFLEX*; *PUPILLARY REFLEX*; *ROOTING REFLEX*.

**reflex arc** the nervous circuit involved in a *\*reflex*, being at its simplest a sensory nerve with a receptor, linked at a synapse in the brain or spinal cord with a motor nerve, which supplies a muscle or gland (see illustration). In a simple reflex (such as the *\*patellar reflex*) only two neurons may be involved, but in other reflexes there may be several *\*interneurons* in the arc.

### The reflex arc.

**reflexology** *n.* a complementary therapy based on the theory that reflex points on the feet correspond with all body parts. Firm pressure is applied to the relevant reflex points using the thumb or fingers. Reflexology is said to be able to help with specific illnesses and may also restore the body's natural balance and harmony. It can be used for people of any age and there are very few contraindications.

**reflex sympathetic dystrophy** *see* **COMPLEX REGIONAL PAIN SYNDROME**.

**reflux** *n.* a backflow of liquid, against its normal direction of movement. *See also* **OESOPHAGITIS**; **VESICoureteric Reflux**.

**reformatting** *n.* in radiography, displaying the images in a different plane or multiple planes by manipulating information already obtained. Typical examples are three-dimensional reconstructions and **\*multiplanar reconstructions**.

**refraction** *n.* **1.** the change in direction of light rays when they pass obliquely from one transparent medium to another, of a different density. Refraction occurs as light enters the eye, when it passes from air to the media of the eye, i.e. cornea, aqueous humour, lens, and vitreous humour, to come to a focus on

the retina. Errors of refraction, in which light rays do not come to a focus on the retina due to defects in the refracting media or shape of the eyeball, include astigmatism and long- and short-sightedness. **2.** determination of the power of refraction of the eye. This gives the degree to which the eye differs from normal, which will determine whether or not the patient needs glasses and, if so, how strong they should be.

**refractive error** an abnormality of the eye resulting in a blurred image on the retina as a result of abnormal focusing, which can be corrected by glasses, contact lenses, or **\*refractive surgery**. Refractive errors include **\*myopia**, **\*hypermetropia**, and **\*astigmatism**.

**refractive surgery** any surgical procedure that has as its primary objective the correction of any refractive error. It includes such procedures as clear lens extraction, **\*LASIK**, **\*LASEK**, and photorefractive **\*keratectomy**.

**refractometer** *n.* *see* **OPTOMETER**.

**refractory** *adj.* unresponsive: applied to a condition that fails to respond satisfactorily to a given treatment.

**refractory period** (in neurology) the time of recovery needed for a nerve cell that has just transmitted a nerve impulse or for a muscle fibre that has just contracted. During the refractory period a normal stimulus will not bring about excitation of the cell, which is undergoing **\*repolarization**.

**refrigeration** *n.* lowering the temperature of a part of the body to reduce the metabolic activity of its tissues or to provide a local anaesthetic effect.

**Refsum's disease** an inherited disorder of lipid metabolism resulting in abnormal accumulation of phytanic acid (a fatty acid) in body tissues. This results in a **\*peripheral neuropathy** affecting the sensory and motor nerves, diminishing vision due to **\*retinitis pigmentosa**, and unsteadiness (**\*ataxia**) caused by damage to the cerebellum. [S. Refsum (20th century), Norwegian physician]

**regimen** *n.* (in therapeutics) a prescribed systematic form of treatment, such as a diet, course of drugs, or special exercises, for curing disease or improving health.

**regional specialty** *see* **CATCHMENT AREA**.

**registrar** *n.* *see* **CONSULTANT**.

**regression** *n.* (in psychiatry) reversion to a more immature level of functioning. The term may be applied to the state of a patient in hospital who becomes incontinent and demanding. It may also be applied to a single psychological function; for example, psychoanalysts speak of the **\*libido** regressing to an early stage of development.

**regulations** *pl. n.* explicit rules to govern behaviour that are enforced by specified institutions or agencies. Where regulations are breached, the relevant regulatory authority can impose sanctions. Regulations may derive from legislation, from professional bodies, or from a designated authority.

**regulatory T cell (Treg cell)** a type of T **\*lymphocyte** that suppresses immune responses.

**regurgitation** *n.* **1.** the bringing up of undigested material from the stomach to the mouth (*see* **VOMITING**). **2.** the flowing back of a liquid in a direction opposite to the normal one, as when blood surges back through a defective valve in the heart after the heart has contracted (*see* **AORTIC REGURGITATION**; **MITRAL REGURGITATION**).

**rehabilitation** **1.** (in **\*physical medicine**) the treatment of an ill, injured, or disabled patient with the aim of restoring normal health and function or to prevent the disability from getting worse. **2.** any means for restoring the independence of a patient after diseases or injury, including employment retraining.

**Reifenstein's syndrome (partial androgen insensitivity syndrome)** a congenital resistance to androgen hormones (*see* **ANDROGEN INSENSITIVITY SYNDROME**) resulting in poor development of the male sexual characteristics, which often becomes more obvious at puberty. Some features of feminization may occur (e.g. breast development). [E. C. Reifenstein (1908–75), US endocrinologist]

**reiki** *n.* a complementary therapy based on an ancient healing system rediscovered in the 20th century by a Buddhist monk. It involves a therapist putting his or her hands on or very close to a patient to boost the patient's natural invisible energy fields (reiki means 'universal life force'). It is often

used as an adjunct to other therapies and is said to be helpful for many conditions.

**reimplantation** *n.* *see* **REPLANTATION**.

**reinforcement** *n.* (in psychology) the strengthening of a conditioned reflex (*see* **CONDITIONING**). In classical conditioning this takes place when a conditioned stimulus is presented at the same time as – or just before – the unconditioned stimulus. In operant conditioning it takes place when a pleasurable event (or **reinforcer**), such as a reward, follows immediately after some behaviour. The **reinforcement schedule** governs how often and when such behaviour is rewarded. Different schedules produce different effects on behaviour.

**Reinke's oedema** swelling of the vocal folds of the larynx due to a build-up of fluid in **Reinke's space**, between the internal fibromuscular layer of the vocal fold and its overlying mucosa. It is caused by smoking, vocal overuse, **\*gastro-oesophageal reflux**, or thyroid disease. [F. B. Reinke (1862–1919), German anatomist]

**Reissner's membrane** the membrane that separates the scala vestibuli and the scala media of the **\*cochlea** of the ear. [E. Reissner (1824–78), German anatomist]

**Reiter's syndrome** *see* **REACTIVE ARTHRITIS**. [H. Reiter (1881–1969), German physician]

**rejection** *n.* (in transplantation) the destruction by immune mechanisms of a tissue grafted from another individual. Antibodies, complement, clotting factors, and platelets are involved in the failure of the graft to survive. **\*Allograft** rejection is a vigorous response that can be modified by drugs (such as ciclosporin and corticosteroids) and antibodies against T cells; **\*xenograft** rejection is an acute response that is at present beyond therapeutic control.

**relapse** *n.* a return of disease symptoms after recovery had apparently been achieved or the worsening of an apparently recovering patient's condition during the course of an illness.

**relapsing fever** an infectious disease caused by bacteria of the genus *\*Borrelia*, which is transmitted by ticks or lice and results in recurrent fever. The first episode of fever occurs about a week after infection: it is accompanied by severe headache and aching muscles and joints and lasts 2–8 days. Subsequent attacks are milder and occur at intervals of 3–10 days; untreated, the attacks may continue for up to 12 weeks. Treatment with antibiotics, such as tetracycline or erythromycin, is effective.

**relative analgesia** a sedation technique, used particularly in dentistry, in which a mixture of *\*nitrous oxide* and oxygen (‘gas and air’) is given. The patient remains conscious throughout; the technique is used to supplement local anaesthesia for nervous patients.

**relative density** *see* **SPECIFIC GRAVITY**.

**relativism** *n.* the view that ethical judgments are solely or mainly determined by the cultural, social, or psychological perspectives of those making them. In medical ethics, this often takes the form of cultural relativism, whereby it is assumed that because health-care traditions and practices vary, so too must definitions of what constitutes good practice. *Compare* **KANTIAN ETHICS**.

**relaxant** *n.* an agent that reduces tension and strain, particularly in muscles (*see* **MUSCLE RELAXANT**).

**relaxation** *n.* (in physiology) the diminution of tension in a muscle, which occurs when it ceases to contract: the state of a resting muscle.

**relaxation therapy** treatment by teaching patients to decrease their anxiety by reducing the tone in their muscles. This can be used by itself to help people cope with stressful situations or as a part of *\*desensitization* to specific fears.

**relaxin** *n.* a hormone, secreted by the placenta in the terminal stages of pregnancy, that causes the cervix (neck) of the uterus to dilate and prepares the uterus for the action of *\*oxytocin* during labour.

**Relenza** *n. see* **ZANAMIVIR**.

**reline (rebase)** *n.* the procedure by which the fitting surface of a denture is rebased to make it fit a jaw that has undergone *\*resorption* since the denture

was originally made. The procedure is often necessary for dentures that were fitted immediately after extraction of the teeth.

**rem** *n.* roentgen equivalent man: a former unit dose of ionizing radiation equal to the dose that gives the same biological effect as that due to one roentgen of X-rays. The rem has been replaced by the *\*sievert*.

**REM** rapid eye movement: describing a stage of *\*sleep* during which the muscles of the eyeballs are in constant motion behind the eyelids. People woken up during this stage of sleep generally report that they were dreaming at the time.

**Remicade** *n.* *see* *INFLIXIMAB*.

**remission** *n.* **1.** a lessening in the severity of symptoms or their temporary disappearance during the course of an illness. **2.** a reduction in the size of a cancer and the symptoms it is causing.

**remittent fever** *see* *FEVER*.

**renal** *adj.* relating to or affecting the kidneys.

**renal artery** either of two large arteries arising from the abdominal aorta and supplying the kidneys. Each renal artery divides into an anterior and a posterior branch before entering the kidney.

**renal cell carcinoma (Grawitz tumour, hypernephroma)** a malignant tumour of kidney cells (the alternative name refers to its supposed resemblance to part of the adrenal gland and at one time it was thought to originate from this site). It may be present for some years before giving rise to symptoms, which include fever, loin pain and swelling, and blood in the urine. Treatment is by surgery, but tumours are apt to recur locally or spread via the bloodstream and can often be seen growing along the renal vein. Secondary growths from a renal cell carcinoma in the lung have a characteristic 'cannon-ball' appearance. These tumours are relatively insensitive to radiotherapy and cytotoxic drugs but some respond to such hormones as progestogens. Targeted therapy with *\*sorafenib* and *\*sunitinib* has significantly changed the treatment of advanced tumours.

**renal function tests** tests for assessing the function of the kidneys. These include measurements of the specific gravity of urine, creatinine *\*clearance*

time, and blood urea levels; intravenous urography; and renal angiography.

**renal osteodystrophy** *see* **OSTEODYSTROPHY**.

**renal transplantation** *see* **TRANSPLANTATION**.

**renal tubular acidosis (RTA)** metabolic acidosis due to failure of the kidney to excrete acid into the urine. Three types of RTA are recognized. Type 1 (distal RTA) results from a reduction in net acid secretion in the distal convoluted tubule (*see* **NEPHRON**) and an inability to acidify the urine. Hypokalaemia is often present and may be severe. The condition can be either genetically determined or, more commonly, the result of systemic disease (e.g. autoimmune disorders) or drugs (e.g. amphotericin). Type II (proximal RTA) is due to a lowered threshold for bicarbonate reabsorption; eventually a steady state is established with a low serum bicarbonate but capacity to acidify the urine. Hypokalaemia is present due to **\*aldosteronism** caused by the increased delivery of sodium to the distal tubule. Proximal RTA usually occurs as part of more widespread proximal tubule dysfunction with the **\*Fanconi syndrome**. Type IV RTA results from impaired excretion of both acid and potassium and results in acidosis with hyperkalaemia. It is most commonly seen with aldosterone deficiency. This may be isolated, especially in diabetics, or it may be induced by drugs (angiotensin II antagonists or ACE inhibitors).

**renal tubule (uriniferous tubule)** the fine tubular part of a **\*nephron**, through which water and certain dissolved substances are reabsorbed back into the blood.

**reni- (reno-)** *combining form denoting* the kidney.

**renin** *n.* an enzyme released into the blood by the kidney in response to stress. It reacts with a substrate from the liver to produce **\*angiotensin**, which causes constriction of blood vessels and thus an increase in blood pressure. Excessive production of renin results in the syndrome of **\*renovascular hypertension**.

**rennin** *n.* an enzyme produced in the stomach that coagulates milk. It is secreted by the gastric glands in an inactive form, **prorennin**, which is activated by hydrochloric acid. Rennin converts caseinogen (milk protein) into insoluble casein in the presence of calcium ions. This ensures that the

milk remains in the stomach, exposed to protein-digesting enzymes, for as long as possible. The largest amounts of rennin are present in the stomachs of young mammals.

**renography (isotope renography)** *n.* the radiological study of the kidneys by a **\*gamma camera** following the intravenous injection of a radioactive **\*tracer**, which is concentrated and excreted by the kidneys. The radioactive isotope (usually **\*technetium-99m**) emits gamma rays, which are recorded by the camera positioned over the kidneys. A graph of the radioactivity in each kidney over time provides information on its function and rate of drainage. *See* **DMSA**; **DTPA**; **MAG3**.

**renovascular hypertension** disease affecting the arterial supply to the kidneys, leading to ischaemia and resultant stimulation of the renin-**\*angiotensin**-aldosterone axis. In the major vessels, the most common cause is atheromatous plaque disease. Other causes are fibromuscular dysplasia and **\*Takayasu's disease**.

**reovirus** *n.* one of a group of small RNA-containing viruses that infect both respiratory and intestinal tracts without producing specific or serious diseases (and were therefore termed *respiratory enteric orphan viruses*). *Compare* **ECHOVIRUS**.

**repaglinide** *n. see* **MEGLITINIDES**.

**reperfusion** *n.* restoration of blood flow to a tissue that follows relief of an arterial occlusion, most commonly following the correction of acute coronary artery occlusion by coronary **\*stenting** or **\*thrombolysis** in the context of heart attack.

**repetitive strain injury (RSI)** pain in an upper limb associated with frequent repetition of a particular movement, usually related to keyboard usage. Symptoms often occur in the absence of clear signs, such as **\*tenosynovitis** or **\*tendovaginitis**, which presents difficulties both in treatment and in claiming compensation from an employer (if an industrial cause can be identified).

**repetitive transcranial magnetic stimulation (rTMS)** *see* **TRANSCRANIAL MAGNETIC STIMULATION**.

**replacement bone** a bone that is formed by replacing cartilage with bony material.

**replantation** *n.* **1.** the reattachment of severed limbs (or parts of limbs) and other body parts (e.g. the nose) using *\*microsurgery* to rejoin nerves and vessels. **2. (reimplantation)** (in dentistry) the reinsertion of a tooth into its socket after its accidental or deliberate removal. The prognosis for the tooth is improved if the tooth is not allowed to dry out prior to reimplantation. — **replant** *vb.*

**replication** *n.* the process by which *\*DNA* makes copies of itself when the cell divides. The two strands of the DNA molecule unwind and each strand directs the synthesis of a new strand complementary to itself (see illustration).

**Replication of a DNA molecule.**

**repolarization** *n.* the process in which the membrane of a nerve cell returns to its normal electrically charged state after a nerve impulse has passed. During the passage of a nerve impulse a temporary change in the molecular structure of the membrane allows a surge of ions across the membrane (*see ACTION POTENTIAL*). During repolarization ions diffuse back to restore the

charge and the nerve becomes ready to transmit further impulses. *See* **REFRACTORY PERIOD**.

**repositor** *n.* an instrument used to return a displaced part of the body – for instance, a prolapsed uterus – to its normal position.

**repression** *n.* (in **\*psychoanalysis**) the process of excluding an unacceptable wish or an idea from conscious mental life. The repressed material may give rise to symptoms. One goal of psychoanalysis is to return repressed material to conscious awareness so that it may be dealt with rationally.

**reproduction rate** *see* **FERTILITY RATE**.

**reproductive system** the combination of organs and tissues associated with the process of reproduction. In males it includes the testes, vasa deferentia, prostate gland, seminal vesicles, urethra, and penis; in females it includes the ovaries, Fallopian tubes, uterus, vagina, and vulva. (See illustration.)

**Male reproductive system.**

**Female reproductive system.**

**research ethics committee** *see* **ETHICS COMMITTEE**.

**resection** *n.* surgical removal of a portion of any part of the body. For example, a section of diseased intestine may be removed and the healthy ends sewn together. A **submucous resection** is removal of part of the cartilage septum (central division) of the nose that has become deviated, usually by injury. **Transurethral resection of the prostate (TURP)** – an operation performed when the prostate gland becomes enlarged – involves removal of portions of the gland through the urethra using an instrument called a **\*resectoscope**.

**resectoscope** *n.* a type of surgical instrument (an **\*endoscope**) used in resection of the prostate or in the removal of bladder tumours. The resectoscope allows continuous irrigation of the operation site during the procedure by having a fluid inlet and outlet channel. Resection is performed by an electrically activated wire loop.

**reserpine** *n. see* **RAUWOLFIA**.

**reserve volume** the extra volume of air that an individual could inhale or exhale when breathing to the limit of his or her capacity.

**resident** *n.* in the USA, a licensed physician or surgeon in postgraduate training in a particular specialty, who is responsible for the care of a number

of hospital patients with the assistance of *\*interns*, whom he or she instructs. A resident may work with one or more senior surgeons or physicians.

**residual volume** the volume of air that remains in the lungs after the individual has breathed out as much as he or she can. This volume is increased in *\*emphysema*.

**resistance** *n.* **1.** the degree of *\*immunity* that the body possesses: a measure of its ability to withstand disease. **2.** the degree to which a disease or disease-causing organism remains unaffected by antibiotics or other drugs.

**resolution** *n.* **1.** the stage during which inflammation gradually disappears. **2.** the degree to which individual details can be distinguished by the eye, as through a *\*microscope*.

**resorption** *n.* loss of substance through physiological or pathological means. In dentistry, **internal resorption** occurs from within the pulp cavity; **apical resorption** occurs at the root end. Resorption of the jaws occurs following tooth removal.

**respiration** *n.* the process of gaseous exchange between an organism and its environment. This includes both **external respiration**, which involves *\*breathing*, in which oxygen is taken up by the capillaries of the lung *\*alveoli* and carbon dioxide is released from the blood, and **internal respiration**, during which oxygen is released to the tissues and carbon dioxide absorbed by the blood. Blood provides the transport medium for the gases between the lungs and tissue cells. In addition, it contains a pigment, *\*haemoglobin*, with special affinity for oxygen. Once inside the cell oxygen is utilized in metabolic processes resulting in the production of energy (*see ATP*), water, and waste materials (including carbon dioxide). *See also LUNG.* — **respiratory** *adj.*

**respirator** *n.* **1.** a face mask for administering oxygen or other gas or for filtering harmful fumes, dust, etc. **2.** *see VENTILATOR.*

**respiratory arrest** cessation of breathing, which – without treatment – will very quickly be followed by *\*cardiac arrest*. It may result from airway obstruction, brain or spinal injury, overdose of certain medications (e.g. opioids), disease of the muscles and/or nerves necessary for breathing, or severe lung disease or injury. Treatment must be prompt and include

clearance of any blockage in the airway and ventilatory support, for example by [MOUTH-TO-MOUTH RESUSCITATION](#).

**respiratory distress** severe difficulty in achieving adequate oxygenation in spite of significant efforts to breathe: it is usually associated with increased [\\*respiratory rate](#) and the use of [\\*accessory muscles](#) in the chest wall. It can occur in both obstructive and nonobstructive lung conditions. *See* [ADULT RESPIRATORY DISTRESS SYNDROME](#); [AIRWAY OBSTRUCTION](#); [DYSPNOEA](#); [RESPIRATORY DISTRESS SYNDROME](#); [STRIDOR](#).

**respiratory distress syndrome (RDS; hyaline membrane disease)** the condition of a newborn infant in which the lungs are imperfectly expanded. Initial inflation and normal expansion of the lungs requires the presence of a substance ([\\*surfactant](#)) that reduces the surface tension of the air sacs (alveoli) and prevents collapse of the small airways. Without surfactant the airways collapse, leading to inefficient and ‘stiff’ lungs. The condition is most common and serious among preterm infants, in whom surfactant may be deficient. It lasts 5–10 days, with worsening on days 2–3. Breathing is rapid, laboured, and shallow, and microscopic examinations of lung tissue in fatal cases has revealed the presence of [\\*hyalin](#) material in the collapsed air sacs. The condition is treated by careful nursing, intravenous fluids, and oxygen, with or without positive-pressure ventilation (*see* [NONINVASIVE VENTILATION](#)). Early surfactant replacement therapy has been shown to reduce the severity of RDS and when given prophylactically it has been demonstrated to improve clinical outcome. *See also* [ADULT RESPIRATORY DISTRESS SYNDROME](#).

**respiratory quotient (RQ)** the ratio of the volume of carbon dioxide transferred from the blood into the alveoli to the volume of oxygen absorbed into the alveoli. The RQ is usually about 0.8 because more oxygen is taken up than carbon dioxide excreted.

**respiratory rate (RR)** breathing rate: the number of breaths per minute. Normally between 6 and 12, it increases after exercise and in cases of [\\*respiratory distress](#) and decreases after head injury and opioid overdose.

**respiratory syncytial virus (RSV)** a paramyxovirus (*see* [MYXOVIRUS](#)) that causes infections of the nose and throat. It is a major cause of bronchiolitis

and pneumonia in young children. In tissue cultures infected with the virus, cells merge together to form a conglomerate (**syncytium**). RSV is thought to have a role in **\*sudden infant death syndrome**. Vulnerable children can be treated with **\*ribavirin**, but most children just require supportive measures.

**respiratory system** the combination of organs and tissues associated with **\*breathing**. It includes the nasal cavity, pharynx, larynx, trachea, bronchi, bronchioles, and lungs and also the diaphragm and other muscles associated with breathing movements.

**response** *n.* the way in which the body or part of the body reacts to a **\*stimulus**. For example, a nerve impulse may produce the response of a contraction in a muscle that the nerve supplies.

**response prevention** a form of **\*behaviour therapy** given for severe **\*obsessions**. Patients are encouraged to abstain from rituals and repetitive acts while they are in situations that arouse anxiety. For example, a hand-washing ritual might be treated by stopping washing while being progressively exposed to dirt. The anxiety then declines, and with it the obsessions.

**responsibility** *n.* the state or position of being accountable for one's actions and decisions. In health care, responsibility for some matters may be delegated to a less experienced clinician but overall responsibility remains with the senior. At the same time, responsibility for personal health is with the individual, an approach underlined by **\*dependence** agencies (such as Alcoholics Anonymous). Best health care in practice acknowledges this mutuality or partnership: the physician is an expert in medicine, the patient in him- or herself. *See also* **PROFESSIONALISM**.

**restenosis** *n.* recurrent **\*stenosis**, usually in a blood vessel after such procedures as angioplasty or insertion of a stent.

**restiform body** a thick bundle of nerve fibres that conveys impulses from tracts in the spinal cord to the cortex of the anterior and posterior lobes of the cerebellum.

**resting cell** a cell that is not undergoing division. *See* **INTERPHASE**.

**restless legs syndrome (Ekbom's syndrome)** a condition in which a sense of uneasiness, restlessness, and itching, often accompanied by twitching and pain, is felt in the calves of the legs when sitting or lying down, especially in bed at night. The only relief is walking or moving the legs, which often leads to insomnia. The cause is unknown: it may be inadequate circulation, nerve damage (*see* **PERIPHERAL NEUROPATHY**), deficiency of iron, vitamin B<sub>12</sub>, or folate, or a reaction to antipsychotic or antidepressant drugs. In severe cases treatment with a **\*dopamine** receptor agonist (e.g. pramipexole) may be helpful.

**restoration** *n.* (in dentistry) any type of dental **\*filling** or **\*crown**, which is aimed at restoring a tooth to its normal form, function, and appearance. A **sealant restoration** (or **preventive resin restoration**) is a combination of a **\*fissure sealant** and a small filling.

**rest pain** pain without prior exertion, usually experienced in the feet or chest (**\*angina pectoris**), that indicates an extreme degree of **\*ischaemia**.

**restriction enzyme (restriction endonuclease)** an enzyme, obtained from bacteria, that cuts DNA into specific short segments. Restriction enzymes are widely used in **\*genetic engineering**.

**resuscitation** *n.* the restoration of a person who appears to be dead by the revival of cardiac and respiratory function. *See* **CARDIOPULMONARY RESUSCITATION**; **MOUTH-TO-MOUTH RESUSCITATION**. *See also* **ADVANCE DIRECTIVE, DECISION, OR STATEMENT**; **DNAR ORDER**.

**resuscitation mannikin** a life-size model of a person for practising all aspects of basic and advanced life support, including endotracheal **\*intubation** and **\*defibrillation**.

**retainer** *n.* (in dentistry) **1.** the component of a partial **\*denture** that keeps it in place. **2.** an **\*orthodontic appliance** that holds the teeth in position at the end of active treatment. **3.** the component of a **\*bridge** that is fixed to a natural tooth.

**retardation** *n.* the slowing up of a process. **Psychomotor retardation** is a marked slowing down of activity and speech, which can reach a degree

where a patient can no longer care for him- or herself. It is a symptom of severe *\*depression*.

**retching** *n.* repeated unavailing attempts to vomit.

**rete** *n.* a network of blood vessels, nerve fibres, or other strands of interlacing tissue in the structure of an organ. The **rete testis** is a network of tubules conducting sperm from the seminiferous tubules of the *\*testis* to the vasa efferentia.

**retention** *n.* **1.** inability to pass urine, which is retained in the bladder. The condition may be acute and painful or chronic and painless. **Acute urinary retention (AUR)** can be precipitated by surgery, urinary infection, constipation, and drugs; spontaneous AUR is usually caused by enlargement of the prostate gland in men, although many other conditions may result in obstruction of bladder outflow. Retention is relieved by catheter drainage of the bladder, after which the underlying problem is dealt with. *See also* **INTERMITTENT SELF-CATHETERIZATION**. **2.** the ability to store events in memory. If retention is impaired because of a storage defect, the person affected will have difficulty retrieving memories. This is a feature of *\*dementia*.

**reteplase** *n.* *see* **FIBRINOLYTIC**; **TISSUE-TYPE PLASMINOGEN ACTIVATOR**.

**reticular activating system** the system of nerve pathways in the brain concerned with the level of consciousness – from the states of sleep, drowsiness, and relaxation to full alertness and attention. The system integrates information from all of the senses and from the cerebrum and cerebellum and determines the overall activity of the brain and the autonomic nervous system and patterns of behaviour during waking and sleeping.

**reticular fibres** microscopic, almost nonelastic, branching fibres of *\*connective tissue* that join together to form a delicate supportive meshwork around blood vessels, muscle fibres, glands, nerves, etc. They are composed of a collagen-like protein (**reticulin**) and are particularly common in lymph nodes, the spleen, liver, kidneys, and muscles.

**reticular formation** a network of nerve pathways and nuclei throughout the **\*brainstem**, connecting motor and sensory nerves to and from the spinal cord, the cerebellum and the cerebrum, and the cranial nerves. It is estimated that a single neuron in this network may have synapses with as many as 25,000 other neurons.

**reticulin** *n.* a protein that is the major constituent of **\*reticular fibres**.

**reticulocyte** *n.* an immature red blood cell (erythrocyte). Reticulocytes may be detected and counted by staining living red cells with certain basic dyes that result in the formation of a blue precipitate (**reticulum**) within the reticulocytes. They normally comprise about 1% of the total red cells and are increased (**reticulocytosis**) whenever the rate of red cell production increases.

**reticulocytosis** *n.* an increase in the proportion of immature red blood cells (reticulocytes) in the bloodstream. It is a sign of increased output of new red cells from the bone marrow.

**reticuloendothelial system (RES)** a community of cells – **\*phagocytes** – spread throughout the body. It includes **\*macrophages** and **\*monocytes**. The RES is concerned with defence against microbial infection and with the removal of worn-out blood cells from the bloodstream. *See also* **SPLEEN**.

**reticulosis** *n.* abnormal overgrowth, usually malignant, of any of the cells of the lymphatic glands or the immune system. *See* **LYMPHOMA**; **HODGKIN'S DISEASE**; **BURKITT'S LYMPHOMA**; **MYCOSIS FUNGOIDES**.

**reticulum** *n.* a network of tubules or blood vessels. *See* **ENDOPLASMIC RETICULUM**; **SARCOPLASMIC RETICULUM**.

**retin-** (**retino-**) *combining form denoting* the retina. Example: **retinopexy** (fixation of a detached retina).

**retina** *n.* the light-sensitive layer that lines the interior of the eye. The outer part of the retina (**retinal pigment epithelium**; RPE), next to the **\*choroid**, is pigmented to prevent the passage of light. The inner part, next to the cavity of the eyeball, contains **\*rods** and **\*cones** (light-sensitive cells) and their associated nerve fibres (see illustration). A large number of cones is

concentrated in a depression in the retina at the back of the eyeball called the *\*fovea*. —**retinal** *adj.*

**The structure of the retina.**

**retinaculum** *n.* (*pl.* **retinacula**) a thickened band of tissue that serves to hold various tissues in place. For example, **flexor retinacula** are found over the flexor tendons in the wrist and ankle.

**retinal** **1.** (**retinene**) *n.* the aldehyde of retinol (*\*vitamin A*). *See also* **RHODOPSIN**. **2.** *adj.* *see* **RETINA**.

**retinal artery occlusion** blockage of arterial blood supply to the retina, usually as a result of *\*thrombosis* or *\*embolism*. The central retinal artery enters the eye at the optic disc and then divides into branches to supply different parts of the retina. Blockage of the central retinal artery (**central retinal artery occlusion**) usually results in sudden painless loss of vision.

Blockage of one of the branches of the central retinal artery (**branch retinal artery occlusion**) results in *\*ischaemia* of the retina supplied by the occluded vessel and related visual field loss.

**retinal detachment (detached retina)** separation of the inner nervous layer of the *\*retina* from the outer pigmented layer (retinal pigment epithelium, RPE). It commonly occurs when a break (hole or tear) allows fluid from the vitreous cavity of the eyeball to accumulate under the retina (rhegmatogenous) but can also occur when fluid accumulates by leakage from the RPE (nonrhegmatogenous). Vision is lost in the affected part of the retina. The retina can be reattached by surgical means, such as external *\*plombage* or internal *\*vitrectomy*, or by creating patches of scar tissue between the retina and the choroid by application of extreme cold (see **CRYOSURGERY**) or heat (see **PHOTOCOAGULATION**).

**retinal dialysis** separation of the retina from its insertion at the ora serrata (the anterior margin of the retina, lying just posterior to the ciliary body). This acts as a retinal tear and causes a *\*retinal detachment*.

**retinal vein occlusion** blockage of a vein carrying blood from the retina. Small branch veins carry blood from different parts of the retina and drain into the central retinal vein, which leaves the eye at the optic disc. Blockage of the central retinal vein (**central retinal vein occlusion**) usually results in sudden painless reduction of vision. Distended veins, haemorrhages, and *\*cotton-wool spots* are seen in the retina and the optic disc may become swollen. Blockage of a branch of the central retinal vein (**branch retinal vein occlusion**) results in painless reduction of vision in the affected area, where engorged veins, haemorrhages, and cotton-wool spots may be seen.

**retine** *n.* see **RETINAL**.

**retinitis** *n.* inflammation of the retina caused mainly by viral infection; for example, *\*cytomegalovirus* (CMV) retinitis, HIV retinitis. In practice, the term is often used for noninflammatory conditions; for example, *\*retinitis pigmentosa*. For such conditions the term *\*retinopathy* is becoming more widely used.

**retinitis pigmentosa** a hereditary condition characterized by progressive degeneration of the *\*retina* due to malfunctioning of the retinal pigment

epithelium. It starts in childhood with [\\*night blindness](#) and limited peripheral vision and may progress to complete loss of vision. Progression and visual function are both extremely variable, depending on the type of retinitis pigmentosa.

**retinoblastoma** *n.* a rare malignant tumour of the retina, occurring mainly in developing retinal cells in children usually under the age of two years.

**retinoid** *n.* any one of a group of drugs derived from vitamin A. They bind to one or more of six specific receptors that are found on many cells. On the skin they act to cause drying and peeling and a reduction in oil (sebum) production. These effects can be useful in the treatment of severe [\\*acne](#), [\\*psoriasis](#), [\\*ichthyosis](#), and other skin disorders. Retinoids include [\\*isotretinoin](#), [\\*tretinoin](#), **acitretin**, **tazarotene**, and **alitretinoin**, which is particularly effective for hyperkeratotic hand eczema. Possible side-effects, which may be serious, include severe fetal abnormalities (if taken by pregnant women), toxic effects on babies (if taken by breastfeeding mothers), liver and kidney damage, excessive drying, redness and itching of the skin, and muscle pain and stiffness.

**retinol** *n.* [see VITAMIN A](#).

**retinopathy** *n.* any of various disorders of the retina resulting in impairment or loss of vision. It is usually due to damage to the blood vessels of the retina, occurring (for example) as a complication of longstanding diabetes (**diabetic retinopathy**), high blood pressure, or AIDS (**AIDS retinopathy**). In diabetic retinopathy, haemorrhaging or exudation may occur, either from damaged vessels into the retina or from new abnormal vessels ([see NEOVASCULARIZATION](#)) into the vitreous humour. The later stages require laser treatment ([see PHOTOCOAGULATION](#)). In the UK all people with diabetes are screened using annual digital retinal photography. The warning signs of potentially sight-threatening retinal changes can be spotted and referral to a specialist eye clinic made for further assessment and intervention to prevent a deterioration in vision. **Retinopathy of prematurity** (ROP), formerly known as **retrolental fibroplasia**, is the abnormal growth of developing retinal blood vessels seen in premature infants. It may be mild and resolve spontaneously or severe enough to lead to blindness if untreated.

**retinopexy** *n.* any surgical procedure used to repair a \*retinal detachment. See PNEUMORETINOPEXY; CRYORETINOPEXY.

**retinoschisis** *n.* splitting of the layers of the neurosensory retina with accumulation of fluid between the layers. This is usually static or it may progress very slowly compared to other types of \*retinal detachment.

**retinoscope** *n.* an instrument used to determine the power of spectacle lens required to correct \*refractive errors of the eye. It is held in the hand and casts a beam of light into the subject's eye. The examiner looks along the beam and sees the reflection in the subject's pupil. By interpreting the way the reflection moves as the instrument is moved, and by altering this by lenses held in the other hand near the subject's eye, the examiner is able to determine the degree of refractive error. —**retinoscopy** *n.*

**retinotomy** *n.* a surgical incision into the retina.

**retraction** *n.* **1.** (in obstetrics) the state of uterine muscle fibres remaining shortened after contracting during labour. This results in a gradual progression of the fetus downwards through the pelvis. The basal portion of the uterus becomes thicker and pulls up the dilating cervix over the presenting part. **2.** (in dentistry) the drawing back of one or more teeth into a better position by an \*orthodontic appliance. **3.** (in dentistry) the stretching of facial tissues to expose only the teeth during dental photography.

**retraction ring** a depression in the uterine wall marking the junction between the actively contracting muscle fibres of the upper segment of the uterus and the muscle fibres of the lower segment. This depression is not always visible and is normal. In obstructed labour (e.g. contracted pelvis or malposition of the fetus resulting in shoulder presentation), the muscle fibres of the upper segment become shorter and thicker; the muscle fibres of the lower segment, on the other hand, become elongated and thinner. The junction between the two becomes more distinct as it rises into the abdomen from the pelvis. This abnormal ring is known as **Bandl's ring** and is a sign of impending rupture of the lower segment of the uterus, which becomes progressively thinner as Bandl's ring rises upwards. Immediate action to relieve the obstruction is then necessary, usually in the form of Caesarean section.

**retractor** *n.* a surgical instrument used to expose the operation site by drawing aside the cut edges of skin, muscle, or other tissues. There are several types of retractors for different operations (see illustration).

### Retractors.

**retro-** *prefix denoting at the back or behind.* Examples: **retrobulbar** (at the back of the eyeball); **retroperitoneal** (behind the peritoneum).

**retrobulbar neuritis (optic neuritis)** inflammation of the optic nerve behind the eye, causing increasingly blurred vision. When the inflammation involves the first part of the nerve and can be seen at the optic disc, it is called **optic papillitis**. Retrobulbar neuritis is one of the symptoms of multiple sclerosis but it can also occur as an isolated lesion, in the absence of any other involvement of the nervous system, with the patient recovering vision completely.

**retroflexion** *n.* the bending backward of an organ or part of an organ, especially the abnormal bending backward of the upper part of the uterus (i.e. the part furthest from the cervix). Compare **ANTEFLEXION**.

**retrograde** *adj.* going backwards, or moving in the opposite direction to the normal. (See **PYELOGRAPHY**.) **Retrograde amnesia** is a failure to remember events immediately preceding an illness or injury. *Compare* **ANTEGRADE**.

**retrograde root canal treatment** *see* **APICECTOMY**.

**retrolental fibroplasia** *see* **RETINOPATHY**.

**retroperitoneal fibrosis (RPF)** a condition in which a dense plaque of fibrous tissue develops behind the peritoneum adjacent to the abdominal aorta. It may be secondary to malignancy, medication (methysergide, beta blockers), aortic aneurysm, or certain infections. The ureters become encased and hence obstructed, causing acute **\*anuria** and renal failure. The obstruction can be relieved by **\*nephrostomy** or the insertion of double J **\*stents**. In the acute phase steroid administration may help, but in established RPF **\*ureterolysis** is required.

**retroperitoneal space** the region between the posterior parietal **\*peritoneum** and the front of the **\*lumbar vertebrae**. It contains important structures, including the kidneys, adrenal glands, pancreas, lumbar spinal nerve roots, sympathetic ganglia and nerves, and the abdominal **\*aorta** and its major branches.

**retropharyngeal space** the region behind the **\*pharynx** and in front of the bones of the neck. Infection in this space can result in a **retropharyngeal abscess**.

**retropulsion** *n.* a compulsive tendency to walk backwards. It is a symptom of **\*parkinsonism**.

**retrospective study 1.** a review of the characteristics of a group of individuals, some of whom have a specific disease or condition, to investigate possible causes by comparing affected and unaffected individuals in terms of past experience. *See also* **CASE CONTROL STUDY. 2.** *see* **COHORT STUDY**.

**retroversion** *n.* an abnormal position of the uterus in which it is tilted backwards, with the base lying in the **\*pouch** of Douglas, against the rectum,

instead of on the bladder. It occurs in about 20% of women. *Compare ANTEVERSION.*

**retrovirus** *n.* an RNA-containing virus that can convert its genetic material into DNA by means of the enzyme **\*reverse transcriptase**, which enables it to become integrated into the DNA of its host's cells. Retroviruses have been implicated in the development of some cancers and are associated with conditions characterized by an impaired immune system (**\*HIV** is a retrovirus). They are also used as **\*vectors** in gene therapy.

**retrusion** *n.* (in dentistry) **1.** backward displacement of the lower jaw (mandible). **2.** a malocclusion in which some of the teeth are further back than usual. *Compare PROTRUSION.*

**Rett's syndrome** a disorder affecting young girls, in which stereotyped movements (*see* **STEREOTYPY**) and social withdrawal appear during early childhood. Intellectual development is often impaired and special educational help is needed. The condition is inherited as an X-linked (*see* **SEX-LINKED**) dominant characteristic. [A. Rett (1924–97), Austrian paediatrician]

**revalidation** *n.* the process by which licensed doctors are required to demonstrate to the **\*General Medical Council** on a regular basis that they are up to date and fit to practise medicine. Revalidation aims to give extra confidence to patients that their doctor is being regularly checked by their employer and the GMC. Revalidation started in the UK in December 2012. Licensed doctors usually have to revalidate every five years, by having regular annual appraisals based on the GMC's core guidance for doctors. Only doctors who have a licence to practise are required to revalidate. *See LICENSING. See also CLINICAL GOVERNANCE.*

**revascularization** *n.* **1.** the regrowth of blood vessels following disease or injury so that normal blood supply to an organ, tissue, or part is restored. **2.** the restoration of blood flow to an organ by **\*angioplasty**/**\*stenting** or surgical **\*bypass** grafting. *See CORONARY REVASCULARIZATION.*

**reverse transcriptase** an enzyme, found mainly in **\*retroviruses**, that catalyses the synthesis of DNA from RNA. It enables the viral RNA to be integrated into the host DNA. **Reverse transcriptase inhibitors** are antiviral

drugs that inhibit this process; they include *\*zidovudine* and *\*didanosine*, used in the treatment of HIV infection; and **lamivudine** and **tenofovir disoproxil**, for treating HIV infection and chronic hepatitis B.

**Revlimid** *n.* *see* **LENALIDOMIDE**.

**Reye's syndrome** a rare disorder occurring in childhood. It is characterized by the symptoms of *\*encephalitis* combined with evidence of liver failure. Often, the symptoms develop in the apparent recovery phase of a viral infection. Treatment is aimed at controlling cerebral *\*oedema* and correcting metabolic abnormalities in order to allow spontaneous recovery, but there is still a significant mortality and there may be residual brain damage. The cause is not known, but *\*aspirin* has been implicated and this drug should not be used in children below the age of 16 unless specifically indicated. [R. D. K. Reye (1912–77), Australian histopathologist]

**RFA** *see* **RADIOFREQUENCY ABLATION**.

**rhabdomyolysis** *n.* the rapid breakdown of skeletal muscle cells, with the release of myoglobin and other potentially toxic cell components. Blood levels of *\*creatin kinase* are raised. It can result in *\*hyperkalaemia*, *\*hypovolaemia*, *\*myoglobinuric acute renal failure*, and *\*disseminated intravascular coagulation*. Causes include muscle trauma and crush injury, alcohol abuse, seizures, and medications (notably statins).

**rhabdomyoma** *n.* a rare benign tumour of skeletal muscle or heart muscle.

**rhabdomyosarcoma** *n.* a rare malignant tumour, usually of childhood, originating in, or showing the characteristics of, striated muscle. **Pleomorphic rhabdomyosarcoma** occurs in late middle age, in the muscles of the limbs. **Embryonal rhabdomyosarcomas**, affecting infants, children, and young adults, are classified as **botryoid** (in the vagina (*see* **SARCOMA BOTRYOIDES**), bladder, ear, etc.), **embryonal** (most common in the head and neck, particularly the orbit); and **alveolar** (at the base of the thumb). The pleomorphic and alveolar types respond poorly to treatment; botryoid tumours are treated with a combination of radiotherapy, surgery, and drugs. The embryonal type, if treated at an early stage, can often be cured with a combination of radiotherapy and drugs (including vincristine, dactinomycin, and cyclophosphamide).

**rhagades** *pl. n.* cracks or long thin scars in the skin, particularly around the mouth or other areas of the body subjected to constant movement. The fissures around the mouth and nose of babies with congenital syphilis eventually heal to form rhagades.

**rhegmatogenous** *adj.* resulting from a break or tear in the retina. For example, **rhegmatogenous retinal detachment** results as a consequence of a tear in the retina.

**rheo-** *combining form denoting* **1.** a flow of liquid. **2.** an electric current.

**rhesus factor (Rh factor)** a group of **\*antigens** that may or may not be present on the surface of the red blood cells; it forms the basis of the rhesus blood group system. Most people have the rhesus factor, i.e. they are **Rh-positive**. People who lack the factor are termed **Rh-negative**. Incompatibility between Rh-positive and Rh-negative blood is an important cause of blood transfusion reactions and **\*haemolytic disease of the newborn**. *See also* **BLOOD GROUP**.

**rhesus prophylaxis** *see* **ANTI-D IMMUNOGLOBULIN**; **HAEMOLYTIC DISEASE OF THE NEWBORN**.

**rheumatic fever (acute rheumatism)** a disease affecting mainly children and young adults that arises as a delayed complication of infection of the upper respiratory tract with haemolytic streptococci (*see* **STREPTOCOCCUS**). The main features are fever, arthritis progressing from joint to joint, reddish circular patches on the skin, small painless nodules formed on bony prominences such as the elbow, abnormal involuntary movements of the limbs and head (Sydenham's **\*chorea**), and inflammation of the heart muscle, its valves, and the membrane surrounding the heart. The condition may progress to **chronic rheumatic heart disease**, with scarring and chronic inflammation of the heart and its valves leading to heart failure, murmurs, and damage to the valves. The initial infection is treated with antibiotics (e.g. penicillin) and bed rest, with aspirin to relieve the joint pain. Following an acute attack, long-term prophylaxis with penicillin is often recommended to prevent a relapse. Rheumatic fever is now rare in developed countries.

**rheumatism** *n.* any disorder in which aches and pains affect the muscles and joints. *See* RHEUMATOID ARTHRITIS; RHEUMATIC FEVER; OSTEOARTHRITIS; GOUT.

**rheumatoid arthritis** the second most common form of \*arthritis (after \*osteoarthritis). It typically involves the joints of the fingers, wrists, feet, and ankles, with later involvement of the hips, knees, shoulders, and neck. It is a disease of the synovial lining of joints; the joints are initially painful, swollen, and stiff and are usually affected symmetrically. As the disease progresses the ligaments supporting the joints are damaged and there is erosion of the bone, leading to deformity of the joints. Tendon sheaths can be affected, leading to tendon rupture. Onset can be at any age, and there is a considerable range of severity. Women are at greater risk. Rheumatoid arthritis is an \*autoimmune disease, and most patients show the presence of **rheumatoid factor** or other antibodies in their serum. There are characteristic changes on X-ray. In the early stages there is soft tissue swelling and periarticular osteoporosis; late stages are characterized by marginal bony erosions, narrowing of the articular space, articular destruction, and joint deformity.

Treatment is with a variety of drugs, including anti-inflammatory analgesics (*see* NSAID), corticosteroids, \*disease-modifying antirheumatic drugs, and \*biological therapies. Surgical treatment is by excision of the synovium in early cases or by \*fusion or joint replacement once bony changes have occurred. (*See also* HIP REPLACEMENT.) The condition may resolve spontaneously, but is usually relapsing and remitting with steady progression. It may finally burn itself out, leaving severely deformed joints.

**rheumatology** *n.* the medical specialty concerned with the diagnosis and management of disease involving joints, tendons, muscles, ligaments, and associated structures. *See also* PHYSICAL MEDICINE. —**rheumatologist** *n.*

**rhexis** *n.* the breaking apart of a blood vessel, organ, tissue, or cellular component.

**Rh factor** *see* RHESUS FACTOR.

**rhin-** (**rhino-**) *combining form denoting the nose.*

**rhinencephalon** *n.* the parts of the brain, collectively, that in early stages of evolution were concerned mainly with the sense of smell. The rhinencephalon includes the olfactory nerve, olfactory tract, and the regions now usually classified as belonging to the **\*limbic system**.

**rhinitis** *n.* inflammation of the mucous membrane of the nose. It may be caused by virus infection (**acute rhinitis**; see **COLD**) or an allergic reaction (**allergic rhinitis**; see **HAY FEVER**). In **atrophic rhinitis** the mucous membrane becomes thinned and fragile. In **perennial** (or **vasomotor**) **rhinitis** there is overgrowth of, and increased secretion by, the membrane.

**rhinolith** *n.* a stone (calculus) in the nose, usually formed around a foreign body.

**rhinology** *n.* the branch of medicine concerned with disorders of the nose and nasal passages.

**rhinomycosis** *n.* fungal infection of the lining of the nose.

**rhinophyma** *n.* a bulbous craggy swelling of the nose, usually in men. It is a complication of **\*rosacea** and in no way related to alcohol intake. Paring by plastic surgery may be necessary for cosmetic purposes.

**rhinoplasty** *n.* surgery to alter the shape of the nose, sometimes using tissue (skin, cartilage, or bone) from elsewhere in the body or artificial implants.

**rhinorrhoea** *n.* a persistent watery mucous discharge from the nose, as in the common cold.

**rhinoscleroma** *n.* the formation of nodules in the interior of the nose and **\*nasopharynx**, which become thickened. It is caused by bacterial infection (with *Klebsiella rhinoscleromatis*).

**rhinoscopy** *n.* examination of the interior of the nose using a speculum or endoscope.

**rhinosinusitis** *n.* inflammation of the lining of the nose and paranasal sinuses. Rhinosinusitis is a common condition caused by allergies, infection, immune deficiencies, **\*mucociliary transport** abnormalities, trauma, drugs, or tumours. Various classifications exist. The European Position Paper on Rhinosinusitis and Nasal Polyps 2012 defined acute rhinosinusitis as lasting

up to 12 weeks and chronic rhinosinusitis as lasting 12 or more weeks. Subgroups of the latter include chronic rhinosinusitis with and without nasal polyps and allergic fungal rhinosinusitis. Treatment may require steroids (topical or systemic), antibiotics, immunotherapy, or **\*endoscopic sinus surgery**. See **RHINITIS**; **SINUSITIS**.

**rhinosporidiosis** *n.* an infection of the mucous membranes of the nose, larynx, eyes, and genitals that is caused by the fungus *Rhinosporidium seeberi* and is characterized by the formation of tiny **\*polyps**. It occurs most commonly in Asia.

**rhinovirus** *n.* any one of a group of RNA-containing viruses that cause respiratory infections resembling the common cold. They are included in the **\*picornavirus** group.

**Rhipicephalus** *n.* a genus of hard **\*ticks** widely distributed in the tropics. The dog tick (*R. sanguineus*) can suck human blood and is commonly involved in the transmission of diseases caused by rickettsiae (see **TYPHUS**).

**rhiz-** (**rhizo-**) *combining form denoting a root*. Example: **rhizonychia** (the root of a nail).

**rhizotomy** *n.* a surgical procedure in which selected nerve roots are cut at the point where they emerge from the spinal cord. In **posterior rhizotomy** the posterior (sensory) nerve roots are cut for the relief of intractable pain in the organs served by these nerves. An **anterior rhizotomy** – the cutting of the anterior (motor) nerve roots – is sometimes done for the relief of severe muscle spasm or **\*dystonia**.

**Rhodnius** *n.* a genus of large bloodsucking bugs (see **REDUVIID**). *R. prolixus* is important in the transmission of **\*Chagas' disease** in Central America and the northern part of South America.

**rhodopsin (visual purple)** *n.* a pigment in the retina of the eye, within the **\*rods**, consisting of **retinal** – an aldehyde of retinol (**\*vitamin A**) – and a protein. The presence of rhodopsin is essential for vision in dim light. It is bleached in the presence of light and this stimulates nervous activity in the rods.

**rhombencephalon** *n.* see **HINDBRAIN**.

**rhomboid** *n.* either of two muscles (**rhomboid major** and **rhomboid minor**) situated in the upper part of the back, between the backbone and shoulder blade. They help to move the shoulder blade backwards and upwards.

**rhonchus** *n.* (*pl.* **rhonchi**) an abnormal musical noise produced by air passing through narrowed bronchi. It is heard through a stethoscope, usually when the patient breathes out.

**rhythm method** a contraceptive method in which sexual intercourse is restricted to the **safe period** at the beginning and end of the **\*menstrual cycle**. The safe period is calculated either on the basis of the length of the menstrual cycle or by reliance on the change of body temperature that occurs at ovulation. A third possible indicator (*see* **BILLINGS METHOD**) is the change that occurs with ovulation in the stickiness of the mucus at the neck (cervix) of the uterus. The method depends for its reliability on the woman having uniform regular periods and its failure rate is higher than with mechanical methods, approaching 25 pregnancies per 100 woman-years.

**RI** reference intake (*see* **DIETARY REFERENCE VALUES**).

**rib** *n.* a curved, slightly twisted, strip of bone forming part of the skeleton of the thorax, which protects the heart and lungs. There are 12 pairs of ribs. The head of each rib articulates with one of the 12 thoracic vertebrae of the backbone; the other end is attached to a section of cartilage (*see* **COSTAL CARTILAGE**). The first seven pairs – the **true ribs** – are connected directly to the sternum by their costal cartilages. The next three pairs – the **false ribs** – are attached indirectly: each is connected by its cartilage to the rib above it. The last two pairs of ribs – the **floating ribs** – end freely in the muscles of the body wall. Anatomical name: **costa**.

**ribavirin** *n.* an antiviral drug effective against a range of DNA and RNA viruses, including the herpes group, **\*respiratory syncytial virus**, and **\*hepatitis C**. Possible side-effects include breathing difficulty, bacterial pneumonia, and **\*pneumothorax** (when inhaled) and haemolytic anaemia (with oral treatment); it also antagonizes the action of **\*zidovudine** against HIV.

**riboflavin** *n.* *see* **VITAMIN B<sub>2</sub>**.

**ribonuclease** *n.* an enzyme, located in the **\*lysosomes** of cells, that splits RNA at specific places in the molecule.

**ribonucleic acid** *see* **RNA**.

**ribose** *n.* a pentose sugar (i.e. one with five carbon atoms) that is a component of **\*RNA** and several coenzymes. Ribose is also involved in intracellular metabolism.

**ribosome** *n.* a particle, consisting of RNA and protein, that occurs in cells and is the site of protein synthesis in the cell (*see* **TRANSLATION**). Ribosomes are either attached to the **\*endoplasmic reticulum** or free in the cytoplasm as **\*polysomes**. —**ribosomal** *adj.*

**ribozyme** *n.* an RNA molecule that can act as an enzyme, catalysing changes to its own molecular structure (before its discovery it was assumed that all enzymes were proteins). Research into the ability of genetically engineered ribozymes to destroy the RNA of HIV (the AIDS virus) is ongoing.

**Richter's hernia** a hernia that contains only part of the circumference of the wall of the intestine. There is no intestinal obstruction, but necrosis of the affected section of bowel can develop rapidly. [A. G. Richter (1742–1812), German surgeon]

**ricin** *n.* a highly toxic albumin obtained from castor-oil seeds (*Ricinus communis*) that inhibits protein synthesis and becomes attached to the surface of cells, resulting in gastroenteritis, hepatic congestion and jaundice, and cardiovascular collapse. It is lethal to most species, even in minute amounts (1 µg/kg body weight); it is most toxic if injected intravenously or inhaled as fine particles. Ricin is being investigated as a treatment for certain lymphomas, which depends on its delivery to the exact site of the tumour in order to avoid destruction of healthy cells (*see* **IMMUNOTOXIN**).

**rickets** *n.* a disease of childhood in which the bones do not harden due to a deficiency of **\*vitamin D**. Without vitamin D, not enough calcium salts are deposited in the bones to make them rigid: consequently, they become soft and malformed. This is particularly noticeable in the long bones, which become bowed, and in the front of the ribcage, where a characteristic rickety 'rosary' may become apparent. The deficiency of vitamin D may be dietary or due to lack of exposure to sunlight, which is important in the conversion of

vitamin D to its active form. In the UK rickets is more common in Asian immigrant families.

**Renal rickets** is due to impaired kidney function causing bone-forming minerals to be excreted in the urine, which results in softening of the bones.

**rickettsiae** *pl. n.* (*sing.* **rickettsia**) a group of very small nonmotile spherical or rodlike parasitic bacteria that cannot reproduce outside the bodies of their hosts. Rickettsiae infect arthropods (ticks, mites, etc.), through which they can be transmitted to mammals (including humans), in which they can cause severe illness. The species *Rickettsia akari* causes **\*rickettsial pox**, *R. conorii*, *R. prowazekii*, *R. tsutsugamushi*, and *R. typhi* cause different forms of **\*typhus**, *R. rickettsii* causes **\*Rocky Mountain spotted fever**, and *Coxiella burnetii* causes **\*Q fever**. —**rickettsial** *adj.*

**rickettsial pox** a disease of mice caused by the bacterium *Rickettsia akari* and transmitted to humans by mites: it produces chills, fever, muscular pain, and a rash similar to that of **\*chickenpox**. The disease is mild and runs its course in 2–3 weeks. *See also* **TYPHUS**.

**ridge** *n.* **1.** (in anatomy) a crest or a long narrow protuberance, e.g. on a bone. **2.** (in dental anatomy) the crest of the jawbone following tooth loss. *See* **ALVEOLUS**.

**Riedel's struma** a rare fibrosing destructive disorder of the thyroid gland that may spread to adjacent tissues and obstruct the airway. It is sometimes associated with fibrosis in other parts of the body, such as the bile duct or **\*retroperitoneal fibrosis**. The treatment is surgical removal. [B. M. C. L. Riedel (1846–1916), German surgeon]

**rifampicin** *n.* an antibiotic used to treat various infections, particularly tuberculosis and leprosy. Digestive upsets and sensitivity reactions sometimes occur.

**Rift Valley fever** a virus disease of East Africa transmitted from animals to humans by mosquitoes and causing symptoms resembling those of **\*influenza**.

**RIG** radiologically inserted gastrostomy: *see* **GASTROSTOMY**.

**right** **1.** *adj.* in accordance with ethical principles or accepted professional standards. There may be more than one right action in any given

circumstance. The tradition of **\*Kantian ethics** maintains that an action may be right irrespective of any **\*good** that flows from it; **\*consequentialism** denies this. **2. n.** any moral or legal entitlement. See **HUMAN RIGHTS**.

**rigidity** *n.* (in neurology) resistance to the passive movement of a limb that persists throughout its range. It is a symptom of **\*parkinsonism**. The smooth resistance through the whole range of movement is also known as **lead-pipe rigidity**; with superimposed tremor, as in parkinsonism, it is called **cogwheel rigidity**. Compare **SPASTICITY**.

**rigor** *n.* **1.** an abrupt attack of shivering and a sensation of coldness, accompanied by a rapid rise in body temperature. This often marks the onset of a fever and may be followed by a feeling of heat, with copious sweating. **2. see** **RIGOR MORTIS**.

**rigor mortis** the stiffening of a body that occurs within some eight hours of death in temperate climates, due to chemical changes in muscle tissue. It usually starts to disappear after about 24 hours.

**riluzole** *n.* a drug used to prolong the lives of patients with amyotrophic lateral **\*sclerosis** (see **MOTOR NEURON DISEASE**). Side-effects include nausea, vomiting, and dizziness.

**rima** *n.* (in anatomy) a cleft. The **rima glottidis** (or glottis) is the space between the vocal folds.

**ring** *n.* (in anatomy) see **ANNULUS**.

**ring block** a circumferential ring of local anaesthetic solution used to block the nerves of a digit for purposes of minor surgery (see **NERVE BLOCK**). Precautions are necessary to avoid vascular damage leading to gangrene.

**Ringer's solution (Ringer's mixture)** a clear colourless **\*physiological solution** of sodium chloride (common salt), potassium chloride, and calcium chloride prepared with recently boiled pure water. The osmotic pressure of the solution is the same as that of blood serum. Ringer's solution is used for maintaining organs or tissues alive outside the animal or human body for limited periods. Sterile Ringer's solution may be injected intravenously to treat dehydration. [S. Ringer (1835–1910), British physiologist]

**ringworm (tinea)** *n.* a fungal infection of the skin, the scalp, or the nails. Ringworm is caused by the dermatophyte fungi – species of *Microsporum*, *Trichophyton*, and *Epidermophyton* – and also affects animals, a source of infection for humans. It can be spread by direct contact or via infected materials. The lesions of ringworm may form partial or complete rings and may cause intense itching. The commonest form of ringworm is **athlete's foot (tinea pedis)**, which affects the skin between the toes. Another common type is ringworm of the scalp (**tinea capitis**). There is currently an epidemic of scalp ringworm in industrialized nations spread by human-to-human contact. It targets people of African or Afro-Caribbean extraction and is caused by *Trichophyton tonsurans*. Ringworm also affects the groin and thighs (**tinea cruris**) and the skin under a beard (**tinea barbae**). The disease is treated with antifungal agents taken by mouth (such as itraconazole or terbinafine, especially necessary with tinea capitis or nail involvement) or applied locally (for tinea on the body).

**Rinne's test** a test to determine whether **\*deafness** is conductive or sensorineural. A vibrating tuning fork is held first in the air, close to the ear, and then with its base placed on the bone (mastoid process) behind the ear. If the sound conducted by air is heard louder than the sound conducted by bone the test is positive and the deafness sensorineural; a negative result, when the sound conducted by bone is heard louder, indicates conductive deafness. [H. A. Rinne (1819–68), German otologist]

**RIS** *see* **RADIOLOGY INFORMATION SYSTEM**.

**risk assessment** (in psychiatry) an assessment of the risk that a patient may pose at a given time, which is part of every **\*mental state examination**. Risk assessments are based primarily on past behaviour and certain aspects of current behaviour. They are usually divided into risk to the patient him- or herself, risk to others, and risk of neglect. Such assessments are more reliable for predicting short-term risk than long-term risk.

**risk–benefit analysis** an analytical process used to weigh up the probability of foreseeable risks and benefits of an action or policy. In medical ethics, it provides a means of reconciling the principles of **\*beneficence** and **\*nonmaleficence** where a particular intervention has dangers as well as

benefits. *Compare* **COST–BENEFIT ANALYSIS**. *See also* **CONSEQUENTIALISM**.

**risk factor** an attribute, such as a habit (e.g. cigarette smoking) or exposure to some environmental hazard, that leads the individual concerned to have a greater likelihood of developing an illness. The relationship is one of probability and as such can be distinguished from a *\*causal agent*.

**risk management** a framework are applied to clinical and nonclinical aspects of health care to increase patient safety by identifying potential hazards, assessing the degree of risk, and reducing the risk or determining an acceptable balance between risk and benefit. Risk management should include systems for learning from untoward, significant, or critical incidents and near misses. It is a feature of *\*clinical governance*.

**risk of malignancy index (RMI)** a scoring system that combines ultrasound findings, menopausal status and age, and serum **CA125** levels to give an estimate of the risk of malignancy in a woman with a mass in the Fallopian tubes or ovaries. If the total RMI score is <200 the risk of malignancy is considered to be low. If the total RMI score is >200 the chances of malignancy are raised and management should be planned with a gynaecological oncologist.

**risk register 1.** a list of infants who have experienced some event in their obstetric and/or perinatal history known to be correlated with a higher than average likelihood of serious abnormality. Problems associated with risk registers include limiting the designation of predisposing conditions, so to contain the number on the register within reasonable proportions, and ensuring that children not on the register receive adequate surveillance. **2.** (at-risk register) *see* **CHILD PROTECTION REGISTER**.

**risperidone** *n.* a second-generation *\*antipsychotic* drug used in the treatment of schizophrenia, mania, and other psychoses. Side-effects include nausea, *\*akathisia*, headache, and sedation.

**risus sardonicus** an abnormal grinning expression resulting from involuntary prolonged contraction of facial muscles, as seen in *\*tetanus*.

**ritonavir** *n.* *see* **PROTEASE INHIBITOR**.

**Ritter's disease** *see* STAPHYLOCOCCAL SCALDED SKIN SYNDROME. [G. Ritter von Rittershain (1820–83), German physician]

**rituximab** *n.* a \*monoclonal antibody that acts against the protein CD20, located mainly on the surface of B lymphocytes; it is used in the treatment of many lymphomas and leukaemias, including non-Hodgkin's lymphoma and chronic lymphocytic leukaemia. It is also licensed for the treatment of severe rheumatoid arthritis and \*vasculitis. Side-effects include hypersensitivity reactions and immunosuppression.

**rivastigmine** *n.* *see* ACETYLCHOLINESTERASE INHIBITOR.

**river blindness** *see* ONCHOCERCIASIS.

**RMI** *see* RISK OF MALIGNANCY INDEX.

**RNA (ribonucleic acid)** a \*nucleic acid, occurring in the nucleus and cytoplasm of cells, that is concerned with synthesis of proteins (*see* MESSENGER RNA; RIBOSOME; TRANSFER RNA; TRANSLATION). In some viruses RNA is the genetic material. The RNA molecule is a single strand made up of units called \*nucleotides.

**RNA interference (RNAi)** a mechanism, either natural or the result of biotechnological manipulation, by which \*RNA suppresses or interferes with the expression of a gene or genes. Its possible role in gene-specific therapy is under investigation.

**robotic prostatectomy** *see* PROSTATECTOMY.

**robotic surgery** a type of laparoscopic surgery in which the operating surgeon controls the instruments via a robot. The surgeon sits at a console away from the patient and controls the robot's operating arms.

**Rocky Mountain spotted fever (spotted fever, tick fever)** a disease of rodents and other small mammals in the USA caused by the bacterium *Rickettsia rickettsii* and transmitted to humans by ticks. Symptoms include fever, muscle pains, and a profuse reddish rash like that of measles. If untreated the disease may be fatal, but treatment with tetracycline or chloramphenicol is effective. *See also* TYPHUS.

**rocuronium** *n.* *see* **MUSCLE RELAXANT**.

**rod** *n.* one of the two types of light-sensitive cells in the **\*retina** of the eye (*compare* **CONE**). The human eye contains about 125 million rods, which are necessary for seeing in dim light. They contain a pigment, **\*rhodopsin** (or visual purple), which is broken down (bleached) in the light and regenerated in the dark. Breakdown of visual purple gives rise to nerve impulses; when all the pigment is bleached (i.e. in bright light) the rods no longer function. *See also* **DARK ADAPTATION**; **LIGHT ADAPTATION**.

**rodent ulcer** *see* **BASAL CELL CARCINOMA**.

**roentgen** *n.* a unit of exposure dose of X- or gamma-radiation equal to the dose that will produce  $2.58 \times 10^{-4}$  coulomb on all the ions of one sign, when all the electrons released in a volume of air of mass 1 kilogram are completely stopped.

**Rokitansky–Küster–Hauser syndrome** *see* **MAYER–ROKITANSKY–KÜSTER–HAUSER SYNDROME**.

**role playing** acting out another person's expected behaviour, usually in a contrived situation, in order to understand that person better. It is used in family psychotherapy, in teaching social skills to patients, and also in the training of psychiatric (and other) staff.

**Romaña's sign** an early clinical sign of **\*Chagas' disease**, appearing some three weeks after infection. There is considerable swelling of the eyelids of one or both eyes. This may be due to the presence of the parasites causing the disease but it may also be an allergic reaction to the repeated bites of their insect carriers. [C. Romaña (20th century), Brazilian physician]

**Romanowsky stains** a group of stains used for microscopical examination of blood cells, consisting of variable mixtures of thiazine dyes, such as azure B, with eosin. Romanowsky stains give characteristic staining patterns, on the basis of which blood cells are classified. The group includes the stains of Leishmann, Wright, May-Grünwald, Giemsa, etc. [D. L. Romanowsky (1861–1921), Russian physician]

**Romberg's sign** a finding on examination suggesting a sensory disorder affecting those nerves that transmit information to the brain about the position of the limbs and joints and the tension in the muscles. The patient is asked to stand upright. Romberg's sign is positive if he maintains his posture when his eyes are open but sways and falls when his eyes are closed. [M. Romberg (1795–1873), German neurologist]

**romiplostim** *n.* a drug used in the treatment of chronic *\*idiopathic* thrombocytopenic purpura. It works by stimulating and increasing platelet production.

**rongeur** *n.* powerful biting forceps for cutting tissue, particularly bone.

**R on T phenomenon** (in *\*electrocardiography*) the superimposition of an R wave (ventricular *\*depolarization*) on the T wave (ventricular *\*repolarization*) of the preceding heartbeat. It may trigger ventricular fibrillation. *See* QRS COMPLEX; Q–T INTERVAL; S–T SEGMENT.

**root** *n.* **1.** (in neurology) a bundle of nerve fibres at its emergence from the spinal cord. The 31 pairs of *\*spinal nerves* have two roots on each side, an anterior root containing motor nerve fibres and a posterior root containing sensory fibres. The roots merge outside the cord to form mixed nerves. **2.** (in dentistry) the part of a *\*tooth* that is not covered by enamel and is normally attached to the alveolar bone by periodontal fibres. **3.** the origin of any structure, i.e. the point at which it diverges from another structure. Anatomical name: **radix**.

**root canal treatment** the procedure of fully *\*devitalizing* and removing the remnants of the pulp of a tooth, cleaning and shaping the canal inside the tooth, and filling the root canal (*see* ROOT FILLING). The treatment may extend over several visits. It is used to treat toothache and apical abscesses. *See also* APICECTOMY; ENDODONTICS.

**root end resection** *see* APICECTOMY.

**root filling** **1.** the final stage of *\*root canal treatment*, in which the prepared canal inside a tooth root is filled with a suitable material. **2.** the material used to fill the canal in the root, usually a core of *\*gutta-percha* with a thin coating of sealing cement.

**root induction** (in *\*endodontics*) a procedure to allow continued root formation in an immature tooth with a damaged pulp. See *APEXOGENESIS*.

**rooting reflex** a primitive reflex present in newborn babies: if the cheek is stroked near the mouth, the infant will turn its head to the same side to suckle.

**ropinirole** *n.* a dopamine receptor agonist (see *DOPAMINE*) used to treat Parkinson's disease (either alone or in conjunction with levodopa) and restless legs syndrome. Side-effects include nausea, drowsiness, and swelling (oedema) of the legs.

**Rorschach test** a test to measure aspects of personality, consisting of ten inkblots, half of which are in various colours and the other half in black and white. The responses to the different inkblots are used to derive hypotheses about the subject. The use of the test for the diagnosis of brain damage or schizophrenia is no longer generally supported. See also *PROJECTIVE TEST*. [H. Rorschach (1884–1922), Swiss psychiatrist]

**rosacea** *n.* a chronic inflammatory disease of the face in which the skin becomes abnormally flushed. At times it becomes pustular and there may be an associated *\*keratitis*. The disease occurs in both sexes and at all ages but is most common in women in their thirties; the cause is unknown. Treatment is with topical metronidazole; oral tetracyclines, erythromycin, or isotretinoin; or pulsed dye laser.

**roseola (roseola infantum, exanthem subitum)** *n.* a condition of young children in which a fever lasting for three or four days is followed by a rose-coloured maculopapular rash that fades after two days. The commonest exanthematous fever in young children, it is caused by human herpesvirus 6.

**Ross River fever** a viral disease caused by an *\*alphavirus* transmitted by mosquitoes. Various vertebrates can be infected, and wild rodents may be reservoirs of the infection. The virus can cause epidemics of *\*polyarthritis* and skin rashes (macules and papules). It occurs in Australia and the western Pacific region.

**rostellum** *n.* (*pl.* **rostella**) a mobile and retractable knob bearing hooks, present on the head (scolex) of certain *\*tapeworms*, e.g. *Taenia* and *Echinococcus*.

**rostrum** *n.* (*pl.* **rostra**) (in anatomy) a beaklike projection, such as that on the sphenoid bone. —**rostral** *adj.*

**Rosving's sign** a test used during the assessment of a patient with a possible diagnosis of appendicitis. Pressure is applied to the left iliac fossa. If the test is positive the patient experiences pain in the right iliac fossa. This can be used in conjunction with the history and other clinical signs to guide the clinician as to the likelihood of a diagnosis of appendicitis. [N. T. Rosving (1862–1927), Danish surgeon]

**rotablation** *n.* *see* **ATHERECTOMY**.

**rotator** *n.* a muscle that brings about rotation of a part. The **rotatores** are small muscles situated deep in the back between adjacent vertebrae. They help to extend and rotate the vertebrae.

**rotavirus** *n.* any member of a genus of viruses that occur in birds and mammals and cause diarrhoea (often severe) in children. The viruses are excreted in the faeces of infected individuals and are usually transmitted in food prepared with unwashed hands. Rotavirus infection is endemic worldwide.

**rotavirus vaccine** an oral vaccine against **\*rotavirus** infection. In Britain it is offered to babies at 2 and 3 months of age, alongside their other childhood vaccinations.

**Rothera's test** a method of testing urine for the presence of acetone or acetoacetic acid: a sign of **\*diabetes mellitus**. Strong ammonia is added to a sample of urine saturated with ammonium sulphate crystals and containing a small quantity of sodium nitroprusside. A purple colour confirms the presence of acetone or acetoacetic acid. [A. C. H. Rothera (1880–1915), Australian biochemist]

**Roth spot** a pale area surrounded by haemorrhage sometimes seen in the retina, with the aid of an **\*ophthalmoscope**, in those who have bacterial endocarditis, septicaemia, or leukaemia. [M. Roth (1839–1915), Swiss physician]

**roughage** *n.* *see* **DIETARY FIBRE**.

**rouleau** *n.* (*pl.* rouleaux) a cylindrical structure in the blood formed from several red blood cells piled one upon the other and adhering by their rims.

**round window** *see* FENESTRA.

**roundworm** *n.* *see* NEMATODE.

**roux-en-Y** a technique using an end-to-side anastomosis between a defunctioned section of jejunum and another upper abdominal organ (e.g. stomach, duodenum, common bile duct) in order to bypass an obstruction.

**RPE** retinal pigment epithelium. *See* RETINA.

**RPM** radiofrequency palatal myoplasty. *See* PALATOPLASTY.

**-rrhagia (-rrhage)** *combining form denoting* excessive or abnormal flow or discharge from an organ or part. Examples: **haemorrhage** (excessive bleeding); **menorrhagia** (excessive menstrual flow).

**-rrhaphy** *combining form denoting* surgical sewing; suturing. Example: **herniorrhaphy** (of a hernia).

**-rrhexis** *combining form denoting* splitting or rupture of a part.

**-rrhoea** *combining form denoting* a flow or discharge from an organ or part. Example: **rhinorrhoea** (from the nose).

**RSI** *see* REPETITIVE STRAIN INJURY.

**RSV** *see* RESPIRATORY SYNCYTIAL VIRUS.

**rTMS** repetitive \*transcranial magnetic stimulation.

**rubber dam** (in dentistry) a sheet of latex-containing or latex-free material used to isolate one or more teeth during treatment.

**rubefacient** *n.* an agent that causes reddening and warming of the skin. Rubefacients are often used as \*counterirritants for the relief of muscular pain.

**rubella** *n.* *see* GERMAN MEASLES.

**rubeola** *n.* *see* MEASLES.

**rubeosis iridis (rubeosis)** growth of blood vessels onto the iris, usually as a result of ischaemia of the eye. This occurs, for example, in diabetic **\*retinopathy** and central **\*retinal vein occlusion**.

**rubidium-81** *n.* an artificial radioactive isotope that has a half-life of about four hours and decays into the radioactive gas **\*krypton-81m**, emitting radiations as it does so. It provides a useful source of krypton-81m for use in **\*ventilation-perfusion scanning**. Symbol: Rb-81.

**rubor** *n.* redness: one of the classical signs of inflammation in a tissue, the other three being **\*calor** (heat), **\*dolor** (pain), and **\*tumor** (swelling). The redness of inflamed tissue is due to the increase in size of the small blood vessels in the area, which therefore contain more blood.

**rubrospinal tract** a tract of **\*motor neurons** that extends from the midbrain down to different levels in the spinal cord, carrying impulses that have travelled from the cerebral and cerebellar cortex via the nucleus ruber (red nucleus). The tract plays an important part in the control of skilled and dextrous movements.

**ruga** *n.* (*pl.* rugae) a fold or crease, especially one of the folds of mucous membrane that line the stomach.

**rule of nines** a method for quickly assessing the area of the body covered by burns in order to assist calculation of the amount of intravenous fluid to be given. The body is divided into areas of skin comprising approximately 9% each of the total body surface. These are as follows: each arm = 9%, the head = 9%, each leg = 18%, the back of the torso (including the buttocks) = 18%, the front of the torso = 18%, with the external genitalia making up the final 1%. The rule is not applicable to children, whose body proportions change with age (in younger children the head represents a greater proportion of the total body surface area).

**rumination** *n.* (in psychiatry) an obsessional type of thinking in which the same thoughts or themes are experienced repetitively, to the exclusion of other forms of mental activity. Rumination is a feature of obsessive-compulsive disorder and depression.

**rupture** **1.** *n.* see **HERNIA**. **2.** *n.* the bursting apart or open of an organ or tissue; for example, the splitting of the membranes enclosing an infant during

childbirth. **3.** *vb.* (of tissues, etc.) to burst apart or open.

**Rusch catheter** a catheter traditionally used for prostate surgery but now successful in the management of *\*postpartum haemorrhage* as an alternative to hysterectomy. The catheter is inserted into the uterine cavity and the balloon filled passively with up to 500 ml warm saline to achieve a *\*tamponade* effect. An alternative is the **Bakri balloon**, which has been designed specifically for obstetric use.

**Rusch catheter.**

**Russell–Silver syndrome (Silver–Russell syndrome)** a congenital condition characterized by short stature, a triangular face with a small mandible (lower jaw), and asymmetry of the body. [A. Russell (1918–2003), British paediatrician; H. K. Silver (1918–91), US paediatrician]

**Russian spring-summer encephalitis** an influenza-like viral disease that affects the brain and nervous system and occurs in Russia and central Europe. It is transmitted to humans either through the bite of forest-dwelling ticks of the species *Ixodes persulcatus* or by drinking the milk of infected goats. Infection of the meninges results in paralysis of the limbs and of the muscles of the neck and back. The disease, which is often fatal, can be prevented by vaccination.

**Ryle's tube** a flexible *\*nasogastric tube* that enables aspiration of gastric secretions and evacuation of intestinal gas. [J. A. Ryle (1889–1950), British physician]

# S

**Sabin vaccine** an oral vaccine against (E954) poliomyelitis, prepared by culture of the virus under special conditions so that it loses its virulence (i.e. it becomes attenuated) but retains its ability to stimulate antibody production. [A. B. Sabin (1906–93), US bacteriologist]

**sac** *n.* a pouch or baglike structure. Sacs can enclose natural cavities in the body, e.g. in the lungs (see **ALVEOLUS**) or in the **\*lacrima** apparatus of the eye, or they can be pathological, as in a hernia.

**saccade** *n.* (*pl.* saccades) a rapid movement of the eye used to shift gaze from one object to another. It can be done voluntarily or occurs as a reflex triggered by a visual stimulus in the peripheral visual field.

**sacchar-** (**saccharo-**) *combining form denoting sugar.*

**saccharide** *n.* a carbohydrate. See also **DISACCHARIDE**; **MONOSACCHARIDE**; **POLYSACCHARIDE**.

**saccharine** *n.* a sweetening agent (E954). Saccharine is 300 times as sweet as sugar and has no energy content. It is very useful as a sweetener in diabetic and low-calorie foods. Saccharine is stable at high temperatures and therefore can be used in cooking.

**Saccharomyces** *n.* see **YEAST**.

**saccul** (**sacculus**) *n.* the smaller of the two membranous sacs within the vestibule of the ear: it forms part of the membranous **\*labyrinth**. It is filled with fluid (endolymph) and contains a **\*macula**. This responds to gravity and relays information to the brain about the position of the head.

**saccus** *n.* a sac or pouch. The **saccus endolymphaticus** is the small sac connected to the saccule and utricle of the inner ear by the **\*endolymphatic duct**.

**sacral agenesis (caudal regression syndrome)** a severe neural tube defect specific to diabetic pregnancies. The risk may be correlated with the **\*glycated haemoglobin** (HbA<sub>1c</sub>) level.

**sacralization** *n.* abnormal fusion of the fifth lumbar vertebra with the sacrum.

**sacral nerves** the five pairs of **\*spinal nerves** that emerge from the spinal column in the sacrum. The nerves carry sensory and motor fibres from the upper and lower leg and from the anal and genital regions.

**sacral vertebrae** the five vertebrae that are fused together to form the **\*sacrum**.

**sacro-** *combining form denoting* the sacrum. Examples: **sacrococcygeal** (relating to the sacrum and coccyx); **sacrodynia** (pain in); **sacroiliac** (relating to the sacrum and ilium).

**sacrocolpopexy** *n.* surgical treatment of **\*vault prolapse**, which can be an abdominal or laparoscopic procedure. It involves suspending the prolapsed vaginal vault to the sacral promontory using a synthetic mesh or biological material; however, it is associated with a significant risk of haemorrhage and mesh erosion. **Posterior intravaginal slingplasty** (or **infracoccygeal sacropexy**) is a more recent technique in which a neo-uterosacral ligament (which supports the vagina) is formed. This helps to relocate the vaginal apex and restore the normal vaginal axis. The procedure appears to have similar efficacy to those currently in use but with minimal surgical morbidity.

**sacroiliitis** *n.* inflammation of the sacroiliac joint. Involvement of both joints is a common feature of ankylosing **\*spondylitis** and associated rheumatic diseases, including **\*reactive arthritis** and **\*psoriatic arthritis**. The resultant low back pain and stiffness may be alleviated by rest, anti-inflammatory analgesics, or biological **\*disease-modifying antirheumatic drugs**.

**sacroplasty** *n.* surgery using minimally invasive techniques and liquid cement to stabilize fragile sacral fractures, which previously would have been treated with rest and analgesia.

**sacrospinous ligament fixation** a surgical technique to correct vaginal **\*vault prolapse** after hysterectomy. A stitch is made from the apex of the vagina to the sacrospinous ligament (which supports the vagina) approximately 2 cm medial to the ischial spine. The main complication is bleeding and formation of a haematoma.

**sacrum** *n.* (*pl.* sacra) a curved triangular element of the **\*backbone** consisting of five fused vertebrae (**sacral vertebrae**). It articulates with the last lumbar vertebra above, the coccyx below, and the hip bones laterally. *See also* VERTEBRA. —**sacral** *adj.*

**SAD (seasonal affective disorder)** a disorder marked by changes of mood at particular times of the year. Typically, with the onset of winter, there is depression, general slowing of mind and body, excessive sleeping, and overeating. These symptoms resolve with the coming of spring. The phenomenon may partly account for the known seasonal variation in suicide rates. Prevalence increases with latitude and younger people (especially women) are most likely to be affected. There is evidence that mood is related to light, which suppresses the release of the hormone **\*melatonin** from the pineal gland. Exposure to additional light during the day may relieve symptoms.

**saddle joint** a form of **\*diarthrosis** (freely movable joint) in which the articulating surfaces of the bones are reciprocally saddle-shaped. It occurs at the carpometacarpal joint of the thumb.

**safeguarding** *n.* measures put in place to protect the health, wellbeing, and human rights of children and vulnerable adults, thereby securing them from harm, abuse, and neglect. In Britain this includes legislation, official guidance, and standards laid down by institutions and professional bodies. With its emphasis on pre-empting harm and actively promoting welfare, safeguarding takes a more holistic approach than **child protection**, which focuses on protecting individual children identified as suffering or likely to suffer significant harm (*see* CHILD PROTECTION REGISTER). Adults in need of safeguarding may have mental-health problems, physical disability, or learning difficulties or may be elderly and frail.

**safe period** the days in each **\*menstrual cycle** when conception is least likely. Ovulation generally occurs at the midpoint of each cycle, and in

women with regular periods it is possible to calculate the days at the beginning and end of the cycle when coitus is unlikely to result in pregnancy. *See* [RHYTHM METHOD](#).

**safety** *n.* the prevention of unnecessary [\\*harm](#) to patients, staff, family, and the general public. Where a patient cannot exercise [\\*autonomy](#), lacks self-control and normal judgement, or has a tendency to become violent, safety may become a key issue in devising a treatment plan. *See* [INCOMPETENCE](#); [SECTION](#).

**safranin (safranine)** *n.* a group of water- and alcohol-soluble basic dyes used to stain cell nuclei and as counterstains for Gram-negative bacteria.

**sagittal** *adj.* describing a dorsoventral plane that extends down the long axis of the body, parallel to the median plane, dividing it into right and left parts (see illustration).

**Sagittal plane.**

**sagittal suture** *see* **SUTURE**.

**St Anthony's fire** an old colloquial name for the inflammation of the skin associated with ergot poisoning. *See* **ERGOTISM**.

**St Mark's solution** an electrolyte solution used to prevent dehydration in patients who have a large watery output of faecal fluid from their **\*stoma**, often due to **\*short bowel syndrome**. Originally formulated in St Mark's hospital in London, the solution consists of 1l water, six heaped 5-ml teaspoons glucose, one level 5-ml teaspoon salt, and half a heaped 2.5-ml teaspoon sodium bicarbonate.

**Saint's triad** the coexistence of *\*gallstones*, diverticular disease, and hiatus *\*hernia* in a patient. It is important to identify which of these conditions, if any, is causing the symptoms of dyspepsia. [C. F. M. Saint (1886–1973), South African surgeon]

**St Vitus' dance** an archaic name for *\*Sydenham's chorea*.

**salaam attacks** *see* INFANTILE SPASMS.

**salbutamol** *n.* a drug that stimulates  $\beta_2$  adrenoceptors (*see* SYMPATHOMIMETIC): a short-acting beta agonist used as a *\*bronchodilator* to relieve asthma and other reversible obstructive airways diseases. Side-effects may include dizziness, tremor, and fast heart rate, particularly after large doses.

**salcatonin** *n. see* CALCITONIN.

**salicylic acid** a drug that causes the skin to peel and destroys bacteria and fungi. It is applied to the skin, alone or in combination with other agents, to treat warts, corns, calluses, acne, dandruff, psoriasis, and fungal nail infections. Skin sensitivity reactions may occur after continued use.

**salicylism** *n.* poisoning due to an overdose of aspirin or other salicylate-containing compounds. The main symptoms are headache, dizziness, ringing in the ears (tinnitus), disturbances of vision, vomiting, and – in severe cases – delirium and collapse. There is often severe *\*acidosis*.

**saline (normal saline, physiological saline)** *n.* a solution containing 0.9% *\*sodium chloride*. Saline may be used clinically for irrigating wounds, treating sodium depletion (by intravenous infusion), as a diluent for drugs, and as an ingredient of plasma substitutes.

**saline infusion sonohysterography (SIS)** *see* SONOHYSTEROGRAPHY.

**saliva** *n.* the alkaline liquid secreted by the *\*salivary glands* and the mucous membrane of the mouth. Its principal constituents are water, mucus, buffers, and enzymes (e.g. amylase). The functions of saliva are to keep the mouth moist, to aid swallowing of food, to minimize changes of acidity in the mouth, and to digest starch. *See also* DRY MOUTH. —**salivary** *adj.*

**salivary gland** a gland that produces *\*saliva*. There are three pairs of salivary glands: the *\*parotid glands*, *\*sublingual glands*, and *\*submandibular glands* (see illustration). They are stimulated by reflex action, which can be initiated by the taste, smell, sight, or thought of food.

**Salivary glands.**

**salivary stone** *see* **SIALOLITH**.

**salivation** *n.* the secretion of saliva by the salivary glands of the mouth, increased in response to the chewing action of the jaws or to the thought, taste, smell, or sight of food. A small but regular flow of saliva is maintained to promote cleanliness in the mouth even when food is not being eaten. *See also* **PTYALISM**.

**Salk vaccine** a vaccine against poliomyelitis, formed by treating the virus with formalin, which prevents it from causing disease but does not impair its ability to stimulate antibody production. It is administered by injection. [J. E. Salk (1914–95), US bacteriologist]

**salmeterol** *n.* a *\*sympathomimetic* drug: a long-acting beta agonist used, with inhaled corticosteroids, as a *\*bronchodilator* to control chronic asthma and chronic obstructive pulmonary disease. Possible side-effects include palpitations, a paradoxical worsening of the condition, and a lowering of the blood potassium level.

**Salmonella** *n.* a genus of motile rodlike Gram-negative bacteria that inhabit the intestines of animals and humans and cause disease. They ferment glucose, usually with the formation of gas. The species *S. paratyphi* causes \*paratyphoid fever, and *S. typhi* causes \*typhoid fever. Other species of *Salmonella* cause \*food poisoning, gastroenteritis, and septicaemia.

**salmonellosis** *n.* an infestation of the digestive system by bacteria of the genus \**Salmonella*. See also FOOD POISONING.

**salmon patch (stork mark)** a malformation of the skin in young children consisting of dilated capillaries resulting in a light pink patch, usually on the face or back of the neck, with poorly defined borders. The patch becomes more intense in colour when the child is crying. Most lesions disappear within the first year of life but those on the nape of the neck tend to be more persistent and in some cases may remain for life.

**salping- (salpingo-)** *combining form denoting* **1.** the Fallopian tube. **2.** the auditory tube (meatus).

**salpingectomy** *n.* the surgical removal of a Fallopian tube, most commonly carried out for removal of a tubal pregnancy (see ECTOPIC PREGNANCY). The operation involving both tubes is a permanent and completely effective method of contraception (see STERILIZATION) since it prevents the egg cells passing from the ovaries to the uterus.

**salpingitis** *n.* inflammation of a tube, most commonly applied to inflammation of one or both of the Fallopian tubes caused by bacterial infection spreading from the vagina or uterus or carried in the blood. In **acute salpingitis** there is a sharp pain in the lower abdomen, which may be mistaken for appendicitis, and the infection may spread to the membrane lining the abdominal cavity (see PERITONITIS). In severe cases the tubes may become blocked with scar tissue and the patient will be unable to conceive. The condition is treated with antibiotics and later, if necessary, by the surgical removal of the diseased tube(s).

**salpingography** *n.* \*radiography of one or both Fallopian tubes after a \*radiopaque substance has been introduced into them via an injection into the uterus. **Standardized selective salpingography** enables occluded tubes,

visualized by salpingography, to be restored to patency by means of tubal **\*catheterization**.

**salpingolysis** *n.* a surgical operation carried out to restore patency to blocked Fallopian tubes; it involves the **\*division** and removal of adhesions around the ovarian ends of the tubes.

**salpingo-oophorectomy** *n.* surgical removal of the Fallopian tube and ovary.

**salpingo-oophoritis** *n.* inflammation of a Fallopian tube and an ovary.

**salpingostomy** *n.* the operation performed to restore free passage through a blocked Fallopian tube. The blocked portion of the tube is removed surgically and the continuity is then restored. It is performed in women who have been sterilized previously by tubal occlusion (*see* **STERILIZATION**) and in others whose Fallopian tubes have become blocked as a result of pelvic infection.

**salt depletion** excessive loss of sodium chloride (common salt) from the body. This may result from sweating, persistent vomiting or diarrhoea, or loss of fluid in wounds. The main symptoms are muscular weakness and cramps. Miners and workers in hot climates are particularly at risk, and salt tablets are often taken as a preventive measure.

**Salter–Harris classification (S–H classification)** a classification of fractures involving the growth plate of bones (*see* **PHYSIS**), which is useful for their prognosis and treatment. There are five S–H categories of fracture. [R. Salter and R. I. Harris (20th century), Canadian orthopaedic surgeons]

**salvage procedure** surgical measures to palliate the worst effects of a tumour but with no aim to effect a cure.

**Salvarsan** *n.* *see* **ARSENIC**.

**Salzmann's degeneration** a noninflammatory condition of the cornea resulting in yellow-white nodules under the epithelium in the central area. These may cause symptoms if the epithelium over them breaks down or if they are located along the visual axis. [M. Salzmann (1862–1954), German ophthalmologist]

**Samaritans** *n.* a British voluntary organization providing a telephone service for the suicidal and despairing. Started in 1953 by the Rev. Chad Varah in the cellars of a London church (St Stephen, Walbrook) with one telephone, it now has over 200 branches throughout the country manned by some 22,000 volunteers. It offers a free, nonprofessional, confidential, and (if required) anonymous service at all hours. Samaritans offer little advice, believing that their clients will be helped to make their own decisions by talking to someone who cares.

**sampling frame** *see* **RANDOM SAMPLE**.

**Samter's triad** a syndrome characterized by the presence of asthma, nasal \*polyps, and hypersensitivity to aspirin. [M. Samter (1908–99), German-born US physician]

**sanatorium** *n.* **1.** a hospital or institution for the rehabilitation and convalescence of patients of any kind. **2.** an institution for patients who have suffered from pulmonary tuberculosis.

**sanctity of life** the religious or moral belief that all life – and especially all human life – is intrinsically valuable and so should never be deliberately harmed or destroyed. Many of those who hold such a view will have ethical objections to \*euthanasia, \*abortion, and \*embryo research. The phrase may also be used to denote that the value of life should always be respected, whatever the perceived quality of that life. *See also* **HUMANITY**; **PERSONHOOD**.

**sandfly** *n.* a small hairy fly of the widely distributed genus *Phlebotomus*. Adult sandflies rarely exceed 3 mm in length and have long slender legs. The blood-sucking females of certain species transmit various diseases, including \*leishmaniasis, \*sandfly fever, and \*bartonellosis.

**sandfly fever (Pappataci fever)** a viral disease transmitted to humans by the bite of the sandfly *Phlebotomus papatasi*. Sandfly fever occurs principally in countries surrounding the Persian Gulf and the tropical Mediterranean; it occurs during the warmer months, does not last long, and is never fatal. Symptoms resemble those of influenza. There is no specific treatment apart from aspirin and codeine to relieve the symptoms.

**sandwich therapy** a combination of treatments in which one type of therapy is ‘sandwiched’ between exposures to another therapy. For example, surgical removal of a tumour may be ‘sandwiched’ between pre- and postoperative courses of chemotherapy. *See also* **COMBINED THERAPY**.

**SANE** a British charity whose role is to raise the awareness of mental health issues. It also initiates research into serious mental illness and offers telephone support for those with mental health problems and for those caring for them.

**sangui- (sanguino-)** *combining form denoting blood.*

**sanguineous** *adj.* **1.** stained, containing, or covered with blood. **2.** of tissues) containing more than the normal quantity of blood.

**sanies** *n.* a foul-smelling watery discharge from a wound or ulcer, containing serum, blood, and pus.

**sanitarian** *n.* *see* **MEDICAL ASSISTANT**.

**saphena** *n.* *see* **SAPHENOUS VEIN**.

**saphena varix** an abnormal dilatation of the terminal section of the long \***saphenous vein** in the groin.

**saphenous nerve** a large branch of the \***femoral nerve** that arises in the upper thigh, travels down on the inside of the leg, and supplies the skin from the knee to below the ankle with sensory nerves.

**saphenous vein (saphena)** either of two superficial veins of the leg, draining blood from the foot. The **long saphenous vein** – the longest vein in the body – runs from the foot, up the medial side of the leg, to the groin, where it joins the femoral vein. The **short saphenous vein** runs up the back of the calf to join the popliteal vein at the back of the knee.

**sapr- (sapro-)** *combining form denoting* **1.** putrefaction. **2.** decaying matter.

**sapraemia** *n.* blood poisoning by toxins of saprophytic bacteria (bacteria living on dead or decaying matter). *Compare* **PYAEMIA**; **SEPTICAEMIA**; **TOXAEMIA**.

**saprophyte** *n.* any free-living organism that lives and feeds on the dead and putrefying tissues of animals or plants. *Compare* **PARASITE**. —**saprophytic** *adj.*

**saquinavir** *n.* *see* **PROTEASE INHIBITOR**.

**sarc- (sarco-)** *combining form denoting* **1.** flesh or fleshy tissue. **2.** muscle.

**Sarcocystis** *n.* a genus of parasitic protozoans (*see* **SPOROZOA**) that infect birds, reptiles, and herbivorous mammals. *S. lindemanni*, which occasionally infects humans, forms cylindrical cysts (**sarcocysts**) in the muscle fibres. In heavy infections these cysts can cause tissue degeneration and therefore provoke muscular pain and weakness. Sarcocysts have, in the few positively diagnosed cases, been located in the heart muscles, arm muscles, and larynx.

**sarcoid** **1.** *adj.* fleshy. **2.** *n.* a fleshy tumour.

**sarcoidosis (Boeck's disease)** *n.* a chronic disorder of unknown cause in which the lymph nodes in many parts of the body are enlarged and small fleshy nodules (*see* **GRANULOMA**) develop in the lungs, liver, and spleen. The skin, nervous system, eyes, and salivary glands are also commonly affected (*see* **UVEOPAROTITIS**), and the condition has features similar to **\*tuberculosis**. Recovery is complete with minimal after-effects in two-thirds of all cases.

**sarcolemma** *n.* the cell membrane that encloses a muscle cell (muscle fibre).

**sarcoma** *n.* any **\*cancer** of connective tissue. These tumours may occur in any part of the body, as they arise in the tissues that make up an organ rather than being restricted to a particular organ. They can arise in fibrous tissue, muscle, fat, bone, cartilage, synovium, blood and lymphatic vessels, and various other tissues. *See also* **CHONDROSARCOMA**; **FIBROSARCOMA**; **LEIOMYOSARCOMA**; **LIPOSARCOMA**; **LYMPHANGIOSARCOMA**; **OSTEOSARCOMA**; **RHABDOMYOSARCOMA**. —**sarcomatous** *adj.*

**sarcoma botryoides** the most common tumour of the cervix and vagina in children and adolescents under the age of 16; 90% occur in children under five years. Symptoms are vaginal bleeding and a bloody discharge; in young

girls the tumour may protrude from the cervix. It is a highly malignant **\*rhabdomyosarcoma** with the appearance of a bunch of grapes. Treatment is with triple chemotherapy with or without radiotherapy prior to hysterectomy and vaginectomy.

**sarcomere** *n.* one of the basic contractile units of which **\*striated muscle** fibres are composed.

**Sarcophaga** *n.* a genus of widely distributed non-bloodsucking flies, the flesh flies. Maggots are normally found in carrion or excrement but occasionally females will deposit their eggs in wounds or ulcers giving off a foul-smelling discharge; the presence of the maggots causes a serious **\*myiasis**. Rarely, maggots may be ingested with food and give rise to an intestinal myiasis.

**sarcoplasm (myoplasm)** *n.* the cytoplasm of muscle cells.

**sarcoplasmic reticulum** an arrangement of membranous vesicles and tubules found in the cytoplasm of striated muscle fibres. The sarcoplasmic reticulum plays an important role in the transmission of nervous excitation to the contractile parts of the fibres.

**Sarcoptes** *n.* a genus of small oval mites. The female of *S. scabiei*, the scabies mite, tunnels into the skin, where it lays its eggs. The presence of the mites causes severe irritation, which eventually leads to **\*scabies**.

**sarcostyle** *n.* a bundle of muscle fibrils.

**SARS (severe acute respiratory syndrome)** an **\*atypical pneumonia** caused by a virus, SARS coronavirus (SARS CoV), and spread by close contact with an infected person, that first appeared in November 2002 in Guangdong province, China. Over the next few months it spread to many countries in Asia, Europe, and North and South America before being contained (the last case in this outbreak occurred in June 2003). According to the World Health Organization (WHO), a total of 8098 people worldwide contracted SARS during the 2003 outbreak; 774 of these died. Over the next two years the number of cases declined until the disease itself was declared eradicated by the WHO (in May 2005).

**sartorius** *n.* a narrow ribbon-like muscle at the front of the thigh, arising from the anterior superior spine of the ilium and extending to the tibia, just

below the knee. The longest muscle in the body, the sartorius flexes the leg on the thigh and the thigh on the abdomen.

**SAS** sleep apnoea syndrome (*see* **OBSTRUCTIVE SLEEP APNOEA**).

**saturated fatty acid** a **\*fatty acid** in which all the carbon atoms are linked by single bonds and the molecule is unable to accept additional atoms (i.e. it cannot undergo addition reactions with other molecules). These fats occur mainly in animal and dairy products, and a diet high in these foods may contribute to a high serum cholesterol level, which may increase the risk of **\*coronary artery disease**. *Compare* **UNSATURATED FATTY ACID**.

**saucerization** *n.* **1.** an operation in which tissue is cut away from a wound to form a saucer-like depression. It is carried out to facilitate healing and is commonly used to treat injuries or disorders in which bone is infected. **2.** the concave appearance of the upper surface of a vertebra that has been fractured by compression.

**saxagliptin** *n.* *see* **DPP-IV INHIBITORS**.

**Sayre's jacket** a plaster of Paris cast shaped to fit around and support the backbone. It is used in cases where the vertebrae have been severely damaged by disease, such as tuberculosis. [L. A. Sayre (1820–1900), US surgeon]

**scab** *n.* a hard crust of dried blood, serum, or pus that develops during the body's wound-healing process over a sore, cut, or scratch.

**scabicide** *n.* a drug that kills the mites causing **\*scabies**.

**scabies** *n.* a skin infection caused by the mite **\*Sarcoptes scabiei**. Scabies is typified by severe itching (particularly at night), red papules, and often secondary infection. The female mite invades the skin to lay her eggs and the newly hatched mites pass from person to person by close prolonged contact. The intense itching represents a true allergic reaction to the mite, its eggs, and its faeces. Commonly infected areas are the penis, nipples, and the finger webs. Treatment is by application of a scabicide, usually **\*permethrin** or **\*malathion**, to all areas of the body from the neck down; benzyl benzoate may be used but is more irritant. All members of a family need treatment, but clothing and bedding need not be disinfested.

**scala** *n.* one of the spiral canals of the **\*cochlea**. The **scala media** (**cochlear duct**) is the central membranous canal, containing the sensory apparatus of the cochlea; the **scala vestibuli** and **scala tympani** are the two bony canals of the cochlea.

**scald** *n.* a **\*burn** produced by a hot liquid or vapour, such as boiling water or steam.

**scale 1.** *n.* any of the flakes of dead epidermal cells shed from the skin. **2.** *vb.* to scrape deposits of calculus (tartar) from the teeth (*see* **SCALER**).

**scalenus** *n.* one of four paired muscles of the neck (**scalenus anterior, medius, minimus, and posterior**), extending from the cervical (neck) vertebrae to the first and second ribs. They are responsible for raising the first and second ribs in inspiration and for bending the neck forward and to either side.

**scalenus syndrome (thoracic outlet syndrome)** the group of symptoms caused by compression of the subclavian artery and the lower roots of the brachial plexus against the fibrous and bony structures of the outlet of the upper thoracic vertebrae. Loss of sensation, wasting, and vascular symptoms may be found in the affected arm, which may also be painful.

**scaler** *n.* an instrument for removing calculus from the teeth. It may be a hand instrument (usually sickle or curette) or one energized by rapid ultrasonic vibrations.

**scalpel** *n.* a small pointed surgical knife used by surgeons for cutting tissues. It has a straight handle and usually detachable disposable blades of different shapes.

**scan 1.** *n.* examination of the body or a part of the body using **\*ultrasonography**, **\*computerized tomography** (CT), **\*magnetic resonance imaging** (MRI), or scintigraphy (*see* **SCINTIGRAM**). **2.** *n.* the image obtained from such an examination. **3.** *vb.* to examine the body using any of these techniques.

**scanning laser ophthalmoscope** *see* **OPHTHALMOSCOPE**.

**scanning speech** a disorder of articulation in which the syllables are inappropriately separated and equally stressed. It is caused by disease of the cerebellum or its connecting fibres in the brainstem.

**scaphocephaly** *n.* an abnormally long and narrow skull due to premature closure of the suture between the two parietal bones, along the top of the skull. —**scaphocephalic** *adj.*

**scaphoid bone** a boat-shaped bone of the wrist (*see* **CARPUS**). It articulates with the trapezium and trapezoid bones in front, with the radius behind, and with the capitate and lunate medially. It is commonly injured by falls on the wrist.

**scaphoid fracture** a fracture of the scaphoid bone in the wrist, usually caused by a fall onto the outstretched hand. There is pain and swelling in the **\*anatomical snuffbox** and movements of the wrist and thumb are painful. If the fracture is suspected but not initially visible on X-ray, advanced imaging (a bone scan, CT scan, or MRI) is now increasingly used to confirm the diagnosis without delay. Treatment is with a cast for an undisplaced fracture and by internal fixation for a displaced fracture. Due to the anatomy of its blood supply, healing can take a long time, and a **\*bone graft** and internal fixation may be required for non-**\*union**.

**scapul-** (**scapulo-**) *combining form denoting* the scapula.

**scapula** *n.* (*pl.* scapulas or scapulae) the shoulder blade: a triangular bone, a pair of which form the back part of the shoulder girdle (*see* illustration). The **spine** on its dorsal (back) surface ends at the **acromion process** at the top of the shoulder. This process turns forward and articulates with the collar bone (**\*clavicle**) at the **acromioclavicular joint**; it overhangs the **glenoid fossa**, into which the humerus fits to form the socket of the shoulder joint. The **coracoid process** curves upwards and forwards from the neck of the scapula and provides attachment for ligaments and muscles. —**scapular** *adj.*

**Right scapula (dorsal surface).**

**scar** *n.* a permanent mark left after wound healing. A **hypertrophic scar** is an abnormal raised scar that tends to settle after a year or so, as distinct from a **\*keloid**, which is not only permanent but tends to extend beyond the original wound.

**scarification** *n.* the process of making a series of shallow cuts or scratches in the skin to allow a substance to penetrate the body. This was commonly performed during vaccination against smallpox; the vaccine was administered as a droplet left in contact with the scarified area.

**scarlatina** *n.* see **SCARLET FEVER**.

**scarlet fever** a highly infectious disease caused by a strain of **\*Streptococcus** bacteria that produces toxins. Symptoms begin 2–4 days after exposure and include fever, tonsillitis, and a characteristic widespread scarlet rash. The tongue is also affected; initially covered by a thick white material, it then becomes bright red (the ‘strawberry tongue’). Treatment with antibiotics shortens the course of the disease and reduces the risk of secondary complications, which include kidney and ear inflammation. Medical name: **scarlatina**. Compare **GERMAN MEASLES**.

**Scarpa's triangle** *see* **FEMORAL TRIANGLE**. [A. Scarpa (1747–1832), Italian anatomist and surgeon]

**scat- (scato-)** *combining form denoting faeces.*

**scatter diagram** (in statistics) *see* **CORRELATION**.

**SCC** *see* **SQUAMOUS CELL CARCINOMA**.

**SCDS** *see* **SUPERIOR CANAL DEHISCENCE SYNDROME**.

**Schatzki ring** a ringlike constriction in the lower part of the gullet (oesophagus). The cause is unclear. Patients may be asymptomatic or experience episodic difficulty in swallowing. Diagnosis is made at gastroscopy or **\*barium swallow**. Antisecretory agents and endoscopic balloon dilatation are reserved for symptomatic patients. [R. Schatzki (20th century), German-born US physician]

**Scheuermann's disease (adolescent kyphosis)** a disorder of spinal growth in which a sequence of three or more vertebrae become slightly wedge-shaped. It arises in adolescence and usually occurs in the thoracic spine, causing poor posture, backache, fatigue, and exaggerated **\*kyphosis**. X-ray findings include **\*Schmorl's nodes**. [H. W. Scheuermann (1877–1960), Danish surgeon]

**Schick test** a test to determine whether a person is susceptible to diphtheria. A small quantity of diphtheria toxin is injected under the skin; a patch of reddening and swelling shows that the person has no immunity and – if at particular risk – should be immunized. With safer **\*toxoids**, this test is no longer necessary. [B. Schick (1877–1967), US paediatrician]

**Schiff's reagent** aqueous **\*fuchsin** solution decolourized with sulphur dioxide. A blue coloration develops in the presence of aldehydes. [H. Schiff (1834–1915), German chemist]

**Schilling test** a test used to assess a patient's capacity to absorb vitamin B<sub>12</sub> from the bowel. Radioactive vitamin B<sub>12</sub> is given by mouth and urine collected for 24 hours. A normal individual will excrete at least 10% of the original dose over this period; a patient with **\*pernicious anaemia** will excrete less than 5%. [R. F. Schilling (1919), US physician]

**schindylesis** *n.* a form of **\*synarthrosis** (immovable joint) in which a crest of one bone fits into a groove of another.

**-schisis** *combining form denoting a cleft or split.*

**schisto-** *combining form denoting a fissure; split.*

**schistocyte** *n.* a fragmented red blood cell (erythrocyte).

**schistoglossia** *n.* fissuring of the tongue. Congenital fissures are transverse, whereas those due to disease (such as syphilis) are usually longitudinal.

**Schistosoma (Bilharzia)** *n.* a genus of blood **\*flukes**, three species of which are important parasites of humans causing one of the most serious of tropical diseases (see **SCHISTOSOMIASIS**). *S. japonicum* is common in the Far East; *S. mansoni* is widespread in Africa, the West Indies, and South and Central America; and *S. haematobium* occurs in Africa and the Middle East.

**schistosomiasis (bilharziasis)** *n.* a tropical disease caused by blood flukes of the genus **\*Schistosoma**. Eggs present in the stools or urine of infected people undergo part of their larval development within freshwater snails living in water contaminated with human sewage. The disease is contracted when **\*cercaria** larvae, released from the snails, penetrate the skin of anyone bathing in infected water. Adult flukes eventually settle in the blood vessels of the intestine (*S. mansoni* and *S. japonicum*) or the bladder (*S. haematobium*); the release of their spiked eggs causes anaemia, inflammation, and the formation of scar tissue. Additional intestinal symptoms are diarrhoea, dysentery, enlargement of the spleen and liver, and cirrhosis of the liver. If the bladder is affected, blood is passed in the urine and cystitis and cancer of the bladder may develop. The disease is treated with praziquantel.

**schiz- (schizo-)** *combining form denoting a split or division.*

**schizogony** *n.* a phase of asexual reproduction in the life cycle of a sporozoan (protozoan parasite) that occurs in the liver or red blood cells. The parasite grows and divides many times to form a **schizont**, which contains many **\*merozoites**. The eventual release of merozoites of **\*Plasmodium**, the malaria parasite, from the blood cells produces fever in the patient.

**schizoid personality** a personality characterized by solitariness, emotional coldness to others, inability to experience pleasure, lack of response to praise and criticism, withdrawal into a fantasy world, excessive introspection, and eccentricity of behaviour. *See* **PERSONALITY DISORDER**.

**schizont** *n.* one of the stages that occurs during the asexual phase of the life cycle of a sporozoan. *See* **SCHIZOGONY**.

**schizonticide** *n.* any agent used for killing **\*schizonts**.

**schizophrenia** *n.* a severe **\*mental illness** characterized by a disintegration of the process of thinking, of contact with reality, and of emotional responsiveness. **\*Positive symptoms**, such as **\*delusions** and **\*hallucinations** (especially of voices), are common, and any **\*Schneiderian first-rank symptoms** are particularly indicative of the illness. **\*Negative symptoms** include social withdrawal, impairment of ego boundaries, and loss of energy and initiative. Schizophrenia is diagnosed in ICD-11 only if symptoms persist for at least one month. The illness can spontaneously remit, run a course with infrequent or frequent relapses, or become chronic. The prognosis has improved with **\*antipsychotic** drugs and with vigorous psychological and social management and rehabilitation. The many causes include genetic factors, environmental stress, and various triggering factors. —**schizophrenic** *adj.*

<https://www.rethink.org/diagnosis-treatment/conditions/schizophrenia>

- An introduction to schizophrenia from the Rethink website

**schizotypal personality disorder** a personality disorder characterized by cold aloof feelings, eccentricities of behaviour, odd ways of thinking and talking, and occasional short periods of intense illusions, hallucinations, or delusion-like ideas.

**Schlemm's canal** a channel in the eye, at the junction of the cornea and the sclera, through which the aqueous humour drains. [F. Schlemm (1795–1858), German anatomist]

**Schmidt's syndrome** the autoimmune destruction of a combination of the thyroid, the adrenals, and the beta cells of the islets of Langerhans, causing

type 1 **\*diabetes mellitus**. It is often associated with failure of the ovaries (causing an early menopause), the parathyroids, and the parietal cells of the **\*gastric glands** (causing pernicious anaemia). [M. B. Schmidt (1863–1949), German physician]

**Schmorl's nodes** protrusions of the pulpy inner material of an intervertebral disc into the vertebral body, generally found in the thoracic and lumbar spine. [C. G. Schmorl (1861–1932), German pathologist]

**Schneiderian first- and second-rank symptoms** symptoms of **\*schizophrenia** first classified by German psychiatrist Kurt Schneider (1887–1967) in 1938. First-rank symptoms were considered by Schneider to be particularly indicative of schizophrenia; they include all forms of **\*thought alienation**, **\*delusional perception**, **\*passivity**, and third-person auditory **\*hallucinations** in the form of either a running commentary or voices talking about the patient among themselves. Some schizophrenic patients never exhibit first-rank symptoms or only experience them in some psychotic episodes. They may also occur in **\*mania**. Second-rank symptoms are common symptoms of schizophrenia but also often occur in other forms of mental illness. They include **\*delusions of reference**, paranoid and persecutory **\*delusions**, and second-person auditory hallucinations.

**Schnitzler's syndrome** a rare disorder characterized by chronic **\*urticaria**, fever, bone or joint pain, and enlarged lymph nodes in the neck. There are increased levels of an antibody, IgM (*see* **IMMUNOGLOBULIN**), produced by plasma cells. Treatment with **\*anakinra** is very effective. [L. Schnitzler (20th century), French dermatologist]

**Schönlein–Henoch purpura** *see* **HENOCH–SCHÖNLEIN PURPURA**.

**school health service** (in Britain) a service concerned with promotion of health and wellbeing in schoolchildren, including the early detection of health and social problems and their subsequent treatment and surveillance.

**school nurse** a member of the **\*school health service** who undertakes health improvement activities, including health education and promotion, developmental screening, and vaccinations. **\*Health visitors** sometimes work in this capacity.

**Schwann cells** the cells that lay down the \*myelin sheath around the axon of a medullated nerve fibre. Each cell is responsible for one length of axon, around which it twists as it grows, so that concentric layers of membrane envelop the axon. The gap between adjacent Schwann cells forms a \*node of Ranvier. [T. Schwann (1810–82), German anatomist and physiologist]

**schwannoma** *n.* see NEUROFIBROMA; VESTIBULAR SCHWANNOMA.

**Schwartz rounds** a system of regular meetings in which all health-care and related staff come together to discuss the social and emotional aspects of their work. The aim is to increase mutual support and appreciation, with ultimate benefits for the standard of care provided.

**sciatica** pain radiating from the buttock into the thigh, calf, and occasionally the foot. Although it is in the distribution of the sciatic nerve, sciatica is rarely due to disease of this nerve. Pain felt down the back and lateral aspect of the thigh, leg, and foot is often caused by degeneration or displacement of an intervertebral disc (see PROLAPSED INTERVERTEBRAL DISC), which encroaches upon and irritates a lower lumbar or an upper sacral spinal nerve root. The onset may be sudden, brought on by an awkward lifting or twisting movement that causes a tear in the fibrous coat of the disc, or more gradual, from progressive narrowing secondary to degenerative changes in the disc. The back is often stiff and painful and there may be numbness and weakness in the leg. Bed rest will often relieve the pain but surgical treatment is occasionally necessary (see LAMINECTOMY; DISCECTOMY; MICRODISCECTOMY).

**sciatic nerve** the major nerve of the leg and the nerve with the largest diameter. It runs down behind the thigh from the lower end of the spine; above the knee joint it divides into two main branches, the tibial and common peroneal nerves, which are distributed to the muscles and skin of the lower leg.

**SCID** see SEVERE COMBINED IMMUNE DEFICIENCY.

**scintigram** *n.* a diagram showing the distribution of radioactive \*tracer in a part of the body, produced by recording the flashes of light given off by a \*scintillator as it is struck by radiation of different intensities. This technique is called **scintigraphy**. By scanning the body, section by section, a 'map' of

the radioactivity in various regions is built up, aiding the diagnosis of cancer or other disorders. Such a record is known as a **scintiscan**. These images are now usually obtained using a *\*gamma camera*.

**scintillation counter** a device to measure and record the fluorescent flashes in a *\*scintillator* exposed to high-energy radiation.

**scintillator** *n.* a substance that produces a fluorescent flash when struck by high-energy radiation, such as beta or gamma rays. In medicine the most commonly used scintillator is a crystal of thallium-activated sodium iodide, which forms the basis of a *\*gamma camera*. *See also* SCINTIGRAM.

**scintiscan** *n.* *see* SCINTIGRAM.

**scirrhus** *adj.* describing carcinomas that are stony hard to the touch; for example, carcinoma of the breast.

**scissor leg** a disability in which one leg becomes permanently crossed over the other as a result of spasticity of its *\*adductor* muscles or deformity of the hips. The condition occurs in children with brain damage and in adults after strokes. A *\*tenotomy* or injections with *\*botulinum toxin* may reduce the degree of disability.

**scissura (scissure)** *n.* a cleft or splitting, such as the splitting of the tip of a hair or the splitting open of tissues when a hernia forms.

**scler- (sclero-)** *combining form denoting* **1.** hardening or thickening. **2.** the sclera. **3.** sclerosis.

**sclera (sclerotic coat)** *n.* the white fibrous outer layer of the eyeball. At the front of the eye it becomes the cornea. *See* EYE. —**scleral** *adj.*

**scleral buckle** a surgical procedure in which a piece of silicone plastic or sponge is sewn onto the sclera at the site of a retinal tear to push the sclera towards the tear. The buckle holds the retina against the sclera until scarring seals the tear.

**sclerectomy** *n.* an operation in which a portion of the sclera (the thick white layer of the eyeball) is removed.

**scleritis** *n.* inflammation of the sclera (the white of the eye).

**scleroderma** *n.* thickening of the skin, either localized (see **MORPHOEA**) or generalized, resulting in waxy ivory-coloured areas. Treatment is unsatisfactory, but spontaneous resolution may occur. Scleroderma is thought to be an **\*autoimmune disease**. **\*Systemic sclerosis** is a related multisystem disorder.

**scleromalacia** *n.* thinning of the sclera (white of the eye) as a result of inflammation. Sometimes the sclera fades away completely in an area, and the underlying dark-bluish tissue (usually the ciliary body) bulges beneath the conjunctiva. This state is known as **scleromalacia perforans**.

**sclerosis** *n.* hardening of tissue, usually due to scarring (fibrosis) after inflammation or to ageing. It can affect the lateral columns of the spinal cord and the medulla of the brain (**amyotrophic lateral sclerosis** or **Lou Gehrig's disease**), causing progressive muscular paralysis (see **MOTOR NEURON DISEASE**). It can also occur in scattered patches throughout the brain and spinal cord (see **MULTIPLE SCLEROSIS**) or in the walls of the arteries (see **ARTERIOSCLEROSIS**; **ATHEROSCLEROSIS**). See also **TUBEROUS SCLEROSIS**.

**sclerotherapy** *n.* an **\*interventional radiology** technique in which a **sclerosant** is used to obliterate vascular malformations, recurrent cysts, or varicose veins. This is a substance that damages the lining of the structure into which it is injected, hardening the tissue and eventually obliterating the vessel or cavity. Sodium tetradecyl sulphate, alcohol, ethanolamine, bleomycin, and poldocanol are commonly used sclerosants.

**sclerotic 1.** (**sclerotic coat**) *n.* see **SCLERA**. **2.** *adj.* affected with **\*sclerosis**.

**sclerotome** *n.* **1.** a surgical knife used in the operation of **\*sclerotomy**. **2.** (in embryology) the part of the segmented mesoderm (see **SOMITE**) in the early embryo that gives rise to all the skeletal tissue of the body. The vertebrae and ribs retain the segmented structure, which is lost in the skull and limbs.

**sclerotomy** *n.* an operation in which an incision is made in the sclera (white of the eye).

**scolex** *n.* (*pl.* scolices) the head of a **\*tapeworm**. The presence of suckers and/or hooks on the scolex enables the worm to attach itself to the wall of its host's gut.

**scoliosis** *n.* lateral (sideways) deviation of the backbone, caused by congenital or acquired abnormalities of the vertebrae, muscles, and nerves. Treatment may require spinal braces and, in cases of severe deformity, surgical correction by fusion or **\*osteotomy**. See also **KYPHOSIS**; **KYPHOSCOLIOSIS**.

**-scope** *combining form denoting* an instrument for observing or examining. Example: **gastroscope** (instrument for examining the stomach).

**ScopeGuide** *n.* Trademark. See **3-D MAGNETIC IMAGER**.

**scopolamine** *n.* see **HYOSCINE**.

**scorbutic** *adj.* affected with scurvy.

**scoring system** any of various methods in which the application of an agreed numerical scale is used as a means of estimating the degree of a clinical situation, e.g. the severity of an injury, the degree of patient recovery, or the extent of malignancy. Examples include the **\*Glasgow Coma Scale** (or scoring system) and the **\*injury scoring system**.

**scoto-** *combining form denoting* darkness.

**scotoma** *n.* (*pl.* scotomata) an area of abnormally less sensitive or absent vision in the visual field surrounded by normal sight, caused by abnormalities of the visual pathway. There is a normal physiological **\*blind spot** in the visual field of each eye due to the optic disc, which is not sensitive to light. Islands of total visual loss in other parts of the field are referred to as **absolute scotomata**. A **relative scotoma** is an area where the vision is decreased but still present.

**scotometer** *n.* an instrument used for mapping defects in the visual field. See also **PERIMETER**.

**scotopic** *adj.* relating to or describing conditions of poor illumination. For example, **scotopic vision** is vision in dim light in which the **\*rods** of the retina are involved (see **DARK ADAPTATION**).

**screening test** a test carried out on a large number of apparently healthy people to separate those who may have a specified disease and could benefit

from further testing from those who probably do not. Examples include newborn blood spot screening, cervical screening, and breast screening. The appropriateness of screening depends on the severity and *\*epidemiology* of the disease and the efficacy and availability of treatment. Other factors to be taken into account are the safety, acceptability, cost, *\*sensitivity*, and specificity of the test. No screening test is perfect, and all screening is associated with *\*false positives* and *\*false negatives*. *See also* GENETIC SCREENING; UK NATIONAL SCREENING.

**scrofula** *n.* *\*tuberculosis* of lymph nodes, usually those in the neck, causing the formation of abscesses. Untreated, these burst through the skin and form running sores, which leave scars when they heal. Treatment with antituberculous drugs is effective. The disease, which is now rare in the developed world, most commonly affects young children. —**scrofulous** *adj.*

**scrofuloderma** *n.* tuberculosis of the skin in which the skin breaks down over suppurating tuberculous glands, with the formation of irregular-shaped ulcers with blue-tinged edges. Treatment is with antituberculous drugs, to which scrofuloderma responds better than *\*lupus vulgaris*, another type of skin tuberculosis.

**scrototomy** *n.* an operation in which the scrotum is surgically explored, usually undertaken to investigate patients with probable obstructive *\*azoospermia*.

**scrotum** *n.* the paired sac that holds the testes and epididymides outside the abdominal cavity. Its function is to allow the production and storage of spermatozoa to occur at a lower temperature than that of the abdomen. Further temperature control is achieved by contraction or relaxation of muscles in the scrotum. —**scrotal** *adj.*

**scrub typhus (tsutsugamushi disease)** a disease, widely distributed in SE Asia, caused by the parasitic bacterium *Rickettsia tsutsugamushi* and transmitted to humans through the bite of mites. Only larval mites of the genus *\*Trombicula* are involved as vectors. Symptoms include headache, chills, high temperature (104°F), a red rash over most of the body, a cough, and delirium. A small ulcer forms at the site of the bite. Scrub typhus is treated with tetracycline and other broad-spectrum antibiotics. *See also* RICKETTSIAE; TYPHUS.

**scrum-pox** *n.* a form of **\*herpes** simplex found in rugby players and wrestlers. It is caused by abrasive contact.

**scruple** *n.* a unit of weight used in pharmacy. 1 scruple = 1.295 g (20 grains). 3 scruples = 1 drachm.

**SCUAD** *see* **SEVERE CHRONIC UPPER AIRWAY DISEASE**.

**scurvy** *n.* a disease that is caused by a deficiency of **\*vitamin C** (ascorbic acid). It results from a lack of fresh fruit and vegetables in the diet (unlike most animals, humans cannot synthesize ascorbic acid and must obtain it from food). The first sign of scurvy is swollen bleeding gums, and a rash of tiny bleeding spots around the hair follicles is characteristic. This may be followed by subcutaneous bleeding and the opening of previously healed wounds. Treatment is by administering vitamin C.

**SDB** *see* **SLEEP DISORDERED BREATHING**.

**seasickness** *n. see* **MOTION SICKNESS**.

**seasonal affective disorder** *see* **SAD**.

**seat-belt syndrome** thoracic injuries that arise from violent contact with a restraining seat belt in motor vehicle accidents occurring at high speeds.

**sebaceous cyst 1.** a pale or flesh-coloured dome-shaped cyst that commonly occurs in adults, especially on the face, neck, or trunk. It is firm, with a central dot, and contains keratin, not sebum; such cysts are therefore more correctly referred to as **epidermoid cysts**. They are usually removed surgically. **2.** a cyst of the sebaceous glands occurring in multiple form in a rare inherited condition, **steatocystoma multiplex**.

**sebaceous gland** any of the simple or branched glands in the **\*skin** that secrete an oily substance, **\*sebum**. They open into hair follicles and their secretion is produced by the disintegration of their cells. Some parts of the skin have many sebaceous glands, others few. Activity varies with age: the glands are most active at puberty.

**seborrhoea** *n.* excessive secretion of sebum by the **\*sebaceous glands**. The glands are enlarged, especially on the nose and central face. The condition predisposes to acne and is common at puberty, usually lasting for a few

years. Seborrhoea may be associated with a kind of *\*eczema* (seborrhoeic eczema). —**seborrhoeic** *adj.*

**sebum** *n.* the oily substance secreted by the *\*sebaceous glands* and reaching the skin surface through small ducts that lead into the hair follicles. Sebum provides a thin film of fat over the skin, which slows the evaporation of water; it also has an antibacterial effect.

**second** *n.* the *\*SI unit* of time, equal to the duration of 9,192,631,770 periods of the radiation corresponding to the transition between two hyperfine levels of the ground state of the caesium-133 atom. This unit is now the basis of all time measurements. Symbol: s.

**secondary care** health care provided by hospital clinicians for patients whose *\*primary care* was provided by the *\*general practitioner* or other health professional who first assessed, diagnosed, or treated the patient. Secondary care cannot be accessed directly by patients. For example, a general practitioner who assesses a patient with an unusual skin condition may refer the patient to a dermatologist, who then becomes the source of secondary care. *Compare* **TERTIARY CARE**.

**secondary prevention** the avoidance or alleviation of disease by early detection and appropriate management. Secondary prevention approaches include population *\*screening tests* that identify disease in asymptomatic people, enabling timely treatment; and *\*thrombolysis* in people who have had a heart attack (*\*myocardial infarction*) or ischaemic *\*stroke*. *See also* **PREVENTIVE MEDICINE**; **PRIMARY PREVENTION**; **TERTIARY PREVENTION**.

**secondary sexual characteristics** the physical characteristics that develop after puberty as a result of sexual maturation. In boys they include the growth of facial and pubic hair and the breaking of the voice. In girls they include the growth of pubic hair and the development of the breasts.

**second messenger** an organic molecule that acts within a cell to initiate the response to a signal carried by a chemical messenger (e.g. a hormone) that does not itself enter the cell. Examples of second messengers are *\*inositol triphosphate* and cyclic *\*AMP*.

**second-rank symptom** *see* SCHNEIDERIAN FIRST- AND SECOND-RANK SYMPTOMS.

**secretin** *n.* a hormone secreted from the small intestine (duodenum) when acidified food leaves the stomach. It stimulates the secretion of relatively enzyme-free alkaline juice by the pancreas (*see* PANCREATIC JUICE) and of bile by the liver.

**secretion** *n.* **1.** the process by which a gland isolates constituents of the blood or tissue fluid and chemically alters them to produce a substance that it discharges for use by the body or excretes. The principal methods of secretion – *\*apocrine*, *\*holocrine*, and *\*merocrine* – are illustrated in the diagram. **2.** the substance that is produced by a gland.

#### Methods of secretion.

**secretor** *n.* a person in whose saliva and other body fluids are found traces of the water-soluble A, B, or O agglutinogens that determine *\*blood group*.

**section 1.** *n.* (in surgery) the act of cutting (the cut or division made is also called a section). For example, an **abdominal section** is performed for surgical exploration of the abdomen (*see* LAPAROTOMY). A **transverse section** is a cut made at right angles to a structure's long axis. *See also* CAESAREAN SECTION. **2.** *n.* (in imaging) a three-dimensional reconstruction of body scans obtained by computerized tomography or magnetic resonance imaging. These are reconstituted as transverse, sagittal, and coronal plane

sections. **3.** *n.* (in microscopy) a thin slice of the specimen to be examined under a microscope. **4.** *vb.* (in psychiatry) to issue an order for the compulsory admission of a patient to a psychiatric hospital for assessment and/or treatment of a mental disorder under the appropriate provision or section of the *\*Mental Health Act* 1983 as amended by the Mental Health Act 2007. There are formal procedures, such as review and right to appeal, to ensure this legislation is not abused. A patient who otherwise has *\*capacity* may still consent to or refuse treatment for conditions unrelated to the mental disorder for which he or she is detained.

**section 30 order (parental order)** a court order made under the Human Fertilisation and Embryology Act 1990 that enables a married couple to be regarded as the legal parents of a child born to a *\*surrogate mother* commissioned by that couple. Application must be made within six months of the child's birth and the child's home must be with the husband and wife at the time of the application.

**section 47 removal** a section of the National Assistance Act 1948 that enables a local authority to arrange for the compulsory removal to a place of care of a person who is unwilling to go voluntarily from his or her own home. Individuals who are suffering from a grave chronic disease, or are physically incapacitated, or are living in insanitary conditions because of old age or infirmity can be removed if they are unable to care for themselves and do not receive care and attention from others. A public health consultant and another registered medical practitioner (usually the patient's general practitioner) must certify that removal is in the interests of the patient or that it would prevent injury to the health of, or serious nuisance to, other people.

**sedation** *n.* the production of a restful state of mind, particularly by the use of drugs (*see* *SEDATIVE*).

**sedative** *n.* a drug that has a calming effect, relieving anxiety and tension. Sedatives are *\*hypnotic* drugs administered at lower doses than those needed for sleep (drowsiness is a common side-effect). *See also* *ANXIOLYTIC*.

**sedimentation rate** the rate at which solid particles sink in a liquid under the influence of gravity. *See also* *ESR*.

**see-saw breathing** a pattern of breathing seen in complete (or almost complete) airway obstruction. As the patient attempts to breathe, the diaphragm descends, causing the abdomen to lift and the chest to sink. The reverse happens as the diaphragm relaxes. It is almost always associated with use of the *\*accessory muscles* of respiration and drawing in (recession) of the *\*intercostal muscles* of the chest wall.

**segment** *n.* (in anatomy) a portion of a tissue or organ, usually distinguishable from other portions by lines of demarcation. For example, the uterus consists of **upper** and **lower segments**. The **anterior segment** of the eye is the front portion, including the cornea, anterior chamber, iris, and lens. *See also* **SOMITE**.

**Seidel sign** **1.** a sickle-shaped *\*scotoma* appearing as an upward or downward extension of the blind spot. **2.** a test to confirm leakage of the aqueous humour. *\*Fluorescein sodium* dye is instilled and viewed with cobalt blue light; a bright green flow of liquid is seen at the site of the leakage. [E. Seidel (1882–1948), German ophthalmologist]

**Seip–Berardinelli syndrome** *see* **LIPODYSTROPHY**. [M. Seip (20th century), Scandinavian physician; W. Berardinelli (1903–56), Argentinian physician]

**Seldinger technique** a method for introducing a catheter into a blood vessel or cavity. First, a needle is used to puncture the structure, then a *\*guidewire* is passed through the needle. The needle is removed, and the catheter is introduced over the wire. The technique is used in angiography, cardiac catheterization, cannulation of large veins, and drainage of abscesses and other body cavities. [S. I. Seldinger (1921–98), Swedish radiologist]

**selective (o)estrogen receptor modulator** (SERM) a drug that has oestrogen-like activity in some tissues and an anti-oestrogenic effect in others, depending on the manner of its binding with the oestrogen receptors. *\*Tamoxifen* was the first SERM to be introduced. Because of its activity as an *\*anti-oestrogen* it is used in the treatment of breast cancer, but its oestrogenic activity may cause side-effects. *\*Raloxifene* is used in the treatment of osteoporosis for its oestrogenic effects on bone density.

**selective internal radiation therapy** *see* **RADIOEMBOLIZATION**.

**selective laser trabeculoplasty (SLT)** *see* TRABECULOPLASTY.

**selective serotonin and noradrenaline reuptake inhibitor** *see* SNRI.

**selegiline** *n.* an \*MAO inhibitor that inhibits \*monoamine oxidase B and is used in the treatment of Parkinson's disease. Selegiline is thought to retard the breakdown of \*dopamine. Possible side-effects include faintness on standing up, nausea, involuntary movements, and confusion.

**selenium** *n.* a \*trace element that is an essential component of the enzyme glutathione peroxidase, which catalyses the oxidation of \*glutathione by hydrogen peroxide. It thus has important \*antioxidant properties. The adult RNI (*see* DIETARY REFERENCE VALUES) is 60 µg/day for women and 70 µg/day for men. Dietary deficiency of selenium results in \*cardiomyopathy; vegetarians and vegans can be at risk of deficiency. Symbol: Se.

**selenium sulphide** a selenium compound with antifungal properties, used to treat \*dandruff and scalp infections.

**self-inflating bag** a device for delivering emergency artificial ventilation by means of a tight-fitting face mask, a \*laryngeal mask, or an endotracheal tube (*see* INTUBATION). It consists of a stiff plastic bag, which is squeezed to deliver its gas contents into the patient's airway; when the pressure is released, it is reinflated from the atmosphere or an attached oxygen supply. Flow into and out of the bag is controlled by a system of simple valves. With an attached oxygen supply, high concentrations of oxygen can be given.

**self-limiting** *adj.* describing a condition that runs a predicted course and is unaffected by any treatment.

**sella turcica** a depression in the body of the sphenoid bone that encloses the pituitary gland.

**semeiology** *n.* *see* SYMPTOMATOLOGY.

**semen (seminal fluid)** *n.* the fluid ejaculated from the penis at sexual climax. Each ejaculate may contain 300–500 million spermatozoa suspended in a fluid secreted by the \*prostate gland and \*seminal vesicles with a small contribution from \*Cowper's glands. It contains fructose, which provides the spermatozoa with energy, and \*prostaglandins, which affect the muscles of

the uterus and may therefore assist transport of the spermatozoa. —**seminal** *adj.*

**semi-** *prefix denoting half.*

**semicircular canals** three tubes that form part of the membranous **\*labyrinth** of the ear. They are concerned with balance and each canal registers movement in a different plane. At the base of each canal is a small swelling (an **ampulla**), which contains a **\*crista**. When the head moves the fluid (endolymph) in the canals presses on the cristae, which register the movement and send nerve impulses to the brain.

**semilunar cartilage** one of a pair of crescent-shaped cartilages in the knee joint situated between the femur and tibia.

**semilunar valve** either of the two valves in the heart situated at the origin of the aorta (*see* **AORTIC VALVE**) and the pulmonary artery (*see* **PULMONARY VALVE**). Each consists of three flaps (cusps), which maintain the flow of blood in one direction.

**seminal analysis** analysis of a specimen of semen, which should be obtained after five days of abstinence from coitus, in order to assess male fertility. Normal values are as follows: volume of ejaculate: 2–6.5 ml; liquefaction complete in 30 minutes; sperm concentration: 20–200 million spermatozoa per ml (**sperm count** refers to the total number of spermatozoa in the ejaculate); motility: 60% moving progressively at 30 minutes to 3 hours; abnormal forms: less than 20%. Analysis of three separate specimens is necessary before confirming the presence of an abnormal result.

**seminal vesicle** either of a pair of male accessory sex glands that open into the vas deferens before it joins the urethra. The seminal vesicles secrete most of the liquid component of **\*semen**.

**seminiferous tubule** any of the long convoluted tubules that make up the bulk of the **\*testis**.

**seminoma** *n.* a malignant tumour of the testis, appearing as a swelling, often painless, in the scrotum. It tends to occur in an older age group than the **\*teratomas**. The treatment for localized disease is surgery involving removal of the testis (*see* **ORCHIDECTOMY**). Secondary tumours in the lungs can be

treated with chemotherapy and radiotherapy to the draining lymph nodes. A similar tumour occurs in the ovary (see [DYSGERMINOMA](#)).

**semipermeable membrane** a membrane that allows the passage of some molecules but not others. Cell membranes (see [CELL](#)) are semipermeable. Semipermeable membranes are used clinically in [\\*haemodialysis](#) for patients with kidney failure.

**semiprone** *adj.* describing the position of a patient lying face downwards, but with one or both knees flexed to one side so that the body is not lying completely flat. *Compare* [PRONE](#); [SUPINE](#).

**Semont liberatory manoeuvre** a series of head and body movements used to move microscopic debris from the posterior [\\*semicircular canal](#) in the inner ear. It is used in the treatment of [\\*benign paroxysmal positional vertigo](#).

**SEN** *see* [SPECIAL EDUCATIONAL NEEDS](#).

**senescence** *n.* the process of ageing, which is often marked by a decrease in physical and mental abilities. — **senescent** *adj.*

**senile dementia** a [\\*dementia](#) of old age.

**senna** *n.* any of various preparations of the dried fruits of certain shrubs of the genus *Cassia*, used as a stimulant [\\*laxative](#) to relieve constipation. Side-effects do not usually occur, but severe diarrhoea may follow large doses.

**sensation** *n.* a feeling: the result of messages from the body's sensory receptors registering in the brain as information about the environment. Messages from [\\*exteroceptors](#) are interpreted as specific sensations – smell, taste, temperature, pain, etc. – in the conscious mind. Messages from [\\*interoceptors](#), however, rarely reach the consciousness to produce sensation.

**sense** *n.* one of the faculties by which the qualities of the external environment are appreciated – sight, hearing, smell, taste, or touch.

**sense organ** a collection of specialized cells ([\\*receptors](#)), connected to the nervous system, that is capable of responding to a particular stimulus from either outside or inside the body. Sense organs can detect light (the eyes), heat, pain, and touch (the skin), smell (the nose), and taste (the taste buds).

**sensibility** *n.* the ability to be affected by, and respond to, changes in the surroundings (see **STIMULUS**). Sensibility is a characteristic of cells of the nervous system.

**sensitive** *adj.* possessing the ability to respond to a **\*stimulus**. The cells of the retina, for example, are sensitive to the stimulus of light and respond by sending nerve impulses to the brain. Other **\*receptors** are sensitive to different specific stimuli, such as pressure or the presence of chemical substances.

**sensitivity** *n.* **1.** (in microbiology) the degree to which a disease-causing organism responds to treatment by **\*antibiotics** or other drugs. **2.** (in preventive medicine) a measure of the reliability of a **\*screening test** based on the proportion of people with a specific disease who react positively to the test (the higher the sensitivity the fewer **\*false negatives**). This contrasts with **specificity**, which is the proportion of people free from disease who react negatively to the test (i.e. the higher the specificity the fewer the **\*false positives**). Most screening tests operate such that if the sensitivity is increased the specificity is reduced and the proportion of false positives may rise to unacceptable proportions.

**sensitization** *n.* **1.** alteration of the responsiveness of the body to the presence of foreign substances. In the development of an **\*allergy**, an individual becomes sensitized to a particular allergen and reaches a state of hypersensitivity. The phenomena of sensitization are due to the production of antibodies. **2.** (in behaviour therapy) a form of **\*aversion therapy** in which anxiety-producing stimuli are associated with the unwanted behaviour. In **covert sensitization** the behaviour and an unpleasant feeling (such as disgust) are evoked simultaneously by verbal cues.

**sensory** *adj.* relating to the input division of the nervous system, which carries information from **\*receptors** throughout the body towards the brain and spinal cord.

**sensory cortex** the region of the **\*cerebral cortex** responsible for receiving incoming information relayed by sensory nerve pathways from all parts of the body. Different areas of cortex correspond to different parts of the body and to the various senses. Compare **MOTOR CORTEX**.

**sensory deprivation** a major reduction in incoming sensory information. The main input sensory channels are the eyes, ears, skin, and nose. If input from all of these is blocked, there is loss of the sense of reality, distortion of time and imagined space, hallucinations, bizarre thought patterns, and other indications of neurological dysfunction. Even minimal sensory deprivation in early childhood can have a serious effect on the personality.

**sensory nerve** a nerve that carries information inwards, from an outlying part of the body towards the central nervous system. Different sensory nerves convey information about temperature, pain, touch, taste, etc., to the brain. Compare **MOTOR NERVE**.

**sentinel lymph node** the first lymph node to show evidence of metastasis (spread) of a malignant tumour (e.g. breast cancer) via the lymphatic system. Absence of cancer cells in the sentinel node indicates that more distal lymph nodes will also be free of metastasis. In breast cancer, the change in practice to perform axillary lymph node dissection only if the sentinel node contains metastatic tumour has reduced the risk of arm lymphoedema. Similarly, in head and neck squamous cell carcinomas, the sentinel lymph node procedure is used as an alternative to neck dissection.

**separation anxiety** a state of distress and fear at the prospect of leaving familiar people (e.g. parents) and secure surroundings, such as is experienced by some children when they first go to school. It may be caused by insecure **\*attachment**.

**sepsis** *n.* the putrefactive destruction of tissues by disease-causing bacteria or their toxins. **Postpartum** (or **puerperal**) **sepsis**, characterized by **\*puerperal pyrexia** and other signs of serious infection (septic **\*shock**), occurs within six weeks of childbirth. Postpartum sepsis caused by group A  $\beta$ -haemolytic streptococci is an important cause of maternal death in the UK.

**sept- (septi-)** *combining form denoting* **1.** seven. **2. (septo-)** a septum, especially the nasal septum. **3.** sepsis.

**septal defect** a hole in the partition (septum) between the left and right halves of the heart. This abnormal communication is usually congenital due to an abnormality of heart development in the fetus, but can occasionally occur as a complication of **\*myocardial infarction**. It may be found between

the two atria (*see* [ATRIAL SEPTAL DEFECT](#)) or between the ventricles (*see* [VENTRICULAR SEPTAL DEFECT](#)). A septal defect permits abnormal circulation of blood from the left side of the heart, where pressures are higher, to the right. This abnormal circulation is called a **shunt** and results in excessive blood flow through the lungs. *\*Pulmonary hypertension* and *\*heart failure* may occur with large shunts. A heart *\*murmur* is normally present. Large defects are closed surgically or by using percutaneous catheter techniques (*see* [ATRIAL SEPTAL DEFECT](#)), but small defects do not require treatment.

**septate uterus** *see* [ARCUATE UTERUS](#).

**septic** *adj.* relating to or affected with *\*sepsis*.

**septicaemia** *n.* widespread destruction of tissues due to absorption of disease-causing bacteria or their toxins from the bloodstream. The term is also used loosely for any form of *\*blood poisoning*. *Compare* [PYAEMIA](#); [SAPRAEMIA](#); [TOXAEMIA](#).

**septic arthritis (pyogenic arthritis)** infection in a joint. The joint is swollen, hot, and tender, and movement causes severe pain. The infecting organism (usually *Staphylococcus aureus*) can enter the joint via the bloodstream, from an injection or penetrating injury, or by direct spread from an adjacent area of osteomyelitis. The condition is a surgical emergency as it can lead to rapid destruction of articular cartilage, loss of joint function, and septicaemia. Treatment is by *\*arthrotomy* or irrigation of the joint by arthroscopy, with appropriate antibiotic therapy.

**septic shock** *see* [SHOCK](#).

**septostomy** *n.* the creation of an opening in a dividing wall or membrane. For example, this procedure may be performed in cases of *\*twin-to-twin transfusion syndrome*. Using a fine needle, a small hole is made in the membrane dividing the twins to allow amniotic fluid to flow from one twin to the other, thus equalizing the amount of fluid between them.

**Septrin** *n.* *see* [CO-TRIMOXAZOLE](#).

**septum** *n.* (*pl.* septa) a partition or dividing wall within an anatomical structure. For example, the **atrioventricular septum** divides the atria of the heart from the ventricles. —**septal** *adj.* —**septate** *adj.*

**sequela** *n.* (*pl.* sequelae) any disorder or pathological condition that results from a preceding disease or accident.

**sequestration** *n.* **1.** the formation of a fragment of dead bone (*see* **SEQUESTRUM**) and its separation from the surrounding tissue. **2.** (in development) a separated part of an organ; a developmental anomaly.

**sequestrectomy** *n.* surgical removal of a **\*sequestrum**.

**sequestrum** *n.* (*pl.* sequestra) a portion of dead bone formed in an infected bone in chronic **\*osteomyelitis**. It is surrounded by an envelope (**involucrum**) of sclerotic bone and fibrous tissue and can be seen as a dense area within the bone on X-ray. It can cause irritation and the formation of pus, which may discharge through a **\*sinus**, and is usually surgically removed (**sequestrectomy**).

**ser- (sero-)** *combining form denoting* **1.** serum. **2.** serous membrane.

**serine** *n.* *see* **AMINO ACID**.

**SERM** *see* **SELECTIVE (O)ESTROGEN RECEPTOR MODULATOR**.

**seroconvert** *vb.* to produce specific antibodies in response to the presence of an antigen (e.g. a vaccine or a virus). In HIV-positive patients **seroconversion** occurs within about two weeks of the initial infection. It is marked by a sore throat, swollen lymph nodes, fever, aches and pains, and fatigue. *See* **AIDS**.

**serofibrinous** *adj.* describing an exudate of serum that contains a high proportion of the protein fibrin.

**serology** *n.* the study of blood serum and its constituents, particularly their contribution to the protection of the body against disease. *See* **AGGLUTINATION**; **COMPLEMENT FIXATION**; **PRECIPITIN**. —**serological** *adj.*

**sero-negative arthritis** an arthritis in which rheumatoid factor or anticitrullinated protein antibodies (ACPA) are not present in the serum. *See also* SPONDYLOARTHROPATHY.

**seropus** *n.* a mixture of serum and pus, which forms, for example, in infected blisters.

**serosa** *n.* *see* SEROUS MEMBRANE.

**serositis** *n.* inflammation of a \*serous membrane, such as the lining of the thoracic cavity (pleura). *See* POLYSEROSITIS.

**serotherapy** *n.* the use of serum containing known antibodies (*see* ANTISERUM) to treat a patient with an infection or to confer temporary passive \*immunity upon a person at special risk. The use of antisera prepared in animals carries its own risks (for example, a patient may become hypersensitive to horse protein); the risk is reduced if the serum is taken from an immune human being.

**serotonin (5-hydroxytryptamine)** *n.* a compound widely distributed in the tissues, particularly in the blood platelets, intestinal wall, and central nervous system. Serotonin is thought to play a role in inflammation similar to that of \*histamine and it is involved in the genesis of a migrainous headache. Drugs that act like serotonin are used in the treatment of migraine (*see* 5HT<sub>1</sub> AGONIST). It also acts as a \*neurotransmitter, and its levels in the brain are believed to have an important influence on mood. Drugs that prolong its effects are used as antidepressants (*see* SNRI; SSRI).

**serotype** *n.* a category into which material is placed based on its serological activity, particularly in terms of the antigens it contains or the antibodies that may be produced against it. Thus bacteria of the same species may be subdivided into serotypes that produce slightly different antigens. The serotype of an infective organism is important when treatment or prophylaxis with a vaccine is being considered.

**serous** *adj.* **1.** relating to or containing serum. **2.** resembling serum or producing a fluid resembling serum.

**serous membrane (serosa)** a smooth transparent membrane, consisting of **\*mesothelium** and underlying elastic fibrous connective tissue, lining certain large cavities of the body. The **\*peritoneum** of the abdomen, **\*pleura** of the chest, and **\*pericardium** of the heart are all serous membranes. Each consists of two portions: the **parietal** portion lines the walls of the cavity, and the **visceral** portion covers the organs concerned. The two are continuous, forming a closed sac with the organs essentially outside the sac. The inner surface of the sac is moistened by a thin fluid derived from blood serum, which allows frictionless movement of organs within their cavities. *Compare* **MUCOUS MEMBRANE**.

**serpiginous** *adj.* describing a creeping or extending skin lesion, especially one with a wavy edge.

**serratus** *n.* any of several muscles arising from or inserted by a series of processes that resemble the teeth of a saw. An example is the **serratus anterior**, a muscle situated between the ribs and shoulder blade in the upper and lateral parts of the thorax. It is the chief muscle responsible for pushing and punching movements.

**Sertoli cells** cells found in the walls of the seminiferous tubules of the **\*testis**. Compared with the germ cells they appear large and pale. They anchor and probably nourish the developing germ cells, especially the **\*spermatids**, which become partly embedded within them. A **Sertoli-cell tumour** is a rare testicular tumour causing **\*feminization**. [E. Sertoli (1842–1910), Italian histologist]

**sertraline** *n.* an antidepressant drug that acts by prolonging the action of the neurotransmitter serotonin (5-hydroxytryptamine) in the brain (*see* **SSRI**). It is taken for the treatment of depression, obsessive–compulsive disorder, and panic disorder; side-effects may include dizziness, agitation, tremor, nausea, diarrhoea, and drowsiness.

**serum (blood serum)** *n.* the fluid that separates from clotted blood or blood plasma that is allowed to stand. Serum is essentially similar in composition to **\*plasma** but lacks fibrinogen and other substances that are used in the coagulation process.

**serum hepatitis** *see* **HEPATITIS**.

**serum sickness** a reaction that sometimes occurs 7–12 days after injection of a quantity of foreign antigen and is characterized by the deposition of large immune complexes. Since the complexes are deposited in the arteries, kidneys, and joints, the symptoms are those of vasculitis, nephritis, and arthritis.

**sesamoid bone** an oval nodule of bone that lies within a tendon and slides over another bony surface. The patella (kneecap) and certain bones in the hand and foot are sesamoid bones.

**sessile** *adj.* (of a tumour) attached directly by its base without a peduncle (stalk).

**sestamibi parathyroid scan** (in **\*nuclear medicine**) a scan that can help to localize the site of a parathyroid adenoma before surgical removal, to treat primary **\*hyperparathyroidism**. The tracer is technetium-99m-labelled sestamibi (a small protein), which is selectively absorbed by overactive parathyroid glands.

**seton** *n.* a form of treatment in which a thread is passed through a **\*fistula** and tied in a loop. The seton acts as a wick to drain off pus and can be tightened to open the track. This method can be used to treat high anal fistulas because it has a reduced risk of causing incontinence.

**severe chronic upper airway disease (SCUAD)** severe **\*rhinitis** and **\*rhinosinusitis** that has not been fully controlled by optimal pharmacological treatment.

**severe combined immune deficiency (SCID)** a rare disorder that usually manifests itself within the first three months of life by severe bacterial, fungal, and viral infection and **\*failure to thrive**. It is due to reduced numbers of T and B **\*lymphocytes** – white blood cells necessary for fighting infection. Some cases are caused by **\*adenosine deaminase deficiency**. The only treatment currently available is a bone-marrow transplant, but **\*gene therapy** offers hope for the future.

**Sever's disease** **\*apophysitis** caused by pulling at the point of insertion of the Achilles tendon into the calcaneus (heel bone), causing heel pain. [J. W. Sever (20th century), US orthopaedic surgeon]

**sevoflurane** *n.* a rapid-acting general **\*anaesthetic** used for inducing and maintaining anaesthesia during surgery.

**sexarche** *n.* the age when a person first engages in sexual intercourse.

**sex chromatin** **\*chromatin** found only in female cells and believed to represent a single X chromosome in a nondividing cell. It can be used to discover the sex of a baby before birth by examination of cells obtained by **\*amniocentesis** or **\*chorionic villus sampling**. There are two main kinds: (1) the **Barr body**, a small object that stains with basic dyes, found on the edge of the nucleus just inside the nuclear membrane; (2) a drumstick-like appendage to the nucleus in neutrophils (a type of white blood cell).

**sex chromosome** a chromosome that is involved in the determination of the sex of the individual. Women have two **\*X chromosomes**; men have one X chromosome and one **\*Y chromosome**. *Compare* **AUTOSOME**.

**sex hormone** any steroid hormone, produced mainly by the ovaries or testes, that is responsible for controlling sexual development and reproductive function. **\*Oestrogens** and **\*progesterone** are the female sex hormones; **\*androgens** are the male sex hormones.

**sex-limited** *adj.* describing characteristics that are expressed differently in the two sexes but are controlled by genes not on the sex chromosomes, e.g. baldness in men.

**sex-linked** *adj.* describing genes (or the characteristics controlled by them) that are carried on the sex chromosomes, usually the **\*X chromosome**. The genes for certain disorders, such as **\*haemophilia**, are carried on the X chromosome; these genes and disorders are described as **X-linked**. Since most of these sex-linked genes are **\*recessive**, men are more likely to have the diseases since they have only one X chromosome; women can carry the genes but their harmful effects are usually masked by the dominant (normal) alleles on their second X chromosome.

**sexology** *n.* the study of sexual matters, including anatomy, physiology, behaviour, and techniques.

**sex ratio** the proportion of males to females in a population, usually expressed as the number of males per 100 females. The **primary sex ratio**, at

the time of fertilization, is in theory 50% male. The **secondary sex ratio**, found at birth, usually indicates slightly fewer girls than boys.

**sex reversal on Y (SRY)** *see* **Y CHROMOSOME**.

**sexual abuse** *see* **CHILD ABUSE**; **PAEDOPHILIA**.

**sexual deviation** any sexual behaviour regarded as abnormal by society. The deviation may relate to the sexual object (as in **\*fetishism**) or the activity engaged in (for example, **\*paedophilia**, sadism, and exhibitionism). The activity is sexually pleasurable.

The definition of what is normal varies with different cultures and over time, and treatment is appropriate only when the deviation causes suffering. For this reason the term **sexual variation** is now sometimes preferred. Some people may find that **\*counselling** helps them to adjust to their deviation. Others may wish for treatment to change the deviation: **\*aversion therapy** may be used, also **\*conditioning** normal sexual fantasies to pleasurable behaviour. The only helpful effect of drugs is to reduce sexual drive generally.

**sexually transmitted disease (STD)** any disease transmitted by sexual intercourse, formerly known as **venereal disease**. STDs include **\*AIDS**, **\*syphilis**, **\*gonorrhoea**, some **\*Chlamydia** infections, genital **\*herpes**, and **\*soft sore**. The medical specialty concerned with STDs is **genitourinary medicine**.

**Sézary syndrome** a form of **\*cutaneous T-cell lymphoma** manifested by generalized **\*erythroderma**, **\*lymphadenopathy**, and abnormal T lymphocytes (**Sezary cells**) in the blood, skin, and lymph nodes. [A. Sézary (1880–1956), French dermatologist]

**SGA** *see* **SMALL FOR GESTATIONAL AGE**.

**SGLT-2 inhibitors** a class of **\*oral hypoglycaemic drugs** for use in the treatment of type 2 diabetes mellitus. Sodium/glucose cotransporter 2 (SGLT-2) plays the largest role in glucose reabsorption in the kidney. Inhibition of SGLT-2 leads to an increase in the loss of glucose in the urine, a reduction in blood glucose levels, and a modest degree of weight loss over time due to

the increased calorie loss. Two drugs in this class are currently licensed for use in the UK: **dapagliflozin** (Forxiga) and **canagliflozin** (Invokana).

**SGOT** (serum glutamic oxaloacetic transaminase) *see* **ASPARTATE AMINOTRANSFERASE**.

**SGPT** (serum glutamic pyruvic transaminase) *see* **ALANINE AMINOTRANSFERASE**.

**shaking palsy** an archaic name for Parkinson's disease (*see* **PARKINSONISM**).

**shaping** *n.* a technique of **\*behaviour modification** used in the teaching of complex skills or in encouraging rare forms of behaviour. At first the therapist rewards actions that are similar to the desired behaviour; thereafter the therapist rewards successively closer approximations, until eventually only the desired behaviour is rewarded and thereby learned.

**shared delusion** *see* **FOLIE À DEUX**.

**S–H classification** *see* **SALTER–HARRIS CLASSIFICATION**.

**sheath** *n.* **1.** (in anatomy) the layer of connective tissue that envelops structures such as nerves, arteries, tendons, and muscles. **2.** a **\*condom**.

**Sheehan's syndrome** a condition in which **\*amenorrhoea** and infertility follow a major haemorrhage in pregnancy. It is caused by necrosis (death) of the anterior lobe of the pituitary gland as a direct result of the haemorrhage reducing the blood supply to the gland. *Compare* **ASHERMAN SYNDROME**. [H. L. Sheehan (20th century), British pathologist]

**sheltered housing** specially converted (or adapted) accommodation, designed to meet the special needs of people who are capable of a degree of self-care. A warden is generally in attendance. The extent to which meals and other services are provided on a continuous basis varies; so too in Britain does the per capita payment from the appropriate social service department.

**Sheridan–Gardiner test** a test for detecting visual impairment in children who are too young to be able to read the **\*Snellen chart**. A series of cards,

each marked with a single letter of a specific size, are held up at a distance of 6 metres from the child being tested. The child is provided with an identification card containing a selection of letters and is asked to point to the letter that is the same as the one on the card in the distance. The test is suitable for children between the ages of two and seven.

**Shigella** *n.* a genus of nonmotile rodlike Gram-negative bacteria normally present in the intestinal tract of warm-blooded animals. They ferment carbohydrates without the formation of gas. Some *Shigella* species are pathogenic. *S. dysenteriae* is associated with bacillary **\*dysentery**.

**shigellosis** *n.* an infestation of the digestive system by bacteria of the genus *Shigella*, causing bacillary **\*dysentery**.

**shingles** *n.* herpes zoster (*see* **HERPES**).

**shock** *n.* the condition associated with circulatory collapse, when the arterial blood pressure is too low to maintain an adequate supply of blood to the tissues. The patient has a cold sweaty pallid skin, a weak rapid pulse, irregular breathing, dry mouth, dilated pupils, a decreased level of consciousness, and a reduced flow of urine.

**Hypovolaemic shock** is due to a decrease in the volume of blood, as occurs after internal or external **\*haemorrhage**, burns, dehydration, or severe vomiting or diarrhoea. **Cardiogenic shock** results from reduced activity of the heart, as in coronary thrombosis, myocardial infarction, or pulmonary embolism. Shock may also be due to widespread dilatation of the blood vessels so that there is insufficient blood to fill them. This is the case in severe **\*sepsis** (**septic**, **bacteraemic**, or **toxic shock**), with a resultant systemic inflammatory response associated with **\*disseminated intravascular coagulation** and multiple organ failure. Vasodilatation may also be caused by a severe allergic reaction (**anaphylactic shock**: *see* **ANAPHYLAXIS**), overdosage with such drugs as opioids or barbiturates, or the emotional shock due to a personal tragedy or disaster (**neurogenic shock**). Sometimes shock may result from a combination of any of these causes, as in **\*peritonitis**. The treatment of shock is determined by the cause.

**short bowel syndrome** intestinal failure that occurs when the small bowel is shortened by surgery or trauma, resulting in reduced absorption of nutrients.

Some bowel adaptation does occur, but if under 200 cm of small bowel remain it is likely patients will need long-term *\*total parenteral nutrition*.

**short-sightedness** *n.* *see* *MYOPIA*.

**short-stretch bandage** a bandage that exerts low resting pressure. It is inelastic but can stretch by up to 60% of its original length and is used in the treatment of *\*lymphoedema* and venous leg ulcers.

**shoulder** *n.* the ball-and-socket joint (*see* *ENARTHROSIS*) between the glenoid cavity of the *\*scapula* and the upper end (head) of the humerus. It is a common site of dislocation. The joint is surrounded by a capsule closely associated with many tendons: it is the site of many strains and inflammations ('cuff injuries').

**shoulder dystocia** a difficult birth (*see* *DYSTOCIA*) in which the anterior or, less commonly, the posterior fetal shoulder impacts on the maternal symphysis or sacral promontory. It is an obstetric emergency and is diagnosed when the shoulders fail to deliver after the fetal head and when gentle downward traction has failed. Additional obstetric manoeuvres (e.g. *\*McRobert's manoeuvre*) are required to release the shoulders from below the pubic symphysis. It occurs in approximately 1% of vaginal births. There are well-recognized risk factors, such as maternal diabetes and obesity and fetal *\*macrosomia*. There can be a high *\*perinatal mortality rate* and morbidity associated with the condition; the most common fetal injuries are to the brachial plexus, causing an *\*Erb's palsy* or *\*Klumpke's paralysis*. Maternal morbidity is also increased, particularly *\*postpartum haemorrhage*.

**shoulder girdle (pectoral girdle)** the bony structure to which the bones of the upper limbs are attached. It consists of the right and left *\*scapulas* (**shoulder blades**) and clavicles (collar bones).

**shunt** *n.* a passage connecting two anatomical channels or sites, thus diverting blood or other fluid (e.g. cerebrospinal fluid) from one to the other. It may occur as a congenital abnormality (as in *\*septal defects* of the heart) or be surgically created; for example, a **ventriculoperitoneal shunt** is created to transfer excess cerebrospinal fluid in hydrocephalus from the ventricles to the peritoneum. *See also* *ANASTOMOSIS*.

**shunt nephritis** nephritis associated with infected indwelling shunts. The infection is usually with staphylococci (*S. epidermidis*) and patients present with anorexia, malaise, arthralgia, and low-grade fever. Purpura, anaemia, and hepatosplenomegaly may be found and urine analysis shows heavy proteinuria, often with a **\*nephrotic syndrome** and haematuria. Treatment usually involves removal of the infected shunt as well as antibiotics.

**SIADH** *see* **SYNDROME OF INAPPROPRIATE SECRETION OF ANTIDIURETIC HORMONE**.

**sial-** (**sialo-**) *combining form denoting* **1.** saliva. **2.** a salivary gland.

**sialadenitis** *n.* inflammation of a salivary gland.

**sialagogue** *n.* a drug that promotes the secretion of saliva. **\*Parasympathomimetic** drugs have this action.

**sialendoscopy** *n.* examination of the inside of the ducts of the salivary glands by means of a small fiberoptic endoscope. It is used in the diagnosis and treatment of **\*sialoliths** (salivary gland stones).

**sialic acid** an amino sugar. Sialic acid is a component of some **\*glycoproteins**, **\*gangliosides**, and bacterial cell walls.

**sialography** *n.* a technique for X-ray examination of the salivary glands. A series of X-ray images is taken after introducing contrast medium through a cannula into the ducts of the **\*parotid** or **\*submandibular glands** in the mouth. It enables the presence of degenerative disease or stones blocking the ducts to be detected.

**sialolith** *n.* a stone (calculus) in a salivary gland or duct, most often the duct of the submandibular gland. The flow of saliva is obstructed, causing swelling and intense pain. Treatment is primarily by surgery to remove the stone or the whole gland but in a few cases **\*lithotripsy** is used.

**sialorrhoea** *n. see* **PTYALISM**.

**Siamese twins** *see* **CONJOINED TWINS**.

**sib** *n. see* **SIBLING**.

**sibilant** *adj.* whistling or hissing. The term is applied to certain high-pitched abnormal sounds heard through a stethoscope.

**sibling (sib)** *n.* one of a number of children of the same parents, i.e. a brother or sister.

**sickle-cell disease (drepanocytosis)** a hereditary blood disease that mainly affects people of African ancestry but also occurs in the Mediterranean region and reaches high frequencies in parts of Saudi Arabia and India. It occurs when the sickle-cell gene has been inherited from both parents and is characterized by the production of an abnormal type of **\*haemoglobin – sickle-cell haemoglobin (Hbs)** – which precipitates in the red cells when the blood is deprived of oxygen, forming crystals that distort the cells into the characteristic sickle shape: this process is known as **sickling**. An excess of sickle cells in the circulation results in blockage of small blood vessels, producing episodes of severe pain (a **sickle-cell crisis**). Sickle cells are rapidly removed from the circulation, leading to anaemia and jaundice. There is no satisfactory treatment; the highest mortality is in childhood but some patients may live to an age of 60–70 years.

The carrier condition (**sickle-cell trait**) occurs when the defective gene is inherited from only one parent. It generally causes no symptoms but confers some protection from malaria, which accounts for the high frequency of the gene in malarious areas. If a general anaesthetic is to be given to a patient with this condition, the anaesthetist should be alerted.

**sickle-cell nephropathy** progressive renal disease developing in 5–8% of patients with **\*sickle-cell disease**. Infarcts in the cortex can occur with sickle-cell crises and present with pain and haematuria. Acute or more insidious damage to the medulla will lead to a urinary concentrating defect and later to papillary necrosis and/or fibrosis. Occlusion of vessels within the glomerular capillary tuft leads to a secondary form of **\*focal segmental glomerulosclerosis** and can present with the **\*nephrotic syndrome**.

**SIDE** *see* **COFFIN–LOWRY SYNDROME**.

**side-effect** *n.* an effect produced by a drug in addition to its desired therapeutic effects. **Adverse effects** are often undesirable and may be harmful.

**sidero-** *combining form denoting iron.*

**sideroblast** *n.* a red blood cell precursor (*see* **ERYTHROBLAST**) in which iron-containing granules can be demonstrated by suitable staining techniques. Sideroblasts may be seen in normal individuals and are absent in iron deficiency. A certain type of anaemia (**sideroblastic anaemia**) is characterized by the presence of abnormal **ringed sideroblasts**. — **sideroblastic** *adj.*

**siderocyte** *n.* a red blood cell in which granules of iron-containing protein (**Pappenheimer bodies**) can be demonstrated by suitable staining techniques. These granules are normally removed by the spleen and siderocytes are characteristically seen when the spleen is absent.

**sideropenia** *n.* iron deficiency. This may result from dietary inadequacy; increased requirement of iron by the body, as in pregnancy or childhood; or increased loss of iron from the body, usually due to chronic bleeding. The most important manifestation of iron deficiency is **\*anaemia**, which is readily corrected by iron therapy.

**siderosis** *n.* the deposition of iron oxide dust in the lungs, occurring in silver finishers, arc welders, and haematite miners. Iron oxide itself is inert, but pulmonary **\*fibrosis** may develop if fibrogenic dusts such as silica are also inhaled.

**SIDS** *see* **SUDDEN INFANT DEATH SYNDROME**.

**siemens** *n.* the **\*SI unit** of electrical conductance, equal to the conductance between two points on a conductor when a potential difference of 1 volt between these points causes a current of 1 ampere to flow between them. Symbol: S.

**sievert** *n.* the **\*SI unit** of dose equivalent, being the dose equivalent when the absorbed dose of ionizing radiation multiplied by the stipulated dimensionless factors is  $1 \text{ J kg}^{-1}$ . As different types of radiation cause different effects in biological tissue a weighted absorbed dose, called the dose equivalent, is used in which the absorbed dose is modified by multiplying it by dimensionless factors stipulated by the International Commission on Radiological Protection. The sievert has replaced the **\*rem**. Symbol: Sv.

**sigmoid-** *combining form denoting the sigmoid colon.* Example: **sigmoidotomy** (incision into).

**sigmoid colon (sigmoid flexure)** the S-shaped terminal part of the descending **\*colon**, which leads to the rectum.

**sigmoid colectomy (sigmoidectomy)** surgical removal of the sigmoid colon using either an open approach (see **LAPAROTOMY**) or **\*laparoscopy**. It is performed for tumours, severe **\*diverticular disease**, or for an abnormally long sigmoid colon that has become twisted (see **VOLVULUS**).

**sigmoidoscope** *n.* see **SIGMOIDOSCOPY**.

**sigmoidoscopy** *n.* an examination of the rectum and sigmoid colon with a device (**sigmoidoscope**) inserted through the anus. Sigmoidoscopy can be used to identify the causes of diarrhoea and rectal bleeding, such as colitis or cancer. There are two main types of sigmoidoscopy. **Rigid sigmoidoscopy** utilizes a rigid sigmoidoscope, approximately 30 cm in length, to assess for anorectal disease. It can be readily performed in an outpatient clinic. The second type is **flexible sigmoidoscopy**, which is more commonly used and utilizes a flexible endoscope to assess the rectum, sigmoid colon, and descending colon up to the splenic flexure.

**sign** *n.* an indication of a particular disorder that is detected by a physician while examining a patient but is not apparent to the patient. *Compare* **SYMPTOM**.

**significance** *n.* (in statistics) the degree to which an observed relationship between two test groups is unlikely to have occurred by chance alone. An initial assumption is made that there is no meaningful difference between the groups or conditions under investigation (the **null hypothesis**). This can be tested using various statistical procedures, and a calculation that there is a **probability** of less than 5% (**P value** <0.05) is usually considered sufficient to reject the null hypothesis: the observed difference is **statistically significant**. Some tests are **parametric**, based on the assumption that observations will be distributed in a **normal** or **Gaussian** **\*distribution**, where 95% of observations lie within two **\*standard deviations** of the mean (**Student's t test** to compare means). Nonparametric tests (**Mann–Whitney**

U tests) make no assumptions about distribution patterns. *See also* [STANDARD ERROR OF THE MEAN](#).

**sign language (signed language)** a form of communication that uses movements of the hands and other parts of the body together with facial expressions instead of sound. There are many different forms of sign language throughout the world. British Sign Language (BSL) is the form most commonly used in Great Britain. In Northern Ireland, Northern Irish Sign Language (NISL), BSL, and Irish Sign Language (ISL; the most common form in Ireland) are all used.

**sign of Dance (Dance's sign, signe de Dance)** a feeling of emptiness on palpation of the right lower quadrant of the abdomen, which is thought to be characteristic of [\\*intussusception](#). [J. B. H. Dance (1797–1832), French physician]

**sildenafil** *n.* a drug administered orally for the treatment of erectile dysfunction. By inhibiting the action of the enzyme phosphodiesterase type 5, it elevates local [\\*nitric oxide](#) levels, causing smooth muscle relaxation and increased blood flow to the corpus cavernosum of the penis, which results in erection during sexual stimulation. Sildenafil is also licensed for the treatment of pulmonary hypertension. Side-effects include headache, facial flushing, dyspepsia, nasal congestion, and dizziness. Because of severe adverse reactions, the drug is contraindicated in patients taking nitrate-based drugs, such as [\\*glyceryl trinitrate](#). **Tadalafil** and **vardenafil** are drugs with similar actions and effects.

**silicosis** *n.* a lung disease – a form of [\\*pneumoconiosis](#) – produced by inhaling silica dust particles. It affects workers in hard-rock mining and tunnelling, quarrying, stone dressing, sand blasting, and boiler scaling. Silica stimulates [\\*fibrosis](#) of lung tissue, which produces progressive breathlessness and considerably increased susceptibility to tuberculosis.

**silver nitrate** a salt of silver with [\\*astringent](#), [\\*caustic](#), and [\\*disinfectant](#) properties. It is used to destroy warts and umbilical granulomas.

**Silver–Russell syndrome** *see* [RUSSELL–SILVER SYNDROME](#).

**simeticone (activated dimeticone)** *n.* a silicone-based material with antifoaming properties, used in the treatment of infantile colic and also

incorporated into antacid remedies.

**Simmonds disease** loss of sexual function, loss of weight, and other features of failure of the pituitary gland (**\*hypopituitarism**) caused by trauma or tumours or occurring in women after childbirth complicated by bleeding (postpartum haemorrhage). [M. Simmonds (1885–1925), German physician]

**Sims's position** the left-sided knees-up position commonly assumed by patients undergoing examinations of the anus and rectum or vagina. [J. M. Sims (1813–83), US gynaecologist]

**simulator** *n.* an X-ray device used in radiotherapy to localize accurately the exact position of the radiation fields before treatment begins.

**Simulium** *n.* *see* **BLACK FLY**.

**simultanagnosia** *n.* impairment of the ability to perceive or focus on more than one element of a complex visual stimulus at a time, resulting in inability to understand the overall meaning of a situation or scene. This may result from trauma or a stroke at the junction of the occipital and parietal lobes.

**simvastatin** *n.* a drug used to reduce abnormally high levels of cholesterol in the blood (*see* **STATIN**). Its actions and side-effects are similar to those of **\*atorvastatin**.

**Sinemet** *n.* *see* **LEVODOPA**.

**sinew** *n.* a tendon.

**singer's nodule** a pearly white nodule that may develop on the vocal folds of people who use their voice excessively or in those with poor vocal technique.

**single-payer system** a type of health-care system in which there is only one purchaser of health-care services, usually the government. The NHS is a single-payer system.

**single photon emission computed tomography** *see* **SPECT SCANNING**.

**singular nerve** a small subdivision of the **\*vestibular nerve** that carries information from the posterior **\*semicircular canal** to the brain. **Singular**

**neurectomy** is a surgical procedure to divide the singular nerve, occasionally used in the treatment of *\*benign paroxysmal positional vertigo*.

**singultus** *n. see HICCUP.*

**sinistr- (sinistro-)** *combining form denoting left or the left side.*

**sino- (sinu-)** *combining form denoting 1. a sinus. 2. the sinus venosus.*

**sinoatrial node (SA node)** the pacemaker of the heart: a microscopic area of specialized cardiac muscle located in the upper wall of the right atrium near the entry of the vena cava. Fibres of the SA node are self-excitatory, contracting rhythmically at around 70 times per minute. Following each contraction, the impulse spreads throughout the atrial muscle and into fibres connecting the SA node with the *\*atrioventricular node*. The SA node is supplied by fibres of the autonomic nervous system; impulses arriving at the node accelerate or decrease the heart rate.

**sinuplasty** *n. see BALLOON SINUPLASTY.*

**sinus** *n. 1. an air cavity within a bone, especially any of the cavities within the bones of the face or skull (see PARANASAL SINUSES). 2. any wide channel containing blood, usually venous blood. Venous sinuses occur, for example, in the dura mater and drain blood from the brain. 3. a pocket or bulge in a tubular organ, especially a blood vessel; for example, the \*carotid sinus. 4. (sinus tract) an infected blind-ending epithelium-lined tract leading from a focus of infection to the surface of the skin or a hollow organ. See PILONIDAL SINUS.*

**sinus arrhythmia** a normal variation in the heart rate, which accelerates slightly on inspiration and slows on expiration. It is common in young fit individuals.

**sinusitis** *n. inflammation of one or more of the mucous-membrane-lined air spaces in the facial bones that communicate with the nose (the paranasal sinuses). It is often associated with inflammation of the nasal lining (\*rhinitis) and may be acute or chronic (see RHINOSINUSITIS). Symptoms may include pain, purulent discharge from the nose, nasal obstruction, and disturbances of the sense of smell. Many cases are self-limiting. Others require treatment with antibiotics, decongestants, or steroid nose drops. A*

few cases need surgery, such as sinus washouts, [\\*antroscopy](#), or functional [\\*endoscopic sinus surgery](#) (FESS).

**sinusoid** *n.* a small blood vessel found in certain organs, such as the adrenal gland and liver. Large numbers of sinusoids occur in the liver. They receive oxygen-rich blood from the hepatic artery and nutrients from the intestines via the portal vein. Oxygen and nutrients diffuse through the capillary walls into the liver cells. The sinusoids are drained by the hepatic veins. *See also* [PORTAL SYSTEM](#).

**sinus rhythm** a normal heart rhythm, usually as recorded on an electrocardiogram. The [\\*sinoatrial node](#), located in the right atrium, normally functions as the natural pacemaker for the heart.

**sinus venosus** a chamber of the embryonic heart that receives blood from several veins. In the adult heart it becomes part of the right atrium.

**siphonage** *n.* the transfer of liquid from one container to another by means of a bent tube. The procedure is used in gastric [\\*lavage](#), when the stomach is filled with water through a funnel and rubber tube, and the tube is then bent downwards to act as a siphon and empty the stomach of its contents.

**Siphunculina** *n.* a genus of flies. *S. funicola*, the eye fly of India, feeds on the secretions of the tear glands and in landing on or near the eyes contributes to the spread of [\\*conjunctivitis](#).

**Sipple's syndrome** *see* [MENS](#). [J. H. Sipple (1930– ), US physician]

**sirenomelia (mermaid syndrome, symmelia, sympodia)** *n.* a rare and fatal developmental abnormality in which the legs are fused, the kidneys fail to develop, and the sacrum, bladder, and rectum are absent.

**sirolimus (rapamycin)** *n.* an immunosuppressant drug used to prevent rejection in kidney transplantation. Sirolimus was first discovered as a product of the bacterium *Streptomyces hygroscopicus* in a soil sample from Rapa Nui (the Polynesian name for Easter Island), hence the alternative name. It blocks the activation of B and T lymphocytes by [\\*interleukin 2](#) (IL-2).

**SIRT** selective internal radiation therapy: *see* [RADIOEMBOLIZATION](#).

**Sister Mary Joseph nodule** a metastatic tumour nodule in the umbilicus that originates from a tumour in the pelvis or abdomen, particularly ovarian and stomach cancer. [Sister Mary Joseph Dempsey (1856–1939), US nurse]

**sitagliptin** *n.* *see* **DPP-IV INHIBITORS**.

**sito-** *combining form denoting* food.

**sitz bath** a hip bath in which the person is seated so that water or saline solution soaks only the hips and buttocks. Sitz baths are used to treat haemorrhoids and anal fissures (among other conditions).

**SI units (Système International d'Unités)** the internationally agreed system of units now in use for all scientific purposes. Based on the metre-kilogram-second system, SI units have seven base units and two supplementary units. Measurements of all other physical quantities are expressed in derived units, consisting of two or more base units. **Tables 1.1** and **1.2** (Appendix 1) list the base units and the derived units having special names; all these units are defined in the dictionary.

Decimal multiples of SI units are expressed using specified prefixes; where possible a prefix representing 10 raised to a power that is a multiple of three should be used. Prefixes are listed in **Table 1.3** (Appendix 1).

**six-category intervention analysis** a framework for exploring how care is delivered, based on the idea that there are six main styles of interaction (prescriptive, informative, confronting, cathartic, catalytic, and supportive). The analysis is widely used to help health-care professionals develop an understanding of interpersonal relationships, reflect on their own practice, and enhance their interactions with clients.

**Sjögren's syndrome** an autoimmune condition affecting the salivary and lacrimal glands, resulting in a **\*dry mouth** and dryness of the eyes. In the systemic form of the disease other glands may be affected, causing dryness of the airways, vagina, or skin, as well as the joints (producing a relatively mild form of arthritis) and muscles (which ache), and there may be tiredness and lethargy. Sjögren's syndrome may also occur secondarily to other conditions (e.g. rheumatoid arthritis). Symptomatic treatment, including saliva and tear substitutes, is available. Patients are susceptible to dental caries. [H. S. C. Sjögren (1899–1986), Swedish ophthalmologist]

**skatole (methyl indole)** *n.* a derivative of the amino acid tryptophan, excreted in the urine and faeces.

**skeletal muscle** *see* **STRIATED MUSCLE**.

**skeleton** *n.* the rigid framework of connected **\*bones** that gives form to the body, protects and supports its soft organs and tissues, and provides attachments for muscles and a system of levers essential for locomotion. The 206 named bones of the body are organized into the **axial skeleton** (of the head and trunk) and the **appendicular skeleton** (of the limbs). See illustration overleaf. —**skeletal** *adj.*

**The skeleton.**

**skew deviation** a neurological condition of the eyes in which one eye turns down while the other turns up. It is seen in disorders of the **\*cerebellum** or **\*brainstem**.

**skia-** *combining form denoting shadow.*

**skier's thumb (gamekeeper's thumb)** an injury to the ulnar collateral ligament of the thumb, caused by forced abduction across the metacarpophalangeal joint, at the base of the thumb. Treatment is by splintage or, in the case of severe injuries, by surgical repair of the torn ligament ends.

**skin** *n.* the outer covering of the body, consisting of an outer layer, the **\*epidermis**, and an inner layer, the **\*dermis** (see illustration overleaf). Beneath the dermis is a layer of fatty tissue. The skin has several functions. The epidermis protects the body from injury and also from invasion by parasites. It also helps to prevent the body from becoming dehydrated. The combination of erectile hairs, **\*sweat glands**, and blood capillaries in the skin form part of the temperature-regulating mechanism of the body. When the body is too hot, loss of heat is increased by sweating and by the dilation of the capillaries. When the body is too cold the sweat glands are inactive, the capillaries contract, and a layer of air is trapped over the epidermis by the erected hairs. The skin also acts as an organ of excretion (by the secretion of **\*sweat**) and as a sense organ (it contains receptors that are sensitive to heat, cold, touch, and pain). The layer of fat that lies underneath the dermis can act as a reservoir of food and water. Anatomical name: **cutis**.

**Section through the skin.**

**skin graft** a portion of healthy skin cut from one area of the body and used to cover a part that has lost its skin, usually as a result of injury, burns, or operation. A skin graft is normally taken from another part of the body of the same patient (an **\*autograft**), but occasionally skin may be grafted from one person to another as a temporary healing measure (an **\*allograft**). The full thickness of skin may be taken for a graft (*see* **FLAP**) or the surgeon may use three-quarters thickness, thin sheets of skin (*see* **SPLIT-SKIN GRAFT**), or a pinch skin graft. The type used depends on the condition and size of the damaged area. The skin graft may be free or attached by a **\*pedicle**.

**ski-stick injury** a penetrating injury by a ski stick.

**skull** *n.* the skeleton of the head and face, which is made up of 22 bones. It can be divided into the cranium, which encloses the brain, and the face (including the lower jaw (mandible)). The **cranium** consists of eight bones. The frontal, parietals (two), occipital, and temporals (two) form the vault of the skull (**calvaria**) and are made up of two thin layers of compact bone separated by a layer of spongy bone (**diploë**). The remaining bones of the cranium – the sphenoid and ethmoid – form part of its base. The 14 bones that make up the face are the nasals, lacrimals, inferior nasal conchae, maxillae, zygomatics, and palatines (two of each), the vomer, and the mandible. All the bones of the skull except the mandible are connected to each other by immovable joints (*see* **SUTURE**). The skull contains cavities for the eyes (*see* **ORBIT**) and nose (*see* **NASAL CAVITY**) and a large opening at its base (**foramen magnum**) through which the spinal cord passes. See illustration overleaf.

**The skull bones (side view).**

**slapped cheek syndrome** *see* **ERYTHEMA**.

**SLE** systemic lupus erythematosus. *See* **LUPUS ERYTHEMATOSUS**.

**sleep** *n.* a state of natural unconsciousness, during which the brain's activity is not apparent (apart from the continued maintenance of basic bodily

functions, such as breathing) but can be detected by means of an electroencephalogram (EEG). Different stages of sleep are recognized by different EEG wave patterns. Drowsiness is marked by short irregular waves; as sleep deepens the waves become slower, larger, and more irregular. This slow-wave sleep is periodically interrupted by episodes of paradoxical, or **\*REM** (rapid-eye-movement), sleep, when the EEG pattern is similar to that of an awake and alert person. Dreaming occurs during REM sleep. The two states of sleep alternate in cycles of from 30 to 90 minutes, REM sleep constituting about a quarter of the total sleeping time.

**sleep apnoea** cessation of breathing during sleep, which may be **obstructive**, due to frustrated efforts to breathe against blocked upper airways (see **OBSTRUCTIVE SLEEP APNOEA**), or **central**, in which there is no evidence of any voluntary effort.

**sleep apnoea syndrome (SAS)** see **OBSTRUCTIVE SLEEP APNOEA**.

**sleep disordered breathing (SDB)** abnormal patterns of respiration seen during sleep. **\*Obstructive sleep apnoea** is the most common SDB; other types include central **\*sleep apnoea**, such as **\*Cheyne–Stokes respiration**.

**sleeping sickness (African trypanosomiasis)** a disease of tropical Africa caused by the presence in the blood of the parasitic protozoans **\*Trypanosoma gambiense** or *T. rhodesiense*. The parasites are transmitted through the bite of **\*tsetse** flies. Initial symptoms include fever, headache, and chills, followed later by enlargement of the lymph nodes, anaemia, and pains in the limbs and joints. After a period of several months or even years, the parasites invade the minute blood vessels supplying the central nervous system. This causes drowsiness and lethargy, and ultimately – if untreated – the patient dies. Rhodesian sleeping sickness is the more virulent form of the disease. Drugs used to treat the acute stage of the disease include eflornithine, pentamidine, and suramin; melarsoprol (a drug containing arsenic) is used after the brain is affected. Eradication of tsetse flies helps prevent spread of the infection.

**sleep paralysis** a terrifying inability to move or speak while remaining fully alert. It occurs in up to 60% of patients with **\*narcolepsy** and may occur in other conditions, such as severe anxiety.

**sleep-walking** *n.* *see* [SOMNAMBULISM](#).

**sling** *n.* a bandage arranged to support and rest an injured limb so that healing is not hindered by activity. The most common sling is a [\\*triangular bandage](#) tied behind the neck to support the weight of a broken arm. The arm is bent at the elbow and held across the body.

**sling procedure** any of a group of surgical procedures for treating stress incontinence in women. *See* [COLPOSUSPENSION](#); [PUBOVAGINAL SLING](#); [TENSION-FREE VAGINAL TAPE](#).

**slipped capital femoral epiphysis** a condition that occurs when the upper (capital) epiphysis of the femur slips in relation to the rest of the femur. It most commonly affects older teenage boys who are overweight. The main symptoms are pain in the hip or knee and limping gait. It can be diagnosed on X-ray. Treatment usually involves surgery to stabilize the epiphysis.

**slipped disc** a colloquial term for a herniated intervertebral disc (*see* [PROLAPSED INTERVERTEBRAL DISC](#)).

**slippery slope argument** the claim that a relatively innocuous or small first step will result in seriously harmful or otherwise undesirable consequences that will be difficult, if not impossible, to prevent. When or whether such slippery slopes exist is much argued over in medical ethics, especially in debates about [\\*euthanasia](#). *See also* [CONSEQUENTIALISM](#).

**slit lamp** a device for providing a narrow beam of light, used in conjunction with a special microscope. It can be used to examine minutely the structures within the eye, one layer at a time.

**slough** *n.* dead tissue, such as skin, that separates from healthy tissue after inflammation or infection.

**slow virus** one of a group of infective disease agents that resemble [\\*viruses](#) in some of their biological properties but whose physical properties (e.g. sensitivity to radiation) suggest that they may not contain nucleic acid. They are now more commonly known as [\\*prions](#).

**SLT** selective laser [\\*trabeculoplasty](#).

**SMA** *see* **SPINAL MUSCULAR ATROPHY**.

**small-bowel enema (enteroclysis)** a radiological technique for examining the jejunum and ileum by passing a tube through the nose, oesophagus, and stomach into the small bowel and directly injecting **\*barium sulphate**. Images are captured in real time as the contrast moves through the small bowel. It produces highly detailed images of the small bowel, making it particularly useful for investigating coeliac disease and Crohn's disease, as well as strictures, tumours, and obstructions. It can be combined with X-ray imaging, CT, or MRI.

**small-bowel meal (barium follow-through)** a technique for examining the small bowel, often used when small-bowel enema is not tolerated. The patient swallows dilute **\*barium sulphate** suspension and then a series of abdominal radiographs are taken. A complete examination occurs when contrast reaches the first part of the large bowel (caecum). This technique is particularly useful for investigating small-bowel **\*Crohn's disease**.

**small-cell lung cancer (SCLC)** a type of bronchial carcinoma characterized by **small cells** (or **oat cells**), small round or oval cells with darkly staining nuclei and scanty indistinct cytoplasm. Small-cell carcinoma is usually related to smoking and accounts for about one-quarter of bronchial carcinomas; it carries a poor prognosis due to early distant spread, typically to bones, liver, and brain. Treatment is primarily with chemotherapy and radiotherapy and paraneoplastic symptoms (*see* **PARANEOPLASTIC SYNDROME**) from **\*ectopic hormone** production are common. *Compare* **NON-SMALL-CELL LUNG CANCER**.

**small for gestational age (SGA)** describing a fetus or baby that has failed to reach the size or birth weight expected for its gestational age. This may be because the fetus or baby is constitutionally small or it may be due to **\*intrauterine growth restriction** in the fetus. In the latter case, the perinatal outcome is less favourable.

**small intestinal bacterial overgrowth** colonization of the small intestine with excessive concentrations of bacteria. Patients experience nausea, bloating, abdominal pain, diarrhoea, and symptoms of **\*malabsorption**. Diagnosis is made by identifying bacteria in cultures of small bowel aspirates obtained during endoscopy or by glucose hydrogen breath testing,

in which a high concentration of hydrogen in the breath after swallowing glucose indicates bacterial overgrowth. Risk factors include previous abdominal surgery, motility disorders (such as systemic sclerosis), anatomical disruption (such as diverticula, strictures, adhesions, or fistulae), diabetes mellitus, coeliac disease, and Crohn's disease. Management involves treatment of the underlying condition, nutritional support, and cyclical antibiotics.

**smallpox** *n.* an acute infectious virus disease causing high fever and a rash that scars the skin. It is transmitted chiefly by direct contact with a patient. Symptoms commence 8–18 days after exposure and include headache, backache, high fever, and vomiting. On the third day, as the fever subsides, red spots appear on the face and spread to the trunk and extremities. Over the next 8–9 days all the spots (macules) change to pimples (papules), then to pea-sized blisters that are at first watery (vesicles) but soon become pus-filled (pustules). The fever returns, often causing delirium. On the eleventh or twelfth day the rash and fever abate. Scabs formed by drying out of pustules fall off 7–20 days later, leaving permanent scars. The patient remains infectious until all scabs have been shed. Most patients recover but serious complications, such as nephritis or pneumonia, may develop. Treatment with thiosemicarbazone is effective. An attack usually confers immunity; immunization against smallpox has now totally eradicated the disease. Medical name: **variola**. *See also* [ALASTRIM](#); [COWPOX](#).

**smear** *n.* a specimen of tissue or other material taken from part of the body and smeared on a microscope slide for examination. *See* [CERVICAL SMEAR](#).

**smear layer** a layer of microcrystalline and organic particle debris that remains on the hard tissues of the teeth whenever they are cut. It may be important in assisting or preventing the penetration of bacteria into the dentinal tubules. The success of root canal treatment depends on the complete removal of the smear layer with a [\\*chelating agent](#) such as EDTA, but its presence may be useful in restorative dentistry.

**smegma** *n.* the secretion of the glands of the foreskin ([\\*prepuce](#)), which accumulates under the foreskin and has a white cheesy appearance. It becomes readily infested by a harmless bacterium that resembles the tubercle bacillus.

**Smith's fracture** a fracture just above the wrist, across the distal (far) end of the radius, resulting in volar (forward) displacement of the hand and wrist below the fracture. It is the reverse of *\*Colles' fracture*. [R. W. Smith (1807–73), Irish surgeon]

**smooth muscle (involuntary muscle)** muscle that produces slow long-term contractions of which the individual is unaware. Smooth muscle occurs in hollow organs, such as the stomach, intestine, blood vessels, and bladder. It consists of spindle-shaped cells within a network of connective tissue (see illustration) and is under the control of the autonomic nervous system. Compare **STRIATED MUSCLE**.

**Smooth muscle cells.**

**snare** *n.* an instrument consisting of a wire loop designed to remove polyps, tumours, and other projections of tissue, particularly those occurring in body cavities (see illustration). The loop is used to encircle the base of the tumour and is then pulled tight. See also **DIATHERMY**.

**A nasal snare.**

**sneeze** **1.** *n.* an involuntary violent reflex expulsion of air through the nose and mouth provoked by irritation of the mucous membrane lining the nasal cavity. **2.** *vb.* to produce a sneeze.

**Snellen chart** the commonest chart used for testing sharpness of distant vision (see **VISUAL ACUITY**). It consists of rows of capital letters, called **test types (or optotypes)**, the letters of each row becoming smaller down the chart. The large letter at the top is of such a size that it can be read by a person with normal sight from a distance of 60 metres. A normally sighted person can read successive lines of letters from 36, 24, 18, 12, 9, 6, and 5 metres respectively. There is sometimes a line for 4 metres. The subject sits 6 metres from the chart and one eye is tested at a time. If he can only read down as far as the 12-metre line the visual acuity is expressed as 6/12. Normally sighted people can read the 6-metre line, i.e. normal acuity is 6/6, and many people read the 5-metre line with ease. A smaller chart on the same principle is available for testing near vision. In North America the test is done at a distance of 20 feet: 20/20 vision is the same as 6/6. *See also* **LOGMAR CHART**. [H. Snellen (1834–1908), Dutch ophthalmologist]

**snoring** *n.* noisy breathing while asleep due to vibration of the soft palate, uvula, pharyngeal walls, or epiglottis. In children it is often associated with enlargement of the tonsils and adenoids. Treatments of snoring include weight loss, tobacco and alcohol avoidance, adenoidectomy, tonsillectomy, nasal airway surgery, **\*uvulopalatopharyngoplasty**, or other forms of **\*palatoplasty**.

**snow blindness** a painful disorder of the cornea of the eye due to excessive exposure to ultraviolet light reflected from the snow. Recovery usually follows within 24 hours of covering the eyes.

**SNRI (selective serotonin and noradrenaline reuptake inhibitor)** any one of a class of **\*antidepressant** drugs that increase the availability of **\*serotonin** and **\*noradrenaline** by blocking the reabsorption of these neurotransmitters by nerve endings in the brain. Side-effects include gastrointestinal disturbances, giddiness, nausea, and sweating. The group includes **venlafaxine** (also licensed for the treatment of **\*generalized anxiety disorder**) and **duloxetine** (also licensed for treating generalized anxiety disorder, diabetic neuropathy, and stress **\*incontinence** in women).

**snuffles** *n.* **1.** partial obstruction of breathing in infants, caused by the common cold. **2.** (formerly) discharge through the nostrils associated with necrosis of the nasal bones: seen in infants with congenital syphilis.

**social anxiety disorder** an extreme fear of humiliating or embarrassing oneself in social situations (e.g. dating, parties, eating with other people, asking questions, etc.). Symptoms include shaking, blushing, gastrointestinal disturbances, sweating, and other signs of anxiety; people with social anxiety disorder may avoid social situations. Treatment includes cognitive behavioural therapy, occupational therapy, and medication (e.g. antidepressants, anxiolytics, or beta blockers).

**social class** *see* NATIONAL STATISTICS SOCIO-ECONOMIC CLASSIFICATION.

**social marketing** the application of marketing techniques to achieve behaviour change for a social benefit, for example reduction in **\*health inequalities**.

**social medicine** *see* PUBLIC HEALTH MEDICINE.

**social services** advice and practical help with problems associated with social circumstances. Every local authority is responsible for establishing and staffing a social service department. Basic training for social work involves completing an approved degree in social work; there are also social workers with medical and psychiatric training who are seconded for work in hospitals (*see* HOSPITAL SOCIAL WORKER) and specialist social workers in areas such as criminal justice. Social workers assess the eligibility of clients for such social services as care assistants and meals on wheels or refer them to the appropriate statutory or voluntary services; difficulties may sometimes arise when the hospital **\*catchment area** is not coterminous with the local authority. In relation to mental health, social workers may obtain court orders for **\*compulsory admission** where necessary and provide surveillance and support for those being treated at home or in designated hostel accommodation, including those discharged from hospital. (*See also* **AFTERCARE**.) **Case work** involves identifying the causes of the client's problem and, where appropriate, advising how best to correct them and/or adapt to the circumstances.

**social worker** *see* SOCIAL SERVICES.

**socio-economic group** *see* NATIONAL STATISTICS SOCIO-ECONOMIC CLASSIFICATION.

**socket** *n.* (in anatomy) a hollow or depression into which another part fits, such as the cavity in the alveolar bone of the jaws into which the root of a tooth fits. *See also* DRY SOCKET.

**sodium** *n.* a mineral element and an important constituent of the human body (average sodium content of the adult body is 4000 mmol). Sodium controls the volume of extracellular fluid in the body and maintains the acid-base balance. It also helps maintain electrical potentials in the nervous system and is thus necessary for the functioning of nerves and muscles. Sodium is contained in most foods and is well absorbed, the average daily intake in the UK being 8.1 g/day. The amount of sodium in the body is controlled by the kidneys. An excess of sodium leads to the condition of **hypernatraemia**, which often results in *\*oedema*. This can be fatal in newborns, and is more likely to occur in formula-fed infants, particularly if the formula is made up at too high a concentration. Infants are at higher risk as they are less able to remove sodium from the body than adults. Sodium is also implicated in hypertension: a high-sodium diet is thought to increase the risk of hypertension in later life. The UK government target is for adults to consume less than 6 g/day. Symbol: Na.

**sodium bicarbonate** a salt of sodium that neutralizes acid and is used to treat metabolic acidosis (particularly *\*renal tubular acidosis*) and to reduce the acidity of the urine in mild urinary-tract infections. Sodium bicarbonate is also an ingredient of many *\*antacid* preparations and is used in the form of drops to soften earwax.

**sodium channel** *see* ION CHANNEL.

**sodium chloride** common salt: a salt of *\*sodium* that is present in all tissues and is important in maintaining the *\*electrolyte* balance of the body. Sodium chloride infusions are the basis of fluid replacement therapy after operations and for conditions associated with salt depletion, including shock and dehydration (*see* SALINE). Sodium chloride is also a basic constituent of *\*oral rehydration therapy* and is used to irrigate the eye (e.g. for intraocular

surgery) and to treat infections of the bladder (being instilled) and mouth (as a mouthwash).

**sodium cromoglicate** *see* CROMOGLICATE.

**sodium fluoride** a salt of sodium used to prevent tooth decay. Taken in excess by mouth, it may cause digestive upsets and large doses may cause fluorine poisoning. *See also* FLUORIDATION.

**sodium fusidate** an antibiotic used to treat penicillin-resistant infections caused by *\*Staphylococcus*, including osteomyelitis. Common side-effects are nausea and vomiting. *See also* FUSIDIC ACID.

**sodium hydroxide (caustic soda)** a powerful alkali in widespread use as a cleaning agent. It attacks the skin, causing severe chemical burns that are best treated by washing the area with large quantities of water. When swallowed it causes burning of the mouth and throat, which should be treated by giving water, milk, or other fluid to dilute the stomach contents and by gastric lavage.

**sodium hypochlorite** a sodium salt of hypochlorous acid ( $\text{NaOCl}$ ) used in solution as a disinfectant. In dentistry a 0.5–5.0% solution is used for washing out, cleaning, and disinfecting infected root canals.

**sodium nitrite** a sodium salt used, with **sodium thiosulphate**, to treat cyanide poisoning. Both drugs may cause headache and flushing.

**sodium valproate** an *\*anticonvulsant* drug used to treat all types of epilepsy and manic episodes in bipolar disorder. Side-effects may include digestive upsets, weight gain, and (rarely) impaired liver function. It should be used with caution in pregnant women because of a risk of abnormalities developing in the fetus. **Valproic acid** is a related drug with similar uses and effects.

**sodokosis** *n. see* RAT-BITE FEVER.

**soft sore (chancroid)** a sexually transmitted disease caused by the bacterium *Haemophilus ducreyi*, resulting in enlargement and ulceration of lymph nodes in the groin. Treatment with sulphonamides is effective.

**solarium** *n.* a room in which patients are exposed to either sunlight or artificial sunlight (a blend of visible light and infrared and ultraviolet radiation directed from special lamps).

**solar plexus (coeliac plexus)** a network of sympathetic nerves and ganglia high in the back of the abdomen.

**soleus** *n.* a broad flat muscle in the calf of the leg, beneath the **\*gastrocnemius** muscle. The soleus flexes the foot, so that the toes point downwards.

**solifenacin** *n.* an **\*antimuscarinic** drug administered to relieve urinary frequency, urgency, and incontinence due to overactivity of the **\*detrusor** muscle of the bladder. It has few side-effects.

**solitary rectal ulcer syndrome** an uncommon anorectal condition that produces symptoms of anal pain, rectal bleeding, straining during defecation, and obstructed defecation (dyssynergic defecation). **\*Proctoscopy** reveals one or more benign rectal lesions, which are thought to be due to abnormal straining during defecation leading to prolapse of the distal anterior rectal wall and internal anal **\*intussusception**.

**soma** *n.* **1.** the entire body excluding the germ cells. **2.** the body as distinct from the mind.

**somat-** *combining form denoting* **1.** the body. **2.** somatic.

**somatic** *adj.* **1.** relating to the nonreproductive parts of the body. A somatic mutation cannot be inherited. **2.** relating to the body wall (i.e. excluding the viscera), e.g. somatic **\*mesoderm**. *Compare* **SPLANCHNIC**. **3.** relating to the body rather than the mind.

**somatic symptom disorder** in DSM-5, a psychiatric disorder characterized by one or more chronic somatic symptoms about which patients are excessively concerned, preoccupied, or fearful, formerly called **somatization disorder**. These fears and behaviours cause significant distress and dysfunction, and although patients may make frequent use of health-care services, they are rarely reassured and often feel their medical care has been inadequate. The disorder can disrupt personal and family relationships and lead to unnecessary medical and surgical treatment. It is sometimes treated

with **\*cognitive behavioural therapy**, **\*psychotherapy**, and/or **\*antidepressants**.

**somatoform disorders** a group of disorders in which there is a history of repeated physical complaints with no physical basis. They include **\*somatic symptom disorder** and illness anxiety disorder (see **HYPOCHONDRIA**).

**somatomedin** *n.* a protein hormone, produced by the liver in response to stimulation by growth hormone, that stimulates protein synthesis and promotes growth. It is biochemically similar to **\*insulin** and has some actions similar to insulin; it is therefore sometimes said to have **insulin-like activity** (ILA) or is referred to as **insulin-like growth factor** (IGF).

**somatopleure** *n.* the body wall of the early embryo, which consists of a simple layer of ectoderm lined with mesoderm. The amnion is a continuation of this structure outside the embryo. Compare **SPLANCHNOLEURE**.

**somatostatin (growth-hormone-release inhibiting hormone)** a hormone produced by the hypothalamus and some extraneural tissues, including the gastrointestinal tract and pancreas (see **ISLETS OF LANGERHANS**), that acts to inhibit the secretion of many hormones. For example, in the pituitary gland it inhibits the release of **\*growth hormone** (somatotrophin) and in the pancreas it suppresses secretion of insulin and glucagon. **Somatostatin analogues** are used to treat **\*acromegaly** (caused by overproduction of growth hormone) and to relieve the symptoms caused by hormone-secreting neuroendocrine tumours, including **\*carcinoid** tumours. They include **lanreotide** (also licensed for the treatment of thyroid tumours) and **octreotide** (also used to reduce vomiting in palliative care and to treat **\*oesophageal varices**); gastrointestinal upsets (e.g. nausea, loss of appetite, abdominal pain, diarrhoea) are the most common side-effects.

**somatostatinoma** *n.* a rare tumour of the **\*islets of Langerhans** that produces excessive amounts of somatostatin. It is an example of an **\*apudoma**. In severe cases it can cause the **somatostatinoma syndrome**, consisting of diabetes, gall-bladder disease, and **\*steatorrhoea** due to malabsorption.

**somatotrophin** *n.* see **GROWTH HORMONE**.

**somatotype** *n.* see **BODY TYPE**.

**somite** *n.* any of the paired segmented divisions of **\*mesoderm** that develop along the length of the early embryo. The somites differentiate into voluntary muscle, bones, connective tissue, and the deeper layers of the skin (*see* **DERMATOME**; **MYOTOME**; **SCLEROTOME**).

**somnambulism** *n.* sleep-walking: walking about and performing other actions in a semiautomatic way during sleep without later memory of doing so. It is common during childhood and may persist into adult life. It can arise spontaneously or as the result of stress or hypnosis; it may also be a side-effect of a hypnotic drug. —**somnambulistic** *adj.*

**somnolism** *n.* a hypnotic trance. *See* **HYPNOSIS**.

**somnoplasty** *n.* *see* **PALATOPLASTY**.

**Somogyi effect** *see* **DAWN PHENOMENON**. [M. Somogyi (1883–1971), US biochemist]

**sonography** *n.* *see* **ULTRASONOGRAPHY**.

**sonohysterography** *n.* an examination of the uterus and Fallopian tubes using ultrasound rather than X-rays (as in **\*hysterosalpingography**). In **saline infusion sonohysterography (SIS)** evaluation of the endometrial cavity is augmented by the use of saline, which distends the uterine cavity separating the two layers of endometrium and creating a contrast. This can help identify intracavitary lesions (e.g. submucous **\*fibroids**) and determine the amount of cavity distortion.

**sonoplacentography** *n.* *see* **PLACENTOGRAPHY**.

**soporific** *n.* *see* **HYPNOTIC**.

**sorafenib** *n.* a drug used in the management of advanced renal cell carcinoma and resistant thyroid cancer. It is an inhibitor of multiple kinases (*see* **PROTEIN KINASE**; **TYROSINE KINASE INHIBITOR**), preventing the mediation of cell growth and proliferation, and blocks **\*vascular endothelial growth factor** receptors on tumour cells, preventing new vessel formation. Side-effects include rash, diarrhoea, and hypertension.

**sorbitol** *n.* a sugar (carbohydrate) alcohol with a sweet taste, used as a substitute for cane sugar in foods suitable for diabetics since it is absorbed slowly from the intestine. Excess consumption can cause osmotic diarrhoea.

**sordes** *pl. n.* the brownish encrustations that form around the mouth and teeth of patients suffering from fevers.

**sore** *n.* a lay term for any ulcer or other open wound of the skin or mucous membranes, which may be caused by injury or infection. *See also* **PRESSURE SORE**; **SOFT SORE**.

**sore throat** pain at the back of the mouth, commonly due to bacterial or viral infection of the tonsils (**\*tonsillitis**) or the pharynx (**\*pharyngitis**). If infection persists the lymph nodes in the neck may become tender and enlarged (cervical adenitis).

**sotalol** *n.* a drug (*see* **BETA BLOCKER**) used to treat and prevent abnormal heart rhythm (*see* **ARRHYTHMIA**). Side-effects may include digestive upsets, tiredness, and dizziness.

**Sotos syndrome (cerebral gigantism)** a rare inherited disorder resulting in excessive physical growth during the first 2–3 years of life. It presents in childhood with a characteristic facial appearance, a disproportionately large head, large hands and feet, abnormally widely spaced eyes (ocular **\*hypertelorism**), developmental delay, and tall stature for age. Children with Sotos syndrome tend to be large at birth and taller and heavier, stabilizing after about five years to achieve normal adult height. Most cases occur sporadically, although familial cases have been reported. [J. F. Sotos (1927–), U.S. paediatrician]

**souffle** *n.* a soft blowing sound heard through the stethoscope, usually produced by blood flowing in vessels.

**sound** (in surgery) **1. n.** a long rodlike instrument, often with a curved end, used to explore body cavities (such as the bladder) or to dilate **\*stricture(s)** in the urethra or other canals. **2. vb.** to explore a cavity using a sound.

**Southern blot analysis** a technique for identifying a specific form of DNA in cells. The DNA is extracted from the cells and restriction enzymes used to cut it into small fragments. The fragments are separated and a gene **\*probe**

known to match the DNA fragment being sought is used. *Compare* [NORTHERN BLOT ANALYSIS](#); [WESTERN BLOT ANALYSIS](#). [E. M. Southern (1938– ), US biologist]

**Southey's tubes** fine-calibre tubes for insertion into subcutaneous tissue to drain excess fluid. They are rarely used in practice today. [R. Southey (1835–99), British physician]

**SPA** *see* [SPHENOPALATINE ARTERY LIGATION](#).

**space maintainer** a custom-made orthodontic appliance that maintains an existing space in the dentition to allow a permanent tooth to erupt into the space. It may be removable or cemented into place.

**spacer** *n.* a plastic container with a mouthpiece at one end and a hole for an aerosol inhaler at the other. The dose from the inhaler is sprayed into the spacer, from which it can be inhaled without needing to coordinate breathing. It is particularly useful for babies and small children who do not have this coordination. Paediatric spacers also have a small mask that fits onto the mouthpiece of the spacer and is placed over the child's nose and mouth. Spacers help to deliver a greater proportion of the dose to the airways while reducing the proportion absorbed into the body (which is the usual cause of unwanted side-effects)

**Spanish fly** the blister beetle, *Lytta vesicatoria*: source of the irritant and toxic chemical compound cantharidin.

**sparganosis** *n.* a disease caused by the migration of certain tapeworm larvae (*see* [SPARGANUM](#)) in the tissues beneath the skin, between the muscles, and occasionally in the viscera and brain. The larvae, which normally develop in frogs and reptiles, are transferred to humans who eat the uncooked flesh of these animals or drink water contaminated with minute crustaceans infected with the tapeworm larvae. The larvae cause inflammation, swelling, and fibrosis of the tissues. Treatment of the condition, common in the Far East, involves surgical removal of the larvae.

**sparganum** *n.* the larvae of certain tapeworms, including species of *\*Diphyllbothrium* and *Spirometra*, which may infect humans (*see* [SPARGANOSIS](#)). They are actually *\*plerocercoids*, but the generic name

*Sparganum* is sometimes given to them since they fail to develop into adults and definite classification of the species is not possible from the larvae alone.

**spasm** *n.* a sustained involuntary muscular contraction, which may occur either as part of a generalized disorder, such as a **SPASTIC PARALYSIS**, or as a local response to an otherwise unconnected painful condition. **Carpopedal spasm** affects the muscles of the hands and feet and is caused by a reduction in the blood calcium level (often transitory, as in hyperventilation). *See also* **MAIN D'ACCOUCHEUR**.

**spasmo-** *combining form denoting spasm.*

**spasmodic** *adj.* occurring in spasms or resembling a spasm.

**spasmolytic** *n.* a drug that relieves spasm of smooth muscle. *See also* **ANTISPASMODIC**.

**spasmus nutans** a combination of symptoms including a slow nodding movement of the head, **\*nystagmus** (involuntary movements of the eyes), and spasm of the neck muscles. It affects infants and it normally disappears within a year or two.

**spasticity** *n.* resistance to the passive movement of a limb that is maximal at the beginning of the movement and gives way as more pressure is applied. Also known as **clasp-knife rigidity**, it is a symptom of damage to the **\*pyramidal system** in the brain or spinal cord. It is usually accompanied by weakness in the affected limb (*see* **SPASTIC PARALYSIS**). *Compare* **RIGIDITY**.

**spastic paralysis** weakness of a limb or limbs associated with increased reflex activity. This results in resistance to passive movement of the limb (*see* **SPASTICITY**). It is caused by disease affecting the nerve fibres of the **\*pyramidal system**, which in health not only initiate movement but also inhibit the stretch reflexes to allow the movements to take place. *See also* **CEREBRAL PALSY**.

**spatula** *n.* an instrument with a blunt blade used to spread ointments or plasters and, particularly in dentistry, to mix materials. A flat spatula is used

to depress the tongue during examination of the oropharynx.

**spatulation** *n.* the technique of widening the orifice of an anatomical tube prior to joining it up, which makes the join more secure and less prone to narrowing.

**special educational needs (SEN)** the requirements of children who have difficulties in learning or in accessing education. Children with SEN can be supported via mainstream schools or may attend a **\*special school**. Children identified as having SEN that cannot be met by a mainstream school should be assessed by their local authority, which may issue a **statement of special educational needs**. This statement describes the child and the additional help needed.

**special health authority** a type of NHS trust that provides services across the NHS in England, rather than in a single defined geographical area. There are four special health authorities, which exist as arms-length bodies of the Department of Health and Social Care, independent of government: **\*NHS Blood and Transplant**, **\*NHS Business Services Authority**, **\*NHS Resolution** and **\*NHS Counter Fraud Authority**.

**special hospitals (secure hospitals)** hospitals for the care of mentally ill patients who are also dangerous and must therefore be kept securely. The level of security can be low, medium, or high. Most (but not all) patients are there compulsorily under a hospital order made by a court according to the **\*Mental Health Act 1983**.

**special school** (in Britain) an education establishment for children with **\*special educational needs**. The identification and assessment of those needing to attend a special school may occur long before school age. Special schools exist for children with different types of need, including physical disability and hearing impairment. Special education for children with severe disabilities may start as early as two years.

**specialty registrar (in a hospital)** *see* **CONSULTANT**.

**species** *n.* the smallest unit used in the classification of living organisms. Members of the same species are able to interbreed and produce fertile offspring. Similar species are grouped together within one **\*genus**.

**specific** **1.** *n.* a medicine that has properties especially useful for the treatment of a particular disease. **2.** *adj.* (of a disease) caused by a particular microorganism that causes no other disease. **3.** *adj.* of or relating to a species.

**specific gravity** the ratio, more correctly known as **relative density**, of the density of a substance at 20°C to the density of water at its temperature of maximum density (4°C). Measurement of the specific gravity of urine is one of the tests of renal function.

**specificity** *n.* (in screening tests) *see* **SENSITIVITY**.

**spectral domain optical coherence tomography (Fourier domain OCT)** a noncontact noninvasive imaging technique that can reveal layers of the retina by looking at the interference patterns of reflected laser light. Automated software is able to outline the retinal nerve-fibre layer with great precision, which is relevant in glaucoma.

**spectrograph** *n.* an instrument (a **\*spectrometer** or **\*spectroscope**) that produces a photographic record (**spectrogram**) of the intensity and wavelength of electromagnetic radiations.

**spectrometer** *n.* any instrument for measuring the intensity and wavelengths of visible or invisible electromagnetic radiations. *See also* **SPECTROSCOPE**.

**spectrophotometer** *n.* an instrument (a spectrometer) for measuring the intensity of the wavelengths of the components of light (visible or ultraviolet).

**spectroscope** *n.* an instrument used to split up light or other radiation into components of different wavelengths. The simplest spectroscope uses a prism, which splits white light into the rainbow colours of the visible spectrum.

**SPECT scanning (single photon emission computing tomography)** (in nuclear medicine) a **\*cross-sectional imaging** technique for observing an organ or part of the body using a **\*gamma camera**; images are produced after injecting a radioactive **\*tracer**. The camera is rotated around the patient being scanned. Using a computer reconstruction **\*algorithm** similar to that of a **\*computerized tomography** scanner, multiple 'slices' are made through the

area of interest. SPECT scanning is used particularly in cardiac nuclear medicine imaging (see [MUGA SCAN](#)). It differs from PET scanning in that radioactive decay gives off only a single gamma ray.

**specular reflection** (in [\\*ultrasonics](#)) the reflection of sound waves from the surface of an internal structure, which can be used to produce a picture of the surface as a sonogram (see [ULTRASONOGRAPHY](#)). A specular reflection contrasts with vaguer diffuse echoes produced by minor differences in tissue density.

**speculum** *n.* (*pl.* specula) a metal instrument for inserting into and holding open a cavity of the body, such as the vagina, rectum, or nasal orifice, in order that the interior may be examined (see illustration).

**Vaginal speculum (Cusco's).**

**speech and language therapy** the treatment of patients who have problems with communication or eating or drinking because of congenital causes, accidents, or illness (e.g. stroke). Speech and language therapists are [\\*allied health professionals](#) who have special training in this field.

**spell** *n.* the time a patient spends in one hospital or treatment centre, from admission to discharge or transfer to another such. This may consist of one or more [\\*finished consultant episodes](#). See also [CONTINUOUS PATIENT PATHWAY](#).

**sperm** *n.* see [SPERMATOZOON](#).

**sperm-** (**spermi(o)-**, **spermo-**) *combining form denoting* sperm or semen.

**spermat-** (**spermato-**) *combining form denoting* **1.** sperm. **2.** organs or ducts associated with sperm.

**spermatic artery** either of two arteries that originate from the abdominal aorta and travel downwards to supply the testes.

**spermatic cord** the cord, consisting of the **\*vas deferens**, nerves, and blood vessels, that runs from the abdominal cavity to the testicle in the scrotum. The **\*inguinal canal**, through which the spermatic cord passes, becomes closed after the testes have descended.

**spermatid** *n.* a small cell produced as an intermediate stage in the formation of spermatozoa. Spermatids become embedded in **\*Sertoli cells** in the testis. They are transformed into spermatozoa by the process of spermiogenesis (*see* **SPERMATOGENESIS**).

**spermatocele** *n.* a cystic swelling in the scrotum containing sperm. The cyst arises from the epididymis (the duct conveying sperm from the testis) and can be felt as a lump above the testis. Needle **\*aspiration** of the cyst reveals a milky opalescent fluid that contains sperm. Treatment is by surgical removal.

**spermatocyte** *n.* a cell produced as an intermediate stage in the formation of spermatozoa (*see* **SPERMATOGENESIS**). Spermatocytes develop from spermatogonia in the walls of the seminiferous tubules of the testis; they are known as either **primary** or **secondary spermatocytes** according to whether they are undergoing the first or second division of meiosis.

**spermatogenesis** *n.* the process by which mature spermatozoa are produced in the testis (*see* illustration). **\*Spermatogonia**, in the outermost layer of the seminiferous tubules, multiply throughout reproductive life. Some of them divide by meiosis into **\*spermatocytes**, which produce haploid **\*spermatids**. These are transformed into mature spermatozoa by the process of **spermiogenesis**. The whole process takes 70–80 days.

### Spermatogenesis.

**spermatogonium** *n.* (*pl.* spermatogonia) a cell produced at an early stage in the formation of spermatozoa (*see* [SPERMATOGENESIS](#)). Spermatogonia first appear in the testis of the fetus but do not multiply significantly until after puberty. They act as stem cells in the walls of the seminiferous tubules, dividing continuously by mitosis and giving rise to *\*spermatocytes*.

**spermatorrhoea** *n.* the involuntary discharge of semen without orgasm. Semen is usually produced by ejaculation at orgasm and does not normally discharge at other times. If, however, the mechanism of ejaculation is lost, spermatorrhoea may occur.

**spermatozoon (sperm)** *n.* (*pl.* spermatozoa) a mature male sex cell (*see* [GAMETE](#)). The tail of a sperm enables it to swim, which is important as a

means for reaching and fertilizing the ovum (although muscular movements of the uterus may assist its journey from the vagina). *See also* [ACROSOME](#); [FERTILIZATION](#).

### **A spermatozoon.**

**spermaturia** *n.* the presence of spermatozoa in the urine. Spermatozoa are occasionally seen on microscopic examination of the urine and their presence is not abnormal. If present in large numbers, the urine becomes cloudy, usually towards the end of micturition. Abnormal ejaculation into the bladder on orgasm (retrograde ejaculation) may occur after [\\*prostatectomy](#) or other

surgical procedures or in neurological conditions that destroy the ability of the bladder neck to close on ejaculation.

**sperm bank** a facility that collects, freezes, and stores human sperm for future use in *\*artificial insemination* (see **CRYOPRESERVATION**). Sperm is donated by men who relinquish legal rights to any future child, and donors' identities are generally unknown to recipients. In some cases, men store their sperm for their own future use if they are to undergo a medical treatment that might leave them sterile.

**sperm count** *see* **SEMINAL ANALYSIS**.

**spermicide** *n.* an agent that kills spermatozoa. Creams and jellies containing chemical spermicides are used – in conjunction with a *\*diaphragm* – as contraceptives. — **spermicidal** *adj.*

**spermiogenesis** *n.* the process by which spermatids become mature spermatozoa within the seminiferous tubules of the testis. *See* **SPERMATOGENESIS**.

**spheno-** *combining form denoting the sphenoid bone.* Examples: **sphenomaxillary** (relating to the sphenoid and maxillary bones); **sphenopalatine** (relating to the sphenoid bone and palate).

**sphenoid bone** a bone forming the base of the cranium behind the eyes. It consists of a **body**, containing air spaces continuous with the nasal cavity (see **PARANASAL SINUSES**); two **wings** that form part of the orbits; and two **pterygoid processes** projecting down from the point where the two wings join the body. *See* **SKULL**.

**sphenopalatine artery ligation (SPA)** a surgical procedure to identify and occlude the sphenopalatine artery in the nose using endoscopic surgery. It is used in the treatment of severe epistaxis (nosebleed).

**spherocyte** *n.* an abnormal form of red blood cell (*\*erythrocyte*) that is spherical rather than disc-shaped. In blood films spherocytes appear smaller and stain more densely than normal red cells. They are characteristically seen in some forms of haemolytic anaemia. Spherocytes tend to be removed from the blood as they pass through the spleen. *See also* **SPHEROCYTOSIS**.

**spherocytosis** *n.* the presence in the blood of abnormally shaped red cells (**\*spherocytes**). Spherocytosis may occur as a hereditary disorder (**hereditary spherocytosis**) or in certain haemolytic **\*anaemias**.

**sphincter** *n.* a specialized ring of muscle that surrounds an orifice. Contractions of the sphincter partly or completely close the orifice. Sphincters are found, for example, around the anus (**anal sphincter**) and at the openings between the oesophagus and stomach (**lower oesophageal sphincter**, LOS) and between the stomach and duodenum (**pyloric sphincter**).

**sphincter-** *combining form denoting a sphincter.*

**sphincterectomy** *n.* **1.** the surgical removal of any sphincter muscle. **2.** the complete division of a sphincter.

**sphincterotomy** *n.* **1.** surgical division, usually partial, of any sphincter muscle. *See also* **ANAL FISSURE**. **2.** surgical incision of part of the iris in the eye at the border of the pupil.

**sphingolipid** *n.* a **\*phospholipid** that contains sphingosine. Sphingolipids are found in large amounts in brain and nerve tissue.

**sphingosine** *n.* a lipid alcohol that is a constituent of sphingolipids and cerebrosides.

**sphygmo-** *combining form denoting the pulse.*

**sphygmocardiograph** *n.* an apparatus for producing a continuous record of both the heartbeat and the subsequent pulse in one of the blood vessels. The recording can be shown on a moving tape or on an electronic screen.

**sphygmograph** *n.* an apparatus for producing a continuous record of the pulse in one of the blood vessels, showing the strength and rate of the beats.

**sphygmomanometer** *n.* an instrument for measuring **\*blood pressure** in the arteries. It consists of an inflatable cuff connected to a graduated scale gauge calibrated in millimetres of mercury (mmHg). The cuff is applied to a limb (usually the arm) and inflated to exert pressure on a large artery until the blood flow stops. The pressure is then slowly released and, with the aid of a stethoscope to listen to the pulse, it is possible to determine both the systolic

and diastolic pressures (which can be read on the scale). Automated electronic devices are increasingly used.

**sphygmophone** *n.* a device to record the heartbeat or pulse in the form of amplified sound waves played through a loudspeaker or earphones.

**sphygmoscope** *n.* a device for showing the heartbeat or pulse as a visible signal, especially a continuous wave signal on a cathode-ray tube.

**spica** *n.* a bandage wound spirally around an injured limb. At each turn it is given a twist so that the slack material is taken up at the overlap.

**spicule** *n.* a small splinter of bone.

**spider naevus** a dilated arteriole forming a red papule from which radiate prominent capillaries, so that it resembles a spider. Excessive numbers of spider naevi are a sign of liver cirrhosis, hepatitis, thyrotoxicosis, and rheumatoid arthritis; they are also a feature of normal pregnancy. *See also* **TELANGIECTASIS**.

**spigelian hernia** a hernia through the spigelian fascia, a sheath of fibrous tissue that runs along the outside edge of the **\*rectus abdominis** muscle.

**spina bifida (rachischisis)** a developmental defect in which the newborn baby has part of the spinal cord and its coverings exposed through a gap in the backbone. The symptoms may include paralysis of the legs, incontinence, and learning disabilities from the commonly associated brain defect, **\*hydrocephalus**. Spina bifida is associated with an abnormally high level of **\*alpha-fetoprotein** in the amniotic fluid surrounding the embryo. The condition can be diagnosed at about the 16th week of pregnancy by a maternal blood test and confirmed by amniocentesis and ultrasound. The risk of spina bifida is reduced if supplements of **\*folic acid** are taken by women while trying to conceive and during the first three months of pregnancy. *See also* **NEURAL TUBE DEFECTS**.

<http://www.shinecharity.org.uk/>

- Website of Shine, the charity for individuals and families affected by spina bifida and hydrocephalus

**spina bifida occulta** a defect in the bony arch of the spine that (unlike spina bifida) has a normal skin covering; there may be an overlying hairy patch. The condition is usually an incidental finding on X-ray and it is not associated with neurological involvement.

**spinal accessory nerve** *see* ACCESSORY NERVE.

**spinal anaesthesia** **1.** suppression of sensation, usually in the lower part of the body, by the injection of a local anaesthetic into the **\*subarachnoid space**. A very fine needle is used to reduce the amount of cerebrospinal fluid that escapes as the needle penetrates the dura. The technique has complications (headache, sepsis, paraplegia). The injection site for spinal anaesthetics is most often in the lumbar region of the vertebral column, the needle being inserted between the vertebrae (anywhere between the second and fifth). The extent of the area anaesthetized depends upon the amount and strength of local anaesthetic injected. Dilute local anaesthetic solutions are used when the sensory nerves are targeted rather than the motor nerves. Spinal anaesthesia is useful in patients whose condition makes them unsuitable for a general anaesthetic, perhaps because of chest infection; to reduce the requirements for general anaesthetic drugs; or in circumstances where a skilled anaesthetist is not readily available to administer a general anaesthetic. **2.** loss of sensation in part of the body as a result of injury or disease to the spinal cord. The area of the body affected depends upon the site of the lesion: the lower it is in the cord the less the sensory disability.

**spinal column** *see* BACKBONE.

**spinal cord** the portion of the central nervous system enclosed in the vertebral column, consisting of nerve cells and bundles of nerves connecting all parts of the body with the brain. It contains a core of grey matter surrounded by white matter (see illustration overleaf). It is enveloped in three layers of membrane, the **\*meninges**, and extends from the medulla oblongata in the skull to the level of the second lumbar vertebra. From it arise 31 pairs of **\*spinal nerves**.

**The spinal cord (transverse section).**

**spinal muscular atrophy (SMA)** a hereditary condition in which cells of the spinal cord die and the muscles in the arms and legs become progressively weaker. Eventually the respiratory muscles are affected and death usually results from respiratory infection. Most affected individuals are wheelchair-bound by the age of 20 and few survive beyond the age of 30. The gene responsible has been located: in affected children it is inherited as a double **\*recessive**. There are three forms of the disease, based on severity of the symptoms and the age at which they appear. Type 1 (infantile spinal muscular atrophy) is the most acute and aggressive form of the condition (see **WERDNIG–HOFFMANN DISEASE**). Type 2 develops between the ages of 6 months and 2 years and type 3 (**Kugelberg–Wielander disease**), the least severe form, appears between 2 and 17 years of age.

**spinal nerves** the 31 pairs of nerves that leave the spinal cord and are distributed to the body, passing out from the vertebral canal through the spaces between the arches of the vertebrae (see illustration). Each nerve has two **\*roots**, an anterior, carrying motor nerve fibres, and a posterior, carrying

sensory fibres. Immediately after the roots leave the spinal cord they merge to form a mixed spinal nerve on each side.

**The spinal nerves (one side only).**

**spinal shock** a state of **\*shock** accompanied by temporary paralysis of the lower extremities that results from injury to the spine and is often associated with **\*ileus**. If the spinal cord is transected, permanent motor paralysis persists below the level of spinal-cord division.

**spindle** *n.* a collection of fibres seen in a cell when it is dividing. The fibres radiate from the two ends (**poles**) and meet at the centre (the **equator**) giving a structure shaped like two cones placed base to base. It plays an important part in chromosome movement in *\*mitosis* and *\*meiosis* and is also involved in division of the cytoplasm.

**spine** *n.* **1.** a sharp process of a bone. **2.** the vertebral column (*see BACKBONE*). —**spinal** *adj.*

**spino-** *combining form denoting* **1.** the spine. **2.** the spinal cord.

**spinocerebellar degeneration** any of a group of inherited disorders of the cerebellum and corticospinal tracts in the brain. They are characterized by *\*spasticity* of the limbs and cerebellar *\*ataxia*.

**spiral bandage** a bandage wound round a part of the body, overlapping the previous section at each turn.

**spiral CT scanning (helical CT scanning)** a development of conventional *\*computerized tomography* (CT) scanning in which the X-ray tube rotates continuously around the patient as he or she passes through the scanner. This allows the acquisition of images throughout a specified volume of tissue much more quickly. Since these images are digitally acquired (*see DIGITIZATION*), *\*post-processing* can produce images in numerous planes, without further exposure of the patient to ionizing radiation. *See also MULTIDETECTOR COMPUTERIZED TOMOGRAPHY.*

**spiral organ** *see* ORGAN OF CORTI.

**Spirillum** *n.* a genus of highly motile rigid spiral-shaped bacteria usually found in fresh and salt water containing organic matter. They bear tufts of flagella at one or both ends of the cell. Most species are saprophytes, but *S. minus* causes *\*rat-bite fever*.

**spiro-** *combining form denoting* **1.** spiral. **2.** respiration.

**spirochaete** *n.* any one of a group of spiral-shaped bacteria that lack a rigid cell wall and move by means of muscular flexions of the cell. The group includes the genera *\*Borrelia*, *\*Leptospira*, and *\*Treponema*.

**spiograph** *n.* an instrument for recording breathing movements. The record (a tracing) obtained is called a **spiogram**. —**spiography** *n.*

**spirometer** *n.* an instrument for measuring the volume of air inhaled and exhaled. It is used in tests of **\*ventilation**. —**spirometry** *n.*

**spironolactone** *n.* a synthetic corticosteroid that inhibits the activity of the hormone **\*aldosterone** and is used as a potassium-sparing **\*diuretic** to treat fluid retention (oedema) in cirrhosis, **\*ascites**, and severe heart failure. It is also used in treating aldosteronism. Side-effects may include headache, stomach upsets, breast enlargement and impotence (in men), and menstrual disturbances (in women).

**Spitz–Holter valve** a one-way valve used to drain cerebrospinal fluid in order to control **\*hydrocephalus**. The device is inserted into the ventricles of the brain and passes via a subcutaneous tunnel to drain into either the right atrium or the peritoneum.

**splanchn-** (**splanchno-**) *combining form denoting the viscera.*

**splanchnic** *adj.* relating to the viscera, e.g. splanchnic **\*mesoderm**. *Compare* **SOMATIC**.

**splanchnic nerves** the series of nerves in the sympathetic system that are distributed to the blood vessels and viscera, passing forwards and downwards from the chain of sympathetic ganglia near the spinal cord to enter the abdomen and branch profusely.

**splanchnocranium** *n.* the part of the skull that is derived from the **\*pharyngeal arches**, i.e. the mandible (lower jaw).

**splanchnopleure** *n.* the wall of the embryonic gut, which consists of a layer of endoderm with a layer of mesoderm outside it. The yolk sac is a continuation of this structure. *Compare* **SOMATOPLEURE**.

**spleen** *n.* a large dark-red ovoid organ situated on the left side of the body below and behind the stomach. It is enclosed within a fibrous capsule that extends into the spongy interior – the **splenic pulp** – to form a supportive framework. The pulp consists of aggregates of **\*lymphoid tissue** (**white pulp**) within a meshwork of **\*reticular fibres** packed with red blood cells (**red**

**pulp**). The spleen is a major component of the *\*reticuloendothelial system*, producing lymphocytes in the newborn and containing *\*phagocytes*, which remove worn-out red blood cells and other foreign bodies from the bloodstream. It also acts as a reservoir for blood and, in the fetus, as a source of red blood cells. Anatomical name: **lien**. —**splenic** *adj.*

**splen-** (**spleno-**) *combining form denoting the spleen*. Example: **splenorenal** (relating to the spleen and kidney).

**splenectomy** *n.* surgical removal of the spleen. This is sometimes necessary in the emergency treatment of bleeding from a ruptured spleen and in the treatment of some blood diseases. Splenectomy in children may diminish the immune response to infections.

**splenitis** *n.* inflammation of the spleen. *See also* **PERISPLENITIS**.

**splenium** *n.* the thickest part of the *\*corpus callosum*, rounded and protruding backwards over the thalami, the pineal gland, and the midbrain.

**splenomegaly** *n.* enlargement of the spleen. It most commonly occurs in *\*malaria*, *\*schistosomiasis*, and other disorders caused by parasites; in infections; in blood disorders, including some forms of anaemia and lack of platelets (*\*thrombocytopenia*); in *\*leukaemia*; and in *\*Hodgkin's disease*. *See also* **HYPERSPLENISM**.

**splenorenal anastomosis** a method of treating *\*portal hypertension* by joining the splenic vein to the left renal vein. *Compare* **PORTACAVAL ANASTOMOSIS**.

**splenunculus** *n.* a small sphere of splenic tissue occurring at a site other than the spleen. Splenunculi are present in many people.

**splint** *n.* a rigid appliance (*\*orthosis*) used to support or hold a limb or digit in position until healing has occurred. Splints can be used to treat fractures and dislocations and to assist in the healing of soft-tissue injuries.

**splinter haemorrhage** a linear haemorrhage below the nails, usually the result of trauma but also occurring in such conditions as subacute bacterial *\*endocarditis* or severe rheumatoid arthritis.

**split-skin graft (SSG, Thiersch's graft)** a type of skin graft in which thin partial thicknesses of skin are used to cover and heal a wound. They are removed from one site on the body, cut into narrow strips or sheets, and placed onto the wound area to be healed.

**splitting** *n.* a **\*defence mechanism** by which people deal with an emotional conflict by viewing some people as all good and others as all bad: they fail to integrate themselves or other people into complex but coherent images. It is common in people with an **\*emotionally unstable personality disorder**.

**spondyl- (spondylo-)** *combining form denoting* a vertebra or the spine.

**spondylitis** *n.* inflammation of the synovial joints of the backbone. **Ankylosing spondylitis** is a **\*sero-negative arthritis**; 90% of cases carry the tissue-type antigen HLA-B27 (*see* **HLA SYSTEM**). Ankylosing spondylitis predominantly affects young adult Caucasian males and the inflammation affects the joint capsules and their attached ligaments and tendons, principally the intervertebral joints and sacroiliac joints (*see* **SACROILIITIS**). The resultant pain and stiffness are treated by analgesics (including **\*NSAIDs**), physiotherapy, and biological **\*disease-modifying antirheumatic drugs**. The disorder can lead to severe deformities of the spine (*see* **KYPHOSIS**; **ANKYLOSIS**) and the hip joint, in which case surgical correction or **\*arthroplasty** may be required.

**spondyloarthropathy** any **\*sero-negative arthritis** that is characterized by the presence of the tissue-type antigen HLA-B27 (*see* **HLA SYSTEM**) and the absence of rheumatoid factor. Spondyloarthropathies include ankylosing **\*spondylitis**, **\*reactive arthritis**, and **\*psoriatic arthritis**.

**spondylolisthesis** *n.* a forward shift (slippage) of one vertebra upon another, due to a defect in the bone or in the joints that normally bind them together. This may be congenital or develop after injury. The vertebral displacement is most likely to occur in the lumbar (lower back) or cervical (neck) regions of the backbone. The majority of cases in which pain is present are treated with rest, analgesics, and NSAIDs. In a small minority, showing severe disability, pressure on nerve roots, or slippage of more than 50%, surgical fusion may be required.

**spondylolysis** *n.* a bony defect in a vertebra between the **\*lamina** and the **\*transverse process**, thought to be due to a **\*stress fracture** and common in gymnasts.

**spondylosis** *n.* a spinal condition resulting from degeneration and flattening of the intervertebral discs in the cervical, thoracic, or lumbar regions. Symptoms include pain and restriction of movement, and in advanced cases tingling, numbness, and weakness may develop due to pressure on nerve roots. Spondylosis produces a characteristic appearance on X-ray, including narrowing of the space occupied by the disc and the presence of **\*osteophytes**; these features of the disease (**radiological spondylosis**) may not be accompanied by any signs and symptoms. Pain is relieved by analgesics, NSAIDs, and physiotherapy; painful movements are prevented by wearing a neck orthosis (when the neck region is affected) or a lumbosacral corset (for the lower spine). Very severe cases sometimes require surgical fusion.

**spondylosyndesis** *n.* surgical fusion of the intervertebral joints of the backbone.

**spongiform encephalopathy** any one of a group of rapidly progressive degenerative neurological diseases that include scrapie in sheep, bovine spongiform encephalopathy (BSE) in cattle, and **\*kuru**, **\*Creutzfeldt-Jakob disease**, and **\*Gerstmann-Straussler-Scheinker syndrome** in humans. In humans the spongiform encephalopathies are characterized by rapidly progressive dementia associated with myoclonic jerks (*see* **MYOCLONUS**); on pathological examination the brains of affected individuals show a characteristic cystic degeneration. The diseases are thought to be caused by unconventional transmissible agents (*see* **PRION**).

**spongioblast** *n.* a type of cell that forms in the early stages of development of the nervous system, giving rise to **\*astrocytes** and **\*oligodendrocytes**.

**spontaneous** *adj.* arising without apparent cause or outside aid. The term is applied in medicine to certain conditions, such as pathological fractures, that arise in the absence of outside injury; also to recovery from a disease without the aid of specific treatment.

**spontaneous bacterial peritonitis (SBP)** the presence of infection in the abdominal cavity without an obvious cause (see **PERITONITIS**). SBP occurs in patients with liver disease (and occasionally in those with nephrotic syndrome) due to **\*portal hypertension**. This leads to the build-up of large volumes of peritoneal fluid (**\*ascites**) in which infection takes hold and propagates. Patients experience fever, nausea, abdominal pain, further accumulation of ascites, and they may develop **\*hepatic encephalopathy** with rapid deterioration. Diagnosis is made by **\*paracentesis** culture of the ascitic fluid to confirm the presence of bacteria. Treatment includes antibiotics.

**spontaneous intracranial hypotension** see **INTRACRANIAL HYPOTENSION HEADACHE**.

**sporadic** *adj.* describing a disease that occurs only occasionally or in a few isolated places. *Compare* **ENDEMIC**; **EPIDEMIC**.

**spore** *n.* a small reproductive body produced by plants and microorganisms. Some kinds of spores function as dormant stages of the life cycle, enabling the organism to survive adverse conditions. Other spores are the means by which the organism can spread vegetatively. *See also* **ENDOSPORE**.

**sporicide** *n.* an agent that kills spores (e.g. bacterial spores). Some disinfectants that liberate chlorine are sporicides, but most other germicides are ineffective since spores are very resistant to chemical action. — **sporicidal** *adj.*

**sporocyst** *n.* the second-stage larva of a parasitic **\*fluke**, found within the tissues of a freshwater snail. A sporocyst develops from a first stage larva (see **MIRACIDIUM**) and gives rise either to the next larval stage (see **REDIA**) or daughter sporocysts. The latter develop directly into the final larval stage (see **CERCARIA**) without the intermediate redia stage.

**sporogony** *n.* the formation of **\*sporozoites** during the life cycle of a sporozoan. The contents of the zygote, formed by the fusion of sex cells, divide repeatedly and eventually release a number of sporozoites. *Compare* **SCHIZOGONY**.

**sporotrichosis** *n.* a chronic infection of the skin and superficial lymph nodes that is caused by the fungus *Sporothrix schenckii* and results in the formation

of abscesses and ulcers. It occurs mainly in the tropics.

**Sporozoa** *n.* a group of parasitic protozoans that includes *\*Plasmodium*, the malaria parasite. Most sporozoans do not have cilia or flagella. Sporozoan life cycles are complex and usually involve both sexual and asexual stages. Some sporozoans are parasites of invertebrates, and the parasites are passed to new hosts by means of spores. Sporozoans that parasitize vertebrates are transmitted from host to host by invertebrates, which act as intermediate hosts. For example, the mosquito *Anopheles* is the intermediate host of *Plasmodium*.

**sporozoite** *n.* one of the many cells formed as a result of *\*sporogony* during the life cycle of a sporozoan. In *\*Plasmodium* sporozoites are formed by repeated divisions of the contents of the *\*oocyst* inside the body of the mosquito. The released sporozoites ultimately pass into the insect's salivary glands and await transmission to a human host at the next blood meal.

**sports injury** any injury related to the practice of a sport, often resulting from the overuse and stretching of muscles, tendons, and ligaments.

**sports medicine** a specialty concerned with the treatment of *\*sports injuries* and measures designed to prevent or minimize them (e.g. in the design of sports equipment).

**spotted fever** *see* MENINGITIS; ROCKY MOUNTAIN SPOTTED FEVER; TYPHUS.

**sprain** *n.* injury to a ligament, caused by sudden overstretching. As the ligament is not severed it gradually heals, but this may take several months. Sprains should be treated by cold compresses (ice-packs) at the time of injury, and later by restriction of activity.

**Sprengel's deformity** a congenital abnormality of the scapula (shoulder blade), which is small and positioned high in the shoulder. It is caused by failure of the normal development and descent of this bone. [O. G. K. Sprengel (1852–1915), German surgeon]

**sprue (psilosis)** *n.* impaired absorption of food due to disease of the small intestine. **Tropical sprue** is seen in people from temperate regions who move to the tropics. It is characterized by diarrhoea (usually *\*steatorrhoea*), an

inflamed tongue (glossitis), anaemia, and weight loss; the lining of the small intestine becomes inflamed and atrophied, leading to vitamin and micronutrient deficiencies. Its cause is unknown, but infection is most likely. Treatment with antibiotics and **\*folic acid** is usually effective, but the condition often improves spontaneously on return to a temperate climate. *See also* **COELIAC DISEASE**; **MALABSORPTION**.

**spud** *n.* a blunt needle used for removing foreign bodies embedded in the cornea of the eye.

**spur** *n.* a sharp projection, especially one of bone.

**sputum** *n.* material coughed up from the respiratory tract. Its characteristics, including colour, consistency, volume, smell, and the appearance of any solid material within it, often provide important information affecting the diagnosis and management of respiratory disease. Pathological examination of sputum for microorganisms and for abnormal cells may add further information.

**squalene** *n.* an unsaturated hydrocarbon (a terpene), synthesized in the body, from which **\*cholesterol** is derived.

**squama** *n.* (*pl.* squamae) **1.** a thin plate of bone. **2.** a scale, such as any of the scales from the cornified layer of the **\*epidermis**.

**squamo-** *combining form denoting* **1.** the squamous portion of the temporal bone. **2.** squamous epithelium.

**squamous bone** *see* **TEMPORAL BONE**.

**squamous cell carcinoma (SCC)** any cancer of squamous epithelium, arising from such tissues as the skin and the lining of the upper airways and digestive tract (especially in the head and neck). SCC is the second commonest form of skin cancer (after **\*basal cell carcinoma**), occurring usually in late-middle and old age. Cumulative sun exposure is the commonest cause but other environmental carcinogens may be responsible. Renal transplant patients are at particularly high risk of this tumour. SCC is mainly found on areas exposed to light and is three times more common in men than in women. SCC grows faster than basal cell carcinoma; it spreads locally at first but later may spread to sites distant from its origin (*see* **METASTASIS**). Treatment is usually by surgical excision or radiotherapy.

**squamous epithelium** *see* EPITHELIUM.

**squint** *n. see* STRABISMUS.

**SRY** sex reversal on Y. *See* Y CHROMOSOME.

**SSG** *see* SPLIT-SKIN GRAFT.

**SSPE** *see* SUBACUTE SCLEROSING PANENCEPHALITIS.

**SSRI** (selective serotonin reuptake inhibitor) any one of a group of **\*antidepressant** drugs that exert their action by blocking the reabsorption of the neurotransmitter **\*serotonin** by the nerve endings in the brain. Their effect is to prolong the action of serotonin in the brain. As well as depression, SSRIs are used to treat anxiety, generalized anxiety disorder, panic disorder, obsessive–compulsive disorder, post-traumatic stress disorder, and phobias. The group includes **\*citalopram**, **escitalopram**, **\*fluoxetine**, **\*fluvoxamine**, **\*paroxetine**, and **\*sertraline**. Nausea, indigestion, abdominal pain, and other gastrointestinal disturbances are the most common side-effects.

**stadium** *n. (pl. stadia)* a stage in the course of a disease; for example, the **stadium invasionis** is the period between exposure to infection and the onset of symptoms.

**stage** *vb.* (in oncology) to classify a primary tumour by its size and the presence or absence of metastases. In addition to clinical examination, a variety of imaging and surgical techniques may be employed to provide a more accurate assessment. Staging tumours is of importance in prognosis and defining appropriate treatment. *See also* TNM CLASSIFICATION.

**staghorn calculus** a branched stone forming a cast of the collecting system of the kidney and therefore filling the calyces and pelvis. The stone is usually associated with infected urine, the commonest organism being *Proteus vulgaris*. The combination of obstruction and infection can cause **\*pyonephrosis** and, if neglected, a **\*perinephric abscess**. Treatment involves a **\*percutaneous nephrolithotomy**.

**stagnant loop syndrome** *see* BLIND LOOP SYNDROME.

**stain** **1.** *n.* a dye used to colour tissues and other specimens for microscopical examination. In an **acid stain** the colour is carried by an acid radical and the stain is taken up by parts of the specimen having a basic (alkaline) reaction. In a **basic stain** the colour, carried by a basic radical, is attracted to parts of the specimen having an acidic reaction. **Neutral stains** have neither acidic nor basic affinities. A **contrast stain** is used to give colour to parts of a tissue not affected by a previously applied stain. A **differential stain** allows different elements in a specimen to be distinguished by staining them in different colours. **2.** *vb.* to treat a specimen for microscopical study with a stain.

**stammering (stuttering)** *n.* halting articulation with interruptions to the normal flow of speech and repetition of the initial consonants of words or syllables. It usually first appears in childhood and the symptoms are most severe when the stammerer is under any psychological stress. It is not a symptom of organic disease and it will usually respond to the re-education of speech by a trained therapist. —**stammerer** *n.*

**standard deviation** (in statistics) a measure of the dispersion of data about their arithmetic **\*mean**, which is calculated from the square root of the **variance** of the readings in the series. The arithmetic sum of the amounts by which each observation varies from the mean must be zero, but if these variations are squared before being summated, a positive value is obtained: the mean of this value is the variance. (In practice a more reliable estimate of variance is obtained by dividing the sum of the squared deviations by one *less* than the total number of observations.) A large standard deviation indicates that data points vary across a wide range of values, whereas a small standard deviation indicates the opposite. *See also* **SIGNIFICANCE**.

**standard error of the mean (SEM)** the **\*standard deviation** within a sample of observations divided by the square root of the number of observations comprising that sample. The SEM measures the extent to which the means of several different samples taken repeatedly from the same population would vary. It is therefore an indication of the accuracy of the sample mean as an estimate of the mean of the population as a whole.

**standardized mortality ratio (SMR)** the ratio of observed mortality rate to expected mortality rate (calculated using indirect standardization), expressed

as an integer where 100 represents agreement between observed and expected rates. See [STANDARDIZED RATES](#).

**standardized rates** rates used to summarize the [\\*morbidity](#) or [\\*mortality](#) experience of a population. Age-specific rates and population structures from a study population and a reference or [\\*standard population](#) are used to produce a weighted average. Standardized rates can be used to compare the health experience of populations with different structures. **Direct standardization** requires application of age-specific rates from a study population to a reference population structure (e.g. the European standard population) to produce a (**directly**) **standardized rate**. **Indirect standardization** requires application of age-specific rates from a standard population (e.g. England and Wales) to a study population structure to produce an expected morbidity or mortality rate. Compare [CRUDE RATE](#).

**standard population** a notional population used in standardization (see [STANDARDIZED RATES](#)). The **European standard population** is a population of two million, with a defined age structure. It is younger than the England population, and has similar age structures for males and females.

**stapedectomy** *n.* surgical removal of the third ear ossicle (stapes), enabling it to be replaced with a prosthetic bone in the treatment of [\\*otosclerosis](#). A modification of this procedure involves creating a small hole in the base (footplate) of the stapes using a microdrill or laser, rather than completely removing the stapes. This allows insertion of the prosthesis through the hole and is referred to as **stapedotomy**. Most surgeons consider this procedure to be safer than stapedectomy.

**stapedial reflex** reflex contraction of the **stapedius** muscle in the middle ear, attached to the [\\*stapes](#) bone, in response to loud sounds. This protects the cochlea from noise damage by limiting the amount of sound that is transmitted via the stapes. The reflex can be measured using a [\\*tympanometer](#).

**stapes** *n.* a stirrup-shaped bone in the middle [\\*ear](#) that articulates with the incus and is attached to the membrane of the fenestra ovalis. See [OSSICLE](#).

**staphylectomy** *n.* see [UVULECTOMY](#).

**staphylococcal scalded skin syndrome (Ritter's disease)** a potentially serious condition of young infants (and occasionally seen in adults) in which the skin becomes reddened and tender and then peels off, giving the appearance of a scald. The area of skin loss may be quite extensive and is usually centred on the armpits and groin. The underlying cause is an infection by certain bacteria of the genus *\*Staphylococcus*. It is contagious and may occur in clusters. Treatment is by antibiotics (usually intravenous), but careful nursing is essential to prevent skin damage. Admission to hospital is mandatory for small children.

**Staphylococcus** *n.* a genus of Gram-positive nonmotile spherical bacteria occurring in grapelike clusters. Some species are saprophytes; others parasites. Many species produce *\*exotoxins*. The species *S. aureus* is commonly present on skin and mucous membranes; it causes boils and internal abscesses. More serious infections caused by staphylococci include pneumonia, bacteraemia, osteomyelitis, and enterocolitis. *See also* **MRSA**.  
—**staphylococcal** *adj.*

**staphyloma** *n.* abnormal bulging of the cornea or sclera (white) of the eye. **Anterior staphyloma** is a bulging scar in the cornea to which a part of the iris is attached. It is usually the site of a healed corneal ulcer that has penetrated right through the cornea; the iris blocks the hole and prevents the further leakage of fluid from the front chamber of the eye. In **ciliary staphyloma** the sclera bulges over the ciliary body as a result of high pressure inside the eyeball. A bulging of the sclera at the back of the eye (**posterior staphyloma**) occurs in some severe cases of short-sightedness.

**staphylorrhaphy (palatorrhaphy, uraniscorrhaphy)** *n.* surgical suture of a cleft palate.

**staple** *n.* (in surgery) a piece of metal used to join up pieces of tissue. Staples can be used as an alternative to *\*sutures* for an *\*anastomosis* or to bring together the skin edges of an incision; stapling machines have been produced for this purpose. *See also* **ENDOSTAPLER**.

**starch** *n.* the form in which *\*carbohydrates* are stored in many plants and a major constituent of the diet. Starch consists of linked glucose units and occurs in two forms,  **$\alpha$ -amylose** and **amylopectin**. In  $\alpha$ -amylose the units are in the form of a long unbranched chain; in amylopectin they form a branched

chain. The presence of starch can be detected using iodine:  $\alpha$ -amylose gives a blue colour with iodine; amylopectin a red colour. Starch is digested by means of the enzyme *\*amylase*. *See also* [DEXTRIN](#).

**Starling's law** a law stating that, within certain limits, a muscle (including the heart muscle) responds to increased stretching at rest by an increased force of contraction when stimulated. [E. H. Starling (1866–1927), British physiologist]

**startle reflex** *see* [MORO REFLEX](#).

**starvation** *n. see* [MALNUTRITION](#).

**stasis** *n.* stagnation or cessation of flow; for example, of blood or lymph whose flow is obstructed or of the intestinal contents when onward movement (peristalsis) is hindered.

**-stasis** *combining form denoting* stoppage of a flow of liquid; stagnation. Example: **haemostasis** (of blood).

**statementing** *n.* the provision by a local authority of a statement of *\*special educational needs* for children attending school who have mental or physical disabilities severe enough to require extra help at school.

**statement of fitness for work** a medical certificate that replaced forms Med 3 and Med 5 in April 2010 (*see* [Appendix 8](#)).

**static reflex** the reflex maintenance of muscular tone for posture.

**statin** *n.* any one of a class of drugs that inhibit the action of an enzyme involved in the liver's production of cholesterol (*see* [HMG CoA REDUCTASE](#)). Statins can lower the levels of *\*low-density lipoproteins* (LDLs) by 25–45% and are used mainly to treat hypercholesterolaemia but also to reduce the risk of coronary heart disease in susceptible patients. Muscle inflammation and breakdown (*see* [RHABDOMYOLYSIS](#)) is a rare but serious side-effect of statins. The class includes *\*atorvastatin*, **fluvastatin**, *\*pravastatin*, **rosuvastatin**, and *\*simvastatin*.

**status asthmaticus** a severe attack of asthma, which often follows a period of poorly controlled asthma. Patients are distressed and very breathless and

may die from respiratory failure if not vigorously treated with inhaled oxygen, nebulized or intravenous bronchodilators, and corticosteroid therapy; sedatives are absolutely contraindicated. These patients need hospital care in an intensive care unit.

**status epilepticus** the occurrence of repeated epileptic seizures without any recovery of consciousness between them. Its control is a medical emergency, since prolonged status epilepticus may lead to the patient's death or long-term disability.

**status lymphaticus** enlargement of the thymus gland and other parts of the lymphatic system, formerly believed to be a predisposing cause to sudden death in infancy and childhood associated with hypersensitivity to drugs or vaccines.

**Statutory Sick Pay** benefit payable to employees who are unable to work because of illness.

**STD** *see* **SEXUALLY TRANSMITTED DISEASE**.

**steapsin** *n. see* **LIPASE**.

**stearic acid** *see* **FATTY ACID**.

**steat-** (**steato-**) *combining form denoting* fat; fatty tissue.

**steatoma** *n.* any cyst or tumour of a sebaceous gland.

**steatopygia** *n.* the accumulation of large quantities of fat in the buttocks.

**steatorrhoea** *n.* the passage of excess fat in the faeces (more than 5 g/day) due to reduced absorption of fat by the intestine (*see* **MALABSORPTION**). The faeces are pale, malodorous, may look greasy, and are difficult to flush away.

**steatosis** *n.* infiltration of **\*hepatocytes** with fat. This may occur in alcoholism, obesity, metabolic syndrome, pregnancy, malnutrition, viral hepatitis, or certain drugs (such as oestrogens or steroids).

**Steele–Richardson–Olszewski syndrome** *see* **PROGRESSIVE SUPRANUCLEAR PALSY**. [J. C. Steele and J. C. Richardson (20th century),

Canadian neurologists; J. Olszewski (1913–64), Polish-born Canadian neuropathologist]

**Stein–Leventhal syndrome** *see* **POLYCYSTIC OVARY SYNDROME**. [I. F. Stein and M. L. Leventhal (20th century), U.S. gynaecologists]

**stellate fracture** a star-shaped fracture of the kneecap caused by a direct blow. The bone may be either split or severely shattered; if the fragments are displaced, the bone may need to be surgically repaired or rarely removed (**patellectomy**).

**stellate ganglion** a star-shaped collection of sympathetic nerve cell bodies in the root of the neck, from which sympathetic nerve fibres are distributed to the face and neck and to the blood vessels and organs of the thorax.

**Stellwag’s sign** apparent widening of the distance between the upper and lower eyelids (the palpebral fissure) due to retraction of the upper lid and protrusion of the eyeball. It is a sign of exophthalmic **\*goitre**. [C. Stellwag von Carion (1823–1904), Austrian ophthalmologist]

**stem cell** an undifferentiated cell that is able to renew itself and produce specialized cells. **Embryonic stem cells** at the **\*blastocyst** stage of development can differentiate into almost any cell type (except placental cells); they are described as **pluripotent**. Embryonic cells preceding the blastocyst, produced by the first 3–4 divisions of the fertilized egg, are capable of producing all the different cell types required by the developing embryo (i.e. they are **totipotent**). **Adult stem cells** (also known as **somatic stem cells**) occur in many tissues and organs, including bone marrow (*see* **HAEMOPOIETIC STEM CELL**), muscle, liver, pancreas, etc., and can produce the specialized cells needed in the particular tissue or organ in which they arise (i.e. they are **multipotent**). *See also* **UMBILICAL CORD BLOOD BANKED STEM CELLS**.

**STEMI** S–T elevation **\*myocardial infarction**.

**Stemmer’s sign** inability to lift and pinch the skin of the base of the second toe, which is characteristic of lymphoedema. [R. Stemmer (1925–2000), French phlebologist]

**steno-** combining form denoting **1.** narrow. Example: **stenocephaly** (narrowness of the head). **2.** constricted.

**stenopaedic** *adj.* (in ophthalmology) describing an optical device consisting of an opaque disc punctured with a fine slit or hole (or holes), which is placed in front of the eye in the same position as glasses and enables sharper vision in cases of gross long- or short-sightedness or astigmatism. It sharpens the image formed on the retina because it confines the light reaching the eye to one or more fine beams, which pass through the centre of the lens undeviated by refractive error. The same principle is used in the pin-hole camera.

**stenosis** *n.* the abnormal narrowing of a passage or opening, such as a blood vessel or heart valve. *See* **AORTIC STENOSIS**; **CAROTID ARTERY STENOSIS**; **MITRAL STENOSIS**; **PULMONARY STENOSIS**; **PYLORIC STENOSIS**.

**stenostomia (stenostomy)** *n.* the abnormal narrowing of an opening, such as the opening of the bile duct.

**Stensen's duct** the long secretory duct of the **\*parotid** salivary gland. [N. Stensen (1838–86), Danish physician]

**stent** *n.* a tube placed inside a tubular structure in the body to keep it open. It may be a simple plastic or metal tube; the former are more easily removable, while the latter give a larger lumen for a given outer diameter. Metallic stents are further divided into self-expanding stents, which open up by themselves on deployment, and balloon-expandable stents, which need to be expanded with the use of a balloon. Stents may be used at operation to aid healing of an anastomosis, for example of a ureter. Alternatively they can be placed across an obstruction to maintain an open lumen, for example in obstruction due to tumour in the oesophagus, stomach, bile ducts, colon, or ureter. In an artery after **\*angioplasty**, stents help to prevent recoiling. The stents used in coronary artery disease are balloon-expandable and nowadays are coated with drugs that inhibit growth of the scar tissue (neointimal hyperplasia) responsible for recurrent stenosis. These are known as **drug-eluting stents**.

**stepping reflex** a primitive reflex in newborn babies that should disappear by the age of two months. If the baby is held in a 'walking' position with the

feet touching the ground, the feet move in a 'stepping' manner. Persistence of this reflex beyond two months is suggestive of **\*cerebral palsy**.

**sterc-** *combining form denoting faeces.*

**stercobilin** *n.* a brownish-red pigment formed during the metabolism of the **\*bile pigments** biliverdin and bilirubin, which are derived from haemoglobin. Stercobilin is subsequently excreted in the urine or faeces.

**stercolith** *n.* a solid mass of dried compressed faeces.

**stereognosis** *n.* the ability to recognize the three-dimensional shape of an object by touch alone. This is a function of the **\*association areas** of the parietal lobe of the brain. *See also* **AGNOSIA**.

**stereoisomers** *pl. n.* compounds having the same molecular formula but different three-dimensional arrangements of their atoms. The atomic structures of stereoisomers are mirror images of each other.

**stereopsis** *n. see* **STEREOSCOPIC VISION**.

**stereoscopic vision (stereopsis)** perception of the shape, depth, and distance of an object as a result of having **\*binocular vision**. The brain receives two distinct images from the eyes, which it interprets as a single three-dimensional image.

**stereotactic localization** the accurate localization, with the help of scans, of structures within the body by using three-dimensional measurements. It enables the accurate positioning within the body of radiotherapy beams or sources for the treatment of tumours and of localizing wires for the biopsy of small tumours. *See also* **STEREOTAXY**; **CYBERKNIFE**; **GAMMA KNIFE**.

**stereotaxy (stereotactic surgery)** *n.* a surgical procedure in which a deep-seated area in the brain is operated upon after its position has been established very accurately by three-dimensional measurements using CT or MRI. The operation may be performed using an electrical current or by heat, cold, or mechanical techniques. *See also* **LEUCOTOMY**.

**stereotypy** *n.* the constant repetition of a complex action, which is carried out in the same way each time. It is seen in **\*catatonia** and **\*autism**; sometimes it is an isolated symptom in people with **\*learning disability**. It is

more common in patients who live in institutions where they are bored and unstimulated and can sometimes cause physical injury to the patient.

**sterile** *adj.* **1.** (of a living organism) barren; unable to reproduce its kind (*see* **STERILITY**). **2.** (of inanimate objects) completely free from bacteria, fungi, viruses, or other microorganisms that could cause infection.

**sterility** *n.* inability to have children, either due to **\*infertility** or (in someone who has been fertile) deliberately induced by surgical procedures as a means of contraception (*see* **STERILIZATION**). Sterility may also be an incidental result of an operation or drug treatment undertaken for other reasons, such as removal of the uterus (**\*hysterectomy**) because of cancer.

**sterilization** *n.* **1.** a surgical operation or any other process that induces **\*sterility** in men or women. In women, hysterectomy and bilateral oophorectomy (surgical removal of both ovaries) are 100% effective and permanent. Alternatively, the Fallopian tubes may be removed (*see* **SALPINGECTOMY**) or divided and/or ligated. These operations can be performed through the abdomen or the vagina. The modern technique (**tubal occlusion**) is to occlude (close) permanently the inner (lower) half of the Fallopian tube through a **\*laparoscope**. The occluding device is usually a clip (the **Hulka-Clemens** or **Filshie clips**) or a small plastic ring (**Falope ring**); **\*diathermy** coagulation carries greater dangers (e.g. bowel burns) and is now little used. A more recent method is the use of a rapid-setting plastic introduced into the tubes through a hysteroscope (*see* **HYSTEROSCOPY**). Men are usually sterilized by **\*vasectomy**. *See also* **CASTRATION**. **2.** the process by which all types of microorganisms (including spores) are destroyed. This is achieved by the use of heat, radiation, chemicals, or filtration. *See also* **AUTOCLAVE**.

**stern-** (**sterno-**) *combining form denoting the sternum.* Example: **sternocostal** (relating to the sternum and ribs).

**Sternberg–Reed cell** *see* **REED–STERNBERG CELL**.

**sternebra** *n.* (*pl.* **sternebrae**) one of the four parts that fuse during development to form the body of the sternum.

**sternocleidomastoid muscle** *see* **STERNOMASTOID MUSCLE**.

**sternohyoid** *n.* a muscle in the neck, arising from the sternum and inserted into the hyoid bone. It depresses the hyoid bone.

**sternomastoid muscle (sternocleidomastoid muscle)** a long muscle in the neck, extending from the mastoid process to the sternum and clavicle. It serves to rotate the neck and flex the head.

**sternomastoid tumour** a small painless nonmalignant swelling in the lower half of the **\*sternomastoid muscle**, appearing a few days after birth. It occurs when the neck of the fetus is in an abnormal position in the uterus, which interferes with the blood supply to the affected muscle, and it is most common after breech births. The tumour may cause a slight tilt of the head towards the tumour and turning of the face to the other side. This can be corrected by physiotherapy aimed at increasing all movements of the body, but without stretching the neck.

**sternotomy** *n.* surgical division of the breastbone (sternum), performed to allow access to the heart and its major vessels.

**sternum** *n.* (*pl.* sterna) the breastbone: a flat bone, 15–20 cm long, extending from the base of the neck to just below the diaphragm and forming the front part of the skeleton of the thorax. The sternum articulates with the collar bones (*see* **CLAVICLE**) and the costal cartilages of the first seven pairs of ribs. It consists of three sections: the middle and longest section – the **body** or **gladiolus** – is attached to the **\*manubrium** at the top and the **\*xiphoid (or ensiform) process** at the bottom. The manubrium slopes back from the body so that the junction between the two parts forms an angle (**angle of Louis** or **sternal angle**). —**sternal** *adj.*

**steroid** *n.* one of a group of compounds having a common structure based on the **steroid nucleus**, which consists of three six-membered carbon rings and one five-membered carbon ring. The naturally occurring steroids include the male and female sex hormones (**\*androgens** and **\*oestrogens**), the hormones of the adrenal cortex (*see* **CORTICOSTEROID**), **\*progesterone**, **\*bile salts**, and **\*sterols**. Synthetic steroids have been produced for therapeutic purposes.

**steroid card** a card that must be carried by patients taking long-term corticosteroid medication, particularly if high doses are used. The card states

that in an emergency treatment with steroids must not be suddenly stopped since this may precipitate an *\*Addisonian crisis*.

**sterol** *n.* one of a group of *\*steroid* alcohols. The most important sterols are *\*cholesterol* and *\*ergosterol*.

**stertor** *n.* a snoring type of noisy breathing heard in deeply unconscious patients.

**steth-** (**stetho-**) *combining form denoting the chest.*

**stethoscope** *n.* an instrument used for listening to sounds within the body, such as those in the heart and lungs (*see* *AUSCULTATION*). A simple stethoscope usually consists of a diaphragm or an open bell-shaped structure (which is applied to the body) connected by rubber or plastic tubes to earpieces for the examiner. More complicated devices may contain electronic amplification systems to aid diagnosis.

**stevia** *n.* a sugar substitute that is 200 to 300 times sweeter than table sugar. Extracted from *Stevia rebaudiana*, it is used as a low-calorie sweetener.

**sthenia** *n.* a state of normal or greater than normal strength. *Compare* *ASTHENIA*. —**sthenic** *adj.*

**stigma** *n.* (*pl.* *stigmata*) **1.** a mark that characterizes a particular disease, such as the *\*café au lait spots* characteristic of neurofibromatosis. **2.** any spot or lesion on the skin. **3.** any condition or disposition that makes a person the subject of moral reproach by society and thus creates a potential barrier to access to health care.

**stilet** (**stylet, stylus**) *n.* **1.** a slender probe. **2.** a wire placed in the lumen of a catheter to give it rigidity while the instrument is passed along a body canal (such as the urethra).

**stillbirth (intrauterine fetal death)** *n.* birth of a fetus that shows no evidence of life (heartbeat, respiration, or independent movement) at any time later than 24 weeks after conception. Under the Stillbirth (Definition) Act 1992, there is a legal obligation to notify all stillbirths to the appropriate authority. The number of such births expressed per 1000 births (live and still) is known as the **stillbirth rate**. In legal terms, viability is deemed to start at the 24th week of pregnancy and a fetus born dead before this time is

known as a *\*miscarriage* or *\*abortion*. However, some fetuses born alive before the 24th week may now survive as a result of improved perinatal care. *See also* [CONFIDENTIAL ENQUIRIES](#).

<https://www.uk-sands.org/>

- Website of Sands (Stillbirth and Neonatal Death Society)

**Still's disease** **1.** *see* [JUVENILE IDIOPATHIC ARTHRITIS](#). **2.** (**adult-onset Still's disease**) a systemic inflammatory disease characterized by a spiking fever, joint pain, and a salmon pink rash that comes and goes. Treatment includes NSAIDs, corticosteroids, or disease-modifying antirheumatic drugs. [Sir G. F. Still (1868–1941), British physician]

**stimulant** *n.* an agent that promotes the activity of a body system or function. *\*Amphetamines*, *\*methylphenidate*, and *\*caffeine* are stimulants of the central nervous system; *\*doxapram* is a respiratory stimulant (*see* [ANALEPTIC](#)).

**stimulator** *n.* any apparatus designed to stimulate nerves and muscles for a variety of purposes. It can be used to stimulate particular areas of the brain or to block pain (as in *\*transcutaneous electrical nerve stimulation*).

**stimulus** *n.* (*pl.* stimuli) any agent that provokes a response, or particular form of activity, in a cell, tissue, or other structure, which is said to be sensitive to that stimulus.

**stippling** *n.* a spotted or speckled appearance, such as is seen in the retina in certain eye diseases or in abnormal red blood cells stained with basic dyes.

**stirrup** *n.* (in anatomy) *see* [STAPES](#).

**stitch** *n.* **1.** a sharp localized pain, commonly in the abdomen, associated with strenuous physical activity (such as running), especially shortly after eating. It is a form of cramp. **2.** *see* [SUTURE](#).

**stock culture** *see* [CULTURE](#).

**Stokes–Adams syndrome (Adams–Stokes syndrome)** attacks of temporary loss of consciousness (*\*syncope*) that occur when blood flow ceases due to

severe *\*bradycardia*. This syndrome may complicate *\*heart block*. [W. Stokes (1804–78) and R. Adams (1791–1875), Irish physicians]

**stoma** *n.* (*pl.* stomata) **1.** (in anatomy) the mouth or any mouthlike part. **2.** (in surgery) the artificial opening of a hollow organ (e.g. the colon or ileum) that has been brought to the abdominal surface (*see* *COLOSTOMY*; *ILEOSTOMY*). **Stoma therapists** are nurses specially trained in the care of these artificial openings and the appliances used with them. —**stomal** *adj.*

**stomach** *n.* a distensible saclike organ that forms part of the alimentary canal between the oesophagus (gullet) and the duodenum (see illustration overleaf). It communicates with the former by means of the **lower oesophageal sphincter** (LOS), or **cardiac sphincter**, and with the latter by the **pyloric sphincter**. The stomach lies just below the diaphragm, to the right of the spleen and partly under the liver. Its function is to continue the process of digestion that begins in the mouth. *\*Gastric juice*, secreted by gastric glands in the mucosa, contains hydrochloric acid and the enzyme *\*pepsin*, which contribute to chemical digestion. This – together with the churning action of the muscular layers of the stomach – reduces the food to a semiliquid partly digested mass that passes on to the duodenum.

**Stomach.** Regions of the stomach seen from the front (above); layers of the stomach wall (below).

**stomach stapling (gastric stapling, vertical banded gastroplasty)** restrictive **\*bariatric surgery** in which staples are inserted into the wall of the stomach to form a small pouch, which restricts the amount of food that can be

eaten. At the same time a gastric band is applied to limit the size of the opening between the pouch and the rest of the stomach.

**stomat-** (**stomato-**) *combining form denoting the mouth.*

**stomatitis** *n.* any inflammation affecting the mucous membranes of the mouth and lip, with or without ulceration. It can have a multitude of different appearances and causes.

**stomatology** (**oral medicine**) *n.* the medical specialty concerned with the structures, functions, and diseases of the mouth. It represents the point at which medicine meets dentistry.

**stomodeum** *n.* the site of the embryonic mouth, marked by a depression lined with ectoderm from which the teeth develop. The membrane separating it from the foregut breaks down by the end of the first month of pregnancy. *Compare* **PROCTODEUM**.

**-stomy** (**-ostomy**) *combining form denoting a surgical opening into an organ or part. Example: colostomy* (into the colon).

**stone** *n. see* **CALCULUS**.

**stool** *n.* **\*faeces** discharged from the anus.

**STOP-Bang** *n.* a questionnaire used to predict patients who have **\*obstructive sleep apnoea**. The name is an acronym of snoring, tiredness, observed apnoeas, high blood pressure, BMI, age, neck size, and gender.

**stop needle** a surgical needle with a shank that has a protruding collar to stop it when the needle has been pushed a prescribed distance into the tissue. A stop needle has the eye at the tip.

**strabismus** (**heterotropia**) *n.* squint: abnormal alignment of the two eyes. The strabismus is most commonly horizontal – **convergent strabismus** (or **esotropia**) or **divergent strabismus** (**exotropia**) – but it may be vertical (**hypertropia**, in which the eye looks upwards, or **hypotropia**, in which it looks downwards). In rare cases both eyes look towards the same point but one is twisted clockwise or anticlockwise in relation to the other (**cyclotropia**). Usually strabismus is **concomitant**, i.e. the abnormal alignment of the two eyes remains fairly constant, in whatever direction the

person is looking. Strabismus acquired by injury or disease is usually **incomitant**, i.e. the degree of misalignment varies in different directions of gaze. *See also* [COVER TEST](#); [DEVIATION](#); [DIVERGENCE](#); [HETEROPHORIA](#).

**strain 1.** *n.* excessive stretching or working of a muscle, resulting in pain and swelling of the muscle. *Compare* [SPRAIN](#). **2.** *n.* a group of organisms, such as bacteria, obtained from a particular source or having special properties distinguishing them from other members of the same species. **3.** *vb.* to damage a muscle by overstretching.

**strain gauge** a sensitive instrument for measuring tension and alterations in pressure. It is extensively used in medical instruments.

**strangulated** *adj.* describing a part of the body whose blood supply has been interrupted by compression of a blood vessel, as may occur in a loop of intestine trapped in a [\\*hernia](#).

**strangulation** *n.* the closure of a passage, such as the main airway to the lungs (resulting in the cessation of breathing), a blood vessel, or the gastrointestinal tract.

**strangury** *n.* severe pain in the urethra referred from the base of the bladder and associated with an intense desire to pass urine. It occurs when the base of the bladder is irritated by a stone or an indwelling catheter. It is also noted in patients with an invasive cancer of the base of the bladder or severe [\\*cystitis](#) or [\\*prostatitis](#), when the strong desire to urinate is accompanied by the painful passage of a few drops of urine.

**Strassman procedure** an operation to correct a double uterus (*see* [UTERUS DIDELPHYS](#)). It has now largely been replaced by hysteroscopic techniques. [P. F. Strassman (1866–1938), German obstetrician and gynaecologist]

**strategic health authority (SHA)** formerly a statutory organization in England that was responsible for strategic leadership, building capacity, organizational development, and performance management in the local National Health Service. SHAs were abolished by the Health and Social Care Act 2012; their responsibilities passed to [\\*NHS England](#), [\\*clinical commissioning groups](#), and [\\*Public Health England](#).

**stratum** *n.* a layer of tissue or cells, such as any of the layers of the \*epidermis of the skin (the **stratum corneum** is the outermost layer).

**strawberry mark (strawberry naevus)** *see* **NAEVUS**.

**streak** *n.* (in anatomy) a line, furrow, or narrow band. *See also* **PRIMITIVE STREAK**.

**Street names for illicit drugs**

[www.talktofrank.com](http://www.talktofrank.com)

Illicit drug	slang/street names (can vary around the country and with differing forms of the drug)
amphetamines:	speed, phet, Billy, whizz, sulph, base, paste, dexies, bennies, black beauties, uppers
alkyl nitrites:	poppers, ram, thrust, rock hard, kix, TNT, liquid gold
cannabis:	bang, black, blast, blow, blunts, Bob Hope, bush, bud, dope, draw, ganja, grass, hash, hashish, hemp, herb, marijuana, pot, puff, Northern Lights, resin, sensi, sinsemilla, shit, skunk, smoke, soap, spliff, wacky backy, weed, zero.
	Some names are based on where it comes from: Afghan, homegrown, Moroccan, etc.
cocaine and crack	powder cocaine: coke, Charlie, C, white, Percy, snow, toot.
	crack (a smokeable form of cocaine): rocks, wash, stones, pebbles, base, freebase
Ecstasy:	E, pills, brownies, Mitsubishi's, Rolex's, Dolphins, XTC, crystal, cowies, mandy
gases, glues, and aerosols:	thinners, volatile substances, whippets, tooting, solvents, petrol, inhalants, huffing, glues, gas, dusting, chroming, butane, aerosols
GHB (gamma-hydroxybutyrate):	GHB, GBH, liquid Ecstasy, geebs, GBL, 4-BD
heroin:	brown, skag, H, horse, gear, smack
ketamine:	green, K, special K, super K, vitamin K, donkey dust
khat:	quat, qat, qaadka, chat
magic mushrooms:	liberties, magics, mushies, liberty cap, shrooms, Amani, agaric, philosopher's stone
LSD (lysergic acid diethylamide):	acid, blotter, cheer, dots, drop, flash, hawk, L, lightening flash, liquid acid, Lucy, microdot, paper mushrooms, rainbows, smilies, stars, tab, trips, tripper, window
	Sometimes LSD is known by the pictures on it, e.g. strawberries
Tranquillizers:	jellies, benzos, eggs, norries, rugby balls, vallies, moggies, mazzies, roofies, downers, blues

**Streptobacillus** *n.* a genus of Gram-negative aerobic nonmotile rodlike bacteria that tend to form filaments. The single species, *S. moniliformis*, is a normal inhabitant of the respiratory tract of rats but causes **\*rat-bite fever** in humans.

**streptococcal toxic shock syndrome** a bacterial disease characterized by fever, shock, and multiple organ failure. It is similar to the **\*toxic shock syndrome** caused by staphylococci, but in these cases the infecting organisms are **\*Streptococcus** Type A bacteria. *See also* **NECROTIZING FASCIITIS**.

**Streptococcus** *n.* a genus of Gram-positive nonmotile spherical bacteria occurring in chains. Most species are saprophytes; some are pathogenic. Many pathogenic species are **haemolytic**, i.e. they have the ability to destroy red blood cells in blood agar. This provides a useful basis for classifying the many different strains. Strains of *S. pyogenes* (the  $\beta$ -haemolytic streptococci) are associated with many infections, including **\*scarlet fever**, and produce many **\*exotoxins**. Strains of the  $\alpha$ -haemolytic streptococci are associated with bacterial **\*endocarditis**. The species *S. pneumoniae* (formerly *Diplococcus pneumoniae*) – the **pneumococcus** – is associated with serious diseases, including pneumonia, pneumococcal **\*meningitis**, and septicaemia; it is also a common bacterial cause of ear infections (*see also* **PNEUMOCOCCAL VACCINE**). It occurs in pairs, surrounded by a capsule (*see* **QUELLUNG REACTION**). *S. mutans* has been shown to cause dental caries. *See also* **LANCEFIELD CLASSIFICATION**; **STREPTOKINASE**. — **streptococcal** *adj.*

**streptodornase** *n.* an enzyme produced by some haemolytic bacteria of the genus *Streptococcus* that is capable of liquefying pus. *See also* **STREPTOKINASE**.

**streptokinase** *n.* an enzyme produced by some haemolytic bacteria of the genus **\*Streptococcus** that is capable of liquefying blood clots (*see also* **FIBRINOLYTIC**). It is given to treat blockage of blood vessels, including deep vein thrombosis, myocardial infarction, and pulmonary embolism (*see* **THROMBOLYSIS**). Side-effects may include digestive upsets, haemorrhage, and fever.

**streptolysin** *n.* an **\*exotoxin** that is produced by strains of *Streptococcus* bacteria and destroys red blood cells.

**Streptomyces** *n.* a genus of aerobic mouldlike bacteria. Most species live in the soil, but some are parasites of animals, humans, and plants; in humans they cause **\*Madura foot**. They are important medically as a source of such antibiotics as **\*streptomycin**, **\*neomycin**, **\*dactinomycin**, and **\*chloramphenicol**.

**streptomycin** *n.* an **\*aminoglycoside** antibiotic, derived from the bacterium *Streptomyces griseus*, that is used in combination with other drugs for

treating tuberculosis and brucellosis. Side-effects causing ear and kidney damage may develop in some patients.

**stress** *n.* any factor that threatens the health of the body or has an adverse effect on its functioning, such as injury, disease, overwork, or worry. The existence of one form of stress tends to diminish resistance to other forms. Constant stress brings about changes in the balance of hormones in the body.

**stress fracture** a fracture occurring in normal bone that has been subjected to excessive and repetitive trauma resulting in cumulative microscopic fractures. Over time, these microfractures exceed the capacity of the normal healing process, resulting in the development of a macroscopic fracture (also known as a **fatigue fracture**). Patients are usually long-distance runners, ballet dancers, footballers, and others who undergo regular intensive training. Pain, localized tenderness, and swelling gradually develop; initially, X-rays are normal, but a bone scan or MRI will usually allow diagnosis to be made. Treatment includes protected weight bearing, rest, cross-training, and (less commonly) surgery.

**stress incontinence** *see* [INCONTINENCE](#).

**stress test** an investigation to seek evidence of cardiac [\\*ischaemia](#). The heart is stressed by exercise or by the administration of an intravenous drug that increases heart rate (i.e. mimicked exercise). Ischaemia may then be detected by electrocardiography (stress ECG or exercise ECG), [\\*echocardiography](#) (showing the development of impaired function in areas of heart muscle that are ischaemic), [\\*myocardial perfusion scan](#), or cardiac MRI.

**stress ulcers** gastric or duodenal ulcers that can be associated with physiological stress from severe head injury (**Cushing's ulcers**) or major burns (**Curling's ulcers**).

**stretch receptor** a cell or group of cells found between muscle fibres that responds to stretching of the muscle by transmitting impulses to the central nervous system through the sensory nerves. Stretch receptors are part of the [\\*proprioceptor](#) system necessary for the performance of coordinated muscular activity.

**stretch reflex (myotatic reflex)** the reflex contraction of a muscle in response to its being stretched.

**stria** *n.* (*pl.* *striae*) (in anatomy) a streak, line, or thin band. The **striae gravidarum** (stretch marks) are the lines that appear on the skin of the abdomen of pregnant women, due to excessive stretching of the elastic fibres. Red or purple during pregnancy, they become white after delivery. The **stria terminalis** is a white band that separates the thalamus from the ventricular surface of the caudate nucleus in the brain.

**striated muscle** a tissue comprising the bulk of the body's musculature. It is also known as **skeletal muscle**, because it is attached to the skeleton and is responsible for the movement of bones, and **voluntary muscle**, because it is under voluntary control. Striated muscle is composed of parallel bundles of multinucleate fibres (each containing many **myofibrils**), which reveal cross-banding when viewed under the microscope. This effect is caused by the alternation of **actin** and **myosin** protein filaments within each myofibril (see illustration). According to the 'sliding filament' theory, when muscle contraction takes place, the two sets of filaments slide past each other, so reducing the length of each unit (**sarcomere**) of the myofibril. The sliding is caused by a series of cyclic reactions, requiring ATP, resulting in a change in orientation of projections on the myosin filaments; each projection is first attached to an actin filament but contracts and releases it to become reattached at a different site.

### Structure of striated muscle.

**stricture** *n.* a narrowing of any tubular structure in the body, such as the oesophagus (gullet), biliary tract, bowel, ureter, or urethra. A stricture may result from inflammation, muscular spasm, growth of a tumour within the affected part, or from pressure on it by neighbouring organs. For example, a **urethral stricture** is a fibrous narrowing of the urethra, usually resulting from injury or inflammation. The patient has increasing difficulty in passing urine and may develop urinary **\*retention**. The site and length of the stricture is assessed by **\*urethrography** and urethroscopy, and treatment is by periodic dilatation of the urethra using **\*sounds**, **\*urethrotomy**, or **\*urethroplasty**. Strictures in the gastrointestinal tract may be dilated by **\*balloons** or treated surgically by **\*stricturoplasty** or division **stricturotomy**. Symptomatic malignant strictures can be managed by insertion of a **\*stent** to relieve the obstruction, especially in cases of oesophageal, colonic, or biliary strictures.

**stricturoplasty** *n.* an operation in which a stricture (usually in the small intestine) is widened by cutting it longitudinally and suturing transversely.

**stridor** *n.* the noise heard on breathing in when the trachea or larynx is obstructed. It tends to be louder and harsher than \*wheeze.

**strobila** *n.* (*pl.* strobilae) the entire chain of segments that make up the body of an adult \*tapeworm.

**stroke (apoplexy)** *n.* a sudden attack of weakness usually affecting one side of the body. It is the consequence of an interruption to the flow of blood to the brain. An **ischaemic stroke** occurs when the flow of blood is prevented by clotting (*see* **THROMBOSIS**) or by a detached clot, either from the heart or a large vessel (such as the carotid artery), that lodges in an artery (*see* **EMBOLISM**). A **haemorrhagic stroke** results from rupture of an artery wall (*see* **CEREBRAL HAEMORRHAGE**). Prolonged reduction of blood pressure may result in more diffuse brain damage, as after a cardiorespiratory arrest. A stroke can vary in severity from a passing weakness or tingling in a limb (*see* **TRANSIENT ISCHAEMIC ATTACK**) to a profound paralysis, coma, and death.

<https://www.stroke.org.uk/>

- Website of the Stroke Association: includes resources for professionals

**stroke volume** the amount of blood ejected from each ventricle on each contraction, which can be affected by medication, exercise, decreases in the volume of circulating blood, or heart anomalies. In a healthy adult, stroke volume is estimated at 70 ml.

**stroma** *n.* the connective tissue basis of an organ, as opposed to the functional tissue (**parenchyma**). For example, the stroma of the erythrocytes is the spongy framework of protein strands within a red blood cell in which the blood pigment haemoglobin is packed; the stroma of the cornea is the transparent fibrous tissue making up the main body of the cornea.

**Strongyloides** *n.* a genus of small slender nematode worms that live as parasites inside the small intestines of mammals. *S. stercoralis* infects the human small intestine (*see* **STRONGYLOIDIASIS**); its larvae, which are passed out in the stools, develop quickly into infective forms.

**strongyloidiasis (strongyloidosis)** *n.* an infestation of the small intestine with the parasitic nematode worm *Strongyloides stercoralis*, common in humid tropical regions. Larvae, present in soil contaminated with human faeces, penetrate the skin of a human host and may produce an itching rash. They migrate to the lungs, where they cause tissue destruction and bleeding, and then via the windpipe and gullet to the intestine. Adult worms burrow into the intestinal wall and may cause ulceration, diarrhoea, abdominal pain, nausea, anaemia, and weakness. Treatment involves use of ivermectin or albendazole.

**strontium** *n.* a yellow metallic element, absorption of which causes bone damage when its atoms displace calcium in bone. The radioactive isotope **strontium-90**, which emits beta rays, is used in radiotherapy for the **\*contact therapy** of skin and eye tumours and in **\*radioimmunotherapy** in combination with **\*monoclonal antibodies**. Another isotope, **strontium-89** (Metastron), has an established role in the treatment of metastatic carcinoma: it is given by intravenous injection for the relief of pain due to bone metastases. Symbol: Sr.

**struma** *n.* (*pl.* strumae) a swelling of the thyroid gland (*see* **GOITRE**). *See also* **RIEDEL'S STRUMA**.

**struma ovarii** a **\*teratoma** of the ovary containing thyroid tissue that becomes overactive and causes thyrotoxicosis. It is diagnosed by radioiodine scanning showing a high uptake in the pelvis; the treatment is surgical removal of the affected ovary.

**strychnine** *n.* a poisonous alkaloid produced in the seeds of the East Indian tree *Strychnos nux-vomica*. In small doses it was formerly widely used in 'tonics'. Poisoning causes painful muscular spasms similar to those of tetanus; the back becomes arched (the posture known as **opisthotonos**) and death is likely to occur from spasm in the respiratory muscles.

**S–T segment** the segment on an **\*electrocardiogram** that represents the interval between the end of ventricular **\*depolarization** (QRS complex) and the beginning of ventricular **\*repolarization** (T wave). The S–T segment is usually depressed by **\*ischaemia** of the heart muscle but raised in the initial phase of myocardial infarction. It is therefore very useful for diagnosis in patients presenting with chest pain.

**Student's t test** *see* **SIGNIFICANCE**. [Pseudonym of W. S. Gosset (1876–1937), British statistician]

**Studer pouch** *see* **CYSTECTOMY**.

**stupe** *n.* any piece of material, such as a wad of cottonwool, soaked in hot water (with or without medication) and used to apply a poultice.

**stupor** *n.* a condition of near unconsciousness, with apparent mental inactivity and reduced ability to respond to stimulation.

**Sturge–Weber syndrome** *see* **ANGIOMA**. [W. A. Sturge (1850–1919) and F. P. Weber (1863–1962), British physicians]

**stuttering** *n. see* **STAMMERING**.

**Stycar tests** Standard Tests for Young Children and Retardates: tests to detect visual problems in children between the ages of six months and five years. They consist of a series of standardized balls, toys, or letters. The tests were developed by the paediatrician Mary Sheridan.

**stye** *n.* acute inflammation of a gland at the base of an eyelash, caused by bacterial infection. The gland becomes hard and tender and a pus-filled cyst develops at its centre. Styes are treated by bathing in warm water or removal of the eyelash involved. Medical name: **hordeolum**.

**stylet** *n. see* **STILET**.

**stylo-** *combining form denoting* the styloid process of the temporal bone. Example: **styломastoid** (relating to the styloid and mastoid processes).

**styloglossus** *n.* a muscle that extends from the tongue to the styloid process of the temporal bone. It serves to draw the tongue upwards and backwards.

**stylohyoid** *n.* a muscle that extends from the styloid process of the temporal bone to the hyoid bone. It serves to draw the hyoid bone backwards and upwards.

**styloid process 1.** a long slender downward-pointing spine projecting from the lower surface of the **\*temporal bone** of the skull. It provides attachment for muscles and ligaments of the tongue and hyoid bone. **2.** any of various

other spiny projections; occurring, for example, at the lower ends of the ulna and radius.

**stylus** *n.* **1.** a pencil-shaped instrument, commonly used for applying external medication; for example, to apply silver nitrate to warts. **2.** *see* **STILET**.

**styptic** *n.* *see* **HAEMOSTATIC**.

**sub-** *prefix denoting* **1.** below; underlying. Examples: **subcostal** (below the ribs); **sublingual** (below the tongue); **submandibular** (below the mandible). **2.** partial or slight.

**subacute** *adj.* describing a disease that progresses more rapidly than a **\*chronic** condition but does not become **\*acute**.

**subacute combined degeneration of the cord** the neurological disorder complicating a deficiency of **\*vitamin B<sub>12</sub>** or folate and often combined with **\*pernicious anaemia**, which causes malabsorption of the vitamin B<sub>12</sub> by the production of intrinsic factor antibodies. There is selective damage to the motor and sensory nerve fibres in the spinal cord, resulting in **\*spasticity** of the limbs and a sensory **\*ataxia**. It may also be accompanied by damage to the peripheral nerves and the optic nerve and by dementia. It is treated by giving vitamin B<sub>12</sub> injections.

**subacute sclerosing panencephalitis (SSPE)** a rare and late complication of **\*measles** characterized by a slow progressive neurological deterioration that is usually fatal. It can occur four to ten years after the initial infection.

**subaponeurotic haemorrhage** bleeding under the **\*aponeurosis** of the scalp resulting from trauma to blood vessels crossing the space from the skull to the overlying scalp. It results from delivery by forceps or vacuum extraction. It is very uncommon but can be fatal. *See also* **CEPHALHAEMATOMA**; **CHIGNON**.

**subarachnoid haemorrhage** sudden bleeding into the subarachnoid space surrounding the brain, which causes severe headache with stiffness of the neck. The usual source of such a haemorrhage is a cerebral **\*aneurysm** that has burst. The diagnosis is confirmed by CT scan or by finding blood-stained cerebrospinal fluid at **\*lumbar puncture**. Identification of the site of the

aneurysm, upon which decisions about treatment will be based, is achieved by cerebral [\\*angiography](#).

**subarachnoid space** the space between the arachnoid and pia [\\*meninges](#) of the brain and spinal cord, containing circulating cerebrospinal fluid and large blood vessels. Several large spaces within it are known as **cisternae**.

**subclavian artery** either of two arteries supplying blood to the neck and arms. The right subclavian artery branches from the innominate artery; the left subclavian arises directly from the aortic arch.

**subclavian steal syndrome** a syndrome produced by proximal narrowing of the subclavian artery. There are no symptoms at rest, but when the affected arm is exercised blood is diverted to the arm down the main subclavian artery, away from smaller branches that arise just beyond the narrowing (i.e. 'stolen' from these branches). If branches to the brain are affected, [\\*syncope](#) may result. The syndrome may result in chest pain in people in whom an internal mammary artery branch of the subclavian artery has been used to bypass a coronary narrowing (see [CORONARY ARTERY BYPASS GRAFT](#)).

**subclinical** *adj.* describing a disease that is suspected but is not sufficiently developed to produce definite signs and symptoms in the patient.

**subconscious** *adj.* **1.** describing mental processes of which a person is not aware. **2.** (in psychoanalysis) denoting the part of the mind that includes memories, motives, and intentions that are momentarily not present in consciousness but can more or less readily be recalled to awareness. Compare [UNCONSCIOUS](#).

**subcutaneous** *adj.* beneath the skin. A **subcutaneous injection** is given beneath the skin. **Subcutaneous tissue** is loose connective tissue, often fatty, situated under the dermis.

**subdural** *adj.* below the dura mater (the outermost of the meninges); relating to the space between the dura mater and arachnoid. See also [HAEMATOMA](#).

**subgingival** *adj.* situated, performed, or occurring under the gums (gingivae), especially in the crevice between the gums and the basal part of the crowns of the teeth.

**subglottis** *n.* that part of the **\*larynx** that lies below the vocal folds.

**subintimal** *adj.* underlying the inner layer (**\*intima**) of a blood vessel: commonly used in vascular and interventional radiology. When a blood vessel is occluded with atheroma, a channel is created in the subintimal plane with a wire and the vessel is opened up by **\*angioplasty** and/or **\*stent** insertion.

**subinvolution** *n.* failure of the uterus to revert to its normal size during the six weeks following childbirth.

**sublimation** *n.* the replacement of socially undesirable means of gratifying motives or desires by means that are socially acceptable. *See also* **DEFENCE MECHANISM**; **REPRESSION**.

**subliminal** *adj.* subconscious: beneath the threshold of conscious perception.

**sublingual** *adj.* below the tongue. Tablets and capsules of some drugs are administered by being placed beneath the tongue, where they dissolve.

**sublingual gland** one of a pair of **\*salivary glands** situated in the lower part of the mouth, one on either side of the tongue. The sublingual glands are the smallest salivary glands; each gland has about 20 ducts, most of which open into the mouth directly above the gland.

**subluxation** *n.* partial **\*dislocation** of a joint, so that the bone ends are misaligned but still in contact.

**submandibular gland (submaxillary gland)** one of a pair of **\*salivary glands** situated below the parotid glands. Their ducts (**Wharton's ducts**) open in two papillae under the tongue, on either side of the frenulum.

**submaxillary gland** *see* **SUBMANDIBULAR GLAND**.

**submentovertical (SMV)** *adj.* denoting an X-ray view of the base of the skull.

**submucosa** *n.* the layer of loose connective (**\*areolar**) tissue underlying a mucous membrane; for example, in the wall of the intestine. —**submucosal** *adj.*

**subphrenic abscess** a collection of pus below the diaphragm, usually affecting the right side. Causes include postoperative infection (particularly after stomach or bowel surgery) and perforation of an organ (e.g. perforated peptic ulcer). Prompt treatment with antibiotics together with radiological or surgical drainage of the abscess is usually required.

**substance misuse** the nonclinical, or recreational, use of pharmacologically active substances such that continued use results in adverse physiological or psychological effects (*see* **DEPENDENCE**). Substances commonly misused include alcohol (*see* **ALCOHOLISM**), *\*amphetamines*, *\*cannabis*, *\*cocaine*, *\*Ecstasy*, *\*heroin*, *\*lysergic acid diethylamide* (LSD) and organic solvents (by inhalation), but also many prescribed medications, such as co-codamol, quetiapine, or pregabalin.

**substituted judgment** a decision made by someone on behalf of a patient lacking capacity that is judged to reflect what the patient would have wanted had he or she had the mental capacity to decide for him- or herself. This judgment is best made by someone close to the patient who has a good knowledge of the patient's beliefs, opinions, and character, provided that there are no potentially conflicting and partial interests at play. *See also* **POWER OF ATTORNEY**; **PROXY DECISION**.

**substitution** *n.* **1.** (in psychoanalysis) the replacement of one idea by another: a form of *\*defence mechanism*. **2.** (**symptom substitution**) (in psychology) the supposed process whereby removing one psychological symptom leads to another symptom appearing if the basic psychological cause has not been removed. It is controversial whether this happens. **3.** the replacement of one addictive and dangerous drug with another that is better controlled and easier to manage, with the aim of harm reduction.

**substitution therapy** provision of a less harmful alternative to a drug or remedy that a patient has been receiving. It is used when the patient has become addicted to a drug or is placing too much reliance upon a particular remedy. An example is the replacement of heroin in an opioid-dependent patient with methadone.

**substrate** *n.* the specific substance or substances on which a given *\*enzyme* acts. For example, starch is the substrate for salivary amylase; RNA is the substrate for ribonuclease.

**subsultus** *n.* abnormal twitching or tremor of muscles, such as may occur in feverish conditions.

**subtertian fever** a form of \*malaria resulting from repeated infection by *Plasmodium falciparum* and characterized by continuous fever.

**subthalamus** a collection of grey matter, shaped like a biconvex lens, lying beneath the \*thalamus and close to the \*corpus striatum, to which it is connected by nerve tracts. It has connections with the cerebral cortex and several other nuclei nearby. Stimulation of this nucleus is now being used in the treatment of Parkinson's disease.

**subtotal** *adj.* almost complete or partial: applied, for example, to surgical procedures (e.g. subtotal \*thyroidectomy) or to occlusion (usually of an artery).

**subzonal insemination (Suzi)** a method of assisting conception in cases of infertility caused by the inability of the spermatozoa to penetrate the barriers surrounding the ovum. Using \*in vitro fertilization techniques, a small number of spermatozoa (no more than six) are injected through the \*zona pellucida into the perivitelline space (which surrounds the egg membrane). If fertilization subsequently occurs, the blastocyst is implanted in the mother's uterus.

**succus** *n.* any juice or secretion of animal or plant origin.

**succus entericus (intestinal juice)** the clear alkaline fluid secreted by the glands of the small intestine. It contains mucus and digestive enzymes, including \*enteropeptidase, \*erepsin, \*lactase, and \*sucrase.

**succussion** *n.* a splashing noise heard when a patient who has a large quantity of fluid in a body cavity, such as the pleural cavity, moves suddenly or is deliberately shaken.

**sucralfate** *n.* an aluminium-containing drug that forms a protective coating over the stomach or duodenal lining; sucralfate is used in the treatment of peptic ulcer. A fairly common side-effect is constipation.

**sucrase** *n.* an enzyme, secreted by glands in the small intestine, that catalyses the hydrolysis of sucrose into its components (glucose and fructose).

**sucrose** *n.* a carbohydrate consisting of glucose and fructose. Sucrose is the principal constituent of cane sugar and sugar beet; it is the sweetest of the natural dietary carbohydrates. The increasing consumption of sucrose in the last 50 years has coincided with an increase in the incidence of dental caries, diabetes, coronary heart disease, and obesity.

**suction** *n.* the use of reduced pressure to remove unwanted fluids or other material through a tube for disposal. Suction is often used to clear secretions from the airways of newly born infants to aid breathing. During surgery, suction tubes are used to remove blood from the area of operation and to decompress the stomach (**nasogastric suction**) and the pleural space of air and blood (**chest suction**).

**Sudan stains** a group of azo compounds used for staining fats. The group includes **Sudan I**, **Sudan II**, **Sudan III**, **Sudan IV**, and **Sudan black**.

**sudden infant death syndrome (SIDS, cot death)** the sudden unexpected death of an infant less than two years old (peak occurrence between two and six months) from an unidentifiable cause. There appear to be many factors involved, the most important of which is the position in which the baby is laid to sleep: babies who sleep on their fronts (the prone position) have an increased risk. Other factors increasing the risk include parental smoking, overheating with bedding, prematurity, and a history of SIDS within the family. About half the affected infants will have had a viral upper respiratory tract infection within the 48 hours preceding their death, many of these being due to the *\*respiratory syncytial virus*.

<https://www.lullabytrust.org.uk/>

- Information on SIDS together with safer sleep advice from the Lullaby Trust (formerly the Foundation for the Study of Infant Deaths)

**sudden unexpected death in epilepsy (SUDEP)** the sudden unexpected nontraumatic death of a person with *\*epilepsy*, with or without evidence of a seizure and with no obvious cause found at post mortem.

**Sudek's atrophy** *see* **COMPLEX REGIONAL PAIN SYNDROME**. [P. H. M. Sudek (1866–1938), German surgeon]

**sudor** *n. see* **SWEAT**.

**sudorific** *n. see* **DIAPHORETIC**.

**suffocation** *n.* cessation of breathing as a result of drowning, smothering, etc., leading to unconsciousness or death (*see* **ASPHYXIA**).

**suffusion** *n.* the spreading of a flush across the skin surface, caused by changes in the local blood supply.

**sugar** *n.* any **\*carbohydrate** that dissolves in water, is usually crystalline, and has a sweet taste. Sugars are classified chemically as **\*monosaccharides** or **\*disaccharides**. Table sugar is virtually 100% pure **\*sucrose** and contains no other nutrient; brown sugar is less highly refined sucrose. Sugar is used as both a sweetening and preserving agent. *See also* **FRUCTOSE**; **GLUCOSE**; **LACTOSE**.

**suggestion** *n.* (in psychology) **1.** the process of changing people's beliefs, attitudes, or emotions by telling them that they will change. **2.** a thought or idea imparted to someone in a hypnotic state.

**suicide** *n.* deliberately causing one's own death. A distinction is usually drawn between **attempted suicide**, when death is averted although the person concerned intended to kill himself (or herself), and other forms of **\*deliberate self-harm**, when the harm is inflicted for reasons other than actually killing oneself. Following the Suicide Act 1961, suicide is not a criminal offence in the UK, but it remains a criminal offence for a person to aid, abet, counsel, or procure the suicide of another (*see* **ASSISTED SUICIDE**). There is good evidence that asking about suicidal thoughts and especially plans is important in the management of depression: and no mention or attempt should be dismissed without appropriate assessment and help, especially in vulnerable groups, such as teenagers or the isolated elderly. Charities such as Samaritans have a vital role to play. *See also* **AUTONOMY**.

**sulcus** *n.* (*pl.* sulci) **1.** one of the many clefts or infoldings of the surface of the brain. The raised outfolding on each side of a sulcus is termed a **gyrus**. **2.**

any of the infoldings of soft tissue in the mouth, for example between the cheek and the alveolus.

**sulfadiazine (sulphadiazine)** *n.* a drug of the **\*sulphonamide** group that is used to prevent the recurrence of rheumatic fever and (in combination with **\*pyrimethamine**) to treat toxoplasmosis. In the form of **silver sulfadiazine**, it is applied to treat infected burns, leg ulcers, and pressure sores.

**sulfamethoxazole (sulphamethoxazole)** *n.* *see* **CO-TRIMOXAZOLE**; **SULPHONAMIDE**.

**sulfasalazine (sulphasalazine)** *n.* a drug that combines aminosalicic acid and sulfapyridine (a drug of the **\*sulphonamide** group), used in the treatment of ulcerative colitis, Crohn's disease, and rheumatoid arthritis (*see also* **DISEASE-MODIFYING ANTIRHEUMATIC DRUG**). The most common side-effects are nausea, loss of appetite, and raised temperature.

**sulfinpyrazone (sulphinpyrazone)** *n.* a **\*uricosuric drug** used for the control of chronic gout. The main side-effects are nausea and abdominal pain; the drug may also activate a latent duodenal ulcer and it should not be taken by patients with impaired kidney function.

**sulpha drug** *see* **SULPHONAMIDE**.

**sulphonamide (sulpha drug)** *n.* one of a group of drugs, derived from sulphanilamide (a red dye), that prevent the growth of bacteria (i.e. they are bacteriostatic). Sulphonamides are effective against a variety of infections and were formerly widely used; because many of them are rapidly excreted and very soluble in the urine, they were particularly useful in treating infections of the urinary tract.

A variety of side-effects may occur with sulphonamide treatment, including nausea, vomiting, headache, and loss of appetite; more severe effects include **\*cyanosis**, blood disorders, skin rashes, and fever. Because of increasing bacterial resistance to sulphonamides, and with the development of more effective less toxic antibiotics, the clinical use of these drugs has declined. Those still used include **\*sulfadiazine**, **\*sulfasalazine**, and sulfamethoxazole (combined with trimethoprim in **\*co-trimoxazole**).

**sulphone** *n.* one of a group of drugs closely related to the **\*sulphonamides** in structure and therapeutic actions. Sulphones possess powerful activity against the bacteria that cause leprosy and tuberculosis. The best known sulphone is **\*dapsone**.

**sulphonylurea** *n.* one of a group of **\*oral hypoglycaemic drugs**, derived from a **\*sulphonamide**, that are used in the treatment of type 2 diabetes mellitus; they act by stimulating the islet cells in the pancreas to produce more insulin. The group includes **\*glibenclamide**, **\*gliclazide**, and **\*tolbutamide**. Side-effects, such as nausea, vomiting, and diarrhoea, are usually mild.

**sulphur** *n.* a nonmetallic element that is active against fungi and parasites. It is a constituent of ointments and other preparations used in the treatment of skin disorders (such as psoriasis).

**sulphuric acid** a powerful corrosive acid,  $\text{H}_2\text{SO}_4$ , widely used in industry. Swallowing the acid causes severe burning of the mouth and throat and difficulty in breathing, speaking, and swallowing. The patient should drink large quantities of milk or water or white of egg; gastric lavage should not be delayed. Skin or eye contact should be treated by flooding the area with water.

**sumatriptan** *n.* a **\*5HT<sub>1</sub> agonist** that is effective in the treatment of acute **\*migraine** and cluster headaches. Possible side-effects include sensations of tingling and tightness, dizziness, drowsiness, fatigue, chest pain, and a rise in blood pressure.

**sunburn** *n.* damage to the skin by excessive exposure to the sun's rays, principally UVB (ultraviolet B), at wavelengths of 290–320 nm. Sunburn may vary from reddening of the skin to the development of large painful fluid-filled blisters, which may cause shock if they cover a large area (*see* **BURN**). Fair-skinned red-haired people (Fitzpatrick skin phototype I) are more susceptible to sunburn than others. Severe sunburn in childhood is a risk factor for the development of malignant **\*melanoma** and other skin tumours in later life.

**sunitinib** *n.* an inhibitor of multiple kinases (*see* **PROTEIN KINASE**; **TYROSINE KINASE INHIBITOR**) that blocks the action of **\*vascular endothelial growth factor**. It is used for the treatment of advanced **\*renal cell**

**carcinoma** and of **\*gastrointestinal stromal tumour** after disease progression or on intolerance to **\*imatinib**. Its most common side-effects include fatigue, asthenia, gastrointestinal disturbances, hypertension, and bleeding.

**sunstroke** *n.* *see* **HEATSTROKE**.

**super-** *prefix denoting* **1.** above; overlying. **2.** extreme or excessive.

**superciliary** *adj.* of or relating to the eyebrows (supercilia).

**superego** *n.* (in psychoanalysis) the part of the mind that functions as a moral conscience or judge. It is also responsible for the formation of ideals for the **\*ego**. The superego is the result of the incorporation of parental injunctions into the child's mind.

**supererogation** *n.* (in ethics) action that goes above and beyond what is morally necessary or required by duty. The extent to which an action must exceed that which is expected or required in order to be considered supererogatory is both debatable and debated. —**supererogatory** *adj.*

**superfecundation** *n.* the fertilization of two or more ova of the same age by spermatozoa from different males. *See* **SUPERFETATION**.

**superfetation** *n.* the fertilization of a second ovum some time after the start of pregnancy, resulting in two fetuses of different maturity in the same uterus.

**superficial** *adj.* (in anatomy) situated at or close to a surface. Superficial blood vessels are those close to the surface of the skin.

**superinfection** *n.* an infection arising during the course of another infection and caused by a different microorganism, which is usually resistant to the drugs used to treat the primary infection. The infective agent may be a normally harmless inhabitant of the body that becomes pathogenic when other harmless types are removed by the drugs or it may be a resistant variety of the primary infective agent, such as **\*MRSA** (*see also* **METICILLIN**).

**superior** *adj.* (in anatomy) situated uppermost in the body in relation to another structure or surface.

**superior canal dehiscence syndrome (SCDS)** a rare condition characterized by sound- or pressure-induced vertigo (*see* **TULLIO PHENOMENON**),

hearing loss, **\*autophony**, and a sense of fullness in the affected ear. It is associated with absence of the bone that normally lies over the superior **\*semicircular canal**. Diagnosis involves computerized tomography and **\*vestibular evoked myogenic potential testing**. Treatment involves surgery to repair the bony defect.

**supernumerary** *n.* (in dentistry) an additional tooth: the condition of having supernumerary teeth is known as **\*hyperdontia**.

**superovulation (controlled ovarian stimulation)** *n.* stimulation of the ovary to produce more follicles with oocytes. Usually induced by gonadotrophin preparations (e.g. **\*human menopausal gonadotrophin**, **\*human chorionic gonadotrophin**), it is performed in **\*in vitro fertilization** and other procedures of assisted conception in order to improve the pregnancy rates. *See also* **OVARIAN HYPERSTIMULATION SYNDROME**.

**supination** *n.* the act of turning the hand so that the palm is uppermost. *Compare* **PRONATION**.

**supinator** *n.* a muscle of the forearm that extends from the elbow to the shaft of the radius. It supinates the forearm and hand.

**supine** *adj.* **1.** lying on the back or with the face upwards. **2.** (of the forearm) in the position in which the palm of the hand faces upwards. *Compare* **PRONE**.

**supine hypotension** *see* **AORTOCAVAL COMPRESSION**.

**supportive** *adj.* (of treatment) aimed at reinforcing the patient's own defence mechanisms in overcoming a disease or disorder.

**suppository** *n.* a medicinal preparation in solid form suitable for insertion into the rectum, vagina, or urethra. **Rectal suppositories** may contain simple lubricants (e.g. glycerin); drugs that act locally in the rectum or anus (e.g. corticosteroids, local anaesthetics); or drugs that are absorbed and act at other sites (e.g. analgesics, such as diclofenac). **Vaginal suppositories** are used in the treatment of some gynaecological disorders (*see* **PESSARY**). **Urethral suppositories** contain antibiotics, local anaesthetics (prior to a procedure), or medication used in the treatment of erectile dysfunction.

**suppression** *n.* **1.** the cessation or complete inhibition of any physiological activity. **2.** (in psychology) a **\*defence mechanism** by which a person consciously and deliberately ignores an idea that is unpleasant.

**suppressor gene** a gene that prevents the expression of another (non-allelic) gene.

**suppressor T cell** a type of T **\*lymphocyte** that prevents an immune response by B cells or other T cells to an antigen.

**suppuration** *n.* the formation of pus.

**supra-** *prefix denoting* above; over. Examples: **supraclavicular** (above the clavicle); **suprahyoid** (above the hyoid bone); **suprarenal** (above the kidney).

**supragingival** *adj.* situated or occurring above the **\*gingiva**; the term is used mainly in reference to the location of calculus, plaque, or caries.

**supraglottis** *n.* that part of the **\*larynx** that lies above the vocal folds and includes the **\*epiglottis**.

**supraorbital** *adj.* of or relating to the area above the eye orbit.

**supraorbital reflex** the closing of the eyelids when the supraorbital nerve is struck, due to contraction of the muscle surrounding the orbit (orbicularis oculi muscle).

**suprapubic catheter** a catheter passed through the abdominal wall above the pubis, usually into a very enlarged bladder with urinary retention. Usually, suprapubic **\*catheterization** is performed only if it is not possible to perform urethral catheterization.

**supraregional specialty** *see* **CATCHMENT AREA**.

**suprarenal glands** *see* **ADRENAL GLANDS**.

**supraventricular tachycardia (SVT)** a rapid regular heartbeat that is usually due to a re-entry circuit between the atria and ventricles (*see* **RE-ENTRY TACHYCARDIA**). It is less commonly due to an ectopic focus in an atrium that is spontaneously discharging at a fast rate (atrial tachycardia).

**supravital staining** the application of a *\*stain* to living tissue, particularly blood cells, removed from the body.

**Sure Start Children's Centre** *see* CHILDREN'S CENTRE.

**surfactant** *n.* a wetting agent. Surfactants can be added to materials used in dentistry to reduce surface tension and so improve flow. **Pulmonary surfactant**, secreted by type II *\*pneumocytes*, is a complex mixture of compounds (including lipids, protein, and carbohydrates) that prevents the air sacs (alveoli) of the lungs from collapsing by reducing surface tension. In its absence, as in the immature lungs of premature babies, *\*atelectasis* and *\*respiratory distress syndrome* will develop.

**surgeon** *n.* a qualified medical practitioner who specializes in surgery. *See* DOCTOR.

**surgery** *n.* **1.** the branch of medicine that treats injuries, deformities, or disease by operation or manipulation. *See also* CRYOSURGERY; MICROSURGERY. **2.** the building in or from which a *\*general practitioner* or a *\*primary care* team works. —**surgical** *adj.*

**surgical emphysema** *see* EMPHYSEMA.

**surgical navigation** *see* COMPUTER-ASSISTED SURGERY.

**surgical neck** the constriction of the shaft of the *\*humerus*, below the head. It is frequently the point at which fracture of the humerus occurs.

**surgical spirit** methylated spirit, usually with small amounts of castor oil and oil of wintergreen: used to sterilize the skin, particularly before injections.

**surrogate decision** *see* PROXY DECISION.

**surrogate mother** a woman who becomes pregnant (by artificial insemination or embryo insertion) following an arrangement made with another party (usually a couple unable themselves to have children) in which she agrees to give the child she carries to that party when it is born. Surrogacy arrangements are made on the understanding that no payment is involved between either parties although reasonable expenses can be paid. *See also* SECTION 30 ORDER.

<https://www.hfea.gov.uk/treatments/explore-all-treatments/surrogacy/>

- Details of surrogacy at the Human Fertilisation and Embryology Authority website

**susceptibility** *n.* vulnerability to disease. It is partly a reflection of general health and health-related behaviour but is also influenced by vaccination or other methods of increasing resistance to specific diseases.

**suspensory bandage** a bandage arranged to support a hanging part of the body. Examples include a sling used to hold an injured lower jaw in position and a bandage used to support the scrotum in various conditions of the male genital organs.

**suspensory ligament** a ligament that serves to support or suspend an organ in position. For example, the suspensory ligament of the lens is a fibrous structure attached to the ciliary processes (*see* **CILIARY BODY**) by means of which the lens of the eye is held in position.

**sustentaculum** *n.* any anatomical structure that supports another structure. — **sustentacular** *adj.*

**Sutent** *n.* *see* **SUNITINIB**.

**suture** **1.** *n.* (in anatomy) a type of immovable joint, found particularly in the skull, that is characterized by a minimal amount of connective tissue between the two bones. The cranial sutures include the **coronal suture**, between the frontal and parietal bones; the **lambdoidal suture**, between the parietal and occipital bones; and the **sagittal suture**, between the two parietal bones (*see* illustration). **2.** *n.* (in surgery) the closure of a wound or incision to facilitate the healing process, using any of various materials. A wide variety of suturing techniques have been developed to meet the differing circumstances of injuries to and incisions in the body tissues (*see* illustration). **3.** *n.* the material – silk, catgut, nylon, any of various polymers, or wire – used to sew up a wound. **4.** *vb.* to close a wound by suture.

**Suture.** Sutures of the skull (internal surface of the vault).

**Suture.** Types of surgical suturing.

**suxamethonium** *n.* a depolarizing **\*muscle relaxant**. It is administered by intravenous injection to produce rapid muscle relaxation for a brief period

during surgery carried out under general anaesthesia.

**Suzi** *n.* see SUBZONAL INSEMINATION.

**SVT** see SUPRAVENTRICULAR TACHYCARDIA.

**swab** *n.* a pad of absorbent material (such as cotton), sometimes attached to a stick or wire, used for cleaning out or applying medication to wounds, operation sites, or body cavities. In operations, gauze swabs are used to clean blood from the site; such swabs are always carefully counted and contain a **\*radiopaque** 'tag' to facilitate identification should it by mischance remain in the body after operation.

**swallowing (deglutition)** *n.* the process by which food is transferred from the mouth to the oesophagus (gullet). Voluntary raising of the tongue forces food backwards towards the pharynx. This stimulates reflex actions in which the larynx is closed by the epiglottis and the nasal passages are closed by the soft palate, so that food does not enter the trachea (windpipe). Lastly, food moves down the oesophagus by **\*peristalsis** and gravity.

**Swan–Ganz catheter** a catheter with an inflatable balloon at its tip, which can be inserted into the pulmonary artery via the right chambers of the heart. Inflation of the balloon enables indirect measurement of pressure in the left atrium. [H. J. C. Swan (1922–2005), US cardiologist; W. Ganz (20th century), US engineer]

**sweat** *n.* the watery fluid secreted by the **\*sweat glands**. Its principal constituents in solution are sodium chloride and urea. The secretion of sweat is a means of excreting nitrogenous waste; at the same time it has a role in controlling the temperature of the body – the evaporation of sweat from the surface of the skin has a cooling effect. Therefore an increase in body temperature causes an increase in sweating. Other factors that increase the secretion of sweat include pain, nausea, nervousness, and drugs (**\*diaphoretics**). Sweating is reduced by colds, diarrhoea, and certain drugs. Anatomical name: **sudor**.

**sweat gland** a simple coiled tubular **\*exocrine gland** that lies in the dermis of the **\*skin**. A long duct carries its secretion (**\*sweat**) to the surface of the skin. Sweat glands occur over most of the surface of the body; they are

particularly abundant in the armpits, on the soles of the feet and palms of the hands, and on the forehead.

**swine influenza** a disease of domesticated pigs, first seen in humans in early 2009, caused by H1N1, a strain of *\*influenza* A virus. Very contagious, the World Health Organization has now declared it to be a pandemic strain in humans. Swine influenza is currently believed not to be as virulent as *\*avian influenza* and it seems to be less severe than the virulent 1918 pandemic, with which it shares antigenic features.

**sycosis** *n.* inflammation of the hair follicles caused by infection with *Staphylococcus aureus*; it commonly affects the beard area (**sycosis barbae**) of men in their thirties or forties. The infection usually spreads unless treated by applying antibiotic ointments or giving antibiotics by mouth.

**Sydenham's chorea** a form of *\*chorea* that mainly affects children and adolescents, especially females. It can occur some months after an infection caused by  $\beta$ -haemolytic streptococci (such as rheumatic fever or scarlet fever), causing uncontrolled movements of the muscles of the shoulders, hips, and face (hence the archaic name, **St Vitus' dance**). Formerly a frightening disease, it is now readily cured by antibiotics. [G. Sydenham (1624–89), English physician]

**Symbicort** *n.* see **BUDESONIDE**.

**symbiosis** *n.* an intimate and obligatory association between two different species of organism (**symbionts**) in which there is mutual aid and benefit. Compare **COMMENSAL**; **MUTUALISM**; **PARASITE**.

**symblepharon** *n.* a condition in which the eyelid adheres to the eyeball. It is usually the result of chemical (especially alkali) burns to the conjunctiva lining the eyelid and eyeball.

**symbolism** *n.* (in psychology) the process of representing an object or an idea by something else. Typically an abstract idea is represented by a simpler and more tangible image. Psychoanalytic theorists hold that conscious ideas frequently act as symbols for unconscious thoughts and that this is particularly evident in dreaming, in *\*free association*, and in the formation of psychological symptoms. According to this theory, a symptom might be a symbolic representation of an unconscious idea. —**symbolic** *adj.*

**symmelia** *n.* see SIRENOMELIA.

**symmetry** *n.* (in anatomy) correspondence of form on either side of a plane or axis. Human bodies are symmetrical around the **\*sagittal** plane.

**sympathectomy** *n.* the surgical **\*division** of sympathetic nerve fibres. It is done to minimize the effects of normal or excessive sympathetic activity. Most often it is used to improve the circulation to part of the body; less commonly to inhibit excess sweating or to relieve the **\*photophobia** induced by an abnormally dilated pupil of the eye.

**sympathetic nervous system** one of the two divisions of the **\*autonomic nervous system**, having fibres that leave the central nervous system, via a chain of ganglia close to the spinal cord, in the thoracic and lumbar regions. Its nerves are distributed to the blood vessels, heart, lungs, intestines and other abdominal organs, sweat glands, salivary glands, and the genitals, whose functions it governs by reflex action, in balance with the **\*parasympathetic nervous system**.

**sympathin** *n.* the name given by early physiologists to the substances released from sympathetic nerve endings, now known to be a mixture of **\*adrenaline** and **\*noradrenaline**.

**sympathoblast** *n.* one of the small cells formed in the early development of nerve tissue that eventually become the neurons of the sympathetic nervous system.

**sympatholytic** *adj.* opposing the effects of the sympathetic nervous system. **\*Guanethidine** blocks the transmission of impulses along adrenergic nerves; it is used to treat high blood pressure. **\*Alpha blockers** and **\*beta blockers** are other kinds of sympatholytic drugs.

**sympathomimetic** *adj.* having the effect of stimulating the **\*sympathetic nervous system**. The actions of sympathomimetic drugs are **adrenergic**: they act on alpha or beta **\*adrenoceptors**. **Alpha-adrenergic stimulants (alpha agonists)** stimulate alpha receptors. They include **\*vasoconstrictors** (e.g. **\*ephedrine**, **\*phenylephrine**, **\*metaraminol**), used to treat nasal congestion and severe hypotension, and the selective  $\alpha_2$  agonists **\*apraclonidine** and **\*brimonidine**, which are used in the treatment of glaucoma. **Beta-adrenergic**

**stimulants (beta agonists)** stimulate  $\beta_1$  and/or  $\beta_2$  adrenoceptors.  $\beta_2$  agonists such as *\*salbutamol*, *\*salmeterol*, and *\*terbutaline* relax bronchial smooth muscle and are used as *\*bronchodilators*. Some  $\beta_2$  agonists, including salbutamol, relax uterine muscle and are sometimes used in the treatment of premature labour (see *TOCOLYTIC*).  $\beta_1$  agonists (e.g. *\*dobutamine*) stimulate  $\beta_1$  receptors in the heart and are therefore used for their *\*inotropic* effects.

**sympathy** *n.* (in physiology) a reciprocal influence exercised by different parts of the body on one another.

**symphysiotomy** *n.* the operation of cutting through the front of the pelvis at the pubic *\*symphysis* in order to enlarge the diameter of the pelvis and aid delivery of a fetus whose head is too large to pass through the pelvic opening. This procedure is now rarely employed.

**symphysis** *n.* **1.** a joint in which the bones are separated by fibrocartilage, which minimizes movement and makes the bony structure rigid. Examples are the **pubic symphysis** (the joint between the pubic bones of the pelvis) and the joints of the backbone, which are separated by intervertebral discs (see illustration). **2.** the line that marks the fusion of two bones that were separate at an early stage of development, such as the symphysis of the *\*mandible*. — **symphysial** or **symphyseal** *adj.*

**Symphysis between two vertebrae.**

**symphysis–fundal height (SFH)** see **FUNDAL HEIGHT**.

**symphysis pubis dysfunction (SPD)** pain in the region of the pelvic girdle, most commonly over the pubic bone in the front or in the lower back and usually caused by excessive movement of the symphysis pubis and other pelvic joints. This is common during pregnancy, hence the condition is also called **pregnancy-related pelvic girdle pain (PPGP)**. Treatment is usually with physiotherapy.

**sympodia** *n. see SIRENOMELIA.*

**symptom** *n.* an indication of a disease or disorder noticed by the patient himself. A **presenting symptom** is one that leads a patient to consult a doctor. *Compare SIGN.*

**symptomatology (semeiology)** *n.* **1.** the branch of medicine concerned with the study of symptoms of disease. **2.** the symptoms of a disease, collectively.

**syn- (sym-)** *prefix denoting union or fusion.*

**Synacthen tests** tests used to assess the ability of the adrenal cortex to produce cortisol. Serum cortisol is measured before and then 30 minutes (or 5 hours) after an intramuscular injection of 250 µg (or 1 mg) tetracosactide (Synacthen), an analogue of **\*ACTH**. The adrenal glands are considered to be inadequate if there is a low baseline concentration of cortisol or the rise is less than a certain predefined amount.

**synaesthesia** *n.* a condition in which a secondary subjective sensation (often colour) is experienced at the same time as the sensory response normally evoked by the stimulus. For example, the sound of the word 'cat' might evoke the colour purple.

**synalgia** *n. see REFERRED PAIN.*

**synapse** *n.* the minute gap across which **\*nerve impulses** pass from one neuron to the next, at the end of a nerve fibre. Reaching a synapse, an impulse causes the release of a **\*neurotransmitter**, which diffuses across the gap and triggers an electrical impulse in the next neuron. Some brain cells have more than 15,000 synapses. *See also NEUROMUSCULAR JUNCTION.*

**synarthrosis** *n.* an immovable joint in which the bones are united by fibrous tissue. Examples are the cranial **\*sutures**. *See also GOMPHOSIS;*

SCHINDYLESIS.

**synchilia (syncheilia)** *n.* congenital fusion of the lips.

**synchondrosis** *n.* a slightly movable joint (*see* AMPHIARTHROSIS) in which the surfaces of the bones are separated by hyaline cartilage, as occurs between the ribs and sternum. This cartilage may become ossified in later development, as between the \*epiphyses and shaft of a long bone.

**synchronized cardioversion** *see* CARDIOVERSION.

**synchysis scintillans (asteroid hyalosis)** tiny refractile crystals of cholesterol suspended in the vitreous humour of the eye. They usually cause no symptoms.

**syncope (fainting)** *n.* loss of consciousness due to a sudden drop in blood pressure, resulting in a temporarily insufficient flow of blood to the brain. It commonly occurs in otherwise healthy people and may be caused by an emotional shock, by standing for prolonged periods, or by injury and profuse bleeding. Recovery is normally prompt and without any persisting ill-effects. *See also* NEUROCARDIOGENIC SYNCOPE.

**syncytiotrophoblast** *n. see* TROPHOBLAST.

**syncytium** *n.* (*pl.* syncytia) a mass of \*protoplasm containing several nuclei. Muscle fibres are syncytia. —**syncytial** *adj.*

**syndactyly** *n.* congenital webbing of the fingers. Adjacent fingers are joined along part or all of their length. They may be joined only by skin, or the bones of the fingers may be joined. Treatment is surgical separation of the fingers, and skin grafts may be required.

**syndesm- (syndesmo-)** *combining form denoting* connective tissue, particularly ligaments.

**syndesmology** *n.* the branch of anatomy dealing with joints and their components.

**syndesmophyte** *n.* a bony outgrowth within a ligament, usually within the ligaments of the intervertebral joints, seen in the sero-negative spondyloarthropathies; for example, ankylosing \*spondylitis, \*reactive

arthritis, and \*psoriatic arthritis. Fusion of syndesmophytes across the joints between vertebrae contributes to rigidity of the spine, seen in advanced cases of these diseases.

**syndesmosis** *n.* an immovable joint in which the bones are separated by connective tissue. An example is the articulation between the bases of the tibia and fibula (see illustration).

**A syndesmosis.**

**syndrome** *n.* a combination of signs and/or symptoms that forms a distinct clinical picture indicative of a particular disorder.

**syndrome of inappropriate secretion of antidiuretic hormone (SIADH)** a condition of inappropriately high plasma levels of ADH (see **VASOPRESSIN**) with associated water retention, dilutional \*hyponatraemia, and the production of highly concentrated urine. Renal, adrenal, thyroid, and hepatic function are normal, as is the volume of circulating blood (euvolaemia). It is caused by a variety of pathological conditions, usually intrathoracic and intracerebral, and also by a number of drugs, including antidepressants, chemotherapy agents, and some of the older antidiabetic agents. The

treatment involves fluid restriction, treatment (or removal) of the underlying cause (or drug), and, in severe cases, administration of *\*demeclocycline* to reduce the effects of ADH on the kidney. Very rarely, hypertonic saline is given.

**syndrome X** *see* **METABOLIC SYNDROME**.

**synechia** *n. (pl. synechiae)* **1.** an adhesion between the iris and another part of the eye. An **anterior synechia** is between the iris and the endothelium of the cornea or the part of the sclera that normally hides the extreme outer edge of the iris from view. A **posterior synechia** is between the iris and the lens. **2.** a small adhesion that forms in the nose after surgery.

**synechialysis** *n.* surgical division or separation of *\*synechiae*.

**syneresis** *n.* **1.** contraction of a blood clot. When first formed, a blood clot is a loose meshwork of fibres containing various blood cells. Over a period of time this contracts, producing a firm mass that seals the damaged blood vessels. **2.** (in ophthalmology) degenerative shrinkage of the vitreous humour due to ageing, which usually results in a *\*vitreous detachment*.

**synergist** *n.* **1.** a drug that interacts with another to produce increased activity, which is greater than the sum of the effects of the two drugs given separately. Some synergists may have dangerous effects, as when MAO inhibitors enhance the effects of antihistamine and antimuscarinic drugs. **2.** a muscle that acts with an *\*agonist* in making a particular movement. — **synergism** *n.*

**synergistic gangrene** gangrene of tissues produced by different bacteria acting together, usually a mixture of aerobic and anaerobic organisms. Particular forms are **Meleney's gangrene** (of the abdominal wall) and **Fournier's gangrene** (of the scrotal area). Synergistic gangrene has a pronounced tendency to spread along fascial planes, causing *\*necrotizing fasciitis*.

**syngeneic** *adj.* describing grafted tissue that is genetically identical to the recipient's tissue, as when the donor and recipient are identical twins.

**synkinesis** *n.* a phenomenon seen after injury to a nerve: voluntary contraction of certain muscles is accompanied by involuntary contraction of

other muscles that are supplied by that nerve.

**synoptophore** *n.* see **AMBLYOSCOPE**.

**synostosis** *n.* the joining by ossification of two adjacent bones. It occurs, for example, at the **\*sutures** between the bones of the skull.

**synovectomy** *n.* surgical removal of the synovium of a joint. This is performed in cases of chronic synovitis, such as rheumatoid arthritis, when other measures have been ineffective, in order to reduce pain in the joint and prevent further destruction.

**synovia (synovial fluid)** *n.* the thick colourless lubricating fluid that surrounds a joint or a bursa and fills a tendon sheath. It is secreted by the synovial membrane.

**synovial joint** see **DIARTHROSIS**.

**synovial membrane (synovium)** the membrane, composed of mesothelium and connective tissue, that forms the sac enclosing a freely movable joint (see **DIARTHROSIS**). It secretes the lubricating synovial fluid.

**synovioma** *n.* a benign or malignant tumour of the synovial membrane. Benign synoviomas occur on tendon sheaths; malignant synoviomas (**synovial sarcomas**) may occur where synovial tissue is not normally found, e.g. in the oesophagus.

**synovitis** *n.* inflammation of the membrane (synovium) that lines a joint capsule, resulting in pain and swelling (arthritis). It is caused by injury, infection, or rheumatic disease. Treatment depends on the underlying cause; to determine this, samples of the synovial fluid or membrane may be taken for examination.

**synovium** *n.* see **SYNOVIAL MEMBRANE**.

**Syntometrine** *n.* see **ERGOMETRINE**.

**syphilide (syphilid)** *n.* the skin rash that appears in the second stage of **\*syphilis**, usually two months to two years after primary infection. Syphilides occur in crops that may last from a few days to several months. They denote a highly infectious stage of the disease.

**syphilis** *n.* a sexually transmitted disease caused by the bacterium *Treponema pallidum*, resulting in the formation of lesions throughout the body. Bacteria usually enter the body during sexual intercourse, through the mucous membranes of the vagina or urethra, but they may rarely be transmitted through wounds in the skin or scratches. Bacteria may also pass from an infected pregnant woman across the placenta to the developing fetus, resulting in the disease being present at birth (**congenital syphilis**).

The primary symptom – a hard painless ulcer (**\*chancre**) at the site of infection – forms 2–4 weeks after exposure. Neighbouring lymph nodes enlarge about 2 weeks later. Secondary stage symptoms appear about two months after infection and include fever, malaise, general enlargement of lymph nodes, and a faint red rash on the chest that persists for 1–2 weeks. After months, or even years, the disease enters its tertiary stage with widespread formation of tumour-like masses (**\*gummas**). Tertiary syphilis may cause serious damage to the heart and blood vessels (**cardiovascular syphilis**) or to the brain and spinal cord (**neurosyphilis**), resulting in **\*tabes dorsalis**, blindness, and **\*general paralysis of the insane**.

Treatment is with antibiotics, such as penicillin and doxycycline. Syphilis can be diagnosed by several blood tests. *Compare* **BEJEL**. —**syphilitic** *adj.*

**syring-** (**syringo-**) *combining form denoting* a tube or long cavity, especially the central canal of the spinal cord.

**syringe** *n.* an instrument consisting of a piston in a tight-fitting tube that is attached to a hollow needle or thin tube. A syringe is used to give injections, remove material from a part of the body, or to wash out a cavity, such as the ear canal.

**syringobulbia** *n. see* **SYRINGOMYELIA**.

**syringoma** *n.* multiple benign tumours of the sweat glands, which show as small hard swellings usually on the face (especially around the eyes), neck, or chest. Treatment is difficult.

**syringomyelia** *n.* a disease of the spinal cord in which longitudinal cavities form within the cord, usually in the cervical (neck) region. The centrally situated cavity (**syrinx**) is especially likely to damage the motor nerve cells and the nerve fibres that transmit the sensations of pain and temperature. Characteristically there is weakness and wasting of the muscles in the hands

with a loss of awareness of pain and temperature. An extension of the cavitation into the lower brainstem is called **syringobulbia**. Cerebellar **\*ataxia**, a partial loss of pain sensation in the face, and weakness of the tongue and palate may occur. Syringomyelia is associated with an **\*Arnold–Chiari malformation** and tumours of the spinal cord.

**system** *n.* (in anatomy) a group of organs and tissues associated with a particular physiological function, such as the **\*nervous system** or **\*respiratory system**.

**systemic** *adj.* relating to or affecting the body as a whole, rather than individual parts and organs.

**systemic circulation** the system of blood vessels that supplies all parts of the body except the lungs. It consists of the aorta and all its branches, carrying oxygenated blood to the tissues, and all the veins draining deoxygenated blood into the vena cava. *Compare* **PULMONARY CIRCULATION**.

**systemic inflammatory response** *see* **SHOCK**.

**systemic sclerosis** a rare connective-tissue disease affecting many systems in the body, mainly in women (3.6:1) in their forties. Genetic and autoimmune factors are implicated. In the diffuse form of the disease, besides **\*scleroderma**, there may be involvement of the lungs, with pulmonary **\*fibrosis**; renal failure and gastrointestinal and myocardial disease also occur. The limited form is also called **\*CREST syndrome**.

**systole** *n.* the period of the cardiac cycle during which the heart contracts. The term usually refers to **ventricular systole**, which lasts about 0.3 seconds. **Atrial systole** lasts about 0.1 seconds. —**systolic** *adj.*

**systolic anterior motion** (SAM) the state of the **\*mitral valve** when it is abnormally pulled forward during ventricular contraction, a characteristic feature of **\*hypertrophic cardiomyopathy**.

**systolic dysfunction** impairment of heart function due to reduced contraction of the left **\*ventricle**. It is most commonly secondary to **\*cardiomyopathy** or **\*myocardial infarction** and may result in heart failure. *Compare* **DIASTOLIC DYSFUNCTION**.

**systolic pressure** *see* **BLOOD PRESSURE**.

# T

**T<sub>3</sub>** *see* TRIIODOTHYRONINE.

**T<sub>4</sub>** *see* THYROXINE.

**tabes dorsalis (locomotor ataxia)** a form of neurosyphilis occurring 5–20 years after the original sexually transmitted infection. The infecting organisms progressively destroy the sensory nerves. Severe stabbing pains in the legs and trunk, an unsteady gait, and loss of bladder control are common. Some patients have blurred vision caused by damage to the optic nerves. Penicillin is used to arrest the progression of this illness. *See also* SYPHILIS; GENERAL PARALYSIS OF THE INSANE.

**tablet** *n.* (in pharmacy) a small disc containing one or more drugs, made by compressing a powdered form of the drug(s). It is usually taken by mouth but may be inserted into a body cavity (*see* SUPPOSITORY).

**tabo-paresis** *n.* a late effect of syphilitic infection of the nervous system in which the patient shows features of \***tabes dorsalis** and \***general paralysis of the insane**.

**TAB vaccine** a combined vaccine used to produce immunity against the diseases typhoid, paratyphoid A, and paratyphoid B.

**TACE** *see* TRANSARTERIAL CHEMOEMBOLIZATION.

**tachy-** *combining form denoting* fast; rapid.

**tachyarrhythmia** *n.* *see* ARRHYTHMIA.

**tachycardia** *n.* an increase in the heart rate above normal. **Sinus tachycardia** may occur normally with exercise or excitement or it may be due to illness,

such as fever. **\*Arrhythmias** may also produce tachycardia (**ectopic tachycardia**). See **VENTRICULAR TACHYCARDIA**; **SUPRAVENTRICULAR TACHYCARDIA**.

**tachyphylaxis** *n.* a falling-off in the effects produced by a drug during continuous use or constantly repeated administration, common in drugs that act on the nervous system.

**tachypnoea** *n.* rapid breathing.

**tacrolimus** *n.* a powerful **\*immunosuppressant** administered to prevent rejection of transplanted organs. Side-effects include gastrointestinal disturbances, tremor, headache, and liver and kidney impairment; it may have adverse effects on the heart. It is also used for the treatment for atopic **\*eczema**.

**tactile** *adj.* relating to or affecting the sense of touch.

**tadalafil** *n.* see **SILDENAFIL**.

**taenia** *n.* (*pl.* **taeniae**) a flat ribbon-like anatomical structure. The **taeniae coli** are the longitudinal ribbon-like muscles of the colon.

**Taenia** *n.* a genus of large tapeworms, some of which are parasites of the human intestine. The 4–10 m long beef tapeworm, *T. saginata*, is the commonest tapeworm parasite of humans. Its larval stage (see **CYSTICERCUS**) develops within the muscles of cattle and other ruminants, and people become infected on eating raw or undercooked beef. *T. solium*, the pork tapeworm, is 2–7 m long. Its larval stage may develop not only in pigs but also in humans, in whom it may cause serious disease (see **CYSTICERCOSIS**). See also **TAENIASIS**.

**taeniicide (taenicide)** *n.* an agent that kills tapeworms.

**taeniafuge** *n.* an agent, such as **\*niclosamide**, that eliminates tapeworms from the body of their host.

**taeniasis** *n.* an infestation with tapeworms of the genus **\*Taenia**. Humans become infected with the adult worms following ingestion of raw or undercooked meat containing the larval stage of the parasite. The presence of a worm in the intestine may occasionally give rise to increased appetite,

hunger pains, weakness, and weight loss. Worms are expelled from the intestine using various anthelmintics, including *\*niclosamide*. *See also* CYSTICERCOSIS.

**Tagamet** *n. see* CIMETIDINE.

**Takayasu's disease (pulseless disease)** progressive occlusion of the arteries arising from the arch of the aorta (including those to the arms and neck), resulting in the absence of pulses in the arms and neck. Symptoms include attacks of unconsciousness (syncope), paralysis of facial muscles, and transient blindness, due to an inadequate supply of blood to the head. [M. Takayasu (1860–1938), Japanese ophthalmologist]

**takotsubo syndrome** sudden extensive damage to the left *\*ventricle* that classically occurs following acute emotional shock. The clinical syndrome mimics acute *\*myocardial infarction*, but no coronary artery is occluded and the extent of ventricular damage exceeds that supplied by any single coronary artery. The appearance of the left ventriculogram resembles a Japanese lobster pot, from which the name derives. The cause is unknown, and in most cases spontaneous recovery occurs.

**tal-** (**talo-**) *combining form denoting* the ankle bone (talus).

**talc** *n.* a soft white powder, consisting of magnesium silicate, used in dusting powders and skin applications. Talc used to dust surgical rubber gloves causes irritation of serous membranes, resulting in adhesions, if not washed off prior to an operation.

**talipes** *n. see* CLUB-FOOT.

**talus (astragalus)** *n.* the ankle bone. It forms part of the *\*tarsus*, articulating with the tibia above, with the fibula to the lateral (outer) side, and with the calcaneus below.

**tambour** *n.* a recording drum consisting of an elastic membrane stretched over one end of a cylinder. It is used in various instruments for recording changes in air pressure.

**Tamiflu** *n. see* OSELTAMIVIR.

**tamoxifen** *n.* a drug used in the treatment of **\*breast cancer**: it binds with hormone receptors in the tumour to inhibit the effect of oestrogens (see **ANTI-OESTROGEN**; **SELECTIVE (O)ESTROGEN RECEPTOR MODULATOR**). Tamoxifen is also used to treat female infertility as it induces ovulation. Side-effects include nausea, vaginal bleeding, facial flushing, tumour pain, and hypercalcaemia.

**tampon** *n.* a pack of gauze, cotton wool, or other absorbent material used to plug a cavity or canal in order to absorb blood or secretions. A vaginal tampon is commonly used by women to absorb the menstrual flow.

**tamponade** *n.* **1.** the insertion of a tampon. **2.** abnormal pressure on a part of the body; for example, as caused by the presence of excessive fluid between the pericardium (sac surrounding the heart) and the heart (see **CARDIAC TAMPONADE**). **3.** the use of air, gas, or a heavy liquid injected into the vitreous humour to exert pressure on the retina, which keeps it apposed to the choroid during surgery to repair a detached retina. See **PNEUMORETINOPEXY**.

**tamsulosin** *n.* a highly selective **\*alpha blocker** taken by mouth to treat **\*lower urinary tract symptoms** thought to be due to benign prostatic hyperplasia (see **PROSTATE GLAND**). Specific side-effects include retrograde ejaculation that is reversible on stopping the drug and also 'floppy iris' syndrome.

**tantalum** *n.* a rare heavy metal used in surgery as it is easily moulded and does not corrode. For example, tantalum sutures and plates are used for repair of defects in the bones of the skull. Symbol: Ta.

**tapetum** *n.* **1.** a layer of specialized reflecting cells in the **\*choroid** behind the retina of the eye. **2.** a band of nerve fibres that form the roof and wall of the lower posterior part of the **\*corpus callosum**.

**tapeworm (cestode)** *n.* any of a group of flatworms that have a long thin ribbon-like body and live as parasites in the intestines of humans and other vertebrates. The body of a tapeworm consists of a head (**scolex**), a short neck, and a **strobila** made up of a chain of separate segments (**proglottides**). Mature proglottides, full of eggs, are released from the free end of the worm

and pass out in the host's stools. Eggs are then ingested by an intermediate host, in whose tissues the larval stages develop (see [PLEROCERCOID](#); [CYSTICERCUS](#); [HYDATID](#)). Humans are the primary hosts for some tapeworms (see [TAENIA](#); [HYMENOLEPIS](#)). However, other genera are also medically important (see [DIPHYLLOBOTHRUM](#); [DIPYLIDIUM](#); [ECHINOCOCCUS](#)).

**tapotement** *n.* a technique used in [\\*massage](#) in which a part of the body is struck rapidly and repeatedly with the hands. Tapotement of the chest wall in bronchitic patients often helps to loosen mucus within the air passages so that it can be coughed up.

**tapping** *n.* see [PARACENTESIS](#).

**tardive dyskinesia** a condition characterized by involuntary repetitive movements of the facial muscles and the tongue, usually resembling continued chewing motions, and the muscles of the limbs. It is associated with long-term medication with certain antipsychotic drugs, especially the [\\*phenothiazines](#), and occurs predominantly in older patients.

**target cell** **1.** a cell that is the focus of attack by antibodies, cytotoxic T cells, or natural killer cells or is the object of the action of a specific hormone. **2.** (in haematology) an abnormal form of red blood cell ([\\*erythrocyte](#)) in which the cell assumes the ringed appearance of a 'target' in stained blood films. Target cells are a feature of several types of anaemia, including those due to iron deficiency, liver disease, and abnormalities in haemoglobin structure.

**targeted agent (targeted therapy)** a drug that interferes with specific molecular targets in the pathways involved in cancer cell growth and signalling, in contrast to [\\*cytotoxic drugs](#) that act primarily on rapidly dividing cells. It typically requires prolonged courses of treatment, and the anticancer action can be synergistic with [\\*chemotherapy](#). Many new drugs are being developed and are undergoing trials to determine optimal use. The [\\*tyrosine kinase inhibitors](#) include imatinib and [\\*epidermal growth factor receptor](#) inhibitors; multitargeted agents include [\\*sorafenib](#) and [\\*sunitinib](#). The monoclonal antibodies include [\\*rituximab](#), [\\*trastuzumab](#), [\\*cetuximab](#), and [\\*bevacizumab](#).

**target lesions** *see* ERYTHEMA.

**target organ** the specific organ or tissue upon which a hormone, drug, or other substance acts.

**tars-** (**tarso-**) *combining form denoting* **1.** the ankle; tarsal bones. **2.** the edge of the eyelid.

**tarsal** **1.** *adj.* relating to the bones of the ankle and foot (**\*tarsus**). **2.** *adj.* relating to the eyelid, especially to its supporting tissue (tarsus). **3.** *n.* any of the bones forming the tarsus.

**tarsalgia** *n.* aching pain arising from the tarsus in the foot.

**tarsal glands** *see* MEIBOMIAN GLANDS.

**tarsectomy** *n.* **1.** surgical excision of the tarsal bones of the foot. **2.** surgical removal of a section of the tarsus of the eyelid.

**tarsitis** *n.* inflammation of the eyelid.

**tarsoplasty** *n.* *see* BLEPHAROPLASTY.

**tarsorrhaphy** *n.* an operation in which the upper and lower eyelids are joined together, either completely or along part of their length. It is performed to protect the cornea or to allow a corneal injury to heal.

**tarsus** *n.* (*pl.* **tarsi**) **1.** the seven bones of the ankle and proximal part of the foot (see illustration). The tarsus articulates with the metatarsals distally and with the tibia and fibula proximally. **2.** the firm fibrous connective tissue that forms the basis of each eyelid.

**Tarsus.** Bones of the right ankle and foot.

**tartar** *n.* an obsolete name for dental **\*calculus**, the hard deposit that forms on the teeth.

**taste** *n.* the sense for the appreciation of the flavour of substances in the mouth. The sense organs responsible are the **\*taste buds** on the surface of the **\*tongue**, which are stimulated when food dissolves in the saliva in the mouth. It is generally held that there are four basic taste sensations – sweet, bitter, sour, and salt – but two others – alkaline and metallic – are sometimes added to this list.

**taste buds** the sensory receptors concerned with the sense of taste (see illustration). They are located in the epithelium that covers the surface of the **\*tongue**, lying in the grooves around the papillae, particularly the circumvallate papillae. Taste buds are also present in the soft palate, the epiglottis, and parts of the pharynx. When a taste cell is stimulated by the presence of a dissolved substance impulses are sent via nerve fibres to the brain. From the anterior two-thirds of the tongue impulses pass via the facial nerve. The taste buds in the posterior third of the tongue send impulses via the glossopharyngeal nerve.

**Structure of a taste bud.**

**taurine** *n.* an amino acid that is a constituent of the **\*bile** salt taurocholate and also functions as a **\*neurotransmitter** in the central nervous system.

**taurocholic acid** *see* **BILE ACIDS**.

**TAVI** *see* **TRANSCATHETER AORTIC VALVE IMPLANTATION**.

**taxane** *n.* any of a group of **\*cytotoxic drugs** formerly extracted from a species of yew tree (*Taxus*) but now synthesized or produced by biotechnological methods. These drugs interact with tubulin, a protein involved in cell division, and have been found to exercise control on the growth of certain cancers, particularly breast and ovarian tumours. Taxanes include **\*docetaxel** and **\*paclitaxel**.

**taxis** *n.* (*in surgery*) the returning to a normal position of displaced bones, organs, or other parts by manipulation only, unaided by mechanical devices.

**Taxol** *n.* *see* **PACLITAXEL**.

**Taxotere** *n.* *see* **DOCETAXEL**.

**Tay–Sachs disease (amaurotic familial idiocy)** an inherited disorder of lipid metabolism (see **LIPIDOSIS**) in which abnormal accumulation of lipid in the brain leads to blindness, learning disabilities, and death in infancy. The gene responsible for the disorder is *\*recessive*, and the disease can now be largely prevented by genetic counselling in communities known to be affected (primarily Ashkenazi Jewish communities). [W. Tay (1843–1927), British physician; B. Sachs (1858–1944), US neurologist]

**tazarotene** *n.* see **RETINOID**.

**TBI** see **TRAUMATIC BRAIN INJURY**.

**TCC** transabdominal cervical cerclage: see **CERVICAL CERCLAGE**.

**T cell** *n.* see **LYMPHOCYTE**; **CYTOTOXIC T CELL**; **HELPER T CELL**; **REGULATORY T CELL**; **SUPPRESSOR T CELL**.

**TCP** *Trade name.* a solution of halogenated *\*phenols*: an effective *\*antiseptic* for minor skin injuries and irritations. It may also be used as a gargle for colds and sore throats.

**TCR** T-cell receptor: an important component of the surface of T *\*lymphocytes*, by which antigen is recognized.

**TCRE** see **TRANSCERVICAL RESECTION OF THE ENDOMETRIUM**.

**Td/IPV** a booster vaccine given to children aged 14 years to top up immunity against tetanus, diphtheria, and polio. See **IMMUNIZATION**.

**tear gas** any of the several kinds of gas used in warfare and by the police to produce temporary incapacitation. Most tear gases produce stinging pain in the eyes and streaming from the eyes and nose. See also **CS GAS**.

**tears** *pl. n.* the fluid secreted by the lacrimal glands (see **LACRIMAL APPARATUS**) to keep the front of the eyeballs moist and clean. Tears contain *\*lysozyme*, an enzyme that destroys bacteria. Irritation of the eye, and sometimes emotion, cause excessive production of tears. See also **BLINKING**.

**technetium-99m** *n.* an isotope of the artificial radioactive element technetium. It emits gamma radiation only, with no beta particles, at a convenient energy for detection by a **\*gamma camera** and has a short half-life. For these reasons it is widely used in nuclear medicine as a **\*tracer** for the examination of many organs (*see* **SCINTIGRAM**). Symbol: Tc-99m.

**tectospinal tract** a tract that conveys nerve impulses from the midbrain, across the midline as it descends, to the spinal cord in the cervical (neck) region. It contains important **\*motor neurons**.

**tectum** *n.* the roof of the **\*midbrain**, behind and above the **\*cerebral aqueduct**. From the nerve tissue protrude two pairs of rounded swellings called the **superior** and **inferior colliculi**, which contain cells concerned with reflexes involving vision and hearing, respectively.

**teeth** *pl. n. see* **TOOTH**.

**tegafur** *see* **FLUOROPYRIMIDINE**; **FLUOROURACIL**.

**tegmen** *n.* (*pl.* tegmina) a structure that covers an organ or part of an organ. For example the **tegmen tympani** is the bony roof of the middle ear.

**tegmentum** *n.* the region of the **\*midbrain** below and in front of the **\*cerebral aqueduct**. It contains the nuclei of several cranial nerves, the **\*reticular formation**, and other ascending and descending nerve pathways linking the forebrain and the spinal cord.

**teichopsia** *n.* shimmering coloured lights, accompanied by blank spots in the visual field (**transient scotomata**), often seen by sufferers at the beginning of an attack of migraine.

**tel-** (**tele-**, **telo-**) *combining form denoting* **1.** end or ending. **2.** distance.

**tela** *n.* any thin weblike tissue, particularly the **tela choroidea**, a folded double layer of **\*pia** mater containing numerous small blood vessels that extends into several of the **\*ventricles** of the brain.

**telangiectasis** *n.* (*pl.* **telangiectases**) a localized collection of distended blood capillary vessels. It is recognized as a red spot, sometimes spidery in appearance (*see* **SPIDER NAEVUS**), that blanches on pressure. Telangiectases may be found in the skin or the lining of the mouth or in the gastrointestinal,

respiratory, and urinary tracts. The condition in which multiple telangiectases occur is termed **telangiectasia**. It may be seen as an inherited condition associated with a bleeding tendency (**hereditary haemorrhagic telangiectasia**: *see* **OSLER-RENDU-WEBER DISEASE**). Accessible bleeding telangiectases (e.g. in the nose) may be obliterated by cauterization.

**telangiitis** *n.* inflammation of the smallest blood vessels (*see* **VASCULITIS**).

**telaprevir** *n.* *see* **BOCEPREVIR**.

**teleceptor** *n.* a sensory **\*receptor** that is capable of responding to distant stimuli. An example is the eye, which is capable of detecting changes and events at a great distance, unlike touch receptors, which depend on close contact.

**telegony** *n.* the unsubstantiated theory that mating with one male has an effect on the offspring of later matings with other males.

**telemedicine** *n.* the use of information technology in the diagnosis and treatment of patients. It includes telephone conversations between physicians or between physicians and patients; tele- or videoconferencing among members of a patient's health-care team; and **telepathology**, in which (for example) digital pictures of microscope slides can be sent by the Internet to a pathologist for a second opinion. Using telemedicine, a paramedic can access a consultant in an A & E department for the appropriate emergency treatment in difficult cases.

**telencephalon** *n.* *see* **CEREBRUM**.

**teleradiology** *n.* the process of transmitting and receiving medical images, to and from distant sites, using the telephone (or cable or satellite) network. This requires a dedicated broad-band link, such as an ISDN line, that has greater capacity for data transfer than standard telephone lines.

**teletherapy (external beam radiotherapy)** *n.* a form of **\*radiotherapy** in which penetrating radiation is directed at a patient from a distance. Originally radium was used as the radiation source; today artificially produced X-rays are predominantly used. *See* **LINEAR ACCELERATOR**.

**telmisartan** *n.* *see* **ANGIOTENSIN II ANTAGONIST**.

**telocentric** *n.* a chromosome in which the centromere is situated at either of its ends. —**telocentric** *adj.*

**telodendron** *n.* one of the branches into which the **\*axon** of a neuron divides at its destination. Each telodendron finishes as a terminal **bouton**, which takes part in a **\*synapse** or a **\*neuromuscular junction**.

**telogen** *n.* *see* **ANAGEN**.

**telomere** *n.* the end of a chromosome, which consists of repeated sequences of DNA that perform the function of ensuring that each cycle of DNA replication has been completed. Each time a cell divides some sequences of the telomere are lost; eventually (after 60–100 divisions in an average cell) the cell dies. Replication of telomeres is directed by **telomerase**, an enzyme consisting of RNA and protein that is inactive in normal cells. Its presence in tumours is linked to the uncontrolled multiplication of cancer cells.

**telophase** *n.* the final stage of **\*mitosis** and of each of the divisions of **\*meiosis**, in which the chromosomes at each end of the cell become long and thin and the nuclear membrane reforms around them. The cytoplasm begins to divide.

**temazepam** *n.* a **\*benzodiazepine** used for the short-term treatment of insomnia and in **\*premedication** before minor surgery. Common side-effects include drowsiness, dizziness, and loss of appetite.

**temoporfin** *n.* *see* **PHOTODYNAMIC THERAPY**.

**temozolomide** *n.* an **\*alkylating agent** with activity against **\*angiogenesis**. It is used for the treatment of **\*glioblastoma** multiforme, either concurrently with radiotherapy or as a single-agent chemotherapy drug, and for multiple myeloma. Side-effects include thrombocytopenia.

**temple** *n.* the region of the head in front of and above each ear.

**temporal** *adj.* of or relating to the temple.

**temporal arteritis** *see* **ARTERITIS**.

**temporal artery** a branch of the external carotid artery that supplies blood mainly to the temple and scalp.

**temporal bone** either of a pair of bones of the cranium. The **squamous** portion forms part of the side of the cranium. The **petrous** part contributes to the base of the skull and contains the middle and inner ears. Below it are the **\*mastoid process**, **\*styloid process**, and zygomatic process (*see* **ZYGOMATIC ARCH**). *See also* **SKULL**.

**temporalis** *n.* a fan-shaped muscle situated at the side of the head, extending from the temporal fossa to the mandible. This muscle lifts the lower jaw, thus closing the mouth.

**temporal lobe** one of the main divisions of the **\*cerebral cortex** in each hemisphere of the brain, lying at the side within the temple of the skull and separated from the frontal lobe by a cleft, the **lateral sulcus**. Areas of the cortex in this lobe are concerned with the appreciation of sound and spoken language.

**temporal lobe epilepsy** *see* **EPILEPSY**.

**temporo-** *combining form denoting* **1.** the temple. **2.** the temporal lobe of the brain.

**temporomandibular joint** the articulation between the **\*mandible** and the **\*temporal bone**: a hinge joint (*see* **GINGLYMUS**).

**temporomandibular joint syndrome** a condition in which the patient has painful temporomandibular joints, tenderness in the muscles that move the jaw, clicking of the joints, and limitation of jaw movement. Stress, resulting in clenching the jaws and grinding the teeth, is often a causal factor but **\*occlusion**, trauma, and systemic factors may also need to be considered. Treatment is normally conservative.

**TEMS** *see* **TRANSANAL ENDOSCOPIC MICROSURGERY**.

**temsirolimus** *n.* a **\*protein kinase** inhibitor used for the treatment of advanced renal cell carcinoma. It targets a serine threonine kinase that regulates a signalling cascade controlling cell proliferation. Side-effects include hypersensitivity reactions (flushing, chest pain, breathlessness).

**tenaculum** *n.* **1.** a sharp wire hook with a handle. The instrument is used in surgical operations to pick up pieces of tissue or the cut end of an artery. **2.** a

band of fibrous tissue that holds a part of the body in place.

**tendinitis** *n.* inflammation of a tendon. It occurs most commonly after excessive overuse but is sometimes due to bacterial infection (e.g. **\*gonorrhoea**), or a generalized rheumatic disease (e.g. **\*rheumatoid arthritis** or ankylosing spondylitis). Treatment is by rest, achieved sometimes by splinting the adjacent joint, and corticosteroid injection into the tender area around the tendon. Tendinitis at the insertion of the supraspinatus muscle is a frequent cause of pain and restricted movement in the shoulder. *See also* **JUMPER'S KNEE**; **TENNIS ELBOW**. *Compare* **TENOSYNOVITIS**.

**tendinosis** *n.* degeneration of a tendon, commonly associated with nodular thickening, that is due to atrophy and may eventually result in tendon rupture. It may occur with ageing or result from overuse or compromise of blood supply.

**tendon** *n.* a tough whitish cord, consisting of numerous parallel bundles of collagen fibres, that serves to attach a muscle to a bone. Tendons are inelastic but flexible; they assist in concentrating the pull of the muscle on a small area of bone. Some tendons are surrounded by **tendon sheaths** – these are tubular double-layered sacs lined with synovial membrane and containing synovial fluid. Tendon sheaths enclose the flexor tendons at the wrist and ankle, where they minimize friction and facilitate movement. *See also* **APONEUROSIS**. —**tendinous** *adj.*

**tendon organ (Golgi tendon organ)** a sensory **\*receptor** found within a tendon that responds to the tension or stretching of the tendon and relays impulses to the central nervous system. Like stretch receptors in muscle, tendon organs are part of the **\*proprioceptor** system.

**tendon transfer** plastic surgery in which the tendon from an unimportant muscle is used to replace the damaged tendon of an important muscle. A common tendon used is the palmaris longus tendon of the forearm.

**tendovaginitis (tenovaginitis)** *n.* inflammatory thickening of the fibrous sheath containing one or more tendons, usually caused by repeated minor injury. It usually occurs at the back of the thumb (**de Quervain's tendovaginitis**) and results in pain on using the wrists. Treatment is by rest,

injection of cortisone into the tendon sheath, and, if these fail, surgical incision of the sheath.

**tenecteplase** *n.* see **FIBRINOLYTIC**; **TISSUE-TYPE PLASMINOGEN ACTIVATOR**.

**tenesmus** *n.* a sensation of the desire to defecate or urinate, associated with straining and the passage of minimal volumes of faeces or urine or none at all. Rectal tenesmus may be due to **\*proctitis**, prolapse of the rectum, rectal tumour, or **\*irritable bowel syndrome**.

**tennis elbow** a painful condition causing degeneration of the origin of the common extensor tendon on the lateral epicondyle of the **\*humerus**, due to overuse of the forearm muscles. Treatment is by rest, massage, and local corticosteroid injection. If the symptoms do not settle, surgery may be required. See also **TENDINITIS**. Compare **GOLFER'S ELBOW**.

**teno-** *combining form denoting a tendon.*

**tenofovir disoproxil** a reverse transcriptase inhibitor (see **REVERSE TRANSCRIPTASE**).

**tenonectomy** *n.* surgical removal of a portion of the **\*Tenon's capsule**.

**tenonotomy** *n.* a surgical incision made into the **\*Tenon's capsule**. It is most often performed to instil local anaesthetic around the eye before performing cataract surgery (sub-Tenon's local anaesthesia).

**Tenon's capsule** the fibrous tissue that lines the orbit and surrounds the eyeball. [J. R. Tenon (1724–1816), French surgeon]

**tenoplasty** *n.* surgical repair of a ruptured or severed tendon.

**tenorrhaphy** *n.* the surgical operation of uniting the ends of divided tendons by suture.

**tenosynovitis (peritendinitis)** *n.* inflammation of a tendon sheath, producing pain, swelling, and an audible creaking on movement. It may result from a bacterial infection or occur as part of a rheumatic disease causing **\*synovitis**.

**tenotomy** *n.* surgical **\*division** of a tendon. This may be necessary to correct a joint deformity caused by tendon shortening or to reduce the imbalance of

forces caused by an overactive muscle in a spastic limb. Tenotomy of the tensor tympani muscle is sometimes used in the treatment of *\*middle ear myoclonus*. *See also* **SCISSOR LEG**.

**tenovaginitis** *n. see* **TENDOVAGINITIS**.

**TENS** *see* **TRANSCUTANEOUS ELECTRICAL NERVE STIMULATION**.

**tension-free vaginal tape (transvaginal tape, TVT)** a surgical sling procedure for treating stress incontinence in women that uses a tape made of polypropylene mesh. The tape is inserted under the mid-urethra (rather than the bladder neck, as in a *\*pubovaginal sling*), passing through the retropubic space on either side, and is fixed to the abdominal wall just internal to the pubic symphysis. The **transobturator tape (TOT)** procedure is similar, but in this technique a tunnel is created out to the *\*obturator foramen* on either side, lessening the risk of vascular and bladder injuries. Tape procedures have lower morbidity rates than *\*colposuspension* and have gradually replaced the latter as the surgical procedure of choice for treating female stress incontinence, but there may be complications associated with nonabsorbable mesh.

**tensor** *n.* any muscle that causes stretching or tensing of a part of the body.

**tensor tympani** *see* **TONIC TENSOR TYMPANI SYNDROME**.

**tent** *n.* **1.** an enclosure of material (usually transparent plastic) around a patient in bed, into which a gas or vapour can be passed as part of treatment. An **oxygen tent** is relatively inefficient as a means of administering oxygen; a face mask or intranasal oxygen are used where possible. **2.** a piece of dried vegetable material, usually a seaweed stem, shaped to fit into an orifice, such as the cervical canal. As it absorbs moisture it expands, providing a slow but forceful means of dilating the orifice.

**tented diaphragm** the radiological sign of a raised diaphragm, which is observed in many conditions including *\*subphrenic abscess*, previous abdominal surgery, *\*peritonitis*, damage to the nerve innervating the diaphragm (the phrenic nerve), and various lung-related disease processes.

**tentorium** *n.* a curved infolded sheet of *\*dura* mater that dips inwards from the skull and separates the cerebellum below from the occipital lobes of the

cerebral hemispheres above.

**terat-** (**terato-**) *combining form denoting a monster or congenital abnormality.*

**teratogen** *n.* any substance, agent, or process that induces the formation of developmental abnormalities in a fetus. Known teratogens include such drugs as **\*thalidomide** and alcohol; such infections as German measles and cytomegalovirus; and also irradiation with X-rays and other ionizing radiation. *Compare* **MUTAGEN**. —**teratogenic** *adj.*

**teratogenesis** *n.* the process leading to developmental abnormalities in the fetus.

**teratology** *n.* the study of developmental abnormalities and their causes.

**teratoma** *n.* a tumour composed of a number of tissues that are not usually found at that site and are derived from all three embryonic **\*germ layers**. Teratomas most frequently occur in the testis and ovary (*see* **DERMOID CYST**), possibly derived from remnants of embryonic cells that have the ability to differentiate into many types of tissue; in most malignant teratomas, cells from all three **\*germ layers** are present. **Malignant teratoma of the testis** is found in young men: it is more common in patients with a history of undescended testis. Like **\*seminoma**, it frequently occurs as a painless swelling of one testis (pain is not a good indication that the swelling is benign). Treatment is by **\*orchidectomy** avoiding an incision into the scrotum. The tumour can spread to lymph nodes, lungs, and bone, treatment of which may involve the use of chemotherapy drugs, such as vinblastine, bleomycin, cisplatin, and etoposide, with a high cure rate even in metastatic disease.

Teratomas often produce **\*alpha-fetoprotein**, beta human chorionic gonadotrophin, or both; the presence of these substances (**\*tumour markers**) in the blood is a useful indication of the amount of tumour and the effect of treatment.

**teratospermia** *n.* *see* **OLIGOSPERMIA**.

**terbinafine** *n.* an antifungal drug used to treat infections of the nails and ringworm. Possible side-effects with oral treatment include nausea,

abdominal pain, and allergic skin rashes.

**terbutaline** *n.* a **\*bronchodilator** drug: a short-acting beta agonist (*see* **SYMPATHOMIMETIC**) used in the treatment of asthma and other respiratory disorders characterized by reversible airways obstruction and to inhibit premature labour. Common side-effects include nervousness and dizziness.

**teres** *n.* either of two muscles of the shoulder, extending from the scapula to the humerus. The **teres major** draws the arm towards the body and rotates it inwards; the **teres minor** rotates the arm outwards.

**terlipressin** *n.* a drug that releases **\*vasopressin** over a period of hours. It is administered to help to control bleeding from **\*oesophageal varices** by constricting the small arteries in the intestinal tract.

**terminal dribble** a **\*lower urinary tract symptom** in which the flow of urine does not end quickly, but dribbles slowly towards an end. This must be distinguished from **\*postmicturition dribble**, which occurs after voiding has been completed.

**terpene** *n.* any of a group of unsaturated hydrocarbons many of which are found in plant oils and resins and are responsible for the scent of these plants (e.g. mint). Larger terpenes include vitamin A, squalene, and the carotenoids.

**tertian fever** *see* **MALARIA**.

**tertiary care** the specialized services provided by centres equipped with diagnostic and treatment facilities not available at general hospitals. *Compare* **PRIMARY CARE**; **SECONDARY CARE**.

**tertiary prevention** reducing the impact of complications and progression of established disease. Examples include **\*cardiac rehabilitation** following myocardial infarction, stroke rehabilitation, and screening people with diabetes for diabetic **\*retinopathy**. In practice, the distinction between tertiary and **\*secondary prevention** is often unclear. *See also* **PREVENTIVE MEDICINE**; **PRIMARY PREVENTION**.

**TESA (testicular sperm aspiration)** a technique used in the treatment of male infertility in which spermatozoa are removed by an incision into and

aspiration from the testis. The sperm are then used to fertilize egg cells in vitro (*see* ICSI).

**tesla** *n.* the **\*SI unit** of magnetic flux density, equal to a density of 1 weber per square metre. This unit is important in **\*magnetic resonance imaging** (MRI). Most MRI scanners operate between 0.1 and 2.5 T, but some modern research scanners may go up to 7 T. Symbol: T.

**testicle** *n.* the **\*testis** and its system of ducts (the vasa efferentia and epididymis) within the scrotum.

**testicular feminization syndrome** *see* **ANDROGEN INSENSITIVITY SYNDROME**.

**testis** *n.* (*pl.* testes) either of the pair of male sex organs that produce spermatozoa and secrete the male sex hormone **\*androgen** under the control of **\*gonadotrophins** from the pituitary gland. The testes of the fetus form within the abdomen but descend into the **\*scrotum** in order to maintain a lower temperature that favours the production and storage of spermatozoa. The bulk of the testis is made up of long convoluted **seminiferous tubules** (*see* illustration), in which the spermatozoa develop (*see* **SPERMATOGENESIS**). The tubules also contain **\*Sertoli cells**, which may nourish developing sperm cells. Spermatozoa pass from the testis to the **\*epididymis** to complete their development. The **interstitial (Leydig) cells**, between the tubules, are the major producers of androgens.

**Testis (longitudinal section).**

**test meal** a standard meal given to stimulate secretion of digestive juices, which can then be withdrawn by tube and measured as a test of digestive function. A **fractional test meal** was a gruel preparation to stimulate gastric secretion, whose acid content was measured. This has been replaced by tests using secretory stimulants. The **Lundh test meal** is a meal of oil and protein to stimulate pancreatic secretion, which is withdrawn from the duodenum and its trypsin content measured as a test of pancreatic function.

**testosterone** *n.* the principal male sex hormone (*see* **ANDROGEN**). Formed from **androstenedione** within the interstitial cells of the **\*testis**, it is converted in target cells to **\*dihydrotestosterone**, which mediates most of its actions. Preparations of testosterone are used for replacement therapy in males with testosterone deficiency; they can be administered orally, by intramuscular depot injection, or topically (in the form of skin patches or gels).

**test-tube baby** a colloquial name for a baby born to a woman as a result of fertilization of one of her ova by her partner's sperm outside her body. *See* **IN VITRO FERTILIZATION**.

**tetan-** (**tetano-**) *combining form denoting* **1.** tetanus. **2.** tetany.

**tetanolysin** *n.* a toxin produced by tetanus bacilli in an infected wound, causing the local destruction of tissues.

**tetanospasmin** *n.* a toxin produced by tetanus bacilli in an infected wound. The toxin diffuses along nerves, causing paralysis, and may reach the spinal cord and brain, when it causes violent muscular spasms and the condition of lockjaw.

**tetanus (lockjaw)** *n.* an acute infectious disease, affecting the nervous system, caused by the bacterium *Clostridium tetani*. Infection occurs by contamination of wounds by bacterial spores. Bacteria multiply at the site of infection and produce a toxin that irritates nerves so that they cause spasmodic contraction of muscles. Symptoms appear 4–25 days after infection and consist of muscle stiffness, spasm, and subsequent rigidity, first in the jaw and neck then in the back, chest, abdomen, and limbs; in severe cases the spasm may affect the whole body, which is arched backwards (*see* **OPISTHOTONOS**). High fever, convulsions, and extreme pain are common. If respiratory muscles are affected, a **\*tracheostomy** or intubation and ventilation is essential to avoid death from asphyxia. Mortality is high in untreated cases but prompt treatment is effective. An attack does not necessarily confer complete immunity. Immunization against tetanus is effective but temporary. —**tetanic** *adj.*

**tetany** *n.* spasm and twitching of the muscles, particularly those of the face, hands, and feet. Tetany is usually caused by a reduction in the blood calcium level, which may be due to underactive parathyroid glands, rickets, or **\*alkalosis**.

**tetra-** *combining form denoting* four.

**tetracaine (amethocaine)** *n.* a potent local anaesthetic applied to the skin before intravenous injections or the insertion of a cannula. It is also applied as eye drops before eye operations.

**tetracosactide (tetracosactin)** *n.* *see* **ACTH**; **SYNACTHEN TESTS**.

**tetracyclines** *pl. n.* a group of antibiotic compounds derived from cultures of *Streptomyces* bacteria. These drugs, which include **\*doxycycline**,

**\*oxytetracycline**, and **tetracycline**, are effective against a wide range of bacterial infections. They are usually given to treat various conditions, including infections caused by **\*Chlamydia** species, respiratory-tract infections, and acne. Side-effects such as nausea, vomiting, and diarrhoea are fairly common. In addition, suppression of normal intestinal bacteria may make the patient susceptible to infection with tetracycline-resistant organisms. Tetracyclines should not be administered after the fourth month of pregnancy and their use should be avoided in children under 12 to prevent unsightly staining of the permanent teeth.

**tetrad** *n.* (in genetics) **1.** the four cells resulting from meiosis after the second telophase. **2.** the four chromatids of a pair of homologous chromosomes (*see* **BIVALENT**) in the first stage of meiosis.

**tetradactyly** *n.* a congenital abnormality in which there are only four digits on a hand or foot.

**tetrahydrocannabinol** *n.* *see* **CANNABIS**.

**tetraiodothyronine** *n.* *see* **THYROXINE**.

**tetralogy of Fallot** a form of congenital heart disease in which there is **\*pulmonary stenosis**, enlargement of the right ventricle, a **\*ventricular septal defect**, and in which the origin of the aorta lies over the septal defect. The affected child is blue (cyanosed) and frequently squats. The defect is corrected surgically. [E. L. A. Fallot (1850–1911), French physician]

**tetraplegia** *n.* *see* **QUADRIPLEGIA**.

**tetrodotoxin** *n.* puffer-fish toxin, one of the most powerful known nerve toxins with a mortality of about 50%. There is no known antidote.

**TGF** *see* **TRANSFORMING GROWTH FACTOR**.

**thalam-** (**thalamo-**) *combining form denoting* the thalamus. Example: **thalamolenticular** (relating to the thalamus and lenticular nucleus of the brain).

**thalamencephalon** *n.* the structures, collectively, at the anterior end of the brainstem, comprising the **\*epithalamus**, **\*thalamus**, **\*hypothalamus**, and

subthalamus, all of which are concerned with the reception and processing of information that enters from sensory nerve pathways.

**thalamic syndrome** a condition resulting from damage to the thalamus, often by a stroke, that is characterized by severe intractable pain and hypersensitivity in the area of the body served by the damaged brain region. It is extremely resistant to treatment.

**thalamotomy** *n.* an operation on the brain in which a lesion is made in a precise part of the **\*thalamus**. It has been used to control psychiatric symptoms of severe anxiety and distress, in which cases the lesion is made in the dorsomedial nucleus of the thalamus, which connects with the frontal lobe. It is now extremely rarely used. *See also* **PSYCHOSURGERY**.

**thalamus** *n.* (*pl.* thalami) one of two egg-shaped masses of grey matter that lie deep in the cerebral hemispheres in each side of the forebrain. The thalami are relay stations for all the sensory messages that enter the brain, before they are transmitted to the cortex. All sensory pathways, except that for the sense of smell, are linked to nuclei within the thalamus, and it is here that the conscious awareness of messages as sensations – temperature, pain, touch, etc. – probably begins.

**thalassaemia (Cooley's anaemia)** *n.* a hereditary blood disease, widespread in the Mediterranean countries, Asia, and Africa, in which there is an abnormality in the protein part of the **\*haemoglobin** molecule. The affected red cells cannot function normally, leading to anaemia. Other symptoms include enlargement of the spleen and abnormalities of the bone marrow. Individuals inheriting the defective gene from both parents are severely affected (**thalassaemia major**), but those inheriting it from only one parent are usually symptom-free. Patients with the major disease are treated with repeated blood transfusions or bone marrow transplantation. The disease can be detected by prenatal diagnosis.

<https://www.ukts.org/>

- Website of the UK Thalassaemia Society

**thalassotherapy** *n.* treatment by means of remedial bathing in sea water.

**thalidomide** *n.* a drug that was formerly used as a sedative. If taken during the first three months of pregnancy, it was found to cause fetal abnormalities involving limb malformation and was withdrawn as a sedative in 1962. Recently, however, thalidomide has been found to be effective in treating myeloma and severe reactions in leprosy. It appears to act in various ways, including as an immunomodulator, anti-inflammatory agent, and angiogenesis inhibitor. Side-effects include constipation, drowsiness, and (with long-term use) peripheral neuropathy. It should not be used in women who are pregnant or capable of becoming pregnant.

**thallium** *n.* a leadlike element that has several dangerously poisonous compounds. The poison is cumulative and causes liver and nerve damage and bone destruction. The victim's hair is likely to fall out and does not grow again. Treatment is by administration of *\*chelating agents*. Symbol: Tl.

**thallium scan** *see* MYOCARDIAL PERFUSION SCAN.

**thallium-technetium isotope subtraction imaging** a technique to image the parathyroid glands. Technetium is taken up only by the thyroid gland, but thallium is taken up by both the thyroid and parathyroid glands. *\*Digital subtraction* of the two isotopes leaves an image of the parathyroid glands alone. It is an accurate technique (90%) for the identification of adenomas of the parathyroid glands secreting excess hormone.

**theca** *n.* a sheathlike surrounding tissue. For example, the **theca folliculi** is the outer wall of a *\*Graafian follicle*.

**theine** *n.* the active volatile principle found in tea (*see* CAFFEINE).

**thelarche** *n.* the process of breast development, which occurs as a normal part of *\*puberty*. Isolated premature breast development in girls is not uncommon and is almost always benign.

**thenar** *n.* **1.** the palm of the hand. **2.** the fleshy prominent part of the hand at the base of the thumb. *Compare* HYPOTHENAR.

—**thenar** *adj.*

**theobromine** *n.* an alkaloid, occurring in cocoa, coffee, and tea, that has a weak diuretic action and dilates coronary and other arteries. It was formerly used to treat angina.

**theophylline** *n.* an alkaloid, occurring in the leaves of the tea plant, that has a diuretic effect and relaxes smooth muscle, especially of the bronchi (it is an **\*antimuscarinic** drug). It is used mainly as a bronchodilator to treat severe asthma attacks. **\*Aminophylline** is theophylline combined with ethylenediamine.

**therapeutic index** the ratio of a dose of a therapeutic agent that produces damage to normal cells to the dose that is necessary to have a defined level of anticancer activity. It indicates the relative efficacy of a treatment against tumours.

**therapeutic misconception** a common misunderstanding on the part of patients involved in a research trial that they themselves will benefit from its findings. Researchers and recruiters for research have an ethical duty to check for this misunderstanding and to correct it wherever possible. If they do not, the principle of **\*informed consent** may be breached.

**therapeutic privilege** the entitlement of a doctor to withhold information from a patient when it is feared that disclosure could cause immediate and serious harm to the patient (e.g. because he or she is suffering from severe depression). In exceptional cases, the need to withhold information may be considered to override the requirement to obtain informed **\*consent** before proceeding with treatment. In such a case therapeutic privilege could be used as a legal defence against the charge of **\*battery** or **\*negligence**. If doctors are intending to invoke the concept of therapeutic privilege they must be prepared to justify their decision. Furthermore, while it was once quite common for doctors to withhold bad news or upsetting information from patients for **\*paternalistic** motives, it is now considered a breach of the patient's **\*autonomy** and the ethicolegal justification for invoking therapeutic privilege where a patient has **\*capacity** is, if it exists at all, extremely limited.

**therapeutics** *n.* the branch of medicine that deals with different methods of treatment and healing (**therapy**), particularly the use of drugs in the cure of disease.

**therm** *n.* a unit of heat equal to 100,000 British thermal units. 1 therm =  $1.055 \times 10^8$  joules.

**therm-** (**thermo-**) *combining form denoting* **1.** heat. **2.** temperature.

**thermoalgesia (thermalgesia)** *n.* an abnormal sense of pain that is felt when part of the body is warmed. It is a type of **\*dysaesthesia** and is a symptom of partial damage to a peripheral nerve or to the fibre tracts conducting temperature sensation to the brain.

**thermoanaesthesia** *n.* absence of the ability to recognize the sensations of heat and coldness. When occurring as an isolated sensory symptom it indicates damage to the spinothalamic tract in the spinal cord, which conveys the impulses of temperature to the thalamus.

**thermocautery** *n.* the destruction of unwanted tissues by heat (*see* **CAUTERIZE**).

**thermocoagulation** *n.* the coagulation and destruction of tissues by cautery.

**thermography** *n.* a technique for measuring and recording the heat produced by different parts of the body by using photographic film sensitive to infrared radiation. The picture produced is called a **thermogram**. The heat radiated from the body varies in different parts according to the flow of blood through the vessels; thus areas of poor circulation produce less heat. On the other hand a tumour with an abnormally increased blood supply may be revealed on the thermogram as a 'hot spot'. The technique was formerly used in the diagnosis of tumours of the breast (**mammothermography**) before the development of more sensitive techniques (*see* **MAMMOGRAPHY**).

**thermoluminescent dosimeter (TLD)** a radiation **\*dosimeter** that utilizes the ability of activated sodium fluoride to luminesce in proportion to the radiation dose to which it is exposed when it is heated. It is now a common form of radiation dosimeter for personnel monitoring.

**thermolysis** *n.* (in physiology) the dissipation of body heat by such processes as the evaporation of sweat from the skin surface.

**thermometer** *n.* a device for registering temperature. A **clinical thermometer** consists of a sealed narrow-bore glass tube with a bulb at one end. It contains mercury, which expands when heated and rises up the tube. The tube is calibrated in degrees, and is designed to register temperatures

between 35°C (95°F) and 43.5°C (110°F). An **oral thermometer** is placed in the mouth; a **rectal thermometer** is inserted into the rectum.

**thermophilic** *adj.* describing organisms, especially bacteria, that grow best at temperatures of 48–85°C. *Compare* **MESOPHILIC**; **PSYCHROPHILIC**.

**thermophore** *n.* any substance that retains heat for a long time, such as kaolin, which is often used in hot poultices.

**thermoreceptor** *n.* a sensory nerve ending that responds to heat or to cold. Such **\*receptors** are scattered widely in the skin and in the mucous membrane of the mouth and throat.

**thermotaxis** *n.* the physiological process of regulating or adjusting body temperature.

**thermotherapy** *n.* the use of heat to alleviate pain and stiffness in joints and muscles and to promote an increase in circulation. **\*Diathermy** provides a means of generating heat within the tissues themselves.

**thiabendazole** *n. see* **TIABENDAZOLE**.

**thiamine** *n. see* **VITAMIN B<sub>1</sub>**.

**thiazide diuretic** *see* **DIURETIC**.

**thiazolidinediones** *pl. n.* a group of **\*oral hypoglycaemic drugs**, including **pioglitazone**, used in the treatment of type 2 **\*diabetes mellitus**. They act by reducing resistance of the body to its own insulin and may be taken alone or in combination with **\*metformin** or a **\*sulphonylurea**. Thiazolidinediones should not be used in patients with heart failure or bladder cancer or with a history of these.

**Thiersch's graft** *see* **SPLIT-SKIN GRAFT**. [K. Thiersch (1822–95), German surgeon]

**thin membrane disease** an inherited disease of the kidneys in which the glomerular basement membrane, which filters waste material from the blood, is too thin, allowing small amounts of blood to pass across it. This can be a cause of **benign familial haematuria** and thin membrane disease is a common finding in renal biopsy series where the procedure has been carried

out as part of the investigation of **\*haematuria**. Thin membranes are also found in other conditions, e.g. in some cases of **\*Alport's syndrome** and **\*Berger's nephropathy**.

**thioguanine** *n.* *see* **TIOGUANINE**.

**thionamides** *pl. n.* a group of chemically related compounds used as **\*antithyroid drugs**. They exert their action on thyroid tissue by inhibiting the iodination of **\*thyroglobulin**, which is an essential step in the manufacture of thyroid hormones.

**thiopental (thiopentone)** *n.* a short-acting **\*barbiturate**. It is given to induce general **\*anaesthesia**. Possible complications of thiopental anaesthesia can include respiratory depression, laryngeal spasm, and thrombophlebitis. The drug is not used when respiratory obstruction is present.

**thiophilic** *adj.* growing best in the presence of sulphur or sulphur compounds. The term is usually applied to bacteria.

**thioxanthene** *n.* *see* **ANTIPSYCHOTIC**.

**third-party payer** the source of payment for hospital or medical services when this is neither the patient (directly) nor the health-care provider. A third-party payer may be the government, an insurance company, an employer, or a philanthropic organization.

**thorac- (thoraco-)** *combining form denoting* the thorax or chest.

**thoracentesis** *n.* *see* **PLEUROCENTESIS**.

**thoracic cavity** the chest cavity. *See* **THORAX**.

**thoracic duct** one of the two main trunks of the **\*lymphatic system**. It receives lymph from both legs, the lower abdomen, left thorax, left side of the head, and left arm and drains into the left innominate vein.

**thoracic vertebrae** the 12 bones of the **\*backbone** to which the ribs are attached. They lie between the cervical (neck) and lumbar (lower back) vertebrae and are characterized by the presence of facets for articulation with the ribs. *See also* **VERTEBRA**.

**thoracocentesis** *n.* *see* PLEUROCENTESIS.

**thoracoplasty** *n.* a former treatment for pulmonary tuberculosis involving surgical removal of parts of the ribs, thus allowing the chest wall to fall in and collapse the affected lung.

**thoracoscope** *n.* an instrument used to inspect the \*pleural cavity. —  
**thoracoscopy** *n.*

**thoracotomy** *n.* surgical opening of the chest cavity to inspect or operate on the heart, lungs, or other structures within.

**thorax** *n.* the chest: the part of the body cavity between the neck and the diaphragm. The skeleton of the thorax is formed by the sternum, costal cartilages, ribs, and thoracic vertebrae of the backbone. It encloses the lungs, heart, oesophagus, and associated structures. *Compare* ABDOMEN. —  
**thoracic** *adj.*

**thought alienation** a symptom of psychosis in which patients feel that their own thoughts are in some way no longer within their control. It includes \*thought insertion, \*thought withdrawal, and \*thought broadcast. Any form of thought alienation is a \*Schneiderian first-rank symptom, highly indicative of schizophrenia.

**thought block** a sudden halting of the flow of thought, usually manifested as an interruption to speech lasting for a few seconds or more; when speech resumes, it is often on an unrelated subject. Thought block is a common symptom in severe mental illness but may also arise in the context of \*psychosis, severe anxiety, or depression.

**thought broadcast** a symptom of psychosis in which the patient feels that his or her thoughts are being distributed into other people's thoughts. It must be differentiated from a mere idea that others can read one's mind, which is common. Thought broadcast requires the conviction of an active transmission of thoughts. This is a \*Schneiderian first-rank symptom, highly indicative of schizophrenia.

**thought echo (echo de la pensée)** a symptom of psychosis in which the patient has a hallucination of hearing aloud his or her own thoughts a short time after thinking them. Similar to the experience of thought echo is that of

**Gedankenlautwerden**, in which the patients hear their own thoughts aloud at the time they think them. The latter was an original *\*Schneiderian first-rank symptom*, but has been left out of most translations of Schneider's work into English.

**thought insertion** a symptom of psychosis in which the patient feels that thoughts are inserted into his or her own head by an outside force or agency. This is a *\*Schneiderian first-rank symptom*, highly indicative of schizophrenia.

**thought-stopping** *n.* a technique of *\*behaviour therapy* used in the treatment of obsessional thoughts. Attention is voluntarily withdrawn from these thoughts and focused on some other vivid image or engrossing activity.

**thought withdrawal** a symptom of psychosis in which patients believe that their own thoughts are being taken out of their head by an outside force. This is a *\*Schneiderian first-rank symptom*, highly indicative of schizophrenia.

**threadworm (pinworm)** *n.* a parasitic nematode worm of the genus *Enterobius* (*Oxyuris*), which lives in the upper part of the human large intestine. The threadlike female worm, some 12 mm long, is larger than the male; it emerges from the anus in the evening to deposit its eggs, and later dies. If the eggs are swallowed and reach the intestine they develop directly into adult worms. Threadworms cause *\*enterobiasis*, a disease common in children throughout the world.

**3-D magnetic imager** an instrument that harnesses magnetic technology to give a virtual image of an endoscope during colonoscopy. It aids steering and minimalizes looping of the endoscope. An external antenna tracks the magnetic field generated by coils built inside the endoscope, enabling real-time 3D imaging of this instrument. Trade name: **ScopeGuide**.

**threonine** *n.* an *\*essential amino acid*. *See also* **AMINO ACID**.

**threshold** *n.* (in neurology) the point at which a stimulus begins to evoke a response, and therefore a measure of the sensitivity of a system under particular conditions. A *\*thermoreceptor* that responds to an increase in temperature of only two degrees is said to have a much lower threshold than one that will only respond to a change in temperature of ten degrees or more. In this example the threshold can be measured directly in terms of degrees.

**thrill** *n.* a vibration felt on placing the hand on the body. A heart murmur that is felt by placing the hand on the chest wall is said to be accompanied by a thrill.

**-thrix** *combining form denoting* a hair or hairlike structure.

**thromb-** (**thrombo-**) *combining form denoting* **1.** a blood clot (thrombus). **2.** thrombosis. **3.** blood platelets.

**thrombasthenia** *n.* a hereditary blood disease in which the function of the **\*platelets** is defective although they are present in normal numbers. The manifestations are identical to those of thrombocytopenic **\*purpura**.

**thrombectomy** *n.* a surgical procedure in which a blood clot (thrombus) is removed from an artery or vein (*see* **ENDARTERECTOMY**; **PHLEBOTHROMBOSIS**).

**thrombin** *n.* a substance (**\*coagulation** factor) that acts as an enzyme, converting the soluble protein fibrinogen to the insoluble protein fibrin in the final stage of **\*blood coagulation**. Thrombin is not normally present in blood plasma, being derived from an inactive precursor, **prothrombin**.

**thromboangiitis obliterans** *see* **BUERGER'S DISEASE**.

**thrombocyte** *n.* *see* **PLATELET**.

**thrombocythaemia** *n.* a disease in which there is an abnormal proliferation of the cells that produce blood **\*platelets** (**\*megakaryocytes**), leading to an increased number of platelets in the blood. This may result in an increased tendency to form clots within blood vessels (thrombosis); alternatively the function of the platelets may be abnormal, leading to an increased tendency to bleed. Treatment is by radiotherapy, **\*cytotoxic drugs**, **\*interferon**, or drugs that inhibit **\*megakaryocyte** maturation.

**thrombocytopenia** *n.* a reduction in the number of **\*platelets** in the blood. This results in bleeding into the skin (*see* **PURPURA**), spontaneous bruising, and prolonged bleeding after injury. Thrombocytopenia may result from failure of platelet production or excessive destruction of platelets. — **thrombocytopenic** *adj.*

**thrombocytosis** *n.* an increase in the number of **\*platelets** in the blood. It may occur in a variety of diseases, including chronic infections, cancers, and certain blood diseases and is likely to cause an increased tendency to form blood clots within vessels (thrombosis).

**thromboembolism** *n.* the condition in which a blood clot (thrombus), formed at one point in the circulation, becomes detached and lodges at another point. It is most commonly applied to the association of phlebothrombosis and **\*pulmonary embolism** (**pulmonary thromboembolic disease**).

**thromboendarterectomy** *n.* *see* **ENDARTERECTOMY**.

**thromboendarteritis** *n.* thrombosis complicating **\*endarteritis**, seen in temporal **\*arteritis**, **\*polyarteritis nodosa**, and syphilis. It may cause death of part of the organ supplied by the affected artery.

**thrombokinase** *n.* *see* **THROMBOPLASTIN**.

**thrombolysis** *n.* the dissolution of a blood clot (thrombus) by the infusion of a **\*fibrinolytic** agent into the blood. It may be used in the treatment of **\*phlebothrombosis**, **\*pulmonary embolism**, and coronary thrombosis.

**thrombolytic** *adj.* describing an agent that breaks up blood clots (thrombi). Thrombolytic drugs are used to unblock arteries in the treatment of myocardial infarction. *See* **FIBRINOLYTIC**; **TISSUE-TYPE PLASMINOGEN ACTIVATOR**.

**thrombophilia** *n.* an inherited or acquired condition that predisposes individuals to **\*thrombosis**. **Inherited thrombophilias** are established causes of systemic thrombosis due to defects in proteins involved in regulating **\*blood coagulation**. Causes include **\*Factor V Leiden** gene mutation, a **\*prothrombin** gene mutation, deficiencies in proteins C and S and antithrombin III, and hyperhomocysteinaemia (*see* **HOMOCYSTEINE**). — **thrombophilic** *adj.*

**thrombophlebitis** *n.* inflammation of the wall of a vein (*see* **PHLEBITIS**) with secondary thrombosis occurring within the affected segment of vein. Pregnant women are more prone to thrombophlebitis because of physiological changes in the blood and the effects of pressure within the abdomen. It may involve

superficial or deep veins of the legs (the latter being less common in pregnancy than the former). Deep vein **\*thrombosis** may precede **\*pulmonary embolism**.

**thromboplastin (tissue factor, Factor III, thrombokinese)** *n.* a substance formed during the earlier stages of **\*blood coagulation**. It acts as an enzyme, converting the inactive substance prothrombin to the enzyme **\*thrombin**.

**thrombopoiesis** *n.* the process of blood **\*platelet** production. Platelets are formed as fragments of cytoplasm shed from giant cells (**\*megakaryocytes**) in the bone marrow by a budding process.

**thromboprophylaxis** *n.* measures taken to reduce the risk of venous **\*thrombosis** and therefore avoid **\*thromboembolism** during hospitalization. Techniques include tight support stockings to minimize venous stasis and subcutaneous injections of a **\*low-molecular-weight heparin** to thin the blood.

**thrombosis** *n.* a condition in which the blood changes from a liquid to a solid state within the cardiovascular system during life and produces a mass of coagulated blood (**thrombus**). Thrombosis may occur within a blood vessel in diseased states. Thrombosis in an artery obstructs the blood flow to the tissue it supplies: obstruction of an artery to the brain is one of the causes of a **\*stroke** and thrombosis in an artery supplying the heart – **\*coronary thrombosis** – results in a heart attack (*see* **MYOCARDIAL INFARCTION**). Thrombosis can also occur in a vein (**deep vein thrombosis**; *see* **PHLEBOTHROMBOSIS**), and it may be associated with inflammation (*see* **THROMBOPHLEBITIS**). The thrombus may become detached from its site of formation and carried in the blood to lodge in another part (*see* **EMBOLISM**).

**thrombotic microangiopathy** the formation of thrombi in arterioles and capillaries, leading to haemolytic anaemia and **\*thrombocytopenia**. The term encompasses primary **\*haemolytic uraemic syndrome** and **\*thrombotic thrombocytopenic purpura**, as well as the microangiopathies that can complicate pregnancy (pregnancy-related haemolytic uraemic syndrome, **\*HELLP syndrome**), **\*malignant hypertension**, **\*scleroderma**, **\*antiphospholipid antibody syndrome**, organ transplantation, and cancer.

**thrombotic thrombocytopenic purpura (TTP)** a rare disorder of coagulation caused by deficiency or inhibition of **\*ADAMTS13**, a protein that is responsible for breaking down von Willebrand factor (see **VON WILLEBRAND'S DISEASE**). This results in haemolytic **\*anaemia**, **\*thrombocytopenia**, and fluctuating neurological abnormalities. It is treated by **\*plasmapheresis**.

**thromboxane A<sub>2</sub> (TXA<sub>2</sub>)** a substance related to prostaglandins that is released by platelets activated by local tissue injury and promotes blood clotting and vasoconstriction. See **PLATELET ACTIVATION**. Compare **PROSTACYCLIN**.

**thrombus** *n.* see **BLOOD CLOT**; **THROMBOSIS**.

**thrush** *n.* see **CANDIDIASIS**.

**thym-** (**thymo-**) *combining form denoting the thymus.*

**thymectomy** *n.* surgical removal of the thymus.

**-thymia** *combining form denoting a condition of the mind.* Example: **cyclothymia** (alternations of mood).

**thymic aplasia** failure of development of the **\*thymus**, resulting in T-lymphocyte deficiency and compromised immunity.

**thymidine** *n.* a compound containing thymine and the sugar deoxyribose. See also **NUCLEOSIDE**.

**thymine** *n.* one of the nitrogen-containing bases (see **PYRIMIDINE**) occurring in the nucleic acid DNA.

**thymitis** *n.* inflammation of the thymus.

**thymocyte** *n.* a lymphocyte within the **\*thymus**.

**thymoma** *n.* a benign or malignant tumour of the **\*thymus**. It is sometimes associated with **\*myasthenia gravis**, a chronic disease in which muscles tire easily. Surgical removal of the tumour may result in improvement of the muscle condition, but the response is often slow.

**thymus** *n.* a bilobed organ in the root of the neck, above and in front of the heart. The thymus is enclosed in a capsule and divided internally by cross walls into many lobules, each full of T lymphocytes (white blood cells associated with antibody production). In relation to body size the thymus is largest at birth. It doubles in size by puberty, after which it gradually shrinks, its functional tissue being replaced by fatty tissue. In infancy the thymus controls the development of **\*lymphoid tissue** and the immune response to microbes and foreign proteins (accounting for allergic response, autoimmunity, and the rejection of organ transplants). T lymphocytes migrate from the bone marrow to the thymus, where they mature and differentiate until activated by antigen. —**thymic** *adj.*

**thyro-** *combining form denoting* the thyroid gland. Example: **thyroglossal** (relating to the thyroid gland and tongue).

**thyrocalcitonin** *n.* *see* **CALCITONIN**.

**thyrocele** *n.* a swelling of the thyroid gland. *See* **GOITRE**.

**thyroglobulin** *n.* a protein in the thyroid gland from which the **\*thyroid hormones** (thyroxine and triiodotyrosine) are synthesized.

**thyrohyoid** *adj.* relating to the thyroid cartilage and hyoid bone. The **thyrohyoid ligaments** form part of the **\*larynx**; contraction of the **thyrohyoid muscle** raises the larynx.

**thyroid acropachy** a rarely seen but well-documented alteration in the shape of the nails resembling **\*clubbing** but unique to Graves' disease (*see* **THYROTOXICOSIS**). It is often associated with formation of new bone seen on X-rays of the hands and wrists, which is said to resemble bubbles along the surface of the bones.

**thyroid antibodies** autoantibodies directed against the cells of the thyroid gland, which serve as a marker of autoimmune thyroid disease. There are two main types: antibodies directed against the thyroid peroxidase (TPO) enzyme; and **anti-thyroglobulin**, directed against the thyroid colloid (*see* **THYROID GLAND**). The highest level of thyroid antibodies is found in **\*Hashimoto's disease**.

**thyroid cancer** any malignant tumour of the thyroid gland, of which there are four main types: **papillary**, **follicular**, **medullary**, and **anaplastic**. These have characteristic presentations and degrees of malignancy, ranging from the papillary tumours, which tend to be relatively low-grade and in some cases can be treated by surgery and thyroxine suppression, to highly aggressive anaplastic tumours, which tend to present with locally advanced disease that is inoperable and unresponsive to radiotherapy or chemotherapy. *See also* **HÜRTHLE CELL TUMOUR**.

**thyroid cartilage** the main cartilage of the **\*larynx**, consisting of two broad plates that join at the front to form a V-shaped structure. The thyroid cartilage forms the **Adam's apple** in front of the larynx.

**thyroid crisis (thyroid storm)** a life-threatening condition due to an acute and severe exacerbation of previously undiagnosed or inadequately treated **\*thyrotoxicosis**. It often follows infections, childbirth, nonthyroid surgery, or trauma but can occur without an obvious cause. The presenting features are a fever, severe agitation, nausea and vomiting, diarrhoea, and abdominal pains. An accelerated heart rate and irregularity of the heart rhythm can cause heart failure, and psychotic episodes or coma can result. Blood tests will reveal hyperthyroidism and may also show altered liver function, high blood sugar, high calcium levels, a high white blood cell count, and often anaemia. Treatment is with intravenous fluids, oxygen, antithyroid drugs (such as **\*carbimazole** or **\*propylthiouracil**), high-dose iodide solution (*see* **LUGOL'S SOLUTION**), high-dose steroids, and beta blockers. The patient must be cooled and given antipyretics, such as paracetamol. Any underlying cause must also be treated.

**thyroidectomy** *n.* surgical removal of the thyroid gland. In **partial thyroidectomy**, only the diseased part of the gland is removed (e.g. one lobe); in **subtotal thyroidectomy**, a method of treating **\*thyrotoxicosis** due to Graves' disease, the surgeon removes approximately 90% of the gland.

**thyroid gland** a large **\*endocrine gland** situated in the base of the neck (see illustration). It consists of two lobes, one on either side of the trachea, that are joined by an **isthmus** (sometimes a third lobe extends upwards from the isthmus). The thyroid gland consists of a large number of closed follicles inside which is a jelly-like **colloid**, which contains **\*thyroglobulin** and the

principal active substances that are secreted by the gland. The thyroid gland is concerned with regulation of the metabolic rate by the secretion of **\*thyroid hormone**, which is stimulated by **\*thyroid-stimulating hormone** from the pituitary gland and requires trace amounts of iodine. The **\*C cells** of the thyroid gland secrete **\*calcitonin**.

**Position of the thyroid gland.**

**thyroid hormone** an iodine-containing substance, synthesized and secreted by the thyroid gland, that is essential for normal metabolic processes and mental and physical development. There are two thyroid hormones, **\*triiodothyronine** and **\*thyroxine**, which are formed from **\*thyroglobulin**. Lack of these hormones gives rise to **\*cretinism** in infants and **\*myxoedema** in adults. Excessive production of thyroid hormones gives rise to **\*thyrotoxicosis**.

**thyroiditis** *n.* inflammation of the thyroid gland. **Acute thyroiditis** is due to bacterial infection, and **subacute** (or **de Quervain's**) **thyroiditis** is caused by a viral infection. **Chronic thyroiditis** is commonly caused by an abnormal immune response (see **AUTOIMMUNITY**) in which lymphocytes invade the tissues of the gland. See **HASHIMOTO'S DISEASE**.

**thyroid-stimulating hormone (TSH, thyrotrophin)** a hormone, synthesized and secreted by the anterior pituitary gland under the control of **\*thyrotrophin-releasing hormone**, that stimulates activity of the thyroid gland. Raised levels of TSH are found in primary **\*hypothyroidism**. Normal or low

TSH levels in the presence of a low serum thyroxine are found in secondary hypothyroidism and the *\*euthyroid sick syndrome*.

**thyroid storm** *see* **THYROID CRISIS**.

**thyroplasty** *n.* a surgical procedure performed on the thyroid cartilage of the larynx to alter the characteristics of the voice.

**thyrotomy** *n.* surgical incision of either the thyroid cartilage in the neck or of the thyroid gland itself.

**thyrotoxicosis** *n.* the syndrome due to excessive amounts of thyroid hormones in the bloodstream, causing a rapid heartbeat, sweating, tremor, anxiety, increased appetite, loss of weight, and intolerance of heat. Causes include simple overactivity of the gland, a hormone-secreting benign tumour or carcinoma of the thyroid, and **Graves' disease (exophthalmic goitre)**, in which there are additional symptoms including swelling of the neck (**goitre**) due to enlargement of the gland and protrusion of the eyes (**exophthalmos**). Treatment may be by surgical removal of the thyroid gland, *\*radioactive iodine therapy* to destroy part of the gland, or by the use of drugs (such as *\*carbimazole* or *\*propylthiouracil*) that interfere with the production of thyroid hormones. —**thyrotoxic** *adj.*

**thyrotoxic periodic paralysis** a condition in which attacks of sudden weakness and flaccidity occur in patients with *\*thyrotoxicosis*, seen most often in males of Asian descent. The attacks last from hours to days; they can be prevented by potassium supplements and subsequent treatment of the thyrotoxicosis.

**thyrotrophin** *n. see* **THYROID-STIMULATING HORMONE**.

**thyrotrophin-releasing hormone (TRH)** a hormone from the hypothalamus (in the brain) that acts on the anterior pituitary gland to stimulate the release of *\*thyroid-stimulating hormone*. A preparation of TRH (**protirelin**) may be given by intravenous injection to test thyroid gland function and to estimate reserves of thyroid-stimulating hormone in the pituitary.

**thyroxine (tetraiodothyronine, T<sub>4</sub>)** *n.* the principal hormone synthesized and secreted into the bloodstream by the thyroid gland (*see* **THYROID HORMONE**). Most of it is converted to a more metabolically active form,

**\*triiodothyronine**, within the peripheral tissues. Both hormones act to increase the basal metabolic rate. A preparation of thyroxine (**levothyroxine sodium**) can be administered by mouth to treat underactivity of the thyroid gland.

**TIA** *see* **TRANSIENT ISCHAEMIC ATTACK**.

**tiabendazole (thiabendazole)** *n.* an **\*anthelmintic** used to treat **\*creeping eruption**. It may cause vomiting, vertigo, and gastric discomfort.

**tibia** *n.* the shin bone: the inner and larger bone of the lower leg (see illustration). It articulates with the **\*femur** above, with the **\*talus** below, and with the **\*fibula** to the side (at both ends); at the lower end is a projection, the medial **\*malleolus**, forming part of the articulation with the talus. —**tibial** *adj.*

**Right tibia and fibula.**

**tibialis** *n.* either of two muscles in the leg, extending from the tibia to the metatarsal bones of the foot. The **tibialis anterior** turns the foot inwards and flexes the toes backwards. Situated behind it, the **tibialis posterior** extends the toes and inverts the foot.

**tibial torsion** a normal variation in posture in which there is an *\*in-toe gait* due to mild internal rotation of the tibia. The condition is often apparent in infancy when the child starts walking and resolves spontaneously with time. Usually symmetrical, it is associated with normal mobility and is pain-free.

**tibio-** *combining form denoting the tibia.* Example: **tibiofibular** (relating to the tibia and fibula).

**tic** *n.* a repeated and largely involuntary movement (motor tic) or utterance (vocal tic) varying in complexity from a muscle twitch or a grunt to elaborate well-coordinated actions and repeated words or phrases. Simple tics occur in about a quarter of all children and usually disappear within a year. Tics most often become prominent when the individual is exposed to emotional stress. *See also* **TOURETTE'S SYNDROME**.

**ticagrelor** *n.* *see* **ANTIPLATELET DRUG**.

**ticarcillin** *n.* a *\*penicillin*-type antibiotic that is used in combination with *\*clavulanic acid* to treat serious infections caused by *Pseudomonas* and *Proteus* bacteria.

**tic douloureux** *see* **NEURALGIA**.

**tick** *n.* a bloodsucking parasite belonging to the order of arthropods (the Acarina) that also includes the *\*mites*. Tick bites can cause serious skin lesions and occasionally paralysis (*see* **IXODES**; **AMBLYOMMA**), and certain tick species transmit *\*typhus*, *\*Lyme disease*, and *\*relapsing fever*. Diethyltoluamide (DEET) is used as a tick repellent. There are two families: Argasidae (soft ticks), which includes *Ornithodoros*, with mouthparts invisible from above and no hard shield (**scutum**) on the dorsal surface; and Ixodidae (hard ticks), including *Dermacentor*, *Haemaphysalis*, and *Rhipicephalus*, with clearly visible mouthparts and a definite scutum.

**tick fever** any infectious disease transmitted by ticks, especially *\*Rocky Mountain spotted fever*.

**Tietze's syndrome** a painful inflammation in the region of the chest, over the junction of bone and cartilage. It differs from *\*COSTOCHONDRITIS* in involving swelling. The cause is unknown and the condition usually resolves

without treatment, but in some cases local injections of corticosteroids are required. [A. Tietze (1864–1927), German surgeon]

**tilting-disc valve** the most commonly used form of mechanical heart valve replacement.

**timolol** *n.* a **\*beta blocker** used in the treatment of high blood pressure (hypertension), angina, and glaucoma and for long-term prophylaxis after an acute myocardial infarction. Side-effects include decreased heart rate, hypotension, and dizziness.

**tincture** *n.* an alcoholic extract of a drug derived from a plant.

**tinea** *n.* *see* **RINGWORM**.

**Tinel's sign** a method for checking the regeneration of a nerve: usually used in patients with **\*carpal tunnel syndrome**. Direct tapping over the sheath of the nerve elicits a distal tingling sensation (*see* **PARAESTHESIA**), which indicates the beginning of regeneration. [J. Tinel (1879–1952), French neurosurgeon]

**tinnitus** *n.* the sensation of sounds in the ears, head, or around the head in the absence of an external sound source. It can occur with any form of hearing loss or with normal hearing. It is thought to be due to a misinterpretation of signals in the central auditory pathways of the brain. The signals that are misinterpreted can arise in any part of the auditory system: the cochlea, cochlear nerve, or within the brain itself. Treatment includes the correction of any underlying condition, counselling, **\*cognitive behavioural therapy**, mindfulness meditation, acceptance and commitment therapy, relaxation techniques, sound therapy (*see* **WHITE NOISE INSTRUMENT**), and use of **\*hearing aids**. A unified method of treatment that makes use of several of these components is referred to as **\*tinnitus retraining therapy**. *See also* **MUSICAL TINNITUS**; **PULSATILE TINNITUS**.

<https://www.tinnitus.org.uk/>

- Website of the British Tinnitus Association

**tinnitus masker** the former name for a **\*white noise instrument**.

**tinnitus retraining therapy (TRT)** a method of treating **\*tinnitus** that embraces a range of techniques, including explanation, counselling, relaxation techniques, meditation, and sound therapy.

**tintometer** *n.* an instrument for measuring the depth of colour in a liquid. The colour can then be compared with those on standard charts so that the concentration of a particular compound in solution can be estimated.

**tinzaparin sodium** *see* **LOW-MOLECULAR-WEIGHT HEPARIN**.

**tioguanine (thioguanine)** *n.* a drug that prevents the growth of cancer cells (*see* **ANTIMETABOLITE**) and is used in the treatment of leukaemias. It commonly reduces the numbers of white blood cells and platelets. Other side-effects include nausea, vomiting, loss of appetite, and jaundice.

**TIPSS (transjugular intrahepatic porto-systemic shunt)** *see* **PORTAL HYPERTENSION**.

**TI-RADS** Thyroid Imaging Reporting and Data System: *see* **BI-RADS**.

**tissue** *n.* a collection of cells specialized to perform a particular function. The cells may be of the same type (e.g. in nervous tissue) or of different types (e.g. in connective tissue). Aggregations of tissues constitute organs.

**tissue culture** the culture of living tissues, removed from the body, in a suitable medium supplied with nutrients and oxygen. **Tissue engineering**, in which skin, cartilage, and other connective-tissue cells are cultured on a **\*fibronectin** 'mat' to create new tissues, is being explored for use in tissue grafting for patients with burns, sports injuries, etc.

**tissue-type plasminogen activator (tPA, TPA)** a natural protein, found in the body and able to be manufactured by genetic engineering, that can break up a thrombus (*see* **THROMBOLYSIS**). It requires the presence of **\*fibrin** as a cofactor and is able to activate **\*plasminogen** on the fibrin surface, which distinguishes it from the other plasminogen activators, **\*streptokinase** and **\*urokinase**. tPAs include **reteplase** and **tenecteplase**, given to treat acute myocardial infarction, and **\*alteplase**.

**tissue typing** determination of the **\*HLA** profiles of tissues to assess their compatibility. It is the most important predictor of success or failure of a

transplant operation.

**titre** *n.* (in immunology) the extent to which a sample of blood serum containing antibody can be diluted before losing its ability to cause agglutination of the relevant antigen. It is used as a measure of the amount of antibody in the serum.

**titubation** *n.* a rhythmical nodding movement of the head, sometimes involving the trunk. It is seen in patients with **\*parkinsonism** and cerebellar disorders. Occasionally the use of this term is extended to include a stumbling gait.

**TLD** *see* **THERMOLUMINESCENT DOSIMETER.**

**T lymphocyte** *n. see* **LYMPHOCYTE.**

**TMS** *see* **TRANSCRANIAL MAGNETIC STIMULATION.**

**TNF** *see* **TUMOUR NECROSIS FACTOR.**

**TNM classification** a classification defined by the **\*UICC** for the extent of spread of a cancer. T refers to the size of the tumour, N the presence and extent of lymph node involvement, and M the presence of distant spread (metastasis).

**tobacco** *n.* the dried leaves of the plant *Nicotiana tabacum* or related species, used in smoking and as snuff. Tobacco contains the stimulant but poisonous alkaloid **\*nicotine**, which enters the bloodstream during smoking. The volatile tarry material also released during smoking contains carcinogenic chemicals (*see* **CARCINOGEN**).

**tobramycin** *n.* an **\*aminoglycoside** antibiotic used to treat septicaemia, lung infection caused by *Pseudomonas* in patients with cystic fibrosis, and urinary, skin, abdominal, and central nervous system infections. Kidney damage or hearing impairment may occur with high doses or prolonged use.

**tocilizumab** *n.* a **\*monoclonal antibody** that inhibits the action of **\*interleukin 6**, an inflammatory **\*cytokine**. It is used to treat adults with moderate or severe rheumatoid arthritis who have not responded to anti-TNF drugs or rituximab and children with juvenile idiopathic arthritis. Common side-effects include sore throat, mouth ulcers, and high blood pressure.

**toco- (toko-)** *combining form denoting childbirth or labour.*

**tocolytic** *n.* a pharmaceutical preparation used to treat preterm labour by stopping uterine contractions for long enough to allow administration of corticosteroids to enhance fetal lung maturity or to enable transfer to a unit with adequate neonatal facilities. Tocolytics include **atosiban**.

**tocopherol** *n.* *see* **VITAMIN E**.

**tokophobia** *n.* *see* **TOKOPHOBIA**.

**toddler's diarrhoea** a disorder of young children characterized by the passage of frequent loose, offensive, and bulky stools in which partially digested or undigested food may be visible (the 'peas and carrot' stool). There is no other definable abnormality and the children gain weight normally. Management consists of excluding other causes of diarrhoea and reassurance that the disorder is benign and self-limiting (it resolves by school age).

**Todd's paralysis (Todd's palsy)** transient paralysis of a part of the body that has previously been involved in a focal epileptic seizure (*see* **EPILEPSY**). [R. B. Todd (1809–60), British physician]

**toko-** *combining form. see* **TOCO-**.

**tokophobia (tocophobia)** *n.* a profound fear of childbirth. There are two types: **primary tokophobia**, which develops in adolescence and causes many women to avoid childbirth altogether; and **secondary tokophobia**, which occurs after a traumatic delivery and can stop a woman having another child. Women are more at risk from tokophobia if they have had any of the following: a history of rape or sexual abuse; harrowing memories of educational videos during adolescence; a history of depression; or experience of panic attacks.

**tolbutamide** *n.* a short-acting drug taken in the treatment of type 2 diabetes mellitus (*see* **SULPHONYLUREA**). Side-effects may include headache and tinnitus. It is now rarely prescribed in the UK, having been superseded by other drugs.

**tolerance** *n.* the reduction or loss of the normal response to a drug or other substance that usually provokes a reaction in the body. **Drug tolerance** **1.** may develop after taking a particular drug over a long period of time. In such cases increased doses are necessary to produce the desired effect. Some drugs that cause tolerance also cause *\*dependence*. *See also* **GLUCOSE TOLERANCE TEST**; **IMMUNOLOGICAL TOLERANCE**; **TACHYPHYLAXIS**. **2.** acceptance of others whose beliefs, customs, behaviour, or lifestyle are different from one's own or from accepted social norms. Tolerance is an indispensable virtue in all medical staff and may be of clinical importance when a patient displays unusual behaviour during initial assessment.

**tolterodine** *n.* an *\*antimuscarinic* drug taken to treat *\*detrusor* overactivity giving rise to the *\*lower urinary tract symptoms* of frequency, urgency, or urge incontinence.

**toluidine blue** a dye used in microscopy for staining basophilic substances in tissue specimens.

**-tome** *combining form denoting* a cutting instrument. Example: **microtome** (instrument for cutting microscopical sections).

**tomo-** *combining form denoting* **1.** section or sections. **2.** surgical operation.

**tomography** *n.* a technique used to produce an image (**tomogram**) of structures at a particular depth within the body by bringing them into sharp focus while deliberately blurring structures above and below them. In plain film tomography the source of X-rays and the photographic film are moved around the patient to produce a single 'slice' at a time. By contrast, multiple slices are produced in *\*computerized tomography* (CT), which uses multiple radiation detectors so that the images can be stacked up to give additional three-dimensional information. *See also* **DENTAL PANTOMOGRAM**; **POSITRON EMISSION TOMOGRAPHY**; **SPECT SCANNING**.

**tomotherapy** *n.* a type of radiotherapy in which the radiation is delivered in a slice-by-slice rotating method similar to a CT scan, which also allows daily *\*image-guided radiotherapy*.

**-tomy (-otomy)** *combining form denoting* a surgical incision into an organ or part. Example: **gastrotomy** (into the stomach).

**tone** *n.* see **TONUS**.

**tongue** *n.* a muscular organ attached to the floor of the mouth. It consists of a **body** and a **root**, which is attached by muscles to the hyoid bone below, the styloid process behind, and the palate above. It is covered by mucous membrane, which is continuous with that of the mouth and pharynx. On the undersurface of the tongue a fold of mucous membrane, the **frenulum linguae**, connects the midline of the tongue to the floor of the mouth. The surface of the tongue is covered with minute projections (**papillae**), which give it a furred appearance (see illustration). **\*Taste buds** are arranged in grooves around the papillae, particularly the fungiform and circumvallate papillae. The tongue has three main functions. It helps in manipulating food during mastication and swallowing; it is the main organ of taste; and it plays an important role in the production of articulate speech. Anatomical name: **glossa**.

**The tongue (upper surface).**

**tongue-tie** *n.* see **ANKYLOGLOSSIA**.

**tonic 1.** *adj.*

a. relating to normal muscle tone.

b. marked by continuous tension (contraction), e.g. a tonic muscle **\*spasm**.

**2.** *n.* a medicinal substance purporting to increase vigour and liveliness and produce a feeling of wellbeing; beneficial effects of tonics are probably due to their placebo action.

**tonicity** *n.* **1.** the normal state of slight contraction, or readiness to contract, of healthy muscle fibres. **2.** the effective osmotic pressure of a solution. *See* **HYPERTONIC**; **HYPOTONIC**; **OSMOSIS**.

**tonic pupil (Adie's pupil)** a pupil that is dilated as a result of damage to the nerves supplying the ciliary muscle and iris. It reacts poorly to light but may constrict better for near vision, with slow redilation on refixation at a distance. The tonic pupil is sensitive to dilute 0.1% pilocarpine drops, which cause marked constriction but have little effect on a normal pupil. The tonic pupil may become miotic (*see* **MIOSIS**) over time.

**tonic tensor tympani syndrome** involuntary persistent contraction of the **tensor tympani** muscle in the middle ear, attached to the malleus bone, giving rise to tinnitus, distorted hearing, a sensation of blockage of the ear, or pain.

**tono-** *combining form denoting* **1.** tone or tension. **2.** pressure.

**tonofibril** *n.* a tiny fibre occurring in bundles in the cytoplasm of cells that lie in contact, as in epithelial tissue. Tonofibrils are concerned with maintaining contact between adjacent cells. *See* **DESMOSOME**.

**tonography** *n.* the measurement and recording of intraocular pressure while the eyeball is subjected to pressure over a period of several minutes. It is used to assess aqueous outflow and diagnose glaucoma. *See* **TONOMETER**.

**tonometer (ophthalmotonometer)** *n.* **1.** a small instrument for measuring the pressure inside the eye. There are several types. The **applanation tonometer** measures the force required to flatten a known area of the cornea after a drop of local anaesthetic has made the cornea numb. A greater force is required when the pressure inside the eye is increased, and vice versa. The **Goldmann applanation tonometer** flattens a corneal area of 3 mm<sup>2</sup>. *See also* **PNEUMOTONOMETER**. **2.** an instrument for measuring pressure in some other part of the body.

—**tonometry** *n.*

**tonsillectomy** *n.* surgical removal of the tonsils.

**tonsillitis** *n.* inflammation of the tonsils due to bacterial or viral infection, causing a sore throat, fever, and difficulty in swallowing. If tonsillitis due to streptococcal infection is not treated (by antibiotics) it may lead to **\*rheumatic fever** or **\*nephritis**.

**tonsils** *pl. n.* masses of **\*lymphoid tissue** around the pharynx, usually referring to the **palatine tonsils** on either side of the **\*oropharynx**. However, there is more tonsil tissue below the palatine tonsils, on the back of the tongue (the **lingual tonsils**), and small deposits around the openings of the **\*Eustachian tubes** in the nasopharynx (the **tubal tonsils**). The tonsils are concerned with protection against infection. Together with the **\*adenoids**, they form **\*Waldeyer's ring**.

**tonus (tone)** *n.* the normal state of partial contraction of a resting muscle, maintained by reflex activity.

**tooth** *n.* (*pl.* teeth) one of the hard structures in the mouth used for cutting and chewing food. Each tooth is embedded in a socket in part of the jawbone (mandible or maxilla) known as the **alveolar bone** (or **alveolus**), to which it is attached by the **\*periodontal membrane**. The exposed part of the tooth (**crowns**) is covered with **\*enamel** and the part within the bone (**root**) is coated with **\*cementum**; the bulk of the tooth consists of **\*dentine** enclosing the **\*pulp** (see illustration). The group of embryological cells that gives rise to a tooth is known as the **tooth germ**. There are four different types of tooth (see **CANINE**; **INCISOR**; **PREMOLAR**; **MOLAR**). See also **DENTITION**.

**Section of a molar tooth.**

**tooth extraction** *see* **EXTRACTION**.

**toothpaste** *n.* a paste used for cleaning the teeth. It contains a fine abrasive and a suitable flavouring to promote use. Most toothpastes contain **\*fluoride** salts, which help to prevent **\*dental caries**. Some contain antimicrobials, to counteract dental **\*plaque**, and whitening agents.

**tooth wear (tooth surface loss)** a condition in which loss of tooth substance is excessive for the patient's age. It includes **\*attrition**, **\*erosion**, and **\*abrasion**, but the cause is not always obvious. A combination of intrinsic and extrinsic factors may be responsible.

**tooth whitening** *see* **BLEACHING**.

**topagnosis** *n.* inability to identify a part of the body that has been touched. It is a symptom of disease in the parietal lobes of the brain. The normal ability

to localize touch is called **topognosis**.

**tophus** *n.* (*pl.* **tophi**) a hard deposit of crystalline uric acid and its salts in the skin, cartilage (especially of the ears), or joints; a feature of *\*gout*.

**topical** *adj.* local: used for the route of administration of a drug that is applied directly to the part being treated (e.g. to the skin or eye).

**topical calcineurin inhibitors** *see* **CALCINEURIN INHIBITORS**.

**topiramate** *n.* *see* **ANTICONVULSANT**.

**topo-** *combining form denoting place; position; location.*

**topography** *n.* the study of the different regions of the body, including the description of its parts in relation to the surrounding structures. — **topographical** *adj.*

**topoisomerase inhibitor** any one of a class of *\*cytotoxic drugs* that work by blocking the action of topoisomerase enzymes, which promote the uncoiling of the DNA double helix, a necessary preliminary to replication. Topoisomerase I inhibitors include **irinotecan**, used for treating advanced colorectal cancer (especially in combination with *\*fluorouracil*); and **topotecan**, given for treating advanced ovarian cancer, relapsed small-cell lung cancer, and recurrent cervical cancer. Side-effects include delayed but severe diarrhoea and reduction in blood-cell production by the bone marrow. Topoisomerase II inhibitors include *\*etoposide* and *\*doxorubicin*.

**topotecan** *n.* *see* **TOPOISOMERASE INHIBITOR**.

**Torkildsen procedure** an operation in which a *\*shunt* is created between the lateral *\*ventricle* of the brain and the *\*cisterna magna* to bypass a block of the cerebral *\*aqueduct* and thus relieve *\*hydrocephalus*. Originally this was achieved by means of an external indwelling catheter, but later techniques use an internal catheter, which reduces the risk of septic complications. [A. Torkildsen (20th century), Norwegian neurosurgeon]

**torpor** *n.* a state of sluggishness and diminished responsiveness: a characteristic of certain mental disorders and a symptom of certain forms of poisoning or metabolic disorder.

**TORS** *see* **TRANS-ORAL ROBOTIC SURGERY**.

**torsades de pointes** a very dangerous form of **\*ventricular tachycardia** characterized by a sinusoidal (twisting) pattern on the electrocardiogram due to a constantly shifting cardiac electrical vector (hence the French term, meaning ‘twisting of points’). It is usually a side-effect of medication but may also occur in patients with severe deficiency of potassium or magnesium or inherited abnormalities of the cardiac electrical system. *See* **LONG QT SYNDROME**.

**torsion** *n.* twisting. Abnormal twisting of a testis within the scrotum or of a loop of bowel in the abdomen may impair blood and nerve supplies to these parts and cause severe damage.

**torticollis (wryneck)** *n.* an irresistible turning movement of the head that becomes more persistent, so that eventually the head is held continually to one side. This is a form of **\*dystonia**; the spasm of the muscles is often painful. It may be caused by a birth injury to the sternomastoid muscle (*see* **STERNOMASTOID TUMOUR**). Relief may be obtained by cutting the motor nerve roots of the spinal nerves in the neck region or by injection of the affected muscles with **\*botulinum toxin**.

**toruloma** *n.* a tumour-like lesion in the lungs resulting from **\*cryptococcosis**.

**torulosis** *n. see* **CRYPTOCOCCOSIS**.

**Torus mandibularis** a benign bony growth that develops on the mandible on the side closest to the tongue. It is predominantly a bilateral condition.

**Torus palatinus** A benign bony growth that develops on the palate, most commonly on the midline.

**TOT** transobturator tape. *See* **TENSION-FREE VAGINAL TAPE**.

**total parenteral nutrition (TPN)** the delivery of all the essential nutrients directly into the bloodstream through a catheter in a vein. This may be by the peripheral route, via a vein in the upper arm (*see* **PICC LINE**) for short-term use (*see* **PERIPHERAL PARENTERAL NUTRITION**), or centrally, into the subclavian vein in the neck (*see* **HICKMAN CATHETER**), for longer than two weeks. TPN has a risk of complications and should only be used when the

gastrointestinal tract is not functioning. \*Enteral feeding is always the preferred route. *See also* ARTIFICIAL NUTRITION AND HYDRATION; NUTRITION.

**totipotent** *adj.* *see* STEM CELL.

**Tourette's syndrome (TS, Gilles de la Tourette syndrome)** a condition characterized by the simultaneous appearance of verbal and motor \*tics within one year. Motor tics can be simple (eye rolling, flicking, incomplete movements) or complex (involuntary movements consisting of several components, mostly involving the arms). Verbal tics can be simple (grunts, throat clearing) or complex (uttering of words or, in 30% of patients, involuntary obscene speech). Rarely, the patient may also involuntarily repeat the words or imitate the actions of others (*see* PALILALIA). The condition usually starts in childhood and commonly improves with age. The prevalence is about 1% with a male preponderance. There is a strong hereditary element. Drug treatment and psychological support are sometimes helpful. [G. Gilles de la Tourette (1857–1904), French neurologist]

**tourniquet** *n.* a device to press upon an artery and prevent flow of blood through it, usually a cord, rubber tube, or tight bandage bound around a limb. Tourniquets are no longer recommended as a first-aid measure to stop bleeding from a wound because of the danger of reducing the supply of oxygen to other tissues (direct pressure on the wound itself is considered less harmful). However, a temporary tourniquet to increase the distension of veins when a sample of blood is being taken does no harm.

**tow** *n.* the teased-out short fibres of flax, hemp or jute, used in swabs for cleaning, in \*packs or \*stupes for the application of poultices, and for a variety of other purposes.

**Towne's projection** a \*posteroanterior X-ray film to show the entire skull and mandible. [E. B. Towne (1883–1957), US otolaryngologist]

**tox-** (**toxi-**, **tox-**, **toxic(o)-**) *combining form denoting* **1.** poisonous; toxic. **2.** toxins or poisoning.

**toxaemia** *n.* blood poisoning that is caused by toxins formed by bacteria growing in a local site of infection. It produces generalized symptoms,

including fever, diarrhoea, and vomiting. *Compare* [PYAEMIA](#); [SAPRAEMIA](#); [SEPTICAEMIA](#).

**toxic** *adj.* having a poisonous effect; potentially lethal.

**toxic epidermal necrolysis (TEN, Lyell's syndrome)** a severe reaction to medications with a high mortality rate. Medications causing TEN include sulfonamides, anticonvulsants, antiretrovirals, and allopurinol. Widespread separation of the dead epidermal layer from underlying skin occurs, with consequent problems due to skin failure: impaired temperature regulation, infection risk, severe pain, etc. Mucous membranes are commonly affected, including the eyes (sometimes leading to blindness), mouth, and genitalia. Multi-organ failure may occur. Treatments include stopping the offending medication, good supportive nursing (usually in an ITU or HDU setting), antibiotics where appropriate, and intravenous immunoglobulin or ciclosporin.

**toxicity** *n.* the degree to which a substance is poisonous. *See also* [LD<sub>50</sub>](#).

**toxicology** *n.* the study of poisonous materials and their effects upon living organisms. —**toxicologist** *n.*

**toxiosis** *n.* the deleterious effects of a toxin; poisoning: includes any disease caused by the toxic effects of any substances.

**toxic shock syndrome** a state of acute *\*shock* due to *\*septicaemia*. The commonest cause is a retained foreign body (e.g. a tampon or IUCD) combined with the presence of staphylococci (*see also* [STREPTOCOCCAL TOXIC SHOCK SYNDROME](#)). The condition can be life-threatening if not treated aggressively with appropriate antibiotics and supportive care (including fluid and electrolyte replacement).

**toxin** *n.* a poison produced by a living organism, especially by a bacterium (*see* [ENDOTOXIN](#); [EXOTOXIN](#)). In the body toxins act as *\*antigens*, and special *\*antibodies* (**antitoxins**) are formed to neutralize their effects.

**Toxocara** *n.* a genus of large nematode worms that are intestinal parasites of vertebrates. *T. canis* and *T. cati*, the common roundworms of dogs and cats

respectively, have life cycles similar to that of the human roundworm, *\*Ascaris lumbricoides*. See **TOXOCARIASIS**.

**toxocariasis (visceral larva migrans)** *n.* an infestation with the larvae of the dog and cat roundworms, *Toxocara canis* and *T. cati*. Humans, who are not the normal hosts, become infected on swallowing eggs of *Toxocara* present on hands or in food and drink contaminated with the faeces of infected domestic pets. The larvae, which migrate around the body, cause destruction of various tissues; the liver becomes enlarged and the lungs inflamed (see **PNEUMONITIS**). Symptoms may include fever, joint and muscle pains, vomiting, an irritating rash, and convulsions. Larvae can also lodge in the retina of the eye where they cause inflammation and *\*granuloma*. The disease, widely distributed throughout the world, primarily affects children. Treatment is with mebendazole.

**toxoid** *n.* a poisonous material (toxin), such as that produced by tetanus and diphtheria agents, that has been rendered harmless by chemical treatment while retaining its antigenic activity. Toxoids are used in *\*vaccines*.

**Toxoplasma** *n.* a genus of crescent-shaped sporozoans that live as parasites within the cells of various tissues and organs of vertebrate animals, especially birds and mammals, and complete their life cycle in a single host, the cat. *T. gondii* infects sheep, cattle, dogs, and humans, sometimes provoking an acute illness (see **TOXOPLASMOSIS**).

**toxoplasmosis** *n.* a disease of mammals and birds caused by the protozoan *Toxoplasma gondii*, which is usually transmitted to humans through ingesting undercooked meat or food or drink contaminated with the faeces of infected cats. Generally symptoms are mild (swollen lymph nodes and an influenza-like illness), but the disease can be serious in immunocompromised patients and requires treatment with a combination of *\*pyrimethamine* and *\*sulfadiazine*. Infection usually confers lifelong immunity. If acquired during pregnancy it can cause **congenital toxoplasmosis** in the unborn baby. Although most babies are unaffected or have very mild disease, some can have severe malformations of the skull and eyes or active infection in the liver. It can also cause stillbirth. Infection can be detected by blood tests in the mother; if the diagnosis is confirmed, the mother can be treated with spiramycin.

**tPA (TPA)** *see* **TISSUE-TYPE PLASMINOGEN ACTIVATOR**.

**TPN** *see* **TOTAL PARENTERAL NUTRITION**.

**Tpot** an acronym for the *potential* doubling time, the time taken for a tumour to double its cells in the absence of cell loss (i.e. by radiation). It is related to the rate constant for cell production ( $kP$ ), where  $kP = \log 2/T_{pot}$ , and enables direct measurement of the rate of cell proliferation by tumours.

**trabecula** *n.* (*pl.* **trabeculae**) **1.** any of the bands of tissue that pass from the outer part of an organ to its interior, dividing it into separate chambers. For example, trabeculae occur in the penis. **2.** any of the thin bars of bony tissue in spongy *\*bone*. **3.** the hypertrophied bands of bladder-wall muscle that are found in bladder outlet obstruction.

—**trabecular** *adj.*

**trabecular meshwork** the tissue, located in the anterior chamber of the eye at the angle between the cornea and iris, that consists of a group of tiny canals through which aqueous fluid drains into *\*Schlemm's canal* and exits the anterior chamber.

**trabeculectomy** *n.* an operation for glaucoma in which a part of the *\*trabecular meshwork* is removed. This allows aqueous fluid to filter out of the eye under the conjunctiva, thus reducing the pressure inside the eye.

**trabeculoplasty** *n.* a method used to selectively destroy parts of the *\*trabecular meshwork* and hence reduce intraocular pressure in the treatment of glaucoma. This may be achieved by means of a laser, as in **argon laser trabeculoplasty** (ALT; *see* **ARGON LASER**) and **selective laser trabeculoplasty** (SLT), in which a YAG laser is used to selectively target melanin within the pigmented trabecular meshwork cells to achieve lowering of the intraocular pressure.

**trace element** an element that is required in minute concentrations for normal growth and development; the body contains a total of <5 g of the element. Trace elements include fluorine (*see* **FLUORIDE**), manganese, *\*zinc*, copper, *\*iodine*, cobalt, *\*selenium*, molybdenum, *\*chromium*, and silicon. They may serve as *\*cofactors* or as constituents of complex molecules (e.g. cobalt in vitamin B<sub>12</sub>).

**tracer** *n.* a substance that is introduced into the body and whose progress can subsequently be followed so that information is gained about metabolic processes. Radioactive tracers, which are substances labelled with **\*radionuclides**, give off radiation that can be detected on a **\*scintigram** or with a **\*gamma camera**. They are used for a variety of purposes in **\*nuclear medicine**. See **MUGA SCAN**; **POSITRON EMISSION TOMOGRAPHY**; **SPECT SCANNING**.

**trache-** (**tracheo-**) *combining form denoting the trachea.*

**trachea** *n.* the windpipe: the part of the air passage between the **\*larynx** and the main **\*bronchi**, i.e. from just below the Adam's apple, passing behind the notch of the **\*sternum** (breastbone) to behind the angle of the sternum. The upper part of the trachea lies just below the skin, except where the thyroid gland is wrapped around it. — **tracheal** *adj.*

**tracheal tugging** a sign that is indicative of an **\*aneurysm** of the aortic arch: a pulsatile downward tug is felt on the windpipe when the finger is placed in the midline at the root of the neck.

**tracheitis** *n.* inflammation of the **\*trachea**, usually secondary to bacterial or viral infection in the nose or throat. Tracheitis causes soreness in the chest and a painful cough and is often associated with bronchitis. In babies it can cause asphyxia, particularly in **\*diphtheria**. Treatment includes appropriate antibacterial drugs, humidification of the inhaled air or oxygen, and mild sedation to relieve exhaustion due to persistent coughing.

**trachelectomy** *n.* radical removal of the cervix in cases of cervical cancer when the women have not completed childbearing.

**tracheoplasty** *n.* a surgical procedure to widen the trachea in patients who have narrowing (stenosis) of the trachea.

**tracheostomy (tracheotomy)** *n.* a surgical operation in which a hole is made into the **\*trachea** through the neck to relieve obstruction to breathing, as in diphtheria. A curved metal, plastic, or rubber tube is usually inserted through the hole and held in position by tapes tied round the neck. It may be possible for the patient to speak by occluding the opening with the fingers. The tube must be kept clean and unblocked. Tracheostomy is also used in conjunction with artificial respiration, when it serves not only to secure the

airway but also provides a route for sucking out secretions and protects the airway against the inhalation of pharyngeal contents. *See also* [MINITRACHEOSTOMY](#).

**tracheotomy** *n.* *see* [TRACHEOSTOMY](#).

**trachoma** *n.* a chronic contagious eye disease – a severe form of [\\*conjunctivitis](#) – caused by the bacterium *Chlamydia trachomatis*; it is common in some hot countries. The conjunctiva of the eyelids becomes inflamed, leading to discharge of pus. If untreated, the conjunctiva becomes scarred and shrinks, causing the eyelids to turn inwards so that the eyelashes scratch the cornea ([\\*trichiasis](#)); blindness can be a late complication. Treatment with tetracyclines is effective in the early stages of the disease.

**tract** *n.* **1.** a group of nerve fibres passing from one part of the brain or spinal cord to another, forming a distinct pathway, e.g. the spinothalamic tract, pyramidal tract, and corticospinal tract. **2.** an organ or collection of organs providing for the passage of something, e.g. the digestive tract.

**traction** *n.* the application of a pulling force, especially as a means of counteracting the natural tension in the tissues surrounding a broken bone (*see* [COUNTERTRACTION](#)), to produce correct alignment of the fragments. Considerable force, exerted with weights, ropes, and pulleys, may be necessary to ensure that a broken femur is kept correctly positioned during the early stages of healing. Traction is also used for the treatment of back pain by physiotherapists.

**tractography** *n.* a [\\*magnetic resonance imaging](#) technique using [\\*diffusion tensor imaging](#) to show the direction of the main nerve tracts in the brain and their connections.

**tractotomy** *n.* a neurosurgical operation for the relief of intractable pain. The nerve fibres that carry painful sensation to consciousness travel from the spinal cord through the brainstem in the spinothalamic tracts. This procedure is designed to sever the tracts within the medulla oblongata. *See also* [CORDOTOMY](#).

**tragus** *n.* the projection of cartilage in the [\\*pinna](#) of the outer ear that extends back over the opening of the external auditory meatus. It is used as a

reference point in orthodontic measurements.

**tramadol** *n.* an opioid analgesic (*see* **OPIATE**) used for the relief of moderate or severe pain. It causes less respiratory depression, constipation, and likelihood of dependence than other opioids.

**TRAM flap** *transverse rectus abdominis myocutaneous \*flap*: a piece of tissue (skin, muscle, and fat) dissected from the abdomen, between the umbilicus and pubis, and used to reconstruct the breast after mastectomy. The flap of tissue is dissected along with its blood supply and moved into its new position on this pedicle.

**trance** *n.* a state in which reaction to the environment is diminished although awareness is not impaired. It can be caused by hypnosis, meditation, catatonia, conversion disorder, drugs (such as hallucinogens), and religious ecstasy.

**tranexamic acid** a drug that prevents the breakdown of blood clots in the circulation (*\*fibrinolysis*) by blocking the activation of plasminogen to form *\*plasmin*, i.e. it is an **antifibrinolytic** drug. It is administered as an antidote to overdose by *\*fibrinolytic* drugs and to control severe bleeding, for example after surgery or to treat menorrhagia. Possible side-effects include nausea and vomiting.

**tranquillizer** *n.* a drug that produces a calming effect, relieving anxiety and tension. *\*Antipsychotic* drugs (formerly known as **major tranquillizers**) have this effect and are used to treat severe mental disorders (psychoses), including schizophrenia and mania. *\*Anxiolytic* drugs (formerly known as **minor tranquillizers**) are used to relieve anxiety and tension due to various causes.

**trans-** *prefix denoting through or across.* Example: **transurethral** (through the urethra).

**transaminase** *n.* an enzyme that catalyses the transfer of an amino group from an amino acid to an  $\alpha$ -keto acid in the process of *\*transamination*. Examples include *\*aspartate aminotransferase* (AST), which catalyses the transamination of glutamate and oxaloacetate to  $\alpha$ -ketoglutarate and aspartate, and *\*alanine aminotransferase* (ALT), converting glutamate and pyruvate to  $\alpha$ -ketoglutarate and alanine.

**transamination** *n.* a process involved in the metabolism of amino acids in which amino groups ( $-\text{NH}_2$ ) are transferred from amino acids to certain  $\alpha$ -keto acids, with the production of a second keto acid and amino acid. The reaction is catalysed by enzymes (*see* **TRANSAMINASE**), which require pyridoxal phosphate as a coenzyme.

**transanal endoscopic microsurgery (TEMS)** a minimally invasive surgical procedure for rectal polyps not suitable for colonoscopic resection. For early rectal cancer it can be an alternative to lower anterior resection of the rectum. The procedure is performed through the anus and rectum using an **\*operating microscope** and microsurgical instruments.

**transarterial chemoembolization (TACE)** an **\*interventional radiology** procedure to treat liver cancer in which a chemotherapeutic agent (usually doxyrubicin) loaded onto tiny beads is directly delivered to the cancerous area. This involves passing a catheter through the femoral artery in the groin and selectively placing it into the hepatic artery. A minute catheter (microcatheter) is then placed through the existing catheter and advanced more selectively into the area of cancer. Thus, the chemotherapy-loaded beads can be administered directly to the cancer, where they can not only treat it but also block the blood supply to that area (**\*embolization**).

**transcatheter aortic valve implantation (TAVI)** replacement of the aortic valve in patients with **\*aortic stenosis** using a catheter-delivered prosthesis rather than open heart surgery. Usually the catheter is passed via the femoral artery, but sometimes it can be passed via the subclavian artery or through the wall of the left ventricle via a localized **\*thoracotomy**.

**transcervical resection of the endometrium (TCRE)** an operation, which is performed under local anaesthetic, in which the membrane lining the uterus (*see* **ENDOMETRIUM**) is cut away by a form of **\*electrosurgery** using a **\*resectoscope**, which is introduced through the cervix. Like **\*endometrial ablation**, TCRE is used as an alternative to hysterectomy to treat abnormally heavy menstrual bleeding as it results in fewer complications and shorter stays in hospital.

**transcoelomic spread** a route of tumour **\*metastasis** across a body cavity, such as the pleural, pericardial, or peritoneal cavity. Transcoelomic spread commonly occurs in advanced cancers of the lung, stomach, colon, ovary, and

endometrium. It may be associated with the development of a malignant \*effusion.

**transcranial magnetic stimulation (TMS)** stimulation of the brain by strong magnetic fields that induce electric currents in the underlying brain tissue. **Repetitive transcranial magnetic stimulation (rTMS)**, consisting of a series of TMS pulses, is used to treat depression. Its clinical utility is controversial, with inconsistent research results regarding its efficacy. Although there have been some small studies regarding its use with other conditions, such as OCD, rTMS is not currently used routinely in the treatment for any illness other than depression.

**transcription** *n.* the process in which the information contained in the \*genetic code is transferred from DNA to RNA: the first step in the manufacture of proteins in cells. See MESSENGER RNA; TRANSLATION.

**transcutaneous electrical nerve stimulation (TENS)** the introduction of pulses of low-voltage electricity into tissue for the relief of pain. It is effected by means of a small portable battery-operated unit with leads connected to electrodes attached to the skin; the strength and frequency of the pulses, which prevent the passage of pain impulses to the brain, can be adjusted by the patient. TENS is used mainly for the relief of rheumatic pain and as analgesia during labour.

**transducer** *n.* a device used to convert one form of signal into another, allowing its measurement or display to be made appropriately. For example, an \*ultrasound probe converts reflected ultrasound waves into electronic impulses, which can be displayed on a TV monitor.

**transduction** *n.* the transfer of DNA from one bacterium to another by means of a \*bacteriophage (phage). Some bacterial DNA is incorporated into the phage. When the host bacterium is destroyed the phage infects another bacterium and introduces the DNA from its previous host, which may become incorporated into the new host's DNA.

**transection** *n.* **1.** a cross section of a piece of tissue. **2.** cutting across the tissue of an organ (*see also* SECTION).

**transfection** *n.* the direct transfer of DNA molecules into a cell.

**transferase** *n.* an enzyme that catalyses the transfer of a group (other than hydrogen) between a pair of substrates.

**transference** *n.* (in psychoanalysis) the process by which a patient comes to feel and act towards the therapist as though he or she were somebody from the patient's past life, especially a powerful parent. The patient's transference feelings may be of love or of hatred, but they are inappropriate to the actual person of the therapist. **Countertransference** is the reaction of the therapist to the patient, which is similarly based on past relationships.

**transferrin (siderophilin)** *n.* a **\*glycoprotein**, found in the blood plasma, that is capable of binding iron and thus acts as a carrier for iron in the bloodstream.

**transfer RNA** a type of RNA whose function is to attach the correct amino acid to the protein chain being synthesized at a **\*ribosome**. *See also* TRANSLATION.

**transformation zone** the area of the **\*cervix** of the uterus where the squamous epithelium, which covers the vaginal portion of the cervix, joins with the columnar epithelium, which forms the lining (endocervix) of the cervical canal.

**transforming growth factor (TGF)** a protein – a **\*cytokine** – that controls growth, proliferation, and other functions in most cells. It plays a role in asthma and other respiratory diseases and is also involved in diseases elsewhere in the body. There are two classes: TGF- $\alpha$  and TGF- $\beta$ .

**transfusion** *n.* **1.** the injection of a volume of blood obtained from a healthy person (the **donor**) into the circulation of a patient (the **recipient**) whose blood is deficient in quantity or quality, through accident or disease. Direct transfusion from one person to another is rarely performed; usually packs of carefully stored blood of different **\*blood groups** are kept in **\*blood banks** for use as necessary. Before a blood transfusion the recipient's blood type is tested so that only blood that is compatible will be transfused to reduce potentially life-threatening transfusion reactions. During transfusion the blood is allowed to drip, under gravity, through a needle inserted into one of the recipient's veins. Blood transfusion is routine during major surgical operations in which much blood is likely to be lost. **2.** the administration of

any fluid, such as plasma or saline solution, into a patient's vein by means of a *\*drip*. *See also* [AUTOTRANSFUSION](#).

**transgender** *adj.* describing the condition of one who firmly believes that he or she belongs to the gender opposite to his or her biological sex. A transgender person will often seek **gender reassignment**, i.e. to be legally recognized as belonging to the gender opposite to that on his or her birth certificate. The transition may involve hormone treatment and/or surgery but there is no requirement for this. Under current UK law, the person must supply evidence that he or she has been medically diagnosed with *\*gender dysphoria*, has lived in his or her acquired gender for the past two years, and intends to remain in it until death. A proposed reform to the law would replace this process with one of simple self-declaration (although this idea has aroused some opposition). 'Transgender' is now preferred to the older term **transsexual**, as this refers more narrowly to those who have undergone surgery to change gender. *See also* [GENDER DYSPHORIA](#).

**transhepatic** *adj.* through the liver: describing a procedure or investigation in which access to the biliary system is gained by this route (e.g. *\*percutaneous* transhepatic cholangiopancreatography).

**transient ischaemic attack (TIA)** the result of temporary disruption of the circulation to part of the brain due to *\*embolism*, *\*thrombosis* to brain arteries, or spasm of the vessel walls (*see* [STROKE](#)). The most common symptoms are transient loss of vision in one eye and weakness or numbness in one limb or part of a limb. Patients recover within 24 hours.

**transillumination** *n.* the technique of shining a bright light through part of the body to examine its structure. Transillumination of the sinuses of the skull is a means of detecting abnormalities.

**transitional cell carcinoma** a form of cancer that affects the **urothelium**, which lines the urinary collecting system of the kidney, ureters, bladder, and the proximal part of the urethra. It is the most common type of bladder cancer.

**transjugular** *adj.* through the jugular vein: a route commonly taken to gain access to the venous system to place lines or undertake interventions (e.g. IVC filter insertion and transjugular liver biopsies).

**translation** *n.* (in cell biology) the manufacture of proteins in a cell, which takes place at the ribosomes. The information for determining the correct sequence of amino acids in the protein is carried to the ribosomes by **\*messenger RNA**, and the amino acids are brought to their correct position in the protein by **\*transfer RNA**.

**translational research** a type of scientific enquiry that focuses on developing practical application from the findings from basic scientific research. The field of translational research is sometimes described as comprising T1 research and T2 research. The former focuses on developing novel clinical treatments from laboratory-based basic science; the latter on embedding the findings of clinical trials into everyday practice. *See also* **ACADEMIC HEALTH SCIENCE NETWORK**.

**translocation** *n.* (in genetics) a type of chromosome mutation in which a part of a chromosome is transferred to another part of the same chromosome or to a different chromosome. This changes the order of the genes on the chromosomes and can lead to serious genetic disorders, e.g. chronic myeloid leukaemia.

**transmethylation** *n.* the process whereby an amino acid donates its terminal methyl ( $-\text{CH}_3$ ) group for the methylation of other compounds. Methionine is the principal methyl donor in the body and the donated methyl group may subsequently be involved in the synthesis of such compounds as choline or creatinine or in detoxification processes.

**transmigration** *n.* the act of passing through or across, e.g. the passage of blood cells through the intact walls of capillaries and venules (*see* **DIAPYCNOSIS**).

**transmural myocardial infarction** a **\*myocardial infarction** that involves the full thickness of the left ventricular wall.

**transobturator tape (TOT)** *see* **TENSION-FREE VAGINAL TAPE**.

**transoesophageal echocardiography (TOE)** *see* **ECHOCARDIOGRAPHY**.

**trans-oral robotic surgery (TORS)** a form of robot-assisted surgery used for treating difficult-to-access tumours of the pharynx and larynx.

**transplantation** *n.* the implantation of an organ or tissue (*see* **GRAFT**) from one part of the body to another or from one person (the donor) to another (the recipient). Success for transplantation depends on the degree of compatibility between donor and graft: it is greatest for **\*autografts** (self-grafts), less for **\*allografts** (between individuals of the same species), and least for **\*xenografts** (between different species; *see* **XENOTRANSPLANTATION**). Skin and bone grafting are examples of transplantation techniques in the same individual. A kidney transplant involves the grafting of a healthy kidney from a donor to replace the diseased kidney of the recipient: renal transplantation is the second commonest example of human transplant surgery using allografts (after corneal grafts – *see* **KERATOPLASTY**). Bone-marrow, blood-stem-cell, heart, heart–lung, pancreatic, and liver transplants are also very successful. Patients have undergone laryngeal transplantation following **\*laryngectomy**. Transplanting organs or tissues between individuals is a difficult procedure because the recipient's immune system perceives the transplant as a foreign object and rejects it. Special treatment (e.g. with **\*immunosuppressant** drugs) is needed to prevent transplant rejection, and the less common but equally devastating effects of an attack by the graft's immune cells on the host.

Ethical questions arise over donated organs. If the donor is living, is the organ properly a **\*gift**? If the donor has recently died, how has the death been judged and has **\*consent** been given explicitly by the patient or surviving relatives (**opting in**) or is it assumed if the donor has not forbidden it (**opting out**)?

**transposition** *n.* the abnormal positioning of a part of the body such that it is on the opposite side to its normal site in the body. For example, it may involve the heart (*see* **DEXTROCARDIA**).

**transposition of the great vessels** a congenital abnormality of the heart in which the aorta arises from the right ventricle and the pulmonary artery from the left ventricle. Life is impossible unless there is an additional abnormality, such as a septal defect, that permits the mixing of blood between the pulmonary and systemic (aortic) circulations. Few of those untreated survive infancy and childhood, but the defect may be improved or corrected surgically. In **congenitally corrected transposition**, it is in fact the ventricles that are transposed rather than the great vessels. Thus the aorta

arises from the right ventricle and the pulmonary artery from the left ventricle, as in uncorrected transposition, but in this case the blood flow in the systemic and pulmonary circulations follows the normal routes.

**transrectal ultrasonography (TRUS)** an *\*ultrasonography* technique for examination of the prostate gland and seminal vesicles by placing an ultrasound probe through the anus to lie directly behind these structures in the rectum. Because of the close proximity of the probe, excellent detail is seen. The technique enables transrectal or transperineal biopsies of the prostate to be taken in a systematic manner in the diagnosis of cancer. *See also* **VESICULOGRAPHY**.

**transseptal puncture** a procedure in which, under X-ray guidance, a sharp-tipped catheter positioned in the heart is used to create a small hole in the partition (septum) separating the atria. This allows other catheters to be passed from the right to the left atrium for the purposes of pressure measurement, *\*ablation*, or *\*valvuloplasty*.

**transsexual** *n. see* **TRANSGENDER**.

**transthoracic impedance** resistance to the flow of electricity through the heart muscle during *\*defibrillation* due to the thoracic structures lying between the defibrillation paddles and the heart. These structures include the skin and soft subcutaneous tissues, the ribs and sternum, the lungs, and the pericardium. The best way to reduce the impedance, and thus to deliver the maximum available current to the heart, is to use defibrillation gel pads (*see* **COUPLING AGENTS**), to deliver the shock when the lungs are empty of air, or to press firmly down if using hand-held paddles. Transthoracic impedance is usually between 70 and 80 ohms.

**transtympanic** *adj.* across the eardrum. This can refer to the injection of medication through the eardrum into the middle ear cavity (*see* **INTRATYMPANIC**) to treat conditions of the inner ear or the insertion of an electrode through the eardrum to perform *\*electrocochleography*.

**transudation** *n.* the passage of a liquid through a membrane, especially of blood through the wall of a capillary vessel. The liquid is called the **transudate**.

**transuretero-ureterostomy** *n.* the operation of connecting one ureter to the other in the abdomen. The damaged/obstructed ureter is cut above the diseased or damaged segment and joined end-to-side to the other ureter.

**transurethral resection of the prostate (TURP)** *see* RESECTION.

**transurethral vaporization of the prostate (TUVP)** a technique that vaporizes (rather than resects) prostate tissue; it is associated with less bleeding during the procedure. TUVP is used to treat **\*lower urinary tract symptoms** thought to be due to benign prostatic hyperplasia (*see* PROSTATE GLAND) or urinary retention.

**transvaginal tape (TVT)** *see* TENSION-FREE VAGINAL TAPE.

**transvaginal ultrasonography** an **\*ultrasonography** technique for examination of the female pelvis using a vaginal probe instead of an abdominal transducer. It allows the use of a higher frequency, thus providing superior resolution and therefore a more detailed anatomy of the female pelvis and an earlier and more accurate identification of fetal structures.

**transverse** *adj.* (in anatomy) situated at right angles to the long axis of the body or an organ.

**transverse process** the long projection from the base of the neural arch of a **\*vertebra**.

**transvestism (cross-dressing)** *n.* dressing in clothes normally associated with the opposite sex, which may occur in both heterosexual and homosexual people. Cross-dressing may be practised by transsexuals (*see* TRANSGENDER), in whom it is not sexually arousing. Other transvestites are fetishistic, and in these cross-dressing is sexually arousing and may lead to masturbatory or other sexual behaviour. Treatment may be by behavioural techniques, such as **\*aversion therapy**, but is not always needed. *See also* SEXUAL DEVIATION. —**transvestite** *n.*

**Trantas dots** slightly elevated greyish-white dots consisting of clumps of degenerating eosinophils and epithelial cells, seen on the conjunctiva at the junction of the cornea and sclera in cases of allergic conjunctivitis. [A. Trantas (1867–1960), Greek ophthalmologist]

**tranylcypromine** *n.* see **MAO INHIBITOR**.

**trapezium** *n.* a bone of the wrist (see **CARPUS**). It articulates with the scaphoid bone behind, with the first metacarpal in front, and with the trapezoid and second metatarsal on either side.

**trapezius** *n.* a flat triangular muscle covering the back of the neck and shoulder. It is important for movements of the scapula and it also draws the head backwards to either side.

**Left trapezius muscle.**

**trapezoid bone** a bone of the wrist (see **CARPUS**). It articulates with the second metatarsal bone in front, with the scaphoid bone behind, and with the trapezium and capitate bones on either side.

**trash foot** a condition resulting from occlusion of the small arteries of the foot by atherosclerotic debris (see **ATHEROMA**). This occurs during abdominal aortic surgery or catheter manipulation, for example during coronary angiography. Clinically it presents with pain and eventually patchy ulceration and gangrene of the whole or part of the foot.

**trastuzumab** *n.* a **\*monoclonal antibody** used to treat types of breast cancer and metastatic stomach cancer that are positive for **\*HER2**: the drug binds to these receptors on the tumour. Side-effects include damage to the heart, chills, fever, and allergic reactions.

**trauma** *n.* **1.** a physical wound or injury, such as a fracture or blow. **Trauma scores** are numerical systems for assessing the severity and prognosis of serious injuries. **2.** (in psychology) an emotionally painful and harmful event. \***Post-traumatic stress disorder** may follow an overwhelmingly stressful event, such as battle, assault, or serious injury.

—**traumatic** *adj.*

**traumatic brain injury (TBI)** injury to the brain due to external force, such as occurs following falls, road traffic accidents, and violence. It is a major cause of death and chronic disability worldwide, especially in young males.

**traumatic fever** a fever resulting from a serious injury.

**traumatology** *n.* accident surgery: the branch of surgery that deals with wounds and disabilities arising from injuries.

**travel sickness** *see* **MOTION SICKNESS**.

**trazodone** *n.* a drug, related to the tricyclic \***antidepressants**, that is used in the treatment of depression, particularly in agitated and anxious patients, and anxiety. Side-effects are milder than with tricyclic antidepressants.

**Treacher Collins syndrome (Treacher Collins deformity)** a hereditary disorder of facial development. It is characterized by underdevelopment of the jaw and zygomatic (cheek) bones and the precursors of the ear fail to develop, which results in a variety of ear and facial malformations. The ear abnormality may cause deafness. [E. Treacher Collins (1862–1919), British ophthalmologist]

**treatment bias** the making of decisions by a health-care provider based on (sometimes unconscious) nonmedical criteria. Examples include assuming that a woman's physical complaints are 'all in her head' and neglecting to consider depression as a possible diagnosis in a man.

**treatment field** *n.* (in radiotherapy) an area of the body selected for treatment with radiotherapy. For example, a **mantle field** comprises the neck, armpits, and central chest, for the radiotherapy of Hodgkin's disease. Radiation is administered to the defined area by focusing the beam of particles emitted by the radiotherapy machine and shielding the surrounding area of the body.

**Treg cell** *see* **REGULATORY T CELL**.

**trematode** *n. see* **FLUKE**.

**tremor** *n.* a rhythmical and alternating movement that may affect any part of the body. The **physiological tremor** is a feature of the normal mechanism for maintaining posture. It may be more apparent in states of fatigue or anxiety or when the thyroid gland is overactive. **Essential tremor** is slower and particularly affects the hands and arms when held out or holding a teacup. It can be embarrassing and inconvenient but it is not accompanied by any other symptoms. A similar tremor may also occur in several members of one family and also in elderly people. Alcohol reduces the intensity of essential tremor. Treatment is with beta blockers, such as propranolol. **Primary orthostatic tremor** affects the legs when standing still, causing unsteadiness if the position is maintained. **Resting tremor** is a prominent symptom of *\*parkinsonism*. An **intention tremor** occurs when a patient with disease of the cerebellum tries to touch an object. The closer the object is approached the wilder become the movements.

**trench fever** an infectious disease caused by the bacterium *\*Bartonella quintana* and transmitted by body lice (*\*Pediculus humanus corporis*). It was prevalent among soldiers during both World Wars and is now seen mainly in homeless people. Symptoms include variable fever and persistent pain in the shins and other bones.

**trench foot (immersion foot)** blackening of the toes and the skin of the foot due to death of the superficial tissues and caused by prolonged immersion in cold water or exposure to damp and cold.

**Trendelenburg position** a special operating-table posture for patients undergoing surgery of the pelvis or for patients suffering from shock to reduce blood loss in operations on the legs. The patient is laid on his or her back with the pelvis higher than the head, inclined at an angle of about 45°. [F. Trendelenburg (1844–1924), German surgeon]

**Trendelenburg's test (Trendelenburg's sign)** a test for detecting dysfunction of the hip joint. Normally when a leg is lifted off the ground, the pelvis on the same side is raised by the hip abductor muscles on the other side. If these muscles cannot raise the pelvis against body weight, the pelvis

will tilt downwards and the test is positive, indicating arthritis, paralysis of the muscles due to superior gluteal nerve injury, or other hip pathology (e.g. congenital hip dislocation). [F. Trendelenburg]

**trephine** *n.* a surgical instrument used to remove a circular area of tissue, usually from the cornea of the eye (in the operation of penetrating **\*keratoplasty**) or from bone (for microscopical examination). It consists of a hollow tube with a serrated cutting edge. It is used during the preliminary stages of craniotomy.

**Treponema** *n.* a genus of anaerobic spirochaete bacteria. All species are parasitic and some cause disease in animals and humans: *T. carateum* causes **\*pinta**, *T. pallidum* **\*syphilis**, and *T. pertenue* **\*yaws**.

**treponematosi** *n.* any infection caused by spirochaete bacteria of the genus *Treponema*. See **PINTA**; **SYPHILIS**; **YAWS**.

**trespass against the person** see **BATTERY**.

**tretinoin** *n.* a **\*retinoid** drug applied as a solution for the treatment of acne and sun-damaged skin; side-effects include redness and burning of the skin and increased sensitivity to sunlight. It is also taken by mouth to treat acute promyelocytic leukaemia; side-effects may include fever, breathlessness, flushing, headache, and fetal abnormalities (it should not be taken during pregnancy).

**triad** *n.* (in medicine) a group of three united or closely associated structures or three symptoms or effects that occur together. A **portal triad** in a portal canal of the liver consists of a branch of the portal vein, a branch of the hepatic artery, and an interlobular bile tubule.

**triage** *n.* a system whereby patients are evaluated and categorized according to the seriousness of their injuries or illnesses with a view to prioritizing treatment and other resources. In emergency situations it is designed to maximize the number of survivors.

**triamcinolone** *n.* a synthetic corticosteroid hormone that reduces inflammation but does not cause salt and water retention. It is used for treating a wide range of inflammatory and allergic conditions, including rheumatoid arthritis, eczema, psoriasis, and hay fever. Common side-effects

include headache, dizziness, somnolence, muscle weakness, and a fall in blood pressure, particularly on the sudden withdrawal of treatment.

**triamterene** *n.* a potassium-sparing **\*diuretic** given, usually in combination with a thiazide or loop diuretic, for the treatment of various forms of fluid retention (oedema). Common side-effects include nausea, vomiting, weakness, reduced blood pressure, and dry mouth.

**triangle** *n.* (in anatomy) a three-sided structure or area; for example, the **\*femoral triangle**.

**triangular bandage** a piece of material cut or folded into a triangular shape and used for making an arm sling or holding dressings in position.

**Triatoma** *n.* a genus of bloodsucking bugs (see **REDUVIID**). *T. infestans* is important in transmitting **\*Chagas' disease** in Argentina, Uruguay, and Chile.

**triceps** *n.* a muscle with three heads of origin, particularly the **triceps brachii**, which is situated on the back of the upper arm and contracts to extend the forearm. It is the **\*antagonist** of the **\*brachialis**.

**triceps jerk** a tendon reflex that acts at the level of the seventh cervical spinal nerve. With the elbow flexed and relaxed, the triceps tendon is struck just above the elbow, causing contraction of the triceps and extension of the elbow. This reflex is increased in upper **\*motor neuron** lesions and absent in lower motor neuron lesions.

**trich- (tricho-)** *combining form denoting* hair or hairlike structures.

**trichiasis** *n.* a condition in which the eyelashes rub against the eyeball, producing discomfort and sometimes ulceration of the cornea. It may result from inflammation of the eyelids, which makes the lashes grow out in abnormal directions, or when scarring of the conjunctiva (lining membrane) turns the eyelid inwards. It accompanies all forms of **\*entropion**.

**Trichinella** *n.* a genus of minute parasitic nematode worms. The adults of *T. spiralis* live in the human small intestine, where the females release large numbers of larvae. These bore through the intestinal wall and can cause disease (see **TRICHINOSIS**). The parasite can also develop in pigs and rats.

**trichiniasis** *n.* see **TRICHINOSIS**.

**trichinosis (trichiniasis)** *n.* a disease of cold and temperate regions caused by the larvae of the nematode worm *\*Trichinella spiralis*. Humans contract trichinosis after eating imperfectly cooked meat infected with the parasite's larval cysts. Larvae, released by females in the intestine, penetrate the intestinal wall and cause diarrhoea and nausea. They migrate around the body and may cause fever, vertigo, delirium, and pains in the limbs. The larvae eventually settle within cysts in the muscles, and this may result in pain and stiffness. The intestinal phase of the disease is treated with anthelmintics.

**trichloracetic acid** an *\*astringent* used for a variety of skin conditions. It is also applied topically to produce sloughing, especially for the removal of warts.

**trichobezoar** *n.* hairball: a mass of swallowed hair in the stomach or gastrointestinal tract. *See* **BEZOAR**.

**Trichocephalus** *n. see* **WHIPWORM**.

**trichoglossia** *n.* hairiness of the tongue, due to the growth of fungal organisms infecting its surface.

**trichology** *n.* the study of hair.

**Trichomonas** *n.* a genus of parasitic flagellate protozoans that move by means of a wavy membrane, bearing a single flagellum, projecting from the body surface. *T. vaginalis* often infects the vagina, where it may cause severe irritation and a foul-smelling discharge (*see* **VAGINITIS**), and sometimes also the male *\*urethra*; it can be transmitted during sexual intercourse. *T. hominis* and *T. tenax* live in the large intestine and mouth respectively. *See also* **TRICHOMONIASIS**.

**trichomoniasis** *n.* **1.** an infection of the digestive system by the protozoan *Trichomonas hominis*, causing dysentery. **2.** an infection of the vagina due to the protozoan *Trichomonas vaginalis*, causing inflammation of genital tissues with vaginal discharge (*see* **VAGINITIS**). It can be transmitted to males in whom it causes urethral discharge. Treatment is with *\*metronidazole*.

**trichomycosis** *n.* any hair disease that is caused by infection with a fungus.

**Trichophyton** *n.* a genus of fungi, parasitic in humans, that frequently infect the skin, nails, and hair and cause *\*ringworm*. See also DERMATOPHYTE.

**trichorrhexis nodosa** a condition in which the hairs break easily. It may be due to a hereditary condition or it may occur as a consequence of repeated physical or chemical injury. The latter condition may follow the use of heat or bleach on the hair or be caused by persistent rubbing.

**Trichosporon** *n.* a genus of fungi, parasitic in humans, that infect the scalp and beard.

**trichotillomania** *n.* a pathologically strong impulse that causes a person to persistently rub or pull out his or her hair, causing conspicuous hair loss. This is a disorder of impulse control.

**trichromatic** *adj.* describing or relating to the normal state of colour vision, in which a person is sensitive to all three of the primary colours (red, green, and blue) and can match any given colour by a mixture of these three. Compare DICHROMATIC; MONOCHROMAT.

**trichuriasis** *n.* an infestation of the large intestine by the *\*whipworm*, *Trichuris trichiura*; it occurs principally in humid tropical regions. The infection is acquired by eating food contaminated with the worms' eggs. Symptoms, including bloody diarrhoea, anaemia, weakness, and abdominal pain, are evident only in heavy infestations. Trichuriasis can be treated with mebendazole.

**Trichuris** *n.* see WHIPWORM.

**tricuspid atresia** a rare form of congenital heart disease in which there is no communication between the right atrium and the right ventricle. Affected babies present with *\*cyanosis*, breathlessness, particularly on feeding, and *\*failure to thrive*. Diagnosis is by *\*echocardiography*. Treatment involves surgical intervention, but the prognosis is often poor.

**tricuspid valve** the valve in the heart between the right atrium and right ventricle. It consists of three cusps that channel the flow of blood from the atrium to the ventricle and prevent any backflow.

**tricyclic antidepressants (tricyclics)** see ANTIDEPRESSANT.

**tridactyly** *n.* a congenital abnormality in which there are only three digits on a hand or foot.

**trifluoperazine** *n.* an **\*antipsychotic** drug (a phenothiazine) used in the treatment of schizophrenia and other psychoses, severe anxiety, and severe nausea and vomiting. Common side-effects include drowsiness, dryness of mouth, dizziness, abnormal facial and body movements, and tremor.

**trifocal lenses** lenses in which there are three segments. The upper provides a clear image of distant objects; the lower is used for reading and close work; and the middle one for the intermediate distance. Musicians sometimes find the middle segment useful for reading the score during performance.

**trigeminal nerve** the fifth and largest **\*cranial nerve** (V), which is split into three main branches: ophthalmic, maxillary, and mandibular (see illustration). The motor fibres are responsible for controlling the muscles involved in chewing, while the sensory fibres relay information about temperature, pain, and touch from the whole front half of the head (including the mouth) and also from the meninges.

**The trigeminal nerve.**

**trigeminal neuralgia (tic douloureux)** *see* **NEURALGIA**.

**trigeminy** *n.* a condition in which the heartbeats can be subdivided into groups of three. The term is most often used of an electrocardiogram in

which the first two beats are normal but every third beat is premature (*see* [ECTOPIC BEAT](#)).

**trigger finger** *n.* an impairment in the ability to extend a finger, resulting either from a nodular thickening in the flexor tendon or a narrowing of the flexor tendon sheath. On unclenching the fist, the affected finger (usually the third or fourth) at first remains bent and then, on overcoming the resistance, suddenly straightens ('triggers'). Treatment is by incision of the tendon sheath or injection of steroid around the tendon.

**triglyceride** *n.* a lipid or neutral *\*fat* consisting of glycerol combined with three fatty-acid molecules. Triglycerides are synthesized from the products of digestion of dietary fat: they are the form in which digested fat is transported in the bloodstream (*see* [CHYLOMICRON](#)). High concentrations of triglycerides in the blood predisposes to coronary heart disease (*see* [HYPERTRIGLYCERIDAEMIA](#)). **Medium-chain triglycerides** (MCT) have short-chain fatty acids of 8-10 carbon atoms and can be useful for individuals with malabsorption problems as they can be absorbed without the need for bile salts.

**trigone** *n.* a triangular region or tissue, such as the triangular region of the wall of the bladder that lies between the openings of the two ureters and the urethra.

**trigonitis** *n.* inflammation of the trigone (base) of the urinary bladder. This can occur as part of a generalized *\*cystitis* or it can be associated with inflammation in the urethra, prostate, or cervix (neck) of the uterus. The patient experiences an intense desire to pass urine frequently; treatment includes the clearing of any underlying infection by antibiotic administration.

**trigonocephaly** *n.* a deformity of the skull in which the vault of the skull is sharply angled just in front of the ears, giving the skull a triangular shape. — **trigonocephalic** *adj.*

**trihexyphenidyl (benzhexol)** *n.* an *\*antimuscarinic* drug that is used mainly to reduce muscle tremor and rigidity in drug-induced parkinsonism. The most common side-effects are constipation, dry mouth, and blurred vision.

**triiodothyronine (T<sub>3</sub>)** *n.* the most metabolically active of the **\*thyroid hormones**, which is mostly formed in the tissues from **\*thyroxine**. A preparation of triiodothyronine (**\*liothyronine** sodium) is administered by mouth or injection for treating underactivity of the thyroid.

**trimeprazine** *n.* *see* **ALIMEMAZINE**.

**trimester** *n.* (in obstetrics) any one of the three successive three-month periods (the **first**, **second**, and **third trimesters**) into which a pregnancy may be divided.

**trimethoprim** *n.* an antibacterial drug that is active against a range of microorganisms; it is used mainly in the treatment of chronic urinary-tract infections and respiratory-tract infections. Long-term treatment may cause anaemia due to deficiency of folate, with which the drug interacts (*see* **DIHYDROFOLATE REDUCTASE INHIBITOR**). Trimethoprim is also administered in a combined preparation with sulfamethoxazole (*see* **CO-TRIMOXAZOLE**) but is now more usually prescribed alone, because of the severity of the side-effects of co-trimoxazole.

**trimipramine** *n.* a tricyclic **\*antidepressant** drug that also possesses sedative properties. Common side-effects include drowsiness, dizziness, dry mouth, and a fall in blood pressure.

**trinitrophenol** *n.* *see* **PICRIC ACID**.

**triose** *n.* a carbohydrate with three carbon units: for example, glyceraldehyde.

**triple rhythm** *see* **GALLOP RHYTHM**.

**triple test 1.** (in **\*prenatal screening**) a blood test that can be performed between the 15th and 20th weeks of pregnancy but has largely been replaced by combined first-trimester **\*PAPP-A** screening and **\*nuchal translucency scanning**. Levels of **\*alpha-fetoprotein** (AFP), **\*unconjugated oestriol** (uE<sub>3</sub>), and **\*human chorionic gonadotrophin** (hCG) in the serum are computed with maternal age to determine the statistical likelihood of the fetus being affected by Down's syndrome or spina bifida. The **double test** is similar but omits measurement of uE<sub>3</sub>. **2.** *see* **INSULIN STRESS TEST**.

**triploid** *adj.* describing cells, tissues, or individuals in which there are three complete chromosome sets. *Compare* **HAPLOID**; **DIPLOID**. —**triploid** *n.*

**triptan** *n.* *see* **5HT<sub>1</sub> AGONIST**.

**triquetrum (triquetral bone)** *n.* a bone of the wrist (*see* **CARPUS**). It articulates with the ulna behind and with the pisiform, hamate, and lunate bones in the carpus.

**trismus** *n.* spasm of the jaw muscles, keeping the jaws tightly closed. This is the characteristic symptom of **\*tetanus** but it also occurs less dramatically as a sensitivity reaction to certain drugs and in disorders of the **\*basal ganglia**.

**trisomy** *n.* a condition in which there is one extra chromosome present in each cell in addition to the normal (diploid) chromosome set. A number of chromosome disorders are due to trisomy, including **\*Down's syndrome** and **\*Klinefelter's syndrome**. —**trisomic** *adj.*

**tritanopia** *n.* a rare defect of colour vision in which affected persons are insensitive to blue light and confuse blues and greens. *Compare* **DEUTERANOPIA**; **PROTANOPIA**.

**trocar** *n.* an instrument used combined with a **\*cannula** to draw off fluids from a body cavity (such as the peritoneal cavity). It comprises a metal tube containing a removable shaft with a sharp three-cornered point; the shaft is withdrawn after the trocar has been inserted into the cavity.

**trochanter** *n.* either of the two protuberances that occur below the neck of the **\*femur**.

**troche** *n.* a medicinal lozenge, taken by mouth, used to treat conditions of the mouth or throat and also of the alimentary canal.

**trochlea** *n.* an anatomical part having the structure or function of a pulley; for example the groove at the lower end of the **\*humerus** or the fibrocartilaginous ring in the frontal bone (where it forms part of the orbit), through which the tendon of the superior oblique eye muscle passes. —**trochlear** *adj.*

**trochlear nerve** the fourth **\*cranial nerve** (IV), which supplies the superior oblique muscle, one of the muscles responsible for movement of the eyeball

in its socket. The action of the trochlear nerve is coordinated with that of the \*oculomotor and the \*abducens nerves.

**trochoid joint (pivot joint)** a form of \*diarthrosis (freely movable joint) in which a bone moves round a central axis, allowing rotational movement. An example is the joint between the atlas and axis vertebrae.

**Troisier's sign** enlargement of the lymph node at the base of the neck on the left side (**Troisier's node**), which indicates metastatic spread from an abdominal malignant growth, usually a carcinoma of the stomach. [C. E. Troisier (1844–1919), French physician]

**Trombicula** *n.* a genus of widely distributed mites – the harvest mites. The six-legged parasitic larvae (chiggers) are common in fields during the autumn and frequently attack humans, remaining attached to the skin for several days while feeding on the lymph and digested skin tissues. Their bite causes intense irritation and a severe dermatitis. Various repellents, e.g. benzyl benzoate, can be applied to clothing. *Trombicula* larvae transmit scrub typhus in southeast Asia.

**troph- (tropho-)** *combining form denoting* nourishment or nutrition.

**trophoblast** *n.* the tissue that forms the wall of the \*blastocyst. At implantation it forms two layers, an inner cellular layer (**cytotrophoblast**), which does not invade maternal tissue and forms the outer surface of the \*chorion; and an outer syncytial layer (**syncytiotrophoblast**, or **plasmotrophoblast**), which erodes the maternal tissue and forms the chorionic \*villi of the placenta. *See also* GESTATIONAL TROPHOBLASTIC DISEASE.

**trophozoite** *n.* a stage in the life cycle of the malarial parasite (*Plasmodium*) that develops from a merozoite in the red blood cells. The trophozoite, which has a ring-shaped body and a single nucleus, grows steadily at the expense of the blood cell; eventually its nucleus and cytoplasm undergo division to form a \*schizont containing many merozoites.

**-trophy** *combining form denoting* nourishment, development, or growth. Example: **dystrophy** (defective development).

**-tropic** combining form denoting **1.** turning towards. **2.** having an affinity for; influencing.

Example: **inotropic** (muscle).

**tropical abscess (amoebic abscess)** an abscess of the liver caused by infection with *\*Entamoeba histolytica*. See **DYSENTERY**.

**tropical medicine** the study of diseases more commonly found in tropical regions than elsewhere, such as *\*malaria*, *\*leprosy*, *\*trypanosomiasis*, *\*schistosomiasis*, and *\*leishmaniasis*.

**tropical ulcer (Naga sore)** a skin disease prevalent in wet tropical regions. A large open sloughing sore usually develops at the site of a wound or abrasion. The ulcer, commonly located on the feet and legs, is often infected with spirochaetes and other bacteria and may extend deeply and cause destruction of muscles and bones. Treatment involves the application of mild antiseptic dressings and intramuscular doses of *\*penicillin*. Skin grafts may be necessary in more serious cases. The exact cause of the disease has not yet been determined.

**tropicamide** *n.* an *\*antimuscarinic* drug used in the form of eye drops to dilate the pupil so that the inside of the eye can more easily be examined or operated upon.

**tropocollagen** *n.* the molecular unit of *\*collagen*. It consists of a helix of three collagen molecules: this arrangement confers on the fibres structural stability and resistance to stretching.

**troponins** *pl. n.* a group of regulatory proteins found in muscle. Cardiac-specific forms (troponins T and I) may be detected in the blood between 4 hours and 14 days after heart muscle damage, and thus constitute highly sensitive and specific tests for the detection of *\*myocardial infarction*.

**trospium chloride** an *\*antimuscarinic* drug indicated for the treatment of overactivity of the bladder *\*detrusor* muscle with symptoms of urge incontinence, urgency, and frequency. The most common side-effects are dry mouth and constipation.

**Trousseau's sign** spasmodic contractions of muscles, especially the muscles of mastication, in response to nerve stimulation (e.g. by tapping). It is a

characteristic sign of hypocalcaemia (see [TETANY](#)). [A. Trousseau (1801–67), French physician]

**TRT** *see* [TINNITUS RETRAINING THERAPY](#).

**truncus** *n.* a **\*trunk**: a main vessel or other tubular organ from which subsidiary branches arise.

**truncus arteriosus** the main arterial trunk arising from the fetal heart. It develops into the aorta and pulmonary artery.

**trunk** *n.* **1.** the main part of a blood vessel, lymph vessel, or nerve, from which branches arise. **2.** the body excluding the head and limbs.

**TRUS** *see* [TRANSRECTAL ULTRASONOGRAPHY](#).

**truss** *n.* a device for applying pressure to a hernia to prevent it from protruding. It usually consists of a pad attached to a belt with straps or spring strips and it is worn under the clothing.

**trust** *n.* (in the NHS) a self-governing body that provides or commissions any of a range of health-care services, including hospital, community health, and mental health services. NHS trusts have their own boards and budgets and the freedom to provide services of their own selection (within legal and contractual frameworks). *See* [FOUNDATION TRUSTS](#).

**truth-telling** *n.* telling the facts openly, honestly, and unambiguously. Clinicians should speak truthfully to their patients unless there are acceptable justifications not to do so that respect the patient's **\*autonomy**. Without knowing what is wrong, for instance, a patient cannot make a choice of treatments or decide whether to be treated at all. Candour or openness is a requirement of **\*professionalism** but does not extend to inappropriate revelations from clinicians about their personal lives. *See also* [THERAPEUTIC PRIVILEGE](#).

**trypanocide** *n.* an agent that kills trypanosomes and is therefore used to treat infestations caused by these parasites (see [TRYPANOSOMIASIS](#)).

**Trypanosoma** *n.* a genus of parasitic protozoans that move by means of a long trailing flagellum and a thin wavy membrane, which project from the

body surface. Trypanosomes undergo part of their development in the blood of a vertebrate host. The remaining stages occur in invertebrate hosts, which then transmit the parasites back to the vertebrates. *T. rhodesiense* and *T. gambiense*, which are transmitted through the bite of \*tsetse flies, cause \*sleeping sickness in Africa. *T. cruzi*, carried by \*reduviid bugs, causes Chagas' disease in South America.

**trypanosomiasis** *n.* any disease caused by the presence of parasitic protozoans of the genus \**Trypanosoma*. The two most important diseases are \*Chagas' disease (South American trypanosomiasis) and \*sleeping sickness (African trypanosomiasis).

**trypsin** *n.* an enzyme that continues the digestion of proteins by breaking down peptones into smaller peptide chains (see PEPTIDASE). It is secreted by the pancreas in an inactive form, trypsinogen, which is converted in the duodenum to trypsin by the action of the enzyme enteropeptidase.

**trypsinogen** *n.* see TRYPSIN.

**tryptophan** *n.* an \*essential amino acid. See also AMINO ACID.

**T score** a measure of bone mineral density used to evaluate the degree of bone thinning detected on \*DEXA scanning. An individual's T score is the number of standard deviations above or below the mean reference value for young healthy adults. By convention, a score above -1 is considered normal, a score between -1 and -2.5 indicates **osteopenia**, and a score below -2.5 indicates \*osteoporosis.

**tsetse** *n.* a large bloodsucking fly of tropical Africa belonging to the genus *Glossina*. Tsetse flies, which have slender forwardly projecting biting mouthparts, feed during the day on humans and other mammals. They transmit the blood parasites that cause \*sleeping sickness. *G. palpalis* and *G. tachinoides*, which are found along river banks, transmit *Trypanosoma gambiense*; *G. morsitans*, *G. swynnertoni*, and *G. pallidipes*, which are found in savannah country, transmit *T. rhodesiense*.

**TSH** see THYROID-STIMULATING HORMONE.

**TSH receptor antibodies** autoantibodies targeted against the \*thyroid-stimulating hormone (TSH) receptor of the thyroid cells. They can activate

the TSH receptor, leading to the hyperthyroidism of *\*Graves' disease*, or they can block the TSH receptor, causing *\*hypothyroidism*.

**T-sign** an ultrasound diagnosis of monochorionicity at 10–14 weeks gestation: the intertwin membrane inserts directly into the placenta, forming a T-sign. *See* *CHORIONICITY*.

**tsutsugamushi disease** *see* *SCRUB TYPHUS*.

**TTP** *see* *THROMBOTIC THROMBOCYTOPENIC PURPURA*.

**TTTS** *see* *TWIN-TO-TWIN TRANSFUSION SYNDROME*.

**tubal occlusion** blocking of the Fallopian tubes. This is achieved by surgery as a means of *\*sterilization*; it is also a result of *\*pelvic inflammatory disease*.

**tubal pregnancy** *see* *ECTOPIC PREGNANCY*.

**tube** *n.* (in anatomy) a long hollow cylindrical structure, e.g. a *\*Fallopian tube*.

**tuber** *n.* (in anatomy) a thickened or swollen part. The **tuber cinereum** is a part of the brain situated at the base of the hypothalamus, connected to the stalk of the pituitary gland.

**tubercle** *n.* **1.** (in anatomy) a small rounded protuberance on a bone. **2.** the specific nodular lesion of *\*tuberculosis*.

**tubercular** *adj.* having small rounded swellings or nodules, not necessarily caused by tuberculosis.

**tuberculide** *n.* an eruption of the skin that arises in response to an internal focus of tuberculosis.

**tuberculin** *n.* a protein extract from cultures of tubercle bacilli, used to test whether a person has suffered from or been in contact with tuberculosis. In the **Mantoux test** a quantity of tuberculin is injected beneath the skin and a patch of inflammation appearing in the next 48–72 hours is regarded as a positive reaction, meaning that a degree of immunity is present.

**tuberculoma** *n.* a mass of cheeselike material resembling a tumour, seen in some cases of **\*tuberculosis**. Tuberculomas are found in a variety of sites, including the lung or brain, and a single mass may be the only clinical evidence of disease. Treatment is by surgical excision, together with antituberculous drugs.

**tuberculosis (TB)** *n.* an infectious disease caused by the bacillus *Mycobacterium tuberculosis* (first identified by Koch in 1882) and characterized by the formation of nodular lesions (**tubercles**) in the tissues.

In **pulmonary tuberculosis** – formerly known as **consumption** and **phthisis** (wasting) – the bacillus is inhaled into the lungs where it sets up a primary tubercle and spreads to the nearest lymph nodes (the **primary complex**). Natural immune defences may heal it at this stage; alternatively the disease may smoulder for months or years and fluctuate with the patient's resistance. Many people become infected but show no symptoms. Others develop a chronic infection and can transmit the bacillus by coughing and sneezing. Symptoms of the active disease include fever, night sweats, weight loss, and the spitting of blood. In some cases the bacilli spread from the lungs to the bloodstream, setting up millions of tiny tubercles throughout the body (**miliary tuberculosis**), or migrate to the meninges to cause tuberculous **\*meningitis**. Bacilli entering by the mouth, usually in infected cows' milk, set up a primary complex in abdominal lymph nodes, leading to **\*peritonitis**, and sometimes spread to other organs, joints, and bones (see **POTT'S DISEASE**).

Tuberculosis is curable by various combinations of the antibiotics **\*streptomycin**, **\*ethambutol**, **\*isoniazid** (INH), **\*rifampicin**, and **\*pyrazinamide**. Preventive measures in the UK include the detection of cases by X-ray screening of vulnerable populations and vaccination with **\*BCG** vaccine of those with no immunity to the disease (the **\*tuberculin** test identifies which people require vaccination). The childhood immunization schedule no longer includes BCG vaccination at 10–14 years of age; vaccination now targets high-risk groups, such as immigrants from countries with a high incidence of TB. There has been a resurgence of tuberculosis in recent years in association with HIV infection. The number of patients with multidrug resistant TB has also increased due to patients not completing drug courses. Many centres have introduced **directly observed therapy** (DOT), in which nurse practitioners watch patients taking their drugs or administer the drugs.

**tuberos** *adj.* *see* **TUBEROUS**.

**tuberosity** *n.* a large rounded protuberance on a bone. For example, there is a tuberosity at the upper end of the tibia.

**tuberous (tuberos)** *adj.* knobbed; having nodules or rounded swellings.

**tuberous sclerosis (Bourneville's disease, epiloia)** a hereditary disorder in which the brain, skin, and other organs are studded with small plaques or tumours; eye involvement includes retinal tumours (astrocytic **\*hamartomas**), **\*coloboma**, **\*papilloedema**, optic nerve gliomas, and eyelid neuromas. Symptoms include epilepsy, learning difficulties, and behavioural disorders.

**tubo-** *combining form denoting* a tube, especially the Fallopian tube or Eustachian tube.

**tuboabdominal** *adj.* relating to or occurring in a Fallopian tube and the abdomen.

**tubogram** *n.* X-ray imaging of any tube in the body (e.g. a drainage catheter, a Fallopian tube) after injection of a contrast medium through the tube in order to assess its patency or function.

**tubo-ovarian** *adj.* relating to or occurring in a Fallopian tube and an ovary.

**tubotympanal** *adj.* relating to the tympanic cavity and the **\*Eustachian tube**.

**tubule** *n.* (in anatomy) a small cylindrical hollow structure. *See also* **RENAL TUBULE**; **SEMINIFEROUS TUBULE**.

**tubulointerstitium** *n.* spaces around the kidney tubules containing cells and extracellular components. The tubulointerstitium is believed to influence many aspects of the development and functioning of the tubules and blood vessels of the kidney. —**tubulointerstitial** *adj.*

**tubulovillous adenoma** a type of polyp that arises in the colon and rectum and can undergo malignant transformation, usually over a period of years, although this can occur more rapidly in familial **\*polyposis** syndromes.

**tufting** *n.* the presence of more than one hair emerging from a hair follicle. It can occur in the absence of disease, but when widespread it suggests a scarring pathological process, such as folliculitis decalvans.

**tuftsin** *n.* a tetrapeptide derived from IgG (see **IMMUNOGLOBULIN**), produced mainly in the spleen, that stimulates **\*neutrophil** activity (phagocytosis). Levels of tuftsin are reduced after **\*splenectomy**, resulting in diminished resistance to infection, especially by encapsulated organisms.

**tularaemia (rabbit fever)** *n.* a disease of rodents and rabbits, caused by the bacterium *Francisella tularensis*, that is transmitted to humans by deer flies (see **CHRYSOPS**), by direct contact with infected animals, by contamination of wounds, or by drinking contaminated water. Symptoms include an ulcer at the site of infection, inflamed and ulcerating lymph nodes, headache, aching pains, loss of weight, and a fever lasting several weeks. Treatment with chloramphenicol, streptomycin, or tetracycline is effective.

**tulle gras** a soft dressing consisting of open-woven silk (or other material) impregnated with a waterproof soft paraffin wax.

**Tullio phenomenon** dizziness induced by exposure to sound. It is seen in various conditions of the inner ear, including **\*Ménière's disease** and **\*superior canal dehiscence syndrome**. [P. Tullio (1881–1941), Italian biologist]

**tumbu fly** a large non-bloodsucking fly, *Cordylobia anthropophaga*, widely distributed in tropical Africa. The female fly lays its eggs on ground contaminated with urine or excreta or on clothing tainted with sweat or urine. The maggots are normally parasites of rats, but if they come into contact with humans they penetrate the skin, producing boil-like swellings (see also **MYIASIS**). The maggots can be gently eased out by applying oil to the swellings.

**tumefaction** *n.* the process in which a tissue becomes swollen and tense by accumulation within it of fluid under pressure.

**tumescence** *n.* a swelling, or the process of becoming swollen, usually because of an accumulation of blood or other fluid within the tissues.

**tumid** *adj.* swollen.

**tumor** *n.* swelling: one of the classical signs of **\*inflammation** in a tissue, the other three being **\*calor** (heat), **\*rubor** (redness), and **\*dolor** (pain). The

swelling of an inflamed area is due to the leakage from small blood vessels of clear protein-containing fluid, which accumulates between the cells.

**tumour** *n.* any abnormal swelling in or on a part of the body. The term is usually applied to an abnormal growth of tissue, which may be *\*benign* or *\*malignant*. Compare CYST.

**tumour-associated antigen** a protein produced by cancer cells. Its presence in the blood can be revealed by means of a simple blood test, aiding the diagnosis of malignant melanoma and other cancers at their earliest – and most treatable – stages of development.

**tumour-infiltrating lymphocyte (TIL)** a lymphoid cell that can infiltrate solid tumours. Such cells can be cultured in vitro, in the presence of *\*interleukin 2*, and have been used as vehicles for *\*tumour necrosis factor* in gene therapy trials for cancer.

**tumour marker** a substance produced by a tumour that can be used to aid detection of the tumour and to monitor its size and the effects of treatment. An example is *\*alpha-fetoprotein*, which is used to monitor treatment of malignant *\*teratomas*. See also CA125; CA19-9; CARCINO-EMBRYONIC ANTIGEN; HUMAN CHORIONIC GONADOTROPHIN.

**tumour necrosis factor (TNF)** either of two proteins, TNF- $\alpha$  or TNF- $\beta$ , that function as *\*cytokines*. Produced by macrophages, monocytes, T lymphocytes, and various other cells, they mediate many responses, including inflammation, and have a marked action against tumour cells. Anti-TNF drugs (see CYTOKINE INHIBITOR) are used in the treatment of several disorders, especially rheumatoid arthritis and ankylosing spondylitis.

**Tunga** *n.* a genus of sand fleas found in tropical America and Africa. The fertilized female of *T. penetrans*, the chigoe or jigger, burrows beneath the skin of the foot, where it becomes enclosed in a swelling of the surrounding tissues and causes intense itching and inflammation. Surgical removal of the fleas is recommended.

**tunica** *n.* a covering or layer of an organ or part; for example, a layer of the wall of a blood vessel (see ADVENTITIA; INTIMA; MEDIA). The tunica

**albuginea** is a fibrous membrane comprising one of the covering tissues of the ovary, penis, and testis.

**tunnel** *n.* (in anatomy) a canal or hollow groove. *See also* [CARPAL TUNNEL](#).

**tunnel vision** a visual-field defect in which only the central area of the *\*visual field* remains. It occurs in advanced *\*glaucoma* and is simulated by *\*aphakic spectacles*.

**turbinate bone** *see* [NASAL CONCHA](#).

**turbinectomy** *n.* the surgical removal or partial removal of one of the bones forming the nasal cavity (nasal conchae, or turbinate bones), performed in the treatment of nasal obstruction.

**turgescence** *n.* a swelling, or the process by which a swelling arises in tissues, usually by the accumulation of blood or other fluid under pressure.

**turgor** *n.* a state of being swollen or distended.

**Turkel's needle** a specially designed needle for purposes of transrectal prostatic biopsy.

**Turner's syndrome (gonadal dysgenesis)** a genetic defect in women in which there is only one X chromosome instead of the usual two. Affected women are infertile: they have female external genitalia but their ovaries fail to develop normally, resulting in absence of menstrual periods (*see* [AMENORRHOEA](#)). Characteristically they are short and have variable developmental defects, which may include webbing of the neck. [H. H. Turner (1892–1970), US endocrinologist]

**TURP** transurethral resection of the prostate: *see* [RESECTION](#).

**turricephaly** *n.* *see* [OXYCEPHALY](#).

**tussis** *n.* the medical name for *\*coughing*.

**TUVP** *see* [TRANSURETHRAL VAPORIZATION OF THE PROSTATE](#).

**TVT** *see* [TENSION-FREE VAGINAL TAPE](#).

**twin-peak sign** *see* [LAMBDA SIGN](#).

**twins** *pl. n.* two individuals who are born at the same time and of the same parents. **Fraternal** (or **dizygotic**) **twins** are the result of the simultaneous fertilization of two egg cells; they may be of different sexes and are no more alike than ordinary siblings. **Identical** (or **monozygotic**) **twins** result from the fertilization of a single egg cell that subsequently divides to give two separate fetuses. They are of the same sex and otherwise genetically identical; any differences in their appearance are due to environmental influences. All dizygotic twins and about one-third of monozygotic twins are **dichorionic** (i.e. they develop within separate chorionic membranes). About two-thirds of monozygotic twins are **monochorionic**, sharing a chorion. *See* [CHORIONICITY](#). *See also* [CONJOINED TWINS](#).

**twin-to-twin transfusion syndrome (TTTS)** a condition in which communicating vessels in the shared placenta of monochorionic twins (*see* [CHORIONICITY](#)) divert blood to one fetus (the recipient) from the other (the donor), resulting in one fetus with increased blood volume and one anaemic fetus. It complicates 15% of monochorionic twin pregnancies, and a system of ultrasound staging has been developed to assess the severity of the syndrome. TTTS is associated with a high perinatal mortality rate. There is significant morbidity and poor neurodevelopmental outcome in surviving infants due to complications of the disease itself and the high preterm birth rate that invariably accompanies this condition. A range of treatments, including [\\*amnioreduction](#), [\\*septostomy](#), and laser ablation of the communicating vessels, have led to an improvement in overall perinatal survival rates.

**Twin-to-twin transfusion syndrome.**

**tylosis** *n.* an extremely rare focal **\*keratosis** occurring especially on the palms and soles. It occurs early in life and is inherited in an autosomal **\*dominant** fashion. It is associated with oral leukokeratosis and with oesophageal cancer.

**tympan-** (**tympano-**) *combining form denoting* **1.** the eardrum. Example: **tympanectomy** (surgical excision of). **2.** the middle ear.

**tympanic cavity** *see* **MIDDLE EAR**.

**tympanic membrane (eardrum)** the membrane at the inner end of the external auditory meatus, separating the outer and middle ears. It is formed from the outer wall of the lining of the tympanic cavity and the skin that lines the external auditory meatus. When sound waves reach the ear the tympanum vibrates, transmitting these vibrations to the malleus – one of the auditory **\*ossicles** in the middle ear – to which it is attached.

**tympanites (meteorism)** *n.* distension of the abdomen with air or gas: the abdomen is resonant (drumlike) on **\*percussion**. Causes include intestinal obstruction, functional bowel disorder, and **\*aerophagia**.

**tympanogram** *n.* the graphic record of a test of middle ear function carried out on a **\*tympanometer**.

**tympanometer** *n.* an apparatus for testing the pressure in the middle ear and the mobility of the **\*tympanic membrane**. It is used in the diagnosis of **\*glue ear**. —**tympanometry** *n.*

**tympanoplasty** *n.* surgical repair of defects of the eardrum and middle ear ossicles. *See* **MYRINGOPLASTY**.

**tympanotomy** *n.* a surgical operation to expose the middle ear and allow access to the ossicles. It is usually performed by incising around the eardrum and turning it forwards.

**tympanum** *n.* the **\*middle ear** (tympanic cavity) and/or the eardrum (**\*tympanic membrane**).

**typho-** *combining form denoting* **1.** typhoid fever. **2.** typhus.

**typhoid fever** an infection of the digestive system by the bacterium *Salmonella typhi*, causing general weakness, headache, high fever, a rash (rose spots) on the chest and abdomen, chills, and sweating. In serious cases inflammation of the spleen and bones, delirium, and intestinal haemorrhage may occur. It is transmitted through food or drinking water contaminated by the faeces or urine of patients or carriers. Often recovery occurs naturally but relapses are common. Treatment is usually with antibiotics, such as ciprofloxacin or ceftriaxone. Vaccines that provide temporary immunity are available. *Compare* **PARATYPHOID FEVER**.

**typhus (spotted fever)** *n.* any one of a group of infections caused by **\*rickettsiae** and characterized by severe headache, a widespread rash, prolonged high fever, and delirium. They all respond to treatment with chloramphenicol or tetracyclines. **Epidemic typhus** (also known as **classical** or **louse-borne typhus**) is caused by infection with *Rickettsia prowazekii* transmitted by lice. It was formerly very prevalent in overcrowded insanitary conditions (as during wars and famines), with a mortality rate approaching 100%. **Endemic typhus (murine or flea-borne typhus)** is a disease of rats due to *Rickettsia mooseri*; it can be transmitted to humans by rat fleas, causing a mild typhus fever. There are in addition several kinds of **tick**

**typhus** (in which the rickettsiae are transmitted by ticks), including **\*Rocky Mountain spotted fever**, and typhus transmitted by mites (see **RICKETTSIAL POX**; **SCRUB TYPHUS**).

**tyramine** *n.* an amine naturally occurring in cheese. It has a similar effect in the body to that of **\*adrenaline**. This effect can be dangerous in patients taking **\*MAO inhibitors** (antidepressants), in whom blood pressure may become very high. Cheese is therefore not advised when such drugs are prescribed.

**Tyroglyphus** *n.* see **ACARUS**.

**tyrosine** *n.* see **AMINO ACID**.

**tyrosine kinase inhibitor** any one of a class of drugs that interfere with cell growth in a variety of different ways by inhibiting the action of tyrosine kinases. This family of enzymes, which occur both within cells and as components of cell-membrane receptor sites, have an important role in cell division and cell growth. Many tumour cells have been shown to have both intracellular enzymes and extracellular receptor sites, and a variety of anticancer agents have been developed to inhibit enzyme activity at these sites. Among these drugs are **\*imatinib**, **dasatinib**, and **nilotinib**, used for treating chronic myeloid leukaemia; **\*sunitinib**, for treating renal cell carcinoma; and **erlotinib**, for treating pancreatic cancer and non-small-cell lung cancer. See also **EPIDERMAL GROWTH FACTOR RECEPTOR**.

**tyrosinosis** *n.* an inborn defect of metabolism of the amino acid tyrosine that causes excessive excretion of parahydroxyphenylpyruvic acid in the urine. Symptoms include fever, lethargy, irritability, and drowsiness.

# U

**ubiquinone** *n.* a **\*coenzyme** that acts as an electron transfer agent in the mitochondria of cells (*see* **ELECTRON TRANSPORT CHAIN**).

**uE<sub>3</sub>** *see* **UNCONJUGATED OESTRIOL**.

**UGH syndrome** **\*uveitis** associated with **\*glaucoma** and **\*hyphaema**. This is an uncommon inflammatory condition occurring as a complication of intraocular lens **\*implants**.

**Uhthoff phenomenon** the worsening of neurological symptoms, including vision, in demyelinating conditions such as multiple sclerosis, when the body becomes overheated in hot weather or by exercise, fever, or saunas and hot tubs. [W. Uhthoff (1853–1927), German ophthalmologist]

**UICC** Union internationale contre le cancer: an international body promoting cancer prevention and treatment. It produces respected texts on the most important types of cancer, particularly on tumour staging classifications.

**UIP** usual **\*interstitial pneumonia**. *See also* **IDIOPATHIC PULMONARY FIBROSIS**.

**UK National Screening Committee (NSC)** the body responsible for advising the NHS, the ministers of the UK government, and the three devolved governments in the UK about all aspects of screening. The NSC also has responsibility for overseeing all noncancer screening programmes in the NHS in England and monitoring their quality and effectiveness. It was formed in 1996 and became part of **\*Public Health England** in 2013. *See* **screening test**.

SEE WEB LINKS

<https://legacyscreening.phe.org.uk/screening-recommendations.php>

- National Screening Committee website: contains detailed notes on all screening programmes the committee has considered and the rationale for the decisions the committee has made

**ulcer** *n.* **1.** a break in an epithelial surface. *See also* **DENDRITIC ULCER**. **2.** a break in the skin extending to all its layers, or a break in the mucous membrane lining the alimentary tract, that fails to heal and is often accompanied by inflammation. Of the many types of skin ulcer, the most common is the **venous** (or **hypostatic**) **ulcer** of the leg, known incorrectly as a **varicose ulcer**, which is caused by increased venous pressure and usually occurs in older women. *See also* **ARTERIAL ULCER**; **PRESSURE SORE**.

For ulcers of the alimentary tract, *see* **APHTHOUS ULCER**; **DUODENAL ULCER**; **GASTRIC ULCER**; **PEPTIC ULCER**; **STRESS ULCERS**.

**ulcerative colitis** inflammation and ulceration of the colon, initially starting in the rectum (*see* **PROCTITIS**) but ascending to include a part or the whole of the colon (*see* **COLITIS**). Its cause is unknown. Symptoms include abdominal pain, diarrhoea, and rectal bleeding. Acute severe colitis requires urgent in-patient admission for intravenous steroids. Patients who fail to respond to these should be treated with second-line agents (such as infliximab or ciclosporin) or by surgical colectomy.

**ulcerative gingivitis** acute painful gingivitis with ulceration, in which the tissues of the gums are rapidly destroyed. Occurring mainly in debilitated patients, it is associated with anaerobic microorganisms (*see* **FUSOBACTERIUM**; **BACTEROIDES**) and is accompanied by an unpleasant odour. Treatment is with **\*metronidazole** and a careful and thorough regime of oral hygiene supplemented with oxidizing mouthwashes. In the past ulcerative gingivitis has been called **acute necrotizing ulcerative gingivitis** (ANUG), **Vincent stomatitis**, or **Vincent's angina**. A rare complication of severe ulcerative gingivitis is a **\*noma**.

**ule-** (**ulo-**) *combining form denoting* **1.** scars; scar tissue. **2.** the gums.

**ulipristal** *n.* a synthetic female sex hormone – a **\*progestogen** – used for **\*postcoital contraception**. Because it blocks the action of progesterone,

ulipristal is also taken orally to treat *\*fibroids*.

**ulna** *n.* the inner and longer bone of the forearm (see illustration). It articulates with the humerus and radius above and with the radius and indirectly with the wrist bones below. At its upper end is the *\*olecranon process* and *\*coronoid process*; at the lower end is a cone-shaped **styloid process**. —**ulnar** *adj.*

**Right ulna and radius (front view).**

**ulnar artery** a branch of the brachial artery arising at the elbow and running deep within the muscles of the medial side of the forearm. It passes into the palm of the hand, where it unites with the arch of the radial artery and gives off branches to the hand and fingers.

**ulnar nerve** one of the major nerves of the arm. It originates in the neck, from spinal roots of the last cervical and first thoracic divisions, and runs down the inner side of the upper arm to behind the elbow. In the forearm it supplies the muscles with motor nerves; lower down it divides into branches that supply the skin of the palm and fourth and fifth fingers.

**ultra-** *prefix denoting* **1.** beyond. **2.** an extreme degree (e.g. of large or small size).

**ultracentrifuge** *n.* a **\*centrifuge** that works at extremely high speeds of rotation: used for separating large molecules, such as proteins.

**ultradian** *adj.* denoting a biological rhythm or cycle that occurs more frequently than once in 24 hours. *Compare* **CIRCADIAN**, **NYCTOHEMERAL**.

**ultrafiltration** *n.* filtration under pressure. In the kidney, blood is subjected to ultrafiltration to remove the unwanted water, urea, and other waste material that goes to make up urine.

**ultramicroscope** *n.* a microscope for examining particles suspended in a gas or liquid under intense illumination from one side. Light is scattered or reflected from the particles, which can be seen through the eyepiece as bright objects against a dark background.

**ultramicrotome** *n.* an instrument for cutting extremely thin sections of tissue (not more than 0.1  $\mu\text{m}$  thick) for electron microscopy. *See also* **MICROTOME**.

**ultrasonics** *n.* the study of the uses and properties of sound waves of very high frequency (*see* **ULTRASOUND**). — **ultrasonic** *adj.*

**ultrasonography (sonography)** *n.* the use of **\*ultrasound** to produce images of structures in the human body. The ultrasound probe sends out a short pulse of high-frequency sound and detects the reflected waves (echoes) occurring at interfaces within the organs. The direction of the pulse can then be moved across the area of interest with each pulse to build up a complete image. Scans may produce a single stationary image similar to a photograph (static) or multiple sequential images similar to a video (**\*real-time imaging**). The ultrasound waves are transmitted from – and echoes detected by – piezoelectric crystals contained within the scanning probe (*see* **TRANSDUCER**). As far as is known, there are no significant adverse effects

from the use of ultrasound at diagnostic energies. Ultrasound waves are blocked by gas, as in the lungs and bowel, which can obscure underlying structures. The detail seen increases with the frequency of the ultrasound but the depth of penetration decreases. Ultrasonography is extensively used in obstetrics, including the diagnosis of pregnancy, assessment of gestational age, diagnosis of *\*malpresentations*, ectopic pregnancies, and *\*hydatidiform moles*, and detection of structural fetal abnormalities (*see also* **TRANSVAGINAL ULTRASONOGRAPHY**). It is also used to examine the abdominal organs, urinary tract, blood vessels, muscles, and tendons. More specialized techniques include *\*echocardiography*, *\*transrectal ultrasonography* (TRUS), **intraoperative ultrasound** (IOUS), and endoscopic ultrasound examinations. *See also* **DOPPLER ULTRASOUND**.

**ultrasound (ultrasonic waves)** *n.* sound waves of high frequency (above 20 kHz), inaudible to the human ear. Ultrasound in the range 2–20 MHz can be used to produce images of the interior of the human body as the waves reflect off structures back to the probe (*see* **ULTRASONOGRAPHY**). Ultrasound waves have the advantage over X-rays of not being ionizing and are therefore much less harmful, particularly at energy levels used for diagnosis. The vibratory effect of ultrasound can also be used to break up stones in the body (*see* **LITHOTRIPSY**) and in the treatment of rheumatic conditions and cataract (*see* **PHACOEMULSIFICATION**). Ultrasonic instruments are used in dentistry to remove *\*calculus* from the surfaces of teeth and to remove debris from the root canals of teeth in *\*root canal treatment*. **High-intensity focused ultrasound** (*see* **HIFU**) can be used to destroy tissue, such as tumours. **Keepsake ultrasound** is the provision of ultrasound images of a fetus to the parents for nonmedical purposes; it is said by its proponents to help with bonding and to strengthen relationships in the family. *See also* **ENDOSCOPIC ULTRASOUND**.

**ultrasound marker** the appearance, on *\*ultrasonography* of a pregnant woman, of a feature suggesting an abnormality in the fetus. Such markers can be classified as major fetal structural abnormalities or minor ultrasound features called **soft markers**. The latter are usually transient and may resolve spontaneously, but they may indicate the risk of a serious

chromosomal abnormality in the fetus. An example is increased nuchal translucency (*see* [NUCHAL TRANSLUCENCY SCANNING](#)).

**ultraviolet rays** invisible short-wavelength radiation beyond the violet end of the visible spectrum. Sunlight contains ultraviolet rays, which are responsible for the production of both suntan and – on overexposure – *\*sunburn*. The dust and gases of the earth's atmosphere absorb most of the ultraviolet radiation in sunlight (*see* [OZONE](#)). If this did not happen, the intense ultraviolet radiation from the sun would be lethal to living organisms.

**umbilical cord** the strand of tissue connecting the fetus to the placenta. It contains two arteries that carry blood to the placenta and one vein that returns it to the fetus. It also contains remnants of the *\*allantois* and *\*yolk sac* and becomes ensheathed by the *\*amnion*.

**umbilical cord blood banked stem cells** haemopoietic *\*stem cells* collected from umbilical cord blood donated at birth, which can be stored indefinitely and used if a sibling or any other blood-compatible baby develops an illness (such as leukaemia) that could only be treated by cord-blood stem-cell transplantation. This facility is now available in the UK and the USA.

**umbilical granuloma** an overgrowth of tissue during the healing process of the umbilicus (belly button). It is a moist fleshy red lump of tissue seen in some babies in the first few weeks of life after the umbilical cord remnant has dried and fallen off. It can sometimes be seen in adults after navel piercings. If left untreated, the granuloma can take months to resolve.

**umbilical hernia** *see* [EXOMPHALOS](#).

**umbilicus (omphalus)** *n.* the navel: a circular depression in the centre of the abdomen marking the site of attachment of the *\*umbilical cord* in the fetus. — **umbilical** *adj.*

**umbo** *n.* a projecting centre of a round surface, especially the projection of the inner surface of the eardrum to which the malleus is attached.

**uncertainty** *n.* the situation in which no diagnostic conclusion can (yet) be reached but the patient remains ill. Professionals vary in their ability to cope with this uncertainty: the best clinical practice is to accept the lack of clarity,

to continue to support the patient, and to use the situation creatively in his or her **\*best interest** in the interim.

**unciform bone** *see* **HAMATE BONE**.

**uncinate fits** a form of temporal lobe **\*epilepsy** in which hallucinations of taste and smell and inappropriate chewing movements are prominent features.

**unconjugated oestriol (uE<sub>3</sub>)** a product of the placenta, levels of which are reduced in pregnancies affected by Down's syndrome. It is one of the markers used in **\*prenatal screening** tests (*see* **TRIPLE TEST**).

**unconscious** *adj.* **1.** in a state of unconsciousness. **2.** describing those mental processes of which a person is not aware. **3.** (in psychoanalysis) denoting the part of the mind that includes memories, motives, and intentions that are not accessible to awareness and cannot be made conscious without overcoming resistances. In addition to the individual unconscious, Jung postulated the existence of a **\*collective unconscious**. *Compare* **SUBCONSCIOUS**.

**unconsciousness** *n.* a condition of being unaware of one's surroundings, as in sleep, or of being unresponsive to stimulation. An unnatural state of unconsciousness may be caused by factors that produce reduced brain activity, such as lack of oxygen, **\*head** injuries, poisoning, blood loss, and many diseases, or it may be brought about deliberately during general **\*anaesthesia**. *See also* **COMA**.

**uncus** *n.* any hook-shaped structure, especially a projection of the lower surface of the cerebral hemisphere that is composed of cortex belonging to the temporal lobe.

**undecenoic acid** an antifungal agent, applied to the skin for the treatment of athlete's foot.

**undine** *n.* a small rounded container, usually made of glass, for solutions used to wash out the eye. It has a small neck for filling and a long tapering spout with a narrow outlet to deliver a fine stream of fluid to the eye.

**undulant fever** *see* **BRUCELLOSIS**.

**ungual** *adj.* relating to the fingernails or toenails (ungues).

**unguentum** *n.* (in pharmacy) an ointment.

**unguis** *n.* a fingernail or toenail. *See* [NAIL](#).

**uni-** *combining form* denoting one.

**unicellular** *adj.* describing organisms or tissues that consist of a single cell. Unicellular organisms include the protozoans, most bacteria, and some fungi.

**unilateral** *adj.* (in anatomy) relating to or affecting one side of the body or one side of an organ or other part.

**union** *n.* (in a fractured bone) the successful result of healing of a fracture, in which the previously separated bone ends have become firmly united by newly formed bone. Failure of union (**non-union**) may result if the bone ends are not immobilized or from infection or bone diseases. *Compare* [MALUNION](#).

**Union international contre le cancer** *see* [UICC](#).

**unipolar** *adj.* (in neurology) describing a neuron that has one main process extending from the cell body. *Compare* [BIPOLAR](#).

**universal credit** a welfare benefit in the UK that is due to replace six mean-tested benefits and tax credits, with the intention of simplifying the benefits system and strengthening incentives to work. Rollout of universal credit began in 2013 and is ongoing with a forecast completion date of 2022. It has been criticized by some for its focus on the centralization of administration, particularly the requirement for most claimants to file claims online rather than face-to-face, as well as for delays to the rollout, which was originally supposed to be complete in 2017.

**unsaturated fatty acid** a [\\*fatty acid](#) in which one (**monounsaturated**) or many (**polyunsaturated**) of the carbon atoms are linked by double bonds that are easily split in chemical reactions so that other substances can connect to them. These fats occur in fish and plant-derived foods, and a diet high in unsaturated fats is associated with low serum cholesterol levels. *Compare* [SATURATED FATTY ACID](#).

**uPM3** *see* **PCA3**.

**UPPP** *n. see* **UVULOPALATOPHARYNGOPLASTY**.

**urachus** *n.* the remains of the cavity of the **\*allantois**, which usually disappears during embryonic development. In the adult it normally exists in the form of a solid fibrous cord connecting the bladder with the umbilicus, but it may persist abnormally as a patent duct. — **urachal** *adj.*

**uracil** *n.* one of the nitrogen-containing bases (*see* **PYRIMIDINE**) occurring in the nucleic acid RNA.

**uraemia** *n.* the presence of excessive amounts of urea and other nitrogenous waste compounds in the blood. These waste products are normally excreted by the kidneys in urine; their accumulation in the blood occurs in kidney failure and results in nausea, vomiting, lethargy, drowsiness, and eventually (if untreated) death. Treatment may require dialysis or transplantation. — **uraemic** *adj.*

**uran-** (**urano-**) *combining form denoting* the palate.

**urataemia** *n.* the presence in the blood of sodium urate and other urates, formed by the reaction of uric acid with bases. In **\*gout**, urataemia leads to deposition of urates in various parts of the body.

**uraturia** *n.* the presence in the urine of urates (salts of uric acid). Abnormally high concentrations of urates in urine occur in **\*gout**.

**urea** *n.* the main breakdown product of protein metabolism. It is the chemical form in which unrequired nitrogen is excreted by the body in the urine. Urea is formed in the liver from ammonia and carbon dioxide in a series of enzyme-mediated reactions (the **urea cycle**). Accumulation of urea in the bloodstream together with other nitrogenous compounds is due to kidney failure and gives rise to **\*uraemia**.

**urease** *n.* an enzyme that catalyses the hydrolysis of urea to ammonia and carbon dioxide.

**urecchysis** *n.* the escape of uric acid from the blood into spaces in the connective tissue.

**ureter** *n.* either of a pair of tubes, 25–30 cm long, that conduct urine from the pelvis of kidneys to the bladder. The walls of the ureters contain thick layers of smooth muscle, which contract to force urine into the bladder, between an outer fibrous coat and an inner mucous layer. —**ureteral**, **ureteric** *adj.*

**ureter-** (**uretero-**) *combining form denoting* the ureter(s). Example: **ureterovaginal** (relating to the ureters and vagina).

**ureterectomy** *n.* surgical removal of a ureter. This usually includes removal of the associated kidney as well (see **NEPHROURETERECTOMY**). If previous nephrectomy has been performed to remove a kidney that has been destroyed by *\*vesicoureteric reflux* or because of a tumour of the renal pelvis, subsequent ureterectomy may be necessary to cure reflux into the stump of the ureter or tumour in the ureter, respectively. Less commonly, in certain cases an isolated segment of a ureter may be removed for a short ureteric stricture or ureteric tumour.

**ureteritis** *n.* inflammation of the ureter. This usually occurs in association with inflammation of the bladder (see **CYSTITIS**), particularly if caused by *\*vesicoureteric reflux*. Tuberculosis of the urinary tract can also cause ureteritis, which progresses to *\*stricture* formation.

**ureterocele** *n.* a cystic swelling of the wall of the ureter at the point where it passes into the bladder. It may be associated with stenosis of the opening of the ureter and it may cause impaired drainage of the kidney with dilatation of the ureter and *\*hydronephrosis*. Ureterocele may also be complicated by infection, prolapse, and bladder outflow obstruction.

**ureteroenterostomy** *n.* an artificial communication, surgically created, between the ureter and the bowel. In this form of urinary diversion, which bypasses the bladder, the ureters are attached to the sigmoid colon (see **URETEROSIGMOIDOSTOMY**).

**ureterolithotomy** *n.* the surgical removal of a stone from the ureter (see **CALCULUS**). The operative approach depends upon the position of the stone within the ureter. If the stone occupies the lower portion of the ureter, it may be extracted by *\*cystoscopy*, thus avoiding open surgery.

**ureterolysis** *n.* an operation to free one or both ureters from surrounding abnormal adhesions or fibrous tissue (e.g. retroperitoneal fibrosis). It may also be performed prior to pelvic surgery to avoid intraoperative ureteric injury.

**ureteroneocystostomy** *n.* the surgical reimplantation of a ureter into the bladder. This is most commonly performed to cure **\*vesicoureteric reflux**. The ureter is reimplanted obliquely through the bladder wall to act as a valve and prevent subsequent reflux. The operation is usually referred to as an **antireflux procedure** or simply **reimplantation of ureter**.

**ureteronephrectomy** *n.* *see* **NEPHROURETERECTOMY**.

**ureteroplasty** *n.* surgical reconstruction of the ureter using a segment of bowel or a tube of bladder (*see* **BOARI FLAP**). This is necessary if a segment of ureter is damaged by disease or injury.

**ureteropyelonephritis** *n.* inflammation involving both the ureter and the renal pelvis (*see* **URETERITIS**; **PYELITIS**).

**ureteroscope** *n.* a rigid or flexible instrument that can be passed into the ureter and up into the pelvis of the kidney. It is most commonly used to visualize a stone in the ureter and remove it safely under direct vision with a stone basket or forceps. Larger stones need to be fragmented before removal with an ultrasound probe, lithoclast, or lasers. Ureteroscopy can also be used to visualize tumours in the ureter, and a flexible ureteroscope can be passed into the kidney to visualize and treat tumours or stones.

**ureteroscopy** *n.* the inspection of the lumen of the ureter with a **\*ureteroscope**.

**ureterosigmoidostomy** *n.* the operation of implanting the ureters into the sigmoid colon (*see* **URETEROENTEROSTOMY**). This method of permanent urinary diversion may be used after **\*cystectomy** or to bypass a diseased or damaged bladder. The urine is passed together with the faeces, and continence depends upon a normal anal sphincter. The main advantage of this form of diversion is the avoidance of an external opening and appliance to collect the urine; the disadvantages include possible kidney infection,

acidosis, and long-term development of cancer of the colon 20–30 years after the procedure.

**ureterostomy** *n.* the surgical creation of an external opening from the ureter. This usually involves bringing the ureter to the skin surface through the abdominal wall so that the urine can drain into a suitable appliance (**cutaneous ureterostomy**). The divided dilated ureter can be brought through the skin to form a spout, but ureters of a normal size need to be implanted into a segment of bowel used for this purpose (see **ILEAL CONDUIT**) to avoid narrowing and obstruction.

**ureterotomy** *n.* surgical incision into the ureter. The commonest reason for performing this is to allow removal of a stone (see **URETEROLITHOTOMY**).

**urethr-** (**urethro-**) *combining form denoting the urethra.*

**urethra** *n.* the tube that conducts urine from the bladder to the exterior. The female urethra is quite short (about 3.5 cm) and opens just within the **\*vulva**, between the clitoris and vagina. The male urethra is longer (about 20 cm) and runs through the penis. As well as urine, it receives the secretions of the male accessory sex glands (prostate and Cowper's glands and seminal vesicles) and spermatozoa from the **\*vas deferens**; thus it also serves as the ejaculatory duct.

**urethritis** *n.* inflammation of the urethra. This may be due to gonorrhoea (**specific urethritis**), another sexually transmitted infection such as infection with **\*Chlamydia trachomatis** (**nongonococcal urethritis, NGU**; or **nonspecific urethritis, NSU**), or to the presence of a catheter in the urethra. The symptoms are those of urethral discharge with painful or difficult urination (**\*dysuria**). Treatment of urethritis due to infection is by administration of appropriate antibiotics after the causative organisms have been isolated from the discharge. Untreated or severe urethritis results in a urethral **\*stricture**.

**urethrocele** *n.* prolapse of the urethra into the vaginal wall, which may be small and does not cause any symptoms or may cause a bulbous swelling to appear in the vagina, particularly on straining. The condition is associated with previous childbirth. Treatment is not required for small urethroceles,

otherwise surgical repair of the lax tissues gives better support to the urethra and the vaginal wall.

**urethrography** *n.* a technique for X-ray examination of the urethra. \***Contrast medium** is introduced into the urethra so that its outline and any narrowing or other abnormalities may be observed in X-ray images (**urethrograms**). In **ascending (or antegrade) urethrography** contrast medium is injected up the urethra using a special syringe and penile clamp. In **descending urethrography** (or **micturating cystourethrography, MCU**), X-rays of the urethra can be taken during the passing of water-soluble contrast material previously instilled into the bladder in order to demonstrate abnormal urethral narrowing or disorders of micturition, particularly bladder emptying.

**urethroplasty** *n.* surgical repair of the urethra, especially a urethral \***stricture**. **Anastomotic urethroplasty** is used for a short stricture: the area of narrowing is excised and the two adjacent ends are then joined directly to each other. A **substitution urethroplasty** entails the insertion of a flap or patch of skin from the scrotum or a buccal mucosal graft into the urethra at the site of the stricture, which is laid widely open. The operation can be performed in one stage, although two stages are usual in the reconstruction of a posterior urethral stricture (see **URETHROSTOMY**). **Transpubic urethroplasty** is performed to repair a ruptured posterior urethra following a fractured pelvis. Access to the damaged urethra is achieved by partial removal of the pubic bone.

**urethrorrhaphy** *n.* surgical restoration of the continuity of the urethra. This may be required following laceration of the urethra.

**urethrorrhoea** *n.* a discharge from the urethra. This is a symptom of \***urethritis**.

**urethroscope** *n.* an \***endoscope**, consisting of a fine tube fitted with a light and lenses, for examination of the interior of the male urethra, including the prostate region. —**urethroscopy** *n.*

**urethrostenosis** *n.* a \***stricture** of the urethra.

**urethrostomy** *n.* the operation of creating an opening of the urethra in the perineum in men. This can be permanent, to bypass a severe \***stricture** of the

urethra in the penis, or it can form the first stage of an operation to cure a stricture of the posterior section of the urethra (**\*urethroplasty**).

**urethrotomy** *n.* the operation of cutting a short **\*stricture** in the urethra. It is performed under direct vision with a **urethrotome**. This instrument, a type of **\*endoscope**, consists of a sheath down which is passed a fine knife, which is operated by the surgeon viewing the stricture down an illuminated telescope.

**urge incontinence** *see* INCONTINENCE.

**urgency** *n.* a **\*lower urinary tract symptom** in which there is a compelling desire to pass urine immediately; this may or may not be associated with incontinence (urge incontinence).

**urgent treatment centre** *see* NHS WALK-IN CENTRE.

**-uria** *combining form denoting* **1.** a condition of urine or urination. Example: **polyuria** (passage of excess urine). **2.** the presence of a specified substance in the urine. Example: **haematuria** (blood in).

**uric acid** a nitrogen-containing organic acid that is the end-product of nucleic acid metabolism and is a component of the urine. Crystals of uric acid are deposited in the joints of people suffering from **\*gout**.

**uricosuric drug** a drug, such as **\*probenecid** or **\*sulfipyrazone**, that increases the amount of **\*uric acid** excreted in the urine.

**uridine** *n.* a compound containing uracil and the sugar ribose. *See also* NUCLEOSIDE.

**uridrosis** *n.* the presence of excessive amounts of urea in the sweat; when the sweat dries, a white flaky deposit of urea may remain on the skin. The phenomenon occurs in **\*uraemia**.

**urin-** (**urino-**, **uro-**) *combining form denoting* urine or the urinary system.

**urinalysis** *n.* the analysis of **\*urine**, using physical, chemical, and microscopical tests, to determine the proportions of its normal constituents and to detect alcohol, drugs, sugar, blood, protein, or other abnormal constituents.

**urinary bladder** *see* BLADDER.

**urinary diversion** any of various techniques for the collection and diversion of urine away from its usual excretory channels, after the bladder has been removed (see **CYSTECTOMY**) or bypassed. These techniques include **\*ureterosigmoidostomy** and the construction of an **\*ileal conduit**. **Continent diversion**, usually after cystectomy, may be achieved by constructing a reservoir or pouch from a section of small or large intestine or a combination of both. This can be emptied by catheterization via a small **\*stoma** and has the advantage over an ileal conduit in not requiring a urinary drainage bag.

**urinary tract** the entire system of ducts and channels that conduct urine from the kidneys to the exterior. It includes the ureters, the bladder, and the urethra.

**urination (micturition)** *n.* the periodic discharge of urine from the bladder through the urethra. It is initiated by voluntary relaxation of the sphincter muscle below the bladder and maintained by reflex contraction of the muscles of the bladder wall.

**urine** *n.* the fluid excreted by the kidneys, which contains many of the body's waste products. It is the major route by which the end-products of nitrogen metabolism – **\*urea**, **\*uric acid**, and **\*creatinine** – are excreted. The other major constituent is sodium chloride. Over 100 other substances are usually present, but only in trace amounts. Analysis of urine (see **URINALYSIS**) is commonly used in the diagnosis of diseases (for example, there are high levels of urinary glucose in diabetes and of ketone bodies in ketonuria); immunological analysis of urine is the basis of most **\*pregnancy tests**. See **Appendix 3**.

**urine output** see **VITAL SIGNS**.

**uriniferous tubule** see **RENAL TUBULE**.

**urinogenital (urogenital)** *adj.* of or relating to the organs and tissues concerned with both excretion and reproduction, which are anatomically closely associated.

**urinogenital sinus** the duct in the embryo that receives the ureter and the Wolffian and Müllerian ducts and opens to the exterior. The innermost portion forms most of the bladder and the remainder forms the urethra with its associated glands. Part of it may also contribute towards the vagina.

**urinometer** *n.* a hydrometer for measuring the specific gravity of urine.

**urobilinogen** *n.* a colourless product of the reduction of the **\*bile** pigment bilirubin. Urobilinogen is formed from bilirubin in the intestine by bacterial action. Part of it is reabsorbed and returned to the liver; part of it is excreted in the faeces (a trace may also appear in the urine). When exposed to air, urobilinogen is oxidized to a brown pigment, **urobilin**.

**urocele** *n.* a cystic swelling in the scrotum, containing urine that has escaped from the urethra. This may arise following urethral injury. Immediate treatment is to divert the urine by suprapubic **\*cystotomy**, local drainage of the swelling, and antibiotic administration.

**urochesia** *n.* the passage of urine through the rectum. This may follow a penetrating injury involving both the lower urinary tract and the bowel.

**urodynamics** *n.* the investigation of the function of the lower urinary tract. It involves the recording of pressures within the bladder during filling and voiding by the use of special equipment that can also record urethral sphincter pressures. Simultaneously, abdominal pressure is usually recorded with a catheter in the rectum, vagina, or ileal conduit. It is an essential investigation in the study of urinary incontinence. In some men, urodynamic studies are necessary to determine if their **\*lower urinary tract symptoms** are caused by bladder outlet obstruction or **\*detrusor** instability.

**urofollitropin** *n.* *see* **HUMAN MENOPAUSAL GONADOTROPHINS**.

**urogenital** *adj.* *see* **URINOGENITAL**.

**urogram** *n.* an X-ray of the urinary tract or any part of it. It is usually obtained after the intravenous injection of a radiopaque substance, as in **\*intravenous urography**, but the contrast medium can also be introduced percutaneously or, in the case of the bladder, transurethrally (for a **cystogram**; *see* **CYSTOGRAPHY**).

**urography** *n.* radiological examination of the urinary tract. This traditionally involves the injection of radiopaque contrast material and observation of the flow with X-rays (*see* **CYSTOGRAPHY**; **INTRAVENOUS UROGRAPHY**; **PYELOGRAPHY**; **URETHROGRAPHY**). In **CT urography** contrast is injected in the vein and CT of the urinary tract acquired when the contrast arrives

there. The technique is used in *\*haematuria* to exclude the presence of a tumour within the renal pelvis, ureter, or bladder. **MR urography** is used to visualize the urinary tract by *\*magnetic resonance imaging*. An MR contrast medium is injected into a peripheral vein and passes to the kidneys and ureters, when images of thin sections can be obtained. These can be manipulated by computer to reveal the anatomy and any pathology (e.g. stones, tumours) of the imaged structures. MR urography is particularly useful in children.

**urokinase** *n.* an enzyme produced in the kidney and also present in blood and urine that is capable of breaking up blood clots. It activates *\*plasminogen* directly to plasmin, which dissolves blood clots (*see* **PLASMINOGEN ACTIVATORS**). Urokinase is administered to treat deep vein thrombosis and pulmonary embolism.

**urolith** *n.* a stone in the urinary tract. *See* **CALCULUS**.

**urology** *n.* the branch of medicine concerned with the study and treatment of diseases of the urinary tract. —**urological** *adj.* —**urologist** *n.*

**uroporphyrin** *n.* a porphyrin that plays an intermediate role in the synthesis of *\*protoporphyrin IX*. It is excreted in significant amounts in the urine in porphyria.

**ursodeoxycholic acid** a drug (a *\*bile acid*) used to dissolve cholesterol gallstones and to treat primary biliary cirrhosis. Side-effects are infrequent but include diarrhoea and indigestion.

**urticaria (nettle rash, hives)** *n.* an itchy rash resulting partly from the release of *\*histamine* by *\*mast cells*. This causes either short-lived itchy *\*weals*, deeper swellings (angio-oedema), or both. Individual weals typically appear rapidly and resolve spontaneously within hours. **Acute urticaria** is common and represents an immediate response to such allergens as seafood or nuts; it has been linked with upper respiratory tract infections, although many cases remain unexplained. **Chronic urticaria** is not an allergic condition and may persist for years. **Angio-oedema** occurs when the weals involve the deeper levels of the skin, resulting in swelling of the lips, eyes, or tongue, which may constitute a medical emergency. Urticaria can be treated by taking antihistamines regularly, but sometimes immunosuppressant

treatment is needed, especially in autoimmune subtypes. **Cholinergic urticaria** is a condition in which very small weals are brought on by heat, exercise, or emotion; treatment is with antihistamines, but other drugs, including danazol, may be used for severe cases.

**usual interstitial pneumonia (UIP)** *see* **INTERSTITIAL PNEUMONIA; IDIOPATHIC PULMONARY FIBROSIS**.

**uter- (utero-)** *combining form denoting the uterus*. Examples: **uterocervical** (relating to the cervix (neck) of the uterus); **uterovaginal** (relating to the uterus and vagina); **uterovesical** (relating to the uterus and bladder).

**uterine** *adj.* of or relating to the uterus.

**uterine artery embolization** a method of embolizing the uterine artery under radiodiagnostic control (*see* **EMBOLIZATION**). It has been successful in controlling postpartum haemorrhage and can also be used in treating fibroids, correcting arterial or venous malformations of the genital tract, and terminating abdominal and cervical pregnancies.

**uteroplacental insufficiency** the most common cause of **\*intrauterine growth restriction**, due to abnormalities in placental development and **\*trophoblast invasion**. The exact cause may be unknown or due to a number of recognizable causes, e.g. pre-eclampsia, inherited **\*thrombophilias** causing placental infarction or thrombosis, and systemic lupus erythematosus. It may lead to stillbirth.

**uterosacral suspension (vaginal vault suspension)** suturing the uterosacral ligament (attaching the cervix to the sacrum) to the apex of the vagina, which is performed vaginally, laparoscopically, or abdominally to prevent or treat **\*vault prolapse** following hysterectomy.

**uterus (womb)** *n.* the part of the female reproductive tract that is specialized to allow the embryo to become implanted in its inner wall and to nourish the growing fetus from the maternal blood. The nonpregnant uterus is a pear-shaped organ, about 7.5 cm long. It is suspended in the pelvic cavity by means of peritoneal folds (ligaments) and fibrous bands. The upper two-thirds of the uterus (body) is connected to the two **\*Fallopian tubes**, and the narrower lower third (**\*cervix**, or neck) projects at its lower end into the

vagina. The uterus has an inner mucous lining (**\*endometrium**) and a thick wall of smooth muscle (**\*myometrium**). During childbirth the myometrium undergoes strong contractions to expel the fetus through the cervix and vagina. In the absence of pregnancy the endometrium undergoes periodic development and degeneration (*see* **MENSTRUAL CYCLE**). —**uterine** *adj.*

**uterus didelphys (double uterus)** a congenital condition resulting from the incomplete midline fusion of the two **\*Müllerian ducts** during early embryonic development. The usual result is a double uterus with one or two cervices and a single vagina. Complete failure of fusion results in a double uterus with double cervices and two separate vaginae.

**utilitarianism** *n.* the consequentialist theory that maximizing utility (the greatest good or happiness or preferences of the greatest number) has priority over other ethical considerations. Developed in the 19th century by the British philosophers Jeremy Bentham and John Stuart Mill, and thereafter influential in social planning, unadulterated utilitarian policies may threaten the rights (and duties) of individuals and therefore need to be balanced by considerations of **\*deontology**. —**utilitarian** *adj.*

**utilization behaviour** the correct use of an object at an inappropriate time or in an inappropriate situation: such behaviour is indicative of frontal lobe lesions.

**utricle (utriculus)** *n.* **1.** the larger of the two membranous sacs within the vestibule of the ear: it forms part of the membranous **\*labyrinth**. It is filled with fluid (endolymph) and contains a **\*macula**. This responds to gravity and relays information to the brain about the position of the head. **2.** a small sac (the **prostatic utricle**) extending out of the urethra of the male into the substance of the prostate gland.

**uvea (uveal tract)** *n.* the vascular pigmented layer of the eye, which lies beneath the outer layer (sclera). It consists of the **\*choroid**, **\*ciliary body**, and **\*iris**. —**uveal** *adj.*

**uveal tract** *see* **UVEA**.

**uveitis** *n.* inflammation of any part of the uveal tract of the eye, either the iris (**iritis**), ciliary body (**cyclitis**), or choroid (**choroiditis**). Inflammation confined to the iris and ciliary body, which are commonly inflamed together,

is called **anterior uveitis** or **iridocyclitis** (see also **FUCHS' HETEROCHROMIC CYCLITIS**); that confined to the choroid is termed **posterior uveitis**. In general, the causes of anterior and posterior uveitis are different; anterior uveitis (unlike choroiditis) is usually painful, with clusters of inflammatory cells (keratic precipitates) adhering to the inner surface of the cornea. All types may lead to visual impairment, and uveitis is an important cause of blindness. In most cases the disease appears to originate in the uveal tract itself, but it may occur secondarily to disease of other parts of the eye, particularly of the cornea and sclera.

Treatment consists of the use of drugs that suppress the inflammation, combined with measures to relieve the discomfort and more specific drug treatment if a specific cause of the uveitis is found. The drugs may be given as drops, injections, or tablets, often in combination.

**uveoparotitis (uveoparotid fever)** *n.* inflammation of the iris, ciliary body, and choroid regions of the eye (the uvea) and swelling of the parotid salivary gland: one of the manifestations of the chronic disease **\*sarcoidosis**.

**UVPP** see **UVULOPALATOPHARYNGOPLASTY**.

**uvula** *n.* a small soft extension of the soft palate that hangs from the roof of the mouth above the root of the tongue. It is composed of muscle, connective tissue, and mucous membrane.

**uvulectomy (staphylectomy)** *n.* surgical removal of the uvula.

**uvulitis** *n.* inflammation of the uvula.

**uvulopalatopharyngoplasty (uvulopharyngopalatoplasty, UPPP, uvulovelopharyngoplasty, UVPP)** *n.* a surgical operation to remove the uvula, part of the soft palate, and the tonsils in the treatment of snoring and **\*obstructive sleep apnoea**.

**vaccination** *n.* a means of producing immunity to a disease by using a **\*vaccine**, or a special preparation of antigenic material, to stimulate the formation of appropriate antibodies. The name was applied originally only to treatment with vaccinia (cowpox) virus, which gives protection not only against cowpox itself but also against the related smallpox. However, it is now used synonymously with **inoculation** as a method of **\*immunization** against any disease. Vaccination is often carried out in two or three stages, as separate doses are less likely to cause unpleasant side-effects. A vaccine is usually given by injection but may be introduced into the skin through light scratches; for some diseases (such as polio), oral vaccines are available.

**vaccine** *n.* a special preparation of antigenic material that can be used to stimulate the development of antibodies and thus confer active **\*immunity** against a specific disease or number of diseases. Many vaccines are produced by culturing bacteria or viruses under conditions that lead to a loss of their virulence but not of their antigenic nature. Examples of live but attenuated (weakened) organisms in vaccines are those against measles, mumps, and rubella (the MMR vaccine) and tuberculosis. Other vaccines consist of specially treated toxins (**\*toxoids**) or dead bacteria that are still antigenic. Precipitated toxoids are used against diphtheria and tetanus; dead organisms are used against cholera and typhoid. Extensive experimental study continues in the search for cancer vaccines, especially against melanoma and prostate cancer. See **IMMUNIZATION**.

**vaccinia** *n.* see **COWPOX**.

**vaccinoid** *adj.* resembling a local infection with vaccinia (cowpox) virus. A vaccinoid reaction is one of the possible results of vaccination against smallpox in individuals who already have partial immunity. The swelling,

reddening, and blistering are considerably less than the so-called primary reaction that occurs after the inoculation of a person with no immunity against smallpox.

**vacuole** *n.* a space within the cytoplasm of a cell, formed by infolding of the cell membrane, that contains material taken in by the cell. White blood cells form vacuoles when they surround and digest bacteria and other foreign material.

**vacuum aspiration** the removal by suction of the products of conception to terminate a pregnancy or evacuate the uterus following miscarriage. Carried out under local anaesthetic up to the 12th week of pregnancy, it uses a hand-held syringe (**manual vacuum aspiration, MVA**) or an electric pump (**electric vacuum aspiration, EVA**) to create suction.

**vacuum extractor** *see* VENTOUSE.

**VAD** *see* ventricular assist device.

**vagin-** (**vagino-**) *combining form denoting the vagina.*

**vagina** *n.* the lower part of the female reproductive tract: a muscular tube, lined with mucous membrane, connecting the cervix of the uterus to the exterior. It receives the erect penis during coitus: semen is ejaculated into the upper part of the vagina and from there the sperms must pass through the cervix and uterus in order to fertilize an ovum in the Fallopian tube. The wall of the vagina is sufficiently elastic to allow the passage of the newborn child. —**vaginal** *adj.*

**vaginal adenosis** the presence of glandular tissue in or under the vaginal epithelium that undergoes squamous **\*metaplasia**. It may be associated with intrauterine **\*diethylstilbestrol** exposure. *See also* **CLEAR-CELL CARCINOMA**.

**vaginal agenesis** congenital absence of part or all of the vagina. *See* **MAYER–ROKITANSKY–KÜSTER–HAUSER SYNDROME**.

**vaginectomy** *n.* surgical excision of the vagina in cases of vaginal cancer.

**vaginismus** *n.* painful spasm of the muscles surrounding the vagina, usually in response to the **\*vulva** or vagina being touched. Sexual intercourse may be

impossible, and the condition may be associated with fear of or aversion to coitus. Other causative factors include vaginal infection and atrophic *\*vaginitis*.

**vaginitis** *n.* inflammation of the vagina, which may be caused by infection (most commonly with *\*Trichomonas vaginalis*), dietary deficiency, or poor hygiene. There is often itching (*see* **PRURITUS**), increased vaginal discharge, and pain on passing urine. Vaginitis may indicate the presence of sexually transmitted disease. **Atrophic vaginitis** is postmenopausal thinning of the vagina caused by a reduction in the circulating levels of oestrogens. It is a common cause of vaginal dryness and postmenopausal bleeding.

**vaginoplasty (colpoplasty)** *n.* **1.** a tissue-grafting operation on the vagina. **2.** surgical reconstruction of the vagina, for example by using a loop of bowel brought through the *\*pouch* of Douglas.

**vaginosis** *n.* *see* **BACTERIAL VAGINOSIS**.

**vago-** *combining form denoting the vagus nerve.*

**vagotomy** *n.* the surgical cutting of any of the branches of the vagus nerve. This is usually performed to reduce secretion of acid and pepsin by the stomach in order to treat a peptic ulcer. **Truncal vagotomy** is the cutting of the main trunks of the vagus nerve; in **selective vagotomy** the branches of the nerve to the gall bladder and pancreas are left intact. **Highly selective** (or **proximal**) **vagotomy** is the cutting of the branches of the vagus nerve to the body of the stomach, leaving the branches to the outlet (pylorus) intact: this makes additional surgery to permit emptying of the stomach contents unnecessary. Following surgery, patients may experience **postvagotomy diarrhoea** after a meal (*compare* **DUMPING SYNDROME**). Since the introduction of proton-pump inhibitors for the treatment of peptic-ulcer disease, these operations are rarely performed.

**vagus nerve** the tenth *\*cranial nerve* (X), which supplies motor nerve fibres to the muscles of swallowing and parasympathetic fibres to the heart and organs of the chest cavity and abdomen. Sensory branches of the vagus carry impulses from the viscera and the sensation of taste from the mouth.

**VAIN (vaginal intraepithelial neoplasia)** preinvasive disease of the vagina, which has histological features and terminology similar to those of **\*cervical intraepithelial neoplasia** (CIN).

**valaciclovir** *n.* an antiviral drug taken by mouth to treat **\*herpes** infections. Like aciclovir, it is a **\*DNA polymerase inhibitor**. Trade name: **Valtrex**.

**valgus** *adj.* describing any deformity that displaces the distal end of a limb away from the midline. See **CLUB-FOOT**; **HALLUX VALGUS**; **KNOCK-KNEE**. Compare **VARUS**.

**validity** *n.* an indication of the extent to which a measure (e.g. a clinical sign or test) is a true indicator of what it purports to measure (e.g. disease). Reduced validity can arise if the test produces different results when conducted several times on the same person under identical conditions (i.e. **reduced reproducibility, reliability, or repeatability**). This may be because the same observer gets different results on successive occasions (**intraobserver error**) or because a series of different observers fail to obtain the same result (**interobserver error**). Such errors may arise because of a true difference in observation and/or interpretation or because of a preconceived notion (often unconscious) by the observer, which influences his or her behaviour.

**valine** *n.* an **\*essential amino acid**. See also **AMINO ACID**.

**vallecula** *n.* a furrow or depression in an organ or other part. On the undersurface of the cerebellum a vallecula separates the two hemispheres.

**valproic acid** see **SODIUM VALPROATE**.

**Valsalva manoeuvre** an attempt by a person to exhale forcibly with a closed glottis while pinching the nose and keeping the mouth closed, so that no air exits through the mouth or nose, as when straining during a bowel movement or lifting a heavy weight. The resulting increased pressure transplants air through the Eustachian tube, thus equalizing the negative pressure in the middle ear. This manoeuvre can often relieve the ear pain associated with flying, which is usually associated with changes in pressure particularly occurring during takeoff and landing. [A. M. Valsalva (1666–1723), Italian anatomist]

**valsartan** *n.* *see* [ANGIOTENSIN II ANTAGONIST](#).

**value judgment** a judgment of the worth, desirability, acceptability, or merit of something, as distinct from a claim about fact or neutral description.

**values** *pl. n.* (in ethics) the moral standards and principles that govern personal and institutional behaviour. They derive from asking first what makes a good clinician or caring institution and then identifying the attributes, behaviours, actions, and aims appropriate to this end. They include concepts such as truthfulness, kindness, tolerance, and [\\*integrity](#).

**valve** *n.* a structure found in some tubular organs or parts that restricts the flow of fluid within them to one direction only. Valves are important structures in the heart, veins, and lymphatic vessels. Such a valve consists of two or three [\\*cusps](#) fastened like pockets to the walls of the vessel. Blood flowing in the right direction flattens the cusps to the walls, but when flow is reversed the cusps become filled with blood or lymph and dilate to block the opening (see illustration). *See also* [AORTIC VALVE](#); [MITRAL VALVE](#); [PULMONARY VALVE](#); [TRICUSPID VALVE](#).

**Valve.** (A) Cut vein showing the two cusps of a valve; (B) action of a venous valve.

**valvoplasty** *n.* *see* VALVULOPLASTY.

**valvotomy (valvulotomy)** *n.* surgical cutting through a valve. The term is usually used to describe an operation to relieve obstruction caused by stenosed valves in the heart (*see* VALVULOPLASTY).

**valvula** *n.* (*pl.* **valvulae**) a small valve. The **valvulae conniventes** are circular folds of mucous membrane in the small intestine.

**valvulitis** *n.* inflammation of one or more valves, particularly the heart valves. This may be acute or chronic and is most often due to rheumatic fever

(see [ENDOCARDITIS](#)).

**valvuloplasty (valvoplasty)** *n.* therapeutic dilatation of a narrowed heart valve. This used to be done by open heart surgery, but is now performed using balloon catheters threaded into the heart via the venous or arterial system (**balloon valvuloplasty**). It is most commonly used for treatment of [\\*mitral stenosis](#) (using an Inoue balloon) or pulmonary stenosis, and sometimes used as a temporary measure for severe aortic stenosis.

**vancomycin** *n.* an antibiotic, derived from the bacterium *Streptomyces orientalis*, that is effective against most Gram-positive organisms (e.g. streptococci and staphylococci). Used for treating serious infections (including endocarditis and [\\*MRSA](#)) due to strains that are resistant to other antibiotics, it usually has a low toxicity but may cause deafness and blood disorders. Vancomycin and teicoplanin (a related drug with similar uses) are known as **glycopeptide antibiotics**.

**van den Bergh's test** a test to determine whether excess bilirubin in the blood is conjugated or unconjugated, and therefore whether jaundice in a patient is due to [\\*haemolysis](#) or to disease of the liver or bile duct. A sample of serum is mixed with sulphanilic acid, hydrochloric acid, and sodium nitrite. The immediate appearance of a violet colour is called a **direct reaction** and indicates that the jaundice is due to liver damage or obstruction of the bile duct. If the colour appears only when alcohol is added, this is an **indirect reaction** and points to haemolytic jaundice or a congenital unconjugated hyperbilirubinaemia (see [GILBERT'S SYNDROME](#)). [A. A. H. van den Bergh (1869–1943), Dutch physician]

**vanillylmandelic acid (VMA)** a metabolite of [\\*catecholamines](#) excreted in abnormal amounts in the urine in conditions of excess catecholamine production, such as [\\*phaeochromocytoma](#). The measurement of VMA levels in a 24-hour urine sample was formerly used as a screening test for this condition, but in the UK it has been largely superseded by the urinary metanephrine test (see [METANEPHRINE AND NORMETANEPHRINE](#)).

**vaporizer** *n.* a piece of equipment for producing an extremely fine mist of liquid droplets by forcing a jet of liquid through a narrow nozzle with a jet of air. Vaporizers are used to produce aerosols of various medications for use in inhalation therapy.

**Vaquez–Osler disease** *see* **POLYCYTHAEMIA VERA**. [L. H. Vaquez (1860–1936), French physician; Sir W. Osler (1849–1919), Canadian physician]

**ardenafil** *n. see* **SILDENAFIL**.

**variable** *n.* (in statistics) any characteristic (e.g. age, lifestyle, or habit) relating to an individual or group that can take a number of different values. **Categorical** or **qualitative variables** are descriptive characteristics, such as sex, race, or occupation; **quantitative variables** relate to a numerical scale and are subdivided into **discrete variables**, found only at fixed points (e.g. number of children), and **continuous variables**, found at any point on a scale (e.g. weight). *See also* **CONFOUNDING**; **CORRELATION**.

**variable positive airways pressure** *see* **BiPAP**.

**variance** *n. see* **STANDARD DEVIATION**.

**variant Creutzfeldt–Jakob disease (vCJD)** *see* **CREUTZFELDT–JAKOB DISEASE**.

**varicectomy** *n. see* **PHLEBECTOMY**.

**varicella** *n. see* **CHICKENPOX**.

**varices** *pl. n. see* **VARICOSE VEINS**.

**varicocele** *n.* a collection of dilated veins in the spermatic cord. Approximately 90%, affect the left side rather than the right. It usually produces no symptoms apart from occasional aching discomfort. In some cases varicocele is associated with testicular atrophy or a poor sperm count (*see* **OLIGOSPERMIA**) sufficient to cause infertility. Surgical correction or radiological embolization of the varicocele in such patients (**varicocelectomy**) usually results in a considerable improvement in the quality and motility of the sperm, but may or may not improve the number of pregnancies and live births thereafter. A renal cancer should be excluded in men presenting with a left-sided varicocele.

**varicose veins** veins that are distended, lengthened, and tortuous. The superficial veins (saphenous veins) of the legs are most commonly affected;

other sites include the oesophagus (*see* OESOPHAGEAL VARICES) and testes (*\*varicocele*). There is an inherited tendency to varicose veins but obstruction to blood flow is responsible in some cases. Complications including thrombosis, *\*phlebitis*, and haemorrhage may occur. Treatment includes elastic support and *\*sclerotherapy*, but *\*avulsion* (stripping), excision (*\*phlebectomy*), or *\*endovenous laser treatment* is required in some cases. Medical name: **varices**.

**varicotomy** *n.* incision into a varicose vein (*see* PHLEBECTOMY).

**varifocal lenses (progressive lenses)** lenses in which the power (*see* DIOPTRE) gradually changes from one prescription to the other and there is no dividing line on the lens between the different segments (*compare* MULTIFOCAL LENSES). The wearer can see clearly at any distance by raising or lowering the eyes.

**variola** *n.* *see* SMALLPOX.

**varioid 1.** *n.* a mild form of smallpox in people who have previously had smallpox or have been vaccinated against it. **2.** *adj.* resembling smallpox.

**varix** *n.* (*pl.* **varices**) a single *\*varicose vein*.

**varus** *adj.* describing any deformity that displaces the distal end of a limb towards the midline. *See* BOW-LEGS; CLUB-FOOT; HALLUX VARUS. *Compare* VALGUS.

**vas** *n.* (*pl.* **vasa**) a vessel or duct.

**vas- (vaso-)** *combining form denoting* **1.** vessels, especially blood vessels. **2.** the vas deferens.

**vasa efferentia** (*sing.* **vas efferens**) the many small tubes that conduct spermatozoa from the testis to the epididymis. They are derived from some of the excretory tubules of the *\*mesonephros*.

**vasa praevia** an uncommon but potentially disastrous complication of delivery, occurring in about 1 in 5000 deliveries, when unprotected fetal vessels run across the *\*lower uterine segment* and cervix in front of the presenting part of the fetus. It is associated with a velamentous insertion of

the cord (where the umbilical cord inserts directly into the membranes rather than the placenta) and in cases with normal cord insertion when the vessels run between the two lobes of a bilobed placenta. Vessels unsupported by placental tissue or the umbilical cord can tear when the cervix dilates or the membranes rupture, causing rapid fetal haemorrhage. Immediate Caesarean section to save the baby from **\*exsanguination** is indicated. Fetal mortality for cases not recognized before the onset of labour is very high; appropriate use of prenatal ultrasonography may prevent perinatal death.

**vasa vasorum** *pl. n.* the tiny arteries and veins that supply the walls of blood vessels.

**vascular** *adj.* relating to or supplied with blood vessels.

**vascular dementia** *see* **DEMENTIA**.

**vascular endothelial growth factor (VEGF)** a **\*growth factor** made by both normal cells and their abnormal or malignant counterparts to stimulate new blood vessel formation (*see* **ANGIOGENESIS**). It can be targeted by a family of drugs known as **\*angiogenesis inhibitors**, which include **\*bevacizumab**.

**vascularization** *n.* the development of blood vessels (usually capillaries) within a tissue.

**vascular system** *see* **CARDIOVASCULAR SYSTEM**.

**vasculitis (angiitis)** *n.* (*pl.* **vasculitides**) a patchy inflammation of the walls of blood vessels that leads to damage and thrombosis. It can occur on its own (**primary vasculitis**) or in association with other conditions, for example rheumatoid arthritis. All the organs in the body can be affected but common symptoms include skin rashes, arthritis, headaches, breathlessness, and kidney failure. Treatment with corticosteroids or immunosuppressant drugs may be beneficial.

**vasculogenesis** *n.* the formation of new blood vessels resulting from the directed migration and differentiation of angioblasts (precursor cells) into endothelial cells. The primitive vessels undergo further growth and remodelling by **\*angiogenesis**. Although largely confined to the embryo, vasculogenesis has recently been shown to occur in adults from circulating angioblasts.

**vas deferens** (*pl. vasa deferentia*) either of a pair of ducts that conduct spermatozoa from the **\*epididymis** to the **\*urethra** on ejaculation. It has a thick muscular wall the contraction of which assists in ejaculation.

**vasectomy** *n.* the surgical operation of severing the duct (vas deferens) connecting the testis to the seminal vesicle and urethra. Vasectomy of both ducts results in sterility and is an increasingly popular means of birth control. Vasectomy does not affect sexual desire or potency.

**vaso-** *combining form. see* **VAS-**.

**vasoactive** *adj.* affecting the diameter of blood vessels, especially arteries. Examples of vasoactive agents are emotion, pressure, carbon dioxide, and temperature. Some exert their effect directly, others via the **\*vasomotor centre** in the brain.

**vasoactive intestinal peptide** *see* **VIP**.

**vasoconstriction** *n.* a decrease in the diameter of blood vessels, especially arteries. This results from circulating vasoconstrictor hormones (e.g. **\*angiotensin I**) or activation of the **\*vasomotor centre** in the brain, which bring about contraction of the muscular walls of the arteries and hence an increase in blood pressure.

**vasoconstrictor** *n.* an agent that causes narrowing of the blood vessels and therefore a decrease in blood flow. Vasoconstrictor drugs are alpha agonists (*see* **SYMPATHOMIMETIC**): they are used to raise the blood pressure in disorders of the circulation, shock, or severe bleeding and to maintain blood pressure during surgery (e.g. **\*ephedrine**, **\*metaraminol**, **\*phenylephrine**). Some vasoconstrictors (e.g. ephedrine, **\*xylometazoline**) have a rapid effect when applied to mucous membranes and may be used to relieve nasal congestion. If the blood pressure rises too quickly headache and vomiting may occur. A vasoconstrictor is often added to local anaesthetic solutions used in dentistry to prolong their effectiveness.

**vasodilatation** *n.* an increase in the diameter of blood vessels, especially arteries. This results from local vasodilator hormones (e.g. **\*prostaglandins**) or activation of the **\*vasomotor centre** in the brain, which bring about relaxation of the arterial walls and a consequent lowering of blood pressure.

**vasodilator** *n.* a drug that causes widening of the blood vessels and therefore an increase in blood flow. Vasodilators are used to lower blood pressure in cases of hypertension. **Coronary vasodilators**, such as *\*glyceryl trinitrate*, increase the blood flow through the heart and are used to relieve and prevent angina. Large doses of coronary vasodilators cause such side-effects as flushing of the face, severe headache, and fainting. **Peripheral vasodilators** affect blood flow to the limbs; they include *\*alpha blockers* and some *\*calcium-channel blockers*. Certain of the latter (e.g. *\*nifedipine*) are used to treat conditions due to poor circulation, such as Raynaud's disease and intermittent claudication.

**vaso-epididymostomy** *n.* the operation of joining the vas deferens to the epididymis in a side-to-side manner in order to bypass an obstruction to the passage of sperm from the testis. The obstruction, which may be congenital or acquired, is usually present in the mid-portion or tail of the epididymis. Vaso-epididymostomy is therefore usually performed by anastomosing the head of the epididymis to a longitudinal incision in the lumen of the adjacent vas.

**vasography** *n.* X-ray imaging of the *\*vas deferens*. A contrast medium is injected either into the exposed vas deferens at surgery, using a fine needle, or into the ejaculatory duct (which discharges semen from the vesicle into the vas deferens) by inserting a catheter via an endoscope. The technique is used in the investigation of *\*azoospermia*, to look for blockages in the vas.

**vasoligation** *n.* the surgical tying of the vas deferens (the duct conveying sperm from the testis). This is performed to prevent infection spreading from the urinary tract and causing recurrent *\*epididymitis*. It is sometimes performed at the same time as *\*prostatectomy* to prevent the complication of epididymitis in the postoperative period.

**vasomotion** *n.* an increase or decrease in the diameter of blood vessels, particularly the arteries. *See* **VASOCONSTRICTION**; **VASODILATATION**.

**vasomotor** *adj.* controlling the muscular walls of blood vessels, especially arteries, and therefore their diameter.

**vasomotor centre** a collection of nerve cells in the medulla oblongata that receives information from sensory receptors in the circulatory system (*see*

**BARORECEPTOR**) and brings about reflex changes in the rate of the heartbeat and in the diameter of blood vessels, so that the blood pressure can be adjusted. The vasomotor centre also receives impulses from elsewhere in the brain, so that emotion (such as fear) may also influence the heart rate and blood pressure. The centre works through **\*vasomotor nerves** of the sympathetic and parasympathetic systems.

**vasomotor nerve** any nerve, usually belonging to the autonomic nervous system, that controls the circulation of blood through blood vessels by its action on the muscle fibres within their walls or its action on the heartbeat. The **\*vagus nerve** slows the heart and reduces its output, but sympathetic nerves increase the rate and output of the heart and increase blood pressure by causing the constriction of small blood vessels at the same time.

**vasomotor symptoms** subjective sensations experienced by women around the time of the **\*menopause**, often described as explosions of heat (hot flushes), mostly followed by profuse sweating and sometimes preceded by an undetermined sensation with waking at night. Objective signs are sudden reddening of the skin on the head, neck, and chest and profuse sweating. Physiological changes include peripheral vasodilatation, **\*tachycardia** with normal blood pressure, and raised skin temperature with normal body temperature.

**vasopressin (antidiuretic hormone, ADH)** *n.* a hormone, released by the pituitary gland, that increases the reabsorption of water by the kidney, thus preventing excessive loss of water from the body. Vasopressin also causes constriction of blood vessels. Synthetic vasopressin is administered to treat **\*diabetes insipidus** and to control bleeding from **\*oesophageal varices** by restricting arterial blood flow to the liver.

**vasopressor** *adj.* stimulating the contraction of blood vessels and therefore bringing about an increase in blood pressure.

**vasospasm** *n.* see **RAYNAUD'S DISEASE**.

**vasotomy** *n.* a surgical incision into the vas deferens (the duct conveying sperm from the testis). This is usually undertaken to allow catheterization of the vas and the injection of radiopaque contrast material for X-ray

examination (*see* [VASOGRAPHY](#)), to test for patency of the duct in patients with [\\*azoospermia](#).

**vasovagal** *adj.* relating to the action of impulses in the [\\*vagus nerve](#) on the circulation. The vagus reduces the rate at which the heart beats, and so lowers its output.

**vasovagal attack** excessive activity of the vagus nerve, causing slowing of the heart and a fall in blood pressure, which leads to fainting. *See* [SYNCOPE](#).

**vasovasostomy** *n.* the surgical operation of reanastomosing the vas deferens after previous vasectomy: the reversal of vasectomy, undertaken to restore fertility. It is ideally performed using microsurgical techniques. The success rates vary depending on the time between the vasectomy and its reversal.

**vasovesiculitis** *n.* inflammation of the [\\*seminal vesicles](#) and [\\*vas deferens](#). This usually occurs in association with [\\*prostatitis](#) and causes pain in the perineum, groin, and scrotum and a high temperature. On examination the vasa and seminal vesicles are thickened and tender. Treatment includes administration of antibiotics.

**vastus** *n.* any of three muscles (**vastus intermedius**, **vastus lateralis**, and **vastus medialis**) that form part of the [\\*quadriceps](#) muscle of the thigh.

**vault prolapse** prolapse of the [\\*fornix](#) (vault) of the vagina, which occurs at the time of hysterectomy (vaginal or abdominal) when the superior vaginal support mechanism is disrupted. It can be surgically corrected (*see* [SACROCOLPOPEXY](#); [UTEROSACRAL SUSPENSION](#)).

**VCE** *see* [VIDEO CAPSULE ENDOSCOPY](#).

**vCJD** *see* [CREUTZFELDT-JAKOB DISEASE](#).

**vectis** *n.* a small hollow instrument used to introduce fluid into the anterior chamber of the eye in order to raise its pressure to aid cataract extraction.

**vector** *n.* **1.** an animal, usually an insect or a tick, that transmits parasitic microorganisms – and therefore the diseases they cause – from person to person or from infected animals to human beings. Mosquitoes, for example, are vectors of malaria, filariasis, and yellow fever. **2.** an agent used to insert a foreign gene or DNA fragment into a bacterial or other cell in [\\*genetic](#)

**engineering** and **\*gene therapy**. Viruses, especially retroviruses, are often used as vectors: once inside the host cell, the virus can replicate and thus produce copies (**\*clones**) of the gene.

**vegetation** *n.* (in pathology) an abnormal outgrowth from a membrane, fancied to resemble a vegetable growth. In ulcerative endocarditis, such outgrowths, consisting of **\*fibrin** with enmeshed blood cells, are found on the membrane lining the heart valves.

**vegetative** *adj.* **1.** relating to growth and nutrition rather than to reproduction. **2.** functioning unconsciously; autonomic.

**vegetative state** the clinical condition of unawareness of the self or the environment. The patient breathes spontaneously and has a stable circulation and sleep/wake cycles. It results from extensive damage to the cerebral cortex and thalamus while the brainstem and hypothalamus remain intact. The commonest causes are traumatic brain injury (e.g. road-traffic accidents) and cardiopulmonary arrest. Conditions that mimic the vegetative state include the psychiatric state of **\*catatonia** and the **locked-in syndrome**, resulting from damage to the brainstem, in which the patient is conscious but unable to speak or make any movements of the body except for blinking and upward eye movements. *See also* **PERSISTENT VEGETATIVE STATE**.

**VEGF** *see* **VASCULAR ENDOTHELIAL GROWTH FACTOR**.

**vehicle** *n.* (in pharmacy) any substance that acts as the medium in which a drug is administered. Examples are sterile water, isotonic sodium chloride, and dextrose solutions.

**veil of ignorance** a hypothetical state, advanced by the US political philosopher John Rawls, in which decisions about social justice and the allocation of resources would be made fairly, as if by a person who must decide on society's rules and economic structures without knowing what position he or she will occupy in that society. By removing knowledge of status, abilities, and interests, Rawls argued, one could eliminate the usual effects of egotism and personal circumstances on such decisions. Rawls maintained that any society designed on this basis would adhere to two principles: the **principle of equal liberty**, which gives each person the right to as much freedom as is compatible with the freedom of others, and the

**maximin principle**, which allocates resources so that the benefit of the least advantaged people is maximized as far as possible. Rawls's exposition, and the maximin principle in particular, have proved widely influential in discussions of welfare provision and, especially, the allocation of medical resources.

**vein** *n.* a blood vessel conveying blood towards the heart. All veins except the **\*pulmonary vein** carry deoxygenated blood from the tissues, via the capillaries, to the vena cava (see illustration overleaf). The walls of veins consist of three tissue layers, but these are much thinner and less elastic than those of arteries. Veins contain **\*valves** that assist the flow of blood back to the heart. Anatomical name: **vena**. —**venous** *adj.*

**A vein (transverse section).**

**velamen (velamentum)** *n.* a covering membrane.

**Velcade** *n.* see **BORTEZOMIB**.

**vellus** *n.* the fine hair that occurs on the body before puberty is reached.

**velum** *n.* (in anatomy) a veil-like covering. The **medullary velum** is either of two thin layers of tissue that form part of the roof of the fourth ventricle of the brain.

**VEMP** see **VESTIBULAR EVOKED MYOGENIC POTENTIAL TEST**.

**vena** *n.* (*pl.* **venae**) see **VEIN**.

**vena cava** (*pl.* **venae cavae**) either of the two main veins, conveying deoxygenated blood from the other veins to the right atrium of the heart. The **inferior vena cava**, formed by the union of the right and left common iliac veins, receives blood from parts of the body below the diaphragm. The

**superior vena cava**, originating at the junction of the two innominate veins, drains blood from the head, neck, thorax, and arms.

**vene-** (**veno-**) *combining form denoting veins.*

**veneer** *n.* a facing of **\*composite resin** or **\*porcelain** applied to the surface of a tooth to give improved shape and/or colour. The tooth usually requires minimal preparation and the facing is retained by enamel that has been treated by the **\*acid-etch technique**. Veneers are a more conservative way of treating discoloured teeth than by **\*crowns**.

**venene** *n.* a mixture of two or more **\*venoms**: used to produce antiserum against venoms (**antivenene**).

**venepuncture (venipuncture)** *n.* the puncture of a vein for any therapeutic purpose; for example, to extract blood for laboratory tests. *See also* **PHLEBOTOMY**.

**venereal disease (VD)** *see* **SEXUALLY TRANSMITTED DISEASE**.

**venesection** *n.* *see* **PHLEBOTOMY**.

**venlafaxine** *n.* *see* **SNRI**.

**veno-** *combining form. see* **VENE-**.

**venoclysis** *n.* the continuous infusion into a vein of saline or other solution.

**venography (phlebography)** *n.* imaging of the veins. Traditionally a **\*radiopaque** contrast medium is injected into a vein and X-ray photographs (**venograms**) taken as the medium flows towards the heart. Damage, obstruction, or abnormal communication with other vessels can be demonstrated. It can be done during a CT or MRI evaluation. A common usage is in demonstrating deep vein **\*thrombosis** in the legs. Increasingly ultrasound is being used, both with colour Doppler (*see* **DOPPLER ULTRASOUND**) and **\*compression venography**. *See also* **ANGIOGRAPHY**.

**venom** *n.* the poisonous material produced by snakes, scorpions, spiders, and other animals for injecting into their prey or enemies. Some venoms produce no more than local pain and swelling; others produce more general effects and can prove lethal.

**venoplasty** *n.* balloon dilatation of a narrowed vein, similar to **\*angioplasty**.

**venosclerosis** *n.* *see* **PHLEBOSCLEROSIS**.

**venous thromboembolism (VTE)** the formation of a blood clot in a vein, which may become detached and lodged elsewhere. It includes deep vein thrombosis (*see* **PHLEBOTHROMBOSIS**) and **\*pulmonary embolism**. VTE is a leading direct cause of maternal death (*see* **MATERNAL MORTALITY RATE**). *See also* **THROMBOEMBOLISM**.

**ventilation** *n.* **1.** the passage of air into and out of the respiratory tract. The air that reaches only as far as the conducting airways cannot take part in gas exchange and is known as **dead space ventilation** – this may be reduced by performing a **\*tracheostomy**. In the air sacs of the lungs (alveoli) gas exchange is most efficient when matched by adequate blood flow (**\*perfusion**). Ventilation/perfusion imbalance (ventilation of underperfused alveoli or perfusion of underventilated alveoli) is an important cause of **\*anoxia** and **\*cyanosis**. **2.** the use of a **\*ventilator** to maintain or support the breathing movements of patients. Invasive ventilation involves the insertion of an endotracheal tube (*see* **INTUBATION**), through which air is blown into the lungs; patients need to be paralysed and anaesthetized. This need can be eliminated by using techniques of **\*noninvasive ventilation**.

## The principal veins of the body.

**ventilation-perfusion scanning (V/Q scanning)** a nuclear medicine technique in which two different isotopes are used, one inhaled (usually *\*xenon-133* or *\*krypton-81m*), to examine lung ventilation, and the other injected into a vein, to examine lung perfusion. In *\*pulmonary embolism*, the area of lung supplied by the blocked artery is not being perfused with blood – which gives a perfusion defect on the film – but has normal ventilation. This technique is highly sensitive for pulmonary embolism.

**ventilator** *n.* **1.** a device to ensure a supply of fresh air. **2. (respirator)** equipment that is manually or mechanically operated to maintain a flow of air into and out of the lungs of a patient who is unable to breathe normally. **Positive-pressure ventilators** blow air into the patient's lungs; air is released from the lungs when the pressure from the ventilator is relaxed (*see* **BiPAP**; **NIPPY**; **NONINVASIVE VENTILATION**). **Negative-pressure ventilators** are airtight containers in which the air pressure is decreased and increased mechanically. This draws air into and out of the patient's lungs through the normal air passages. The original devices, known colloquially as **iron lungs**, had a seal around the neck and enclosed the whole body except the head. They have been replaced by **cuirass ventilators**, which work on a similar principle but enclose the chest only; there may be a role for these in adults and children with claustrophobia.

**ventouse (vacuum extractor)** *n.* a device to assist delivery consisting of a suction cup that is attached to the head of the fetus: traction is then applied slowly. Introduced in 1954, it is widely used and has now virtually replaced rotational obstetric forceps.

**ventral** *adj.* relating to or situated at or close to the front of the body or to the anterior part of an organ.

**ventricle** *n.* **1.** either of the two lower chambers of the *\*heart*, which have thick muscular walls. The left ventricle, which is thicker than the right, receives blood from the pulmonary vein via the left atrium and pumps it into the aorta. The right ventricle pumps blood received from the venae cavae (via the right atrium) into the pulmonary artery. **2.** one of the four fluid-filled

cavities within the brain (see illustration). The paired first and second ventricles (**lateral ventricles**), one in each cerebral hemisphere, communicate with the third ventricle in the midline between them. This in turn leads through a narrow channel, the **cerebral aqueduct**, to the fourth ventricle in the hindbrain, which is continuous with the spinal canal in the centre of the spinal cord. \*Cerebrospinal fluid circulates through all the cavities. —**ventricular** *adj.*

**Ventricles of the brain (side view).**

**ventricul-** (**ventriculo-**) *combining form denoting a ventricle (of the brain or heart).*

**ventricular assist device (VAD)** a mechanical pump implanted in the body for the purpose of taking over some or all of the pumping action of the heart in patients with severe heart damage. Support may be given to the left ventricle (**LVAD**), right ventricle (**RVAD**), or both. Most such devices require \***thoracotomy**, but a percutaneous device is now also available. This is usually regarded as a temporary measure until the heart has recovered or is transplanted.

**ventricular fibrillation (VF)** *see* **FIBRILLATION**.

**ventricular folds** *see* **VOCAL FOLDS**.

**ventricular septal defect (VSD)** a defect of the heart, usually congenital but occasionally acquired due to damage following *\*myocardial infarction*, in which there is a hole in the partition (septum) separating the two ventricles (see **SEPTAL DEFECT**). In 25% of patients there are other defects present. 50% of VSDs close spontaneously. If the hole is large, blood is diverted to the lungs at a greater pressure than usual and *\*pulmonary hypertension* can occur, which becomes irreversible and progressive (*\*Eisenmenger reaction*). Early surgical intervention can prevent this.

**ventricular tachycardia (VT)** a dangerously fast beating of the heart stemming from an abnormal focus of electrical activity in the *\*ventricles*. The electricity does not pass through the heart along the usual channels and as a result the contraction of the heart muscle is often not as efficient as normal, which can result in a sudden drop in blood pressure or even *\*cardiac arrest*. Left untreated it will prove ultimately fatal. *See also* **ARRHYTHMIA**; **TORSADES DE POINTES**.

**ventriculitis** *n.* inflammation in the ventricles of the brain, usually caused by infection. It may result from the rupture of a cerebral abscess into the cavity of the ventricle or from the spread of a severe form of *\*meningitis* from the subarachnoid space.

**ventriculoatriostomy** *n.* an operation for the relief of raised pressure due to the build-up of cerebrospinal fluid that occurs in *\*hydrocephalus*. Using a system of catheters, the fluid is drained into the jugular vein in the neck.

**ventriculography** *n.* X-ray examination of the ventricles of the brain or heart after the introduction of a contrast medium. This procedure has been largely made redundant by CT and MRI scanning.

**ventriculoperitoneal shunt** *see* **SHUNT**.

**ventriculoscopy** *n.* observation of the ventricles of the brain through a fibre-optic instrument. *See* **ENDOSCOPE**; **FIBRE OPTICS**.

**ventriculostomy** *n.* an operation to introduce a hollow needle (cannula) into one of the lateral ventricles (cavities) of the brain. This may be done to relieve raised intracranial pressure, to obtain cerebrospinal fluid from the

ventricle for examination, or to introduce antibiotics or contrast material for X-ray examination.

**ventro-** *combining form denoting* **1.** ventral. **2.** the abdomen.

**ventrofixation** *n. see* VENTROSUSPENSION.

**ventrosuspension (ventrofixation)** *n.* surgical fixation of a displaced uterus to the anterior abdominal wall. This may be achieved by shortening the round ligaments at their attachment either to the uterus or to the abdominal wall.

**venule** *n.* a minute vessel that drains blood from the capillaries. Many venules unite to form a vein.

**VERA** a framework designed to improve communication between health-care professionals and patients with dementia. It consists of four stages – validation, emotion, reassurance, and activity – which enable staff to acknowledge their patients' perception of a situation, even where this is at variance with reality.

**verapamil** *n.* a **\*calcium-channel blocker** used in the treatment of essential hypertension, angina, and supraventricular arrhythmia. Side-effects may include constipation, nausea, and hypotension.

**Veress needle** a surgical needle used prior to **\*laparoscopy** to gain access to the peritoneal cavity and allow insufflation of carbon dioxide (**\*pneumoperitoneum**) before the insertion of a sharp **\*trocar**. It has an outer cutting sheath and an inner spring-loaded gas-transmitting safety sheath and is inserted into the abdomen either in the midsagittal plane at the lower margin or base of the umbilicus or at **\*Palmer's point**. [J. Veress (20th century), Hungarian surgeon]

**vermicide** *n.* a chemical agent used to destroy parasitic worms living in the intestine. *Compare* VERMIFUGE.

**vermiform appendix** *see* APPENDIX.

**vermifuge** *n.* any drug or chemical agent used to expel worms from the intestine. *See also* ANTHELMINTIC.

**vermis** *n.* the central portion of the **\*cerebellum**, lying between its two lateral hemispheres and immediately behind the pons and the medulla oblongata of the hindbrain.

**vermix** *n.* the vermiform **\*appendix**.

**vernal conjunctivitis** **\*conjunctivitis** of allergic origin, often associated with hay fever or other forms of **\*atopy**.

**Verner–Morrison syndrome** *see* **VIPOMA**. [J. V. Verner (1927– ), US physician; A. B. Morrison (1922– ), Irish pathologist]

**vernier** *n.* a device for obtaining accurate measurements of length, to 1/10th, 1/100th or smaller fractions of a unit. It consists of a fixed graduated main scale against which a shorter vernier scale slides. The vernier scale is graduated into divisions equal to nine-tenths of the smallest unit marked on the main scale. The vernier scale is often adjusted by means of a screw thread. A reading is taken by observing which of the markings on the scales coincide.

**vernix caseosa** the layer of greasy material which covers the skin of a fetus or newborn baby. It is produced by the oil-secreting glands of the skin and contains skin scales and fine hairs.

**verruca (plantar wart)** *n.* (*pl.* **verrucae**) *see* **WART**.

**verrucous carcinoma** an **\*indolent** preinvasive wartlike carcinoma typically of the oral cavity, associated with chewing tobacco, and vulva.

**version** *n.* a manoeuvre to alter the position of a fetus in the uterus to facilitate delivery. *See* **CEPHALIC VERSION**; **PODALIC VERSION**.

**vertebra** *n.* (*pl.* **vertebrae**) one of the 33 bones of which the **\*backbone** is composed. Each vertebra typically consists of a **body**, or **centrum**, from the back of which arises an arch of bone (the **vertebral** or **neural arch**) enclosing a cavity (the **vertebral canal**, or **foramen**) through which the spinal cord passes. The vertebral arch bears one **spinous process** and two **transverse processes**, providing anchorage for muscles, and four **articular processes**, with which adjacent vertebrae articulate (see illustration).

Individual vertebrae are bound together by ligaments and **\*intervertebral discs**. —**vertebral** *adj.*

**Vertebra.** A typical thoracic vertebra (from above).

**vertebral column** *see* **BACKBONE**.

**vertebroplasty** *n.* an **\*interventional radiology** procedure in which bone cement is injected through a wide-bore needle that is placed into a fractured or tumour-bearing vertebra to reduce the movement, and hence to reduce the pain.

**verteporfin** *n.* *see* **PHOTODYNAMIC THERAPY**.

**vertical banded gastroplasty** *see* **GASTROPLASTY**; **STOMACH STAPLING**.

**vertical transmission 1.** (**mother-to-child transmission**) transmission of an infection, such as HIV, hepatitis B, or hepatitis C, from mother to fetus via the placental circulation. **2.** (in population genetics) inheritance of an allele or condition from either the father or mother.

**vertigo** *n.* a disabling sensation in which affected individuals feel that either they themselves or their surroundings are in a state of constant movement. It is most often a spinning sensation but there may be a feeling that the ground is

tilting. It is a symptom of disease either in the *\*labyrinth* of the inner ear or in the *\*vestibular nerve* or its nuclei in the brainstem, which are involved in the sense of balance. *See also* BENIGN PAROXYSMAL POSITIONAL VERTIGO.

**very low-density lipoprotein (VLDL)** a *\*lipoprotein* that is the precursor of *\*low-density lipoprotein* (LDL). Containing triglycerides and cholesterol, it is produced in the liver and circulates in the bloodstream, where its triglycerides are hydrolysed to free fatty acids by *\*lipoprotein lipase*. The remaining lipoprotein becomes progressively denser and richer in cholesterol to form LDL.

**vesical** *adj.* relating to or affecting an anatomical bladder, especially the urinary bladder.

**vesicant** *n.* an agent that causes blistering of the skin.

**vesicle** *n.* **1.** a very small blister in the skin, often no bigger than a pinpoint, that contains a clear fluid (serum). Vesicles occur in a variety of skin disorders, including eczema and herpes. **2.** (in anatomy) any small bladder, especially one filled with fluid. —**vesicular** *adj.*

**vesico-** *combining form denoting* the urinary bladder. Example: **vesicovaginal** (relating to the bladder and vagina).

**vesicofixation** *n.* *see* CYSTOPEXY.

**vesicostomy** *n.* the surgical creation of an artificial channel between the bladder and the skin surface for the passage of urine. It is sometimes combined with closure of the urethra.

**vesicoureteric reflux** the backflow of urine from the bladder into the ureters. It is classified into primary or congenital vesicoureteric reflux, which is due to defective valves (which normally prevent reflux), or secondary, which is due to another condition (e.g. *\*neuropathic bladder*). Infection may be conveyed to the kidneys, causing recurrent attacks of acute *\*pyelonephritis* and scarring of the kidneys in childhood. Children with urinary infection must be investigated for reflux by *\*cystoscopy*; if the condition does not settle with antibiotic therapy corrective surgery must be performed.

**vesicovaginal fistula** an abnormal communication between the bladder and the vagina (*see* **FISTULA**) causing urinary incontinence. This may result from surgical damage to the bladder during a gynaecological operation (e.g. hysterectomy) or radiation damage following radiotherapy for pelvic malignancy. In developing countries it is often caused by necrosis associated with prolonged obstructed labour.

**vesicular breathing** *see* **BREATH SOUNDS**.

**vesiculectomy** *n.* surgical removal of a **\*seminal vesicle**. This operation, which is rarely undertaken, may be performed for chronic infection, unusual cases of infertility, and rarely for a tumour of the seminal vesicles.

**vesiculitis** *n.* inflammation of the seminal vesicles. *See* **VASOVESICULITIS**.

**vesiculography** *n.* any technique for imaging the seminal vesicles. This used to be performed by injecting a contrast medium into the vas deferens during **\*vasography**. More commonly direct injection is now performed during **\*transrectal ultrasonography** (TRUS), enabling sperm to be sampled at the same examination. Injected contrast medium or dye should be seen draining into the vas deferens to the bladder if there is no blockage. **\*Magnetic resonance imaging** is a good technique for imaging the seminal vesicles with no radiation exposure. Both these techniques are useful for investigation of patients with **\*azoospermia**.

**vessel** *n.* a tube conveying a body fluid, especially a blood vessel or a lymphatic vessel.

**vestibular apparatus** those parts of the inner ear involved with balance. They comprise the **\*semicircular canals**, **\*sacculle** and **\*utricle**. *See* **EAR**; **VESTIBULAR SYSTEM**.

**vestibular evoked myogenic potential test (VEMP)** a test used to measure the response of the **\*sacculle**. It is used in the diagnosis of **\*superior canal dehiscence syndrome**, **\*Ménière's disease**, and other disorders of the inner ear.

**vestibular glands** the two pairs of glands that open at the junction of the vagina and vulva. The more posterior of the two are the **greater vestibular**

**glands (Bartholin's glands)**; the other pair are the **lesser vestibular glands**. Their function is to lubricate the entrance to the vagina during coitus.

**vestibular nerve** the division of the **\*vestibulocochlear nerve** that carries impulses from the semicircular canals, utricle, and saccule of the inner ear to the brain, conveying information about the body's posture and movements in space and allowing coordination and balance.

**vestibular neuronitis (vestibular neuritis)** a condition characterized by the sudden onset of vertigo without hearing loss or other auditory symptoms (*compare* **LABYRINTHITIS**). It generally lasts days to weeks and the cause is unknown.

**vestibular schwannoma** a slow-growing benign tumour arising on one of the **\*vestibular nerves**. It is also known as an **acoustic neuroma**, but this is a misnomer as the tumour arises from **\*Schwann cells** rather than nerve cells and on a vestibular nerve rather than the cochlear (acoustic) nerve. Symptoms include hearing loss, tinnitus, and imbalance and there is an increased prevalence of the tumour in patients who have **\*neurofibromatosis** type II. Diagnosis is by MRI scan and treatment is not always required. In those cases where treatment is necessary, this may be by surgery, radiotherapy, or **\*gamma knife**.

**vestibular system** those parts of the body involved in balance. The **peripheral vestibular system**, or **\*vestibular apparatus**, is in the inner ear. The **central vestibular system** comprises those parts of the brain that are involved in balance. The central vestibular system receives other inputs as well as from the ear, in particular inputs from the eyes and proprioceptors.

**vestibule** *n.* (in anatomy) a cavity situated at the entrance to a hollow part. The vestibule of the ear is the cavity of the bony **\*labyrinth** that contains the **\*saccule** and **\*utricle** – the organs of equilibrium. —**vestibular** *adj.*

**vestibulocochlear nerve** the eighth cranial nerve (VIII), responsible for carrying sensory impulses from the inner ear to the brain. It has two branches, the **\*vestibular nerve** and the **\*cochlear nerve**.

**vestigial** *adj.* existing only in a rudimentary form. The term is applied to organs whose structure and function have diminished during the course of evolution until only a rudimentary structure exists.

**VF** ventricular *\*fibrillation*.

**viable** *adj.* capable of living a separate existence. The legal age of viability of a fetus is 24 weeks, by virtue of the Abortion Act 1967 (as amended), but some fetuses now survive birth at an even earlier gestational age due to advances in neonatal medicine and technologies. The treatment of very premature neonates can raise issues of *\*personhood*, *\*quality of life*, and resource allocation. —**viability** *n.*

**viable myocardium** *see* *hibernating myocardium*.

**Viagra** *n. see* *SILDENAFIL*.

**Vibramycin** *n. see* *DOXYCYCLINE*.

**vibrator** *n.* a machine used to generate vibrations of different frequencies, which have a stimulating effect when applied to different parts of the body. A vibrator may also be used to loosen thick mucus in the sinuses or air passages.

**Vibrio** *n.* a genus of Gram-negative motile comma-shaped bacteria widely distributed in soil and water. Most species are saprophytic but some are parasites, including *V. cholerae*, which causes *\*cholera*.

**vibrissa** *n. (pl. vibrissae)* a stiff coarse hair, especially one of the stiff hairs that lie just inside the nostrils.

**vicarious** *adj.* describing an action or function performed by an organ not normally involved in the function. For example, **vicarious menstruation** is a rare disorder in which monthly bleeding occurs from places other than the vagina, such as the sweat glands, breasts, nose, or eyes.

**video-** *combining form denoting* the use of a video camera to view and record moving images. *See* *VIDEOFLUOROSCOPY*.

**video capsule endoscopy (VCE)** an investigation for visualizing the intestinal lining (mucosa). A capsule containing a miniature digital video camera is swallowed by the patient and passively propelled through the intestine by peristalsis. The images are uploaded to a computer for subsequent analysis. Various capsules are available for investigation of oesophageal, small-intestinal, and colonic disorders. The commonest in use

is the small-intestinal capsule, for investigation of obscure gastrointestinal bleeding, recurrent iron-deficiency anaemia, or in cases of suspected Crohn's disease, coeliac disease, or small-bowel tumours.

**videofluoroscopy** *n.* the technique of viewing and recording real time X-ray investigation using a video camera (*see* **REAL-TIME IMAGING**). This enables the moving images to be reviewed at a later time, by individual frames or in slow motion.

**videokeratography** *n.* *see* **CORNEAL TOPOGRAPHY**.

**videokymography** *n.* a method of studying the vibration of the **\*vocal folds** of the **\*larynx** using high-speed digital photography. *See* **LARYNGEAL STROBOSCOPY**.

**video-otoscope** *n.* a small **\*endoscope** connected to a digital camera for examining the outer ear and eardrum.

**vildagliptin** *n.* *see* **DPP-IV INHIBITORS**.

**villus** *n.* (*pl.* villi) one of many short finger-like processes that project from some membranous surfaces. Numerous **intestinal villi** line the small **\*intestine**. Each contains a network of blood capillaries and a **\*lacteal**. Their function is to absorb the products of digestion and they greatly increase the surface area over which this can take place. **Chorionic villi** are folds of the **\*chorion** (the outer membrane surrounding a fetus) from which the fetal part of the **\*placenta** is formed. They provide an extensive area for the exchange of oxygen, carbon dioxide, nutrients, and waste products between maternal and fetal blood. *See also* **ARACHNOID VILLUS**; **CHORIONIC VILLUS SAMPLING**.

**VIN** *see* **VULVAL INTRAEPITHELIAL NEOPLASIA**.

**vinblastine** *n.* *see* **VINCA ALKALOID**.

**vinca alkaloid** one of a group of **\*antimitotic** drugs (*see also* **CYTOTOXIC DRUG**) derived from the periwinkle (*Vinca rosea*). Vinca alkaloids are used especially to treat leukaemias and lymphomas; they include **vinblastine**, **vincristine**, and **vindesine**. **Vinorelbine** is used in the treatment of advanced

breast cancer and *\*non-small-cell lung cancer*. **Vinflunine** is given by intravenous infusion to treat *\*transitional cell carcinoma*. Vinca alkaloids are highly toxic; side-effects include *\*myelosuppression*, peripheral neuropathy, and severe irritation at the injection site.

**Vincent's angina** an obsolete term for *\*ulcerative gingivitis*. [H. Vincent (1862–1950), French physician]

**vincristine** *n. see* **VINCA ALKALOID**.

**vinculum** *n. (pl. vincula)* a connecting band of tissue. The **vincula tendinum** are threadlike bands of synovial membrane that connect the flexor tendons of the fingers and toes to their point of insertion on the phalanges.

**vindesine** *n. see* **VINCA ALKALOID**.

**vinflunine** *n. see* **VINCA ALKALOID**.

**vinorelbine** *n. see* **VINCA ALKALOID**.

**VIP (vasoactive intestinal peptide)** a peptide hormone and neurotransmitter found widely throughout the central nervous system and the gastrointestinal tract. It has numerous actions, including vasodilatation of blood vessels in the gut, reduction of acid secretion by the stomach, and enhanced secretion of electrolytes into the small bowel.

**VIPoma** *n.* a usually malignant tumour of islet cells of the pancreas that secretes large amounts of *\*VIP*. This results in severe watery diarrhoea ('pancreatic cholera' or the **Verner–Morrison syndrome**), with loss of potassium and bicarbonate and a low level of stomach acid. The treatment is surgical removal of the tumour.

**viraemia** *n.* the presence in the blood of virus particles.

**viral pneumonia** an acute infection of the lung caused by any one of a number of viruses, such as *\*respiratory syncytial virus*, adenovirus, influenza and parainfluenza viruses, and enteroviruses. It is characterized by headache, fever, muscle pain, and a cough that produces a thick sputum. The pneumonia can often occur with or subsequent to a systemic viral infection. Treatment is by supportive care, but antibiotics are administered if a bacterial infection is superimposed.

**Virchow–Robin spaces (perivascular spaces)** fluid-filled spaces that form around blood vessels in the **\*pia** mater as they penetrate deeper brain tissue. They may dilate, resulting in raised intracranial pressure. [R. Virchow (1821–1902), German pathologist]

**Virchow's node** an enlarged lymph node that may be palpated above the left clavicle (the left supraclavicular fossa). It is strongly associated with abdominal malignancy, particularly cancer of the stomach, since the lymphatic drainage from the abdomen is channelled via the thoracic duct to the left side of the neck before it enters the left subclavian vein. Enlargement of the right supraclavicular lymph node is associated with lung and oesophageal cancer.

**virilism** *n.* the development in a female of male secondary sexual characteristics, such as increased body hair, muscle bulk, and deepening of the voice.

**virilization** *n.* the most extreme result of excessive androgen production (**\*hyperandrogenism**) in women. It is characterized by temporal balding, a male body form, muscle bulk, deepening of the voice, enlargement of the clitoris, and **\*hirsutism**. Virilization in prepubertal boys may be caused by some tumours (*see* **LEYDIG TUMOUR**).

**virology** *n.* the science of viruses. *See also* **MICROBIOLOGY**.

**virtue ethics** theories that emphasize the ethical importance of the virtues (e.g., honesty or courage), true happiness, and practical wisdom (*compare* **CONSEQUENTIALISM**; **DEONTOLOGY**). In medical ethics, the traits of a 'good doctor' provide the moral compass by which to assess professional practice.

**virulence** *n.* the disease-producing (pathogenic) ability of a microorganism. *See also* **ATTENUATION**.

**virus** *n.* a minute particle that is capable of replication but only within living cells. Viruses are too small to be visible with a light microscope and too small to be trapped by filters. They infect animals, plants, and microorganisms (*see* **BACTERIOPHAGE**). Each consists of a core of nucleic acid (DNA or RNA) surrounded by a protein shell. Some bear an outer lipid

capsule. Viruses cause many diseases, including the common cold, influenza, measles, mumps, chickenpox, herpes, AIDS, polio, and rabies. [\\*Antiviral drugs](#) are effective against some of them, and many viral diseases are controlled by means of vaccines. —**viral** *adj.*

**viscera** *pl. n. (sing. viscus)* the organs within the body cavities, especially the organs of the abdominal cavities (stomach, intestines, etc.). —**visceral** *adj.*

**visceral arch** *see* [PHARYNGEAL ARCH](#).

**visceral cleft** *see* [PHARYNGEAL CLEFT](#).

**visceral hyperalgesia** increased sensitivity to visceral stimulation after injury or inflammation of an internal organ, which can result in chronic pain syndromes.

**visceral pouch** *see* [PHARYNGEAL POUCH](#).

**viscero-** *combining form denoting the viscera.*

**viscodissection** *n.* a surgical technique in which a [\\*viscoelastic material](#) is used to dissect and separate layers of tissue.

**viscoelastic material** a material exhibiting both viscous and elastic properties. It is used in ophthalmic surgery to help maintain the shape of ocular tissues as well as lubricate and minimize trauma. It is commonly used in intraocular surgery, such as cataract surgery. Viscoelastic materials are also used in dentistry for impression and filling materials.

**viscus** *n. see* [VISCERA](#).

**visual acuity** sharpness of vision: the degree to which a person is able to distinguish and resolve fine detail. The essential requirements are a healthy retina and the ability of the eye to focus incoming light to form a sharp image on the retina. Acuity of distant vision is often expressed as a Snellen score (*see* [SNELLEN CHART](#)) or a LogMAR score (*see* [LOGMAR CHART](#)); acuity of near vision as a Jaeger score (*see* [JAEGER TEST TYPES](#)).

**visual field** the area in front of the eye in any part of which an object can be seen without moving the eye. With both eyes open and looking straight

forward it is possible to see well-illuminated objects placed anywhere in front of the eyes, although the eyebrows and eyelids reduce the extent of the field somewhat. This is the **binocular visual field**. With only one eye open the field is **uniocular** and is restricted inwards by the nose. If the object is small or poorly illuminated it will not be seen until it is moved closer to the point at which the eye is actually looking, i.e. nearer to the centre of the visual field. Similarly, coloured objects are not seen so far away from the centre as are white objects of the same size and brightness. This is because the retina is not uniformly sensitive to light of different colours or intensities (see **ROD**; **CONE**): retinal sensitivity increases towards its centre (the **\*macula**). Thus, while there is an absolute visual field beyond which things cannot be seen, no matter how large or bright they are, a relative field exists for objects of different brightness, size, and colour. The most common visual field loss is due to **\*glaucoma**. See also **PERIMETER**.

**visual pathway** see **OPTIC NERVE**.

**visual purple** see **RHODOPSIN**.

**visual reinforcement audiometry (visual reinforced audiometry, VRA)** a behavioural test of hearing for children aged approximately 6 to 30 months in which the subject sits between two calibrated loudspeakers. A sound is generated from one loudspeaker. Children who turn towards the sound are rewarded by brief illumination of a toy adjacent to the loudspeaker. Older children can be tested with headphones, rather than using the loudspeakers, to enable each ear to be tested separately. The test can be adapted for use with older subjects who have learning disabilities.

**vital capacity** the maximum volume of air that a person can exhale after maximum inhalation. It is usually measured on an instrument called a **spirometer**.

**vital centre** any of the collections of nerve cells in the brain that act as governing centres for different vital body functions – such as breathing, heart rate, blood pressure, temperature control etc. – making reflex adjustments according to the body's needs. Most lie in the hypothalamus and brainstem.

**Vitallium** *n.* trade name for an alloy of chromium and cobalt that is used in instruments, prostheses, surgical appliances, and dentures.

**vital signs** signs that a patient is alive, on which are based a commonly performed set of measurements used internationally as a general baseline in medicine and surgery. These include measurements of **\*body temperature** (T), **\*blood pressure** (BP), heart rate (HR; *see* **PULSE**), and **\*respiratory rate** (RR) and can also include assessment of consciousness using the **\*Glasgow Coma Scale** (GCS) and of **urine output** (UO, in millilitres per hour).

**vital staining (intravital staining)** the process of staining a living tissue by injecting a stain into the organism. *Compare* **SUPRAVITAL STAINING**.

**vital statistics** *see* **BIOSTATISTICS**.

**vitamin** *n.* any of a group of substances that are required, in very small amounts, for healthy growth and development: they cannot be synthesized by the body and are therefore essential constituents of the diet. Vitamins are divided into two groups, according to whether they are soluble in water or fat. The water-soluble group includes the vitamin B complex and vitamin C; the fat-soluble vitamins are vitamins A, D, E, and K. Lack of sufficient quantities of any of the vitamins in the diet results in specific vitamin deficiency diseases.

**vitamin A (retinol)** a fat-soluble vitamin that occurs preformed in foods of animal origin (especially milk products, egg yolk, and liver) and is formed in the body from the pigment  $\beta$ -**\*carotene**, present in some vegetable foods (for example green leafy vegetables and carrots). Retinol is essential for growth, vision in dim light, and the maintenance of soft mucous tissue. A deficiency causes stunted growth, **\*night blindness**, **\*xerophthalmia**, **\*keratomalacia**, and eventual blindness. The adult RNI for retinol (*see* **DIETARY REFERENCE VALUES**) is 600  $\mu\text{g/day}$  for women and 700  $\mu\text{g/day}$  for men. Lactating women need an additional 350  $\mu\text{g/day}$ . A retinol equivalent (6  $\mu\text{g}$   $\beta$ -carotene) is nutritionally equivalent to 1  $\mu\text{g}$  retinol.

**vitamin B** any one of a group of water-soluble vitamins that, although not chemically related, are often found together in the same kinds of food (milk, liver, cereals, etc.) and all function as **\*coenzymes**. *See* **VITAMINS B<sub>1</sub>**, **B<sub>2</sub>**, **B<sub>6</sub>**, **B<sub>12</sub>**, **BIOTIN**; **FOLATE**; **NICOTINIC ACID**; **PANTOTHENIC ACID**.

**vitamin B<sub>1</sub> (thiamine, aneurine)** a vitamin of the B complex that is active in the form of **thiamine pyrophosphate**, a coenzyme in decarboxylation reactions in carbohydrate metabolism. A deficiency of vitamin B<sub>1</sub> leads to **\*beriberi**. Good sources of the vitamin are cereals, beans, meat, potatoes, and nuts. The adult RNI (see **DIETARY REFERENCE VALUES**) is 0.4 mg/1000 kcal of dietary calories eaten.

**vitamin B<sub>2</sub> (riboflavin)** a vitamin of the B complex that is a constituent of the coenzymes **\*FAD** (flavine adenine dinucleotide) and **\*FMN** (flavine mononucleotide). Riboflavin is therefore important in tissue respiration; it is also required to aid the absorption of iron. A deficiency of riboflavin causes a condition known as **\*ariboflavinosis**, which is not usually serious. Good sources of riboflavin are liver, milk, and eggs. The adult RNI (see **DIETARY REFERENCE VALUES**) is 1.3–1.6 mg/day.

**vitamin B<sub>6</sub> (pyridoxine)** a vitamin of the B complex from which the coenzyme **\*pyridoxal phosphate**, involved in the transamination of amino acids, is formed. The vitamin is found in most foods and a deficiency is therefore rare. The adult RNI (see **DIETARY REFERENCE VALUES**) is 15 µg/g dietary protein.

**vitamin B<sub>12</sub> (cyanocobalamin)** a vitamin of the B complex. The form of vitamin B<sub>12</sub> with coenzyme activity is **5-deoxyadenosyl cobalamin**, which is necessary for the synthesis of nucleic acids, the maintenance of **\*myelin** in the nervous system, and the proper functioning of **\*folate**, another B vitamin. The vitamin can be absorbed only in the presence of **intrinsic factor**, a protein secreted in the stomach. A deficiency of vitamin B<sub>12</sub> affects nearly all the body tissues, particularly those containing rapidly dividing cells. The most serious effects of a deficiency are **\*pernicious anaemia** and degeneration of the nervous system. Vitamin B<sub>12</sub> is manufactured only by certain microorganisms and is contained only in foods of animal origin. Good sources are liver, fish, and eggs. The adult RNI (see **DIETARY REFERENCE VALUES**) is 1.5 µg/day. Vegans can be at risk of deficiency.

**vitamin C (ascorbic acid)** a water-soluble vitamin with **\*antioxidant** properties that is essential in maintaining healthy connective tissues and the

integrity of cell walls. It is necessary for the synthesis of collagen. A deficiency of vitamin C leads to *\*scurvy*. The adult RNI (see [DIETARY REFERENCE VALUES](#)) is 30 mg/day; rich sources are citrus fruits and vegetables (the main source of the vitamin in the British diet is potatoes). There is no strong evidence that high intakes of vitamin C reduce the incidence of colds.

**vitamin D** a fat-soluble vitamin that enhances the absorption of calcium and phosphorus from the intestine and promotes their deposition in the bone. It occurs in two forms: **ergocalciferol (vitamin D<sub>2</sub>, calciferol)**, which is manufactured by plants when the sterol ergosterol is exposed to ultraviolet light, and **cholecalciferol (vitamin D<sub>3</sub>)**, which is produced by the action of sunlight on 7-dehydrocholesterol, a sterol widely distributed in the skin. A deficiency of vitamin D, either from a poor diet or lack of sunlight, leads to decalcified bones and the development of *\*rickets* and *\*osteomalacia*. Good sources of vitamin D are liver and fish oils. An RNI (see [DIETARY REFERENCE VALUES](#)) was set for the first time in 2015, at 10 ug/d for all individuals over 4 years of age. Research continues into a possible association between vitamin D levels and multiple sclerosis. Vitamin D is toxic and large doses must therefore be avoided.

**vitamin E** any of a group of chemically related fat-soluble compounds (**tocopherols** and **tocotrienols**) that have *\*antioxidant* properties and are thought to stabilize cell membranes by preventing oxidation of their unsaturated fatty acid components. The most potent of these is **α-tocopherol**. Good sources of the vitamin are vegetable oils, eggs, margarine, and wholemeal cereals. It is fairly widely distributed in the diet and a deficiency is therefore unlikely. There is no set recommendation for dietary intake.

**vitamin K** a fat-soluble vitamin occurring in two main forms: **phytomenadione** (of plant origin) and **menaquinone** (synthesized by bacteria in the large intestine; deficiency is rare). It is necessary for the formation of *\*prothrombin* in the liver, which is essential for blood clotting, and it also regulates the synthesis of other clotting factors. Good dietary sources are green leafy vegetables and meat. Large changes in the dietary intake of vitamin K should be avoided by people taking *\*warfarin*.

**vitelliform degeneration (Best's disease)** degeneration of the **\*macula** of the eye that is inherited as a dominant characteristic and usually starts in childhood. There is widespread abnormality of retinal pigment epithelium (see **RETINA**) with the accumulation of a yellowish material, especially in the macular area.

**vitellus** *n.* the yolk of an ovum.

**vitaligo** *n.* a common disorder in which symmetrical white or pale **\*macules** appear on the skin. The face and extremities (including the genitalia) are commonly affected. It is more conspicuous in darker skin types. Vitiligo is an **\*autoimmune disease** and may occur with other such diseases (e.g. thyroid disease or **\*alopecia areata**). It is usually progressive, although spontaneous repigmentation may occur. Treatment with potent topical corticosteroids, topical **\*calcineurin inhibitors**, or phototherapy may be effective. Cosmetic camouflage may be necessary if treatments are unsuccessful.

**vitrectomy** *n.* the removal of the whole or part of the vitreous humour of the eye. **Anterior vitrectomy** is removal of the front portion of the vitreous humour. Vitrectomy is often required to remove a nonresolving vitreous haemorrhage and also as a part of surgical procedures on the retina, including repair of a detached retina.

**vitreous detachment** the separation of the **\*vitreous humour** from the underlying retina. This is a normal ageing process, but it is also more common in such conditions as diabetes and severe myopia. It can sometimes cause a tear in the retina and lead to **\*retinal detachment**.

**vitreous humour (vitreous body)** the transparent jelly-like material that fills the chamber behind the lens of the eye.

**vitrification** *n.* a process in which eggs or embryos in vitro are preserved by being dehydrated, treated with an antifreeze chemical, and then flash-frozen with liquid nitrogen. They instantly become converted into a glassy material without the formation of ice crystals, which can damage the genetic material, seen with slower forms of freezing.

**vitritis** *n.* inflammation within the vitreous humour of the eye.

**viviparous** *adj.* describing animal groups (including most mammals) in which the embryos develop within the body of the mother so that the young are born alive rather than hatch from an egg. —**viviparity** *n.*

**vivisection** *n.* a surgical operation on a living animal for experimental purposes.

**VMA** *see* **VANILLYLMANDELIC ACID**.

**vocal folds (vocal cords)** the two folds of tissue which protrude from the sides of the **\*larynx** to form a narrow slit (glottis) across the air passage (see illustration). Their controlled interference with the expiratory air flow produces audible vibrations that make up speech, song, and all other vocal noises. Alterations in the vocal folds themselves or in their nerve supply by disease interfere with phonation.

**The vocal folds.**

**vocal fremitus** *see* **FREMITUS**.

**vocal resonance** the sounds heard through the stethoscope when the patient speaks (“ninety nine”). These are normally just audible but become much louder (**bronchophony**) if the lung under the stethoscope is consolidated, when they resemble the sounds heard over the trachea and main bronchi. Vocal resonance is lost over pleural fluid except at its upper surface, when it has a bleating quality and is called **aegophony**. *See also* **PECTORILOQUY**.

**vocational training** *see* **FOUNDATION TRAINING**.

**volar** *adj.* relating to the palm of the hand or the sole of the foot (the **vola**).

**Volkmann's contracture** fibrosis and shortening of muscles due to inadequate blood supply, which may arise from arterial injuries or **\*compartment syndrome**. Sites most commonly involved are the forearm, hand, leg, and foot and the condition may result in clawing of the fingers or toes. It may be a complication of fractures, vascular surgery, or using a tight bandage or plaster cast. [R. von Volkmann (1830–89), German surgeon]

**volsellum (vulsellum)** *n.* surgical forceps with clawlike hooks at the ends of both blades.

**volt** *n.* the **\*SI unit** of electric potential, equal to the potential difference between two points on a conducting wire through which a constant current of 1 ampere flows when the power dissipated between these points is 1 watt. Symbol: V.

**voluntary** *adj.* **1.** describing a decision or action taken freely, i.e. without coercion or undue pressure. **\*Consent** must be voluntary if it is to be legally valid. *See also* **AUTONOMY**. **2.** under the control of **\*striated muscle**.

**voluntary admission (informal admission)** entry of a patient into a psychiatric hospital with his (or her) agreement. *Compare* **COMPULSORY ADMISSION**.

**voluntary hospital** in the USA, a hospital that is owned or operated by a religious organization or community association to provide health-care facilities on a non-profit basis. In recent decades the role of voluntary hospitals has changed from one of caring primarily for **\*charity patients** to one of serving all members of a community. At the same time, the practice of charging higher fees to patients able to afford them in order to compensate for the expense of caring for charity patients has generally been eliminated.

**voluntary muscle** *see* **STRIATED MUSCLE**.

**volvulus** *n.* twisting of a part of the digestive tract, usually leading to partial or complete obstruction and often reducing the blood supply, causing gangrene. A volvulus may untwist spontaneously or by manipulation, but surgical exploration is usually performed. **Gastric volvulus** is a twist of the stomach, usually in a hiatus **\*hernia**. **Small-intestinal volvulus** is twisting of part of the bowel around an **\*adhesion**. **Sigmoid volvulus** is a twist of the

sigmoid colon, usually when this part of the colon is particularly long. **Compound volvulus** (or **ileosigmoid knotting**) involves both the small and the large bowel.

**vomer** *n.* a thin plate of bone that forms part of the nasal septum (*see* **NASAL CAVITY**). *See also* **SKULL**.

**vomica** *n.* **1.** an abnormal cavity in an organ, usually a lung, sometimes containing pus. **2.** the abrupt expulsion from the mouth of a large quantity of pus or decaying matter originating in the throat or lungs.

**vomit** **1.** *vb.* to expel the contents of the stomach through the mouth (*see* **VOMITING**). **2.** *n.* the contents of the stomach ejected during vomiting. Medical name: **vomit**.

**vomiting** *n.* the reflex action of expelling the contents of the stomach through the mouth. Vomiting is controlled by a special centre in the brain that may be stimulated by certain drugs or by nerve signalling from the stomach (e.g. after ingesting toxic substances or in stomach diseases, such as peptic ulceration or pyloric stenosis), the intestine (e.g. in intestinal obstruction), or from the inner ear (in motion sickness). The stimulated vomiting centre sets off a chain of nerve impulses producing coordinated contractions of the diaphragm and abdominal muscles and relaxation of the sphincter between the gullet and the stomach, leading to the forcible ejection of stomach contents. Medical name: **emesis**.

**von Hippel–Lindau disease** an inherited syndrome in which **\*haemangioblastomas**, particularly in the cerebellum, are associated with renal and pancreatic cysts, **\*angiomas** in the retina (causing blindness), cancer of the kidney cells, and red birthmarks. [E. von Hippel (1867–1939), German ophthalmologist; A. Lindau (1892–1958), Swedish pathologist]

**von Recklinghausen's disease** **1.** a syndrome due to excessive secretion of **\*parathyroid hormone** (hyperparathyroidism), characterized by loss of mineral from bones, which become weakened and fracture easily, and formation of kidney stones. Medical name: **osteitis fibrosa**. **2.** *see* **NEUROFIBROMATOSIS**. [F. D. von Recklinghausen (1833–1910), German pathologist]

**Von Rosen's sign** *see* **BARLOW MANOEUVRE**. [S. Von Rosen, Swedish orthopaedic surgeon]

**von Willebrand's disease** an inherited disorder of the blood that is characterized by episodes of spontaneous bleeding similar to **\*haemophilia**. It is due to a variety of abnormalities of the **von Willebrand factor**, a glycoprotein necessary for **\*platelet activation**. This results in a bleeding tendency. The most common type of von Willebrand's disease is inherited as an autosomal **\*dominant** trait; some types are inherited as autosomal **\*recessive** traits. [A. von Willebrand (1870–1949), Swedish physician]

**voxel** *n.* short for 'volume element', the volume of tissue in a body that is represented by a **\*pixel** in a cross-sectional image. It depends on the slice thickness of the original scan.

**vPAP** (variable positive airways pressure) trade name for a brand of ventilator that delivers air to the lungs at different levels of pressure. *See* **BiPAP**.

**VRA** *see* **VISUAL REINFORCEMENT AUDIOMETRY**.

**VSD** *see* **VENTRICULAR SEPTAL DEFECT**.

**VT** *see* **VENTRICULAR TACHYCARDIA**.

**VTE** *see* **VENOUS THROMBOEMBOLISM**.

**VT storm** multiple episodes of **\*ventricular tachycardia** (VT) over a period of hours. Treatment can be difficult, particularly as this condition is often triggered as a side-effect of antiarrhythmic medication (*see* **PROARRHYTHMIA**).

**vulnerability** *n.* a position of relative disadvantage, which requires a person to trust and depend upon others. In a medical context, all patients are vulnerable to an extent and some may be particularly so owing to impaired decision-making abilities or social position. Any **\*exploitation** of a vulnerable person is considered contrary to medical ethics. There is increasing interest in the vulnerabilities of health-care professionals themselves and the evidence for **\*compassion fatigue**, **\*burnout**, and **\*ethical erosion** is strong. A number of commentators have argued that the most

effective therapeutic relationships occur when both the patient and clinician are aware of their own humanity because they have each experienced being vulnerable. A number of specific services and support groups have been established to help doctors and other health-care professionals in difficulty (see [Schwartz rounds](#)). —**vulnerable** *adj.*

**vulsellum** *n.* see [VOLSELLUM](#).

**vulv-** (**vulvo-**) *combining form denoting the vulva.*

**vulva** *n.* the female external genitalia. Two pairs of fleshy folds – the **labia majora** and **labia minora** – surround the openings of the vagina and urethra and extend forward to the clitoris (see illustration). See also [VESTIBULAR GLANDS](#). —**vulval** *adj.*

**The vulva.**

**vulval cancer** a relatively rare gynaecological cancer, most common in the elderly. The most common symptom is longstanding itch, but vulval pain, discharge, and bleeding have also been reported. Surgery is the primary treatment, with wide excision by radical [\\*vulvectomy](#) and regional [\\*lymphadenectomy](#). Radiotherapy and chemotherapy can also be used.

**vulval intraepithelial neoplasia (VIN)** premalignant disease of the vulva, which has histological features and terminology similar to those of **\*cervical intraepithelial neoplasia (CIN)**. Viral aetiological factors, such as HPV, are thought to be involved. The most common presenting symptom is itch, but VIN may be asymptomatic and detected only during treatment of preinvasive or invasive lesions of the cervix or lower genital tract.

**vulval vestibulitis** pain on entry or touch of the vulva, with redness of the **\*vestibular glands**, tenderness on pressure, and dyspareunia. The pain, which is localized, is described as a severe burning sensation; itching is not usually a feature (*compare* **VULVITIS**). The condition seems to be more common in premenopausal Caucasian women with a history of anxiety and related disorders. *See also* **VULVODYNIA**.

**vulvectomy** *n.* surgical removal of the external genitals (*see* **VULVA**) of a woman. **Simple vulvectomy** involves excision of the labia majora, labia minora, and clitoris and is carried out for a nonmalignant growth. **Radical vulvectomy** is a much more extensive operation carried out for a malignant growth, e.g. cancer of the vulva. It involves wide excision of the labia majora and minora and the clitoris in addition to complete removal of all regional lymph nodes on both sides. The skin covering these areas is also removed, leaving an extensive raw area that is allowed to heal by **\*granulation**.

**vulvitis** *n.* inflammation of the vulva, which is often accompanied by intense itching (*see* **PRURITUS**).

**vulvodynia** *n.* unexplained vulval pain, often coupled with sexual dysfunction and psychological disorder, which is often described by the patient as a burning stinging sensation and/or rawness. **Cyclic vulvodynia** occurs in relation to menstruation or coitus and is thought to be due to changes in vaginal pH that make the vulva more susceptible to infection. **Essential** (or **dysaesthetic**) **vulvodynia** is thought to be due to an altered perception of cutaneous pain, like postherpetic **\*neuralgia**. Treatment of essential vulvodynia is with tricyclic antidepressants at night, biofeedback, vestibulectomy, cognitive behavioural therapy, topical capsaicin cream, lignocaine gel, and good skin care.

**vulvovaginitis** *n.* inflammation of the vulva and vagina (*see* **PRURITUS**; **VAGINITIS**).

**Waardenburg's syndrome** an inherited form of deafness accompanied by a characteristic white forelock of hair and multiple colours within the irises of the eyes. It is inherited as an autosomal **\*dominant** disease, i.e. the children of an affected parent have a 50% chance of inheriting the disorder, although severity is variable. The gene responsible has been identified. [P. J. Waardenburg (1886–1979), Dutch ophthalmologist]

**wafer** *n.* a thin sheet made from moistened flour, formerly used to enclose a powdered medicine that is taken by mouth.

**WAGR syndrome** Wilms' tumour (*see* **NEPHROBLASTOMA**), aniridia, genitourinary abnormalities, and mental retardation: a condition due to a deletion of part of the short arm of chromosome 11.

**waist to hip ratio (WHR)** the ratio of the circumference of the waist to that of the hips. It is used as a measure of obesity and is a more reliable predictor of obesity-related mortality than **\*body mass index** alone.

**waiter's-tip deformity** *see* **ERB'S PALSY**.

**waiting list** a list of the patients awaiting admission to hospital after having been assessed either as an out-patient or on a **\*domiciliary consultation** involving a specialist. In general the patients are offered places in the order in which their names were placed on the list, but in certain circumstances (e.g. if the condition is potentially dangerous or painful) the consultant may recommend urgent or even immediate admission. One of the variables recorded in relation to hospital admissions is the length of time between the name being placed on the list and the patient being admitted (**waiting time**). General practitioners may also request **direct admission** (immediate) for urgent cases who have not been seen by the consultant; such admission may

be arranged by phone with the consultant or his or her deputy, or via the accident and emergency department of the hospital.

**Waldenstrom's macroglobulinaemia (lymphoplasmacytic lymphoma)** a type of low-grade relatively slow-growing non-Hodgkin's *\*lymphoma* characterized by enlarged lymph nodes and high levels of abnormal IgM (*\*macroglobulin*) in the blood (see **MACROGLOBULINAEMIA**). [J. G. Waldenstrom (1906–96), Swedish physician]

**Waldeyer's ring** the ring of lymphoid tissue formed by the *\*tonsils*. [H. W. G. von Waldeyer (1836–1921), German anatomist]

**walking distance** the measured distance that a patient can walk before he or she is stopped by pain in the muscles, usually the calf muscles, or breathlessness. It is a useful estimate of the degree of impairment of the blood supply. See **CLAUDICATION**.

**Wallerian degeneration** degeneration of a ruptured nerve fibre that occurs within the nerve sheath distal to the point of severance. [A. V. Waller (1816–70), British physician]

**warfarin** *n.* an *\*anticoagulant* used mainly in the prevention and treatment of deep vein thrombosis and pulmonary embolism and to prevent embolism in other patients at risk. The principal toxic effect is local bleeding, usually from the gums and other mucous membranes, and the drug should be avoided during pregnancy. Warfarin has also been used as a rat poison.

**wart** *n.* a benign growth on the skin caused by infection with *\*human papillomavirus* (a few of the many serotypes are *\*oncogenic*). **Common warts** are firm horny papules, 1–10 mm in diameter, found mainly on the hands. Most will clear spontaneously within two years. **Plantar warts** (or **verrucae**) occur on the soles and are often tender. **Plane warts** are flat and skin-coloured – and therefore difficult to see; they are usually found on the face and may be present in very large numbers. **Anogenital warts** are frequently associated with other genital infections (see **CONDYLOMA**). Treatment of warts is with OTC (over-the-counter) remedies, such as lactic and salicylic acids; *\*cryotherapy* with liquid nitrogen is also effective. Curettage and cautery is very occasionally used, as well as immunotherapy with diphencyclopentenone.

**Warthin's tumour (adenolymphoma)** a tumour of the parotid salivary glands, containing epithelial and lymphoid tissues with cystic spaces. [A. S. Warthin (1866–1931), US pathologist]

**Wassermann reaction** formerly, the most commonly used test for the diagnosis of *\*syphilis*. A sample of the patient's blood is examined, using a *\*complement-fixation* reaction, for the presence of antibodies to the organism *Treponema pallidum*. A positive reaction (WR+) indicates the presence of antibodies and therefore infection with syphilis. [A. P. von Wassermann (1866–1925), German bacteriologist]

**water bed** a bed with a flexible water-containing mattress. The surface of the bed adapts itself to the patient's posture, which leads to greater comfort and fewer pressure sores.

**waterbrash** *n.* sudden filling of the mouth with dilute saliva – this often accompanies dyspepsia, particularly if there is nausea – or with acid or bitter fluid in patients with *\*heartburn*.

**water-deprivation test** a test for *\*diabetes insipidus* in which fluid and food intake is withheld completely for up to 24 hours, with regular measurement of plasma and urinary *\*osmolality* and body weight. Normally (and in a person with psychogenic *\*polydipsia*) the output of *\*vasopressin* will be increased in order to concentrate the urine as the plasma osmolality rises; correspondingly, the urine osmolality also rises and its volume diminishes. In a patient with diabetes insipidus, however, the urine osmolality will remain low and of high volume while the patient steadily dehydrates. The test must be abandoned if the patient loses 3% of body weight.

**Waterhouse–Friderichsen syndrome** acute haemorrhage in the adrenal glands with haemorrhage into the skin associated with the sudden onset of acute bacteraemic *\*shock*. It is usually caused by meningococcal septicaemia (see *MENINGITIS*). [R. Waterhouse (1873–1958), British physician; C. Friderichsen (20th century), Danish physician]

**Waters' projection** a *\*posteroanterior* X-ray film to show the maxillae, maxillary sinuses, and zygomatic bones. [C. A. Waters (1888–1961), US radiologist]

**watt** *n.* the **\*SI unit** of power, equal to 1 joule per second. In electrical terms it is the energy expended per second when a current of 1 ampere flows between two points on a conductor between which there is a potential difference of 1 volt. 1 watt =  $10^7$  ergs per second. Symbol: W.

**Watzke–Allen sign** a test used in the diagnosis of a macular hole in the retina. A thin line of light is projected over the macula with a **\*slit lamp** and the patient is asked to report on its appearance. A line appearing broken may indicate a macular hole.

**weal (hive)** *n.* a transient swelling, confined to a small area of the skin, that is characteristic of **\*urticaria** and also occurs due to **\*dermographism**.

**weaning** *n.* the process of gradually introducing nonmilk feeds to an infant, which is generally recommended between four and six months of age. This is when the gastrointestinal and renal tracts are mature enough to handle the variety of foods ingested.

**weber** *n.* the **\*SI unit** of magnetic flux, equal to the flux linking a circuit of one turn that produces an e.m.f. of 1 volt when reduced uniformly to zero in 1 second. Symbol: Wb.

**Weber's test** a hearing test in which a vibrating tuning fork is placed at the midpoint of the forehead. A normal individual hears it equally in both ears, but if one ear is affected by conductive **\*deafness** the sound appears louder in the affected ear. If one ear has a sensorineural deafness the sound appears louder in the unaffected ear. [F. E. Weber (1832–91), German otologist]

**web space** the soft tissue between the bases of the fingers and toes.

**Wechsler scales** standardized scales for the measurement of **\*intelligence quotient** (IQ) in adults and children. They are administered by a psychologist. *See* **INTELLIGENCE TEST**. [D. Wechsler (1896–1981), US psychologist]

**Wegener's granulomatosis** *see* **GRANULOMATOSIS WITH POLYANGIITIS**. [F. Wegener (1907–90), German pathologist]

**Weigart–Meyer rule** the relationship of the upper and lower parts of a two-part kidney with two ureters and their drainage into the bladder. It states that the upper ureter inserts lower and more medially into the bladder in contrast to the lower ureter, which inserts higher and more laterally into the bladder.

[C. Weigert (1845–1904), German pathologist; R. Meyer (1864–1947), German physician]

**Weil–Felix reaction** a diagnostic test for typhus. A sample of the patient's serum is tested for the presence of antibodies against the organism *Proteus vulgaris*. Although this relatively harmless organism is not the cause of typhus, it possesses certain antigens in common with the causative agent of the disease and can therefore be used instead of it in laboratory tests. Typhus is suspected if antibodies are found to be present. [E. Weil (1880–1922), German physician; A. Felix (1887–1956), Czech bacteriologist]

**Weil's disease** *see* **LEPTOSPIROSIS**. [A. Weil (1848–1916), German physician]

**Weiss ring** a ringlike opacity on the posterior vitreous surface, arising as a result of a posterior **\*vitreous detachment**. It is seen as a ring-shaped **\*floater**.

**Welch's bacillus** *see* **CLOSTRIDIUM**. [W. H. Welch (1850–1934), US pathologist]

**Werdnig–Hoffmann disease** a hereditary disorder – a severe form of **\*spinal muscular atrophy** – in which the cells of the spinal cord begin to die between birth and the age of six months, causing a symmetrical muscle weakness. Affected infants become floppy and progressively weaker; respiratory and facial muscles become affected. Children usually die by the age of 20 months from respiratory failure and there is no treatment. **\*Genetic counselling** is required for parents of an affected child as each of their subsequent children has a one in four chance of being affected. [G. Werdnig (1844–1919), Austrian neurologist; J. Hoffmann (1857–1919), German neurologist]

**Wermer's syndrome** *see* **MENS**. [P. Wermer, US physician]

**Werner's syndrome** a rare genetic disorder resulting in premature ageing that starts at adolescence. Growth may be retarded and affected individuals may suffer from a thin skin, arterial disease, leg ulcers, and diabetes. Treatment is limited to the management of complications, such as diabetes. The gene responsible codes for an enzyme involved in the mechanisms of

DNA replication and repair, which in affected individuals is defective. [C. W. O. Werner (1879–1936), German physician]

**Wernicke's encephalopathy** mental confusion or delirium occurring in combination with paralysis of the eye muscles, *\*nystagmus*, and an unsteady gait. It is caused by a deficiency of vitamin B<sub>1</sub> (thiamine) and is most commonly seen in alcoholics and in patients with persistent vomiting or an unbalanced diet. Treatment with thiamine relieves the symptoms. [K. Wernicke (1848–1905), German neurologist]

**Wertheim's hysterectomy** a radical operation performed for cervical cancer, in which the uterus, upper vagina, broad ligaments, and parametrium are removed in conjunction with regional lymph nodes. [E. Wertheim (1864–1920), Austrian gynaecologist]

**Western blot analysis** a technique for the detection of specific proteins. After separation by *\*electrophoresis*, the proteins are bound to radioactively labelled antibodies and identified by X-ray. *Compare* **NORTHERN BLOT ANALYSIS**; **SOUTHERN BLOT ANALYSIS**.

**West Nile fever** a viral disease caused by the West Nile virus (a *\*flavivirus*), which is spread by the *Culex pipiens* mosquito. It causes encephalitis, with influenza-like symptoms, enlarged lymph nodes, and a bright red rash on the chest and abdomen. In patients with a weakened immune system (such as the elderly) it can progress to convulsions, coma, and paralysis.

**wet-and-dry bulb hygrometer** *see* **HYGROMETER**.

**Wharton's duct** the secretory duct of the submandibular *\*salivary gland*. [T. Wharton (1614–73), English physician]

**Wharton's jelly** the mesoderm tissue of the umbilical cord, which becomes converted to a loose jelly-like *\*mesenchyme* surrounding the umbilical blood vessels.

**wheeze** *n.* an abnormal high-pitched (sibilant) or low-pitched sound heard – either by the unaided human ear or through the stethoscope – mainly during expiration. Wheezes occur as a result of narrowing of the airways, such as

results from **\*bronchospasm** or increased secretion and retention of sputum; they are commonly heard in patients with asthma or chronic bronchitis.

**whiplash injury** a soft-tissue injury of the neck resulting from a sudden jerking back (hyperextension) of the head and neck, usually following a rear-end motor vehicle collision. It is associated with muscle, tendon, and ligament tears and inflammation in the front of the neck, which causes pain and stiffness. The possibility of fractures and other serious spinal injuries should be excluded by X-ray or MRI. Treatment includes analgesics, NSAIDs, a soft surgical collar, and physiotherapy. Symptoms occasionally last for many months or years.

**Whipple's disease** a rare disease, occurring commonly (but not exclusively) in males, in which absorption of digested food in the intestine is reduced. As well as symptoms and signs of **\*malabsorption** there is usually abdominal pain, skin pigmentation, and arthritis. Diagnosis is usually made by small-intestinal biopsy (duodenal or **\*jejunal biopsy**) demonstrating the presence of PAS-positive (see **PERIODIC ACID–SCHIFF REACTION**) macrophages containing the causative microorganism, *Tropheryma whipplei*. The disease usually responds to a prolonged course of antibiotics. [G. H. Whipple (1878–1976), US pathologist]

**Whipple's operation** see **PANCREATECTOMY**. [A. O. Whipple (1881–1963), US surgeon]

**Whipple's triad** a combination of three clinical features that indicate the presence of an **\*insulinoma**: **(1)** attacks of fainting, dizziness, and sweating on fasting; **(2)** severe hypoglycaemia present during the attacks; **(3)** relief from the attacks achieved by administering glucose. [A. O. Whipple]

**whipworm** *n.* a small parasitic whiplike nematode worm, *Trichuris trichiura* (*Trichocephalus dispar*), that lives in the large intestine. Eggs are passed out of the body with the faeces and human infection (see **TRICHURIASIS**) results from the consumption of water or food contaminated with faecal material. The eggs hatch in the small intestine but mature worms migrate to the large intestine.

**whistle-blowing** *n.* expressing concerns about the professional performance of a member of staff, team, or organization. NHS organizations are required

to have a whistle-blowing policy that sets out the procedures to be followed by those who wish to raise questions about an aspect of professional practice. *See also* [PUBLIC INTEREST DISCLOSURE](#).

**Whitaker's test** a direct percutaneous renal infusion test to investigate possible obstruction of the ureter or kidney. It detects subtle obstructions that cannot be detected by imaging. [R. Whitaker (20th century), British urologist]

**white blood cell** *see* [LEUCOCYTE](#).

**white fat** *see* [BROWN FAT](#).

**white finger** the pale waxy appearance of a finger resulting from spasm of the vessels of the finger. It occurs in [\\*Raynaud's disease](#) but can also be attributed to the long-term use of vibrating equipment (**vibration white finger**). In the latter case, it is a source of compensation claims.

**white matter** nerve tissue of the central nervous system that is paler in colour than the associated [\\*grey matter](#) because it contains more nerve fibres and thus larger amounts of the insulating material [\\*myelin](#). In the brain the white matter lies within the grey layer of cerebral cortex; in the spinal cord it is between the arms of the X-shaped central core of grey matter.

**white noise instrument** a device, resembling a small hearing aid, that produces sounds of many frequencies at equal intensities and is used in the treatment of tinnitus. Also known as a **broad-band sound generator**, **ear-level sound generator**, **noiser**, or **wide-band sound generator**, it was formerly known as a **tinnitus masker**.

**whitlow** *n.* *see* [PARONYCHIA](#).

**WHO** *see* [WORLD HEALTH ORGANIZATION](#).

**WHO checklist** a process introduced by the World Health Organization to improve patient safety and reduce errors during surgical procedures. There are three phases: checking before induction of anaesthesia; checking after administration of anaesthesia but before start of surgery (referred to as 'time out'); and checking at the end of the procedure with identification of key concerns for the immediate postoperative period (referred to as 'sign out').

**whoop** *n.* a noisy convulsive drawing in of the breath following the spasmodic coughing attack characteristic of **\*whooping cough**.

**whooping cough** an acute highly infectious disease usually caused by the bacterium *Bordetella pertussis*, primarily affecting infants and often occurring in epidemics. After an incubation period of 1–2 weeks there is a catarrhal stage, in which the infant has signs of an upper respiratory tract infection; transmission is through droplet spread. This is followed by an irritating cough that gradually becomes paroxysmal within 1–2 weeks. The paroxysms are followed by a characteristic **\*whoop** and vomiting. In the very young the classical whoop may not develop and instead the paroxysms may be followed by periods of **\*apnoea**. The illness can last 2–3 months, giving it the name ‘the cough of 100 days’ in some countries. Infection can be complicated by bronchopneumonia, weight loss due to repeated vomiting, **\*bronchiectasis**, and convulsions due to **\*asphyxia** or bleeding into the brain tissue. Minor complications include subconjunctival haemorrhage, **\*epistaxis** (nosebleed), facial **\*oedema**, and ulceration of the tongue.

**\*Immunization** against the infection was introduced in the UK in the 1950s and offers protection. An attack usually confers lifelong immunity. Despite good vaccine coverage resulting in the current low levels of disease, whooping cough is still a significant cause of illness and death in the very young. Medical name: **pertussis**.

**WHR** *see* **waist to hip ratio**.

**Widal reaction** an **\*agglutination** test for the presence of antibodies against the *Salmonella* organisms that cause typhoid fever. It is thus a method of diagnosing the presence of the disease in a patient and also a means of identifying the organisms in infected material. [G. F. I. Widal (1862–1929), French physician]

**Williams syndrome** a hereditary condition, caused by a defect (a **\*deletion**) in chromosome 7, marked by a characteristic ‘elfin’ facial appearance (including large eyes, a wide mouth, and small chin), **\*hypercalcaemia**, short stature, learning disabilities, and **\*aortic stenosis**. Most affected children are highly sociable and have unusual conversational ability, using a rich and complex vocabulary. The condition can be diagnosed prenatally. [J. C. P. Williams (20th century), British physician]

**Williams vulvovaginoplasty** a surgical technique of vaginal reconstruction, with the formation of a pouch between the urethra and rectum.

**Wilms' tumour** *see* **NEPHROBLASTOMA**. [M. Wilms (1867–1918), German surgeon]

**Wilson's disease** an inborn defect of copper metabolism in which there is a deficiency of **\*caeruloplasmin** (which normally forms a nontoxic complex with copper). It is inherited as an autosomal **\*recessive** characteristic. The free copper may be deposited in the liver, causing jaundice and cirrhosis, or in the brain, causing learning disabilities and symptoms resembling **\*parkinsonism**. There is a characteristic brown ring in the cornea (the **Kayser–Fleischer ring**). If the excess copper is removed from the body by regular treatment with **\*penicillamine** both mental and physical deficits tend to improve. Medical name: **hepatolenticular degeneration**. [S. A. K. Wilson (1878–1936), British neurologist]

**windigo psychosis** a delusion of having been transformed into a windigo, a mythical monster that eats human flesh. It is often quoted as an example of a culture-specific syndrome (confined to certain North American Indian tribes).

**windowing** *n.* a technique of image manipulation commonly used in **\*cross-sectional imaging** to manipulate a **\*grey scale** image. Typically there is too much data obtained in a scan to see on a single image: the radiologist therefore chooses the window level centred on the density of the tissue of interest and a window width wide enough to include the densities of all the tissues that need to be seen. Tissues denser than this window usually appear white, and tissues darker appear black. Sometimes several different images of the same scan are required at different window settings to assess adequately all the necessary detail (for example, window settings to observe the lung are different from those for the bones or the soft tissues in the chest on CT). *See also* **HOUNSFIELD UNIT**.

**windpipe** *n. see* **TRACHEA**.

**wisdom tooth** the third permanent **\*molar** tooth on each side of either jaw, which erupts normally around the age of 18 years.

**Wiskott–Aldrich syndrome** a rare *\*sex-linked* recessive disorder characterized by eczema, *\*thrombocytopenia*, and deficiency in the immune response (*\*immunodeficiency*). It is caused by a decrease in the amount of **Wiskott–Aldrich syndrome protein** (WASP: a protein occurring in lymphocytes, platelets, and other cells) due to a mutation in the *WASP* gene.

**witch hazel (*hamamelis*)** a preparation made from the leaves and bark of the tree *Hamamelis virginiana*, used as an *\*astringent*, especially for the treatment of sprains and bruises.

**withdrawal** *n.* **1. (social withdrawal)** (in psychology and psychiatry) the removal of one's interest from one's surroundings. *See also* **BEREAVEMENT**. **2. see** **COITUS INTERRUPTUS**. **3. see** **THOUGHT WITHDRAWAL**. **4.** (of treatment) the correct change to *\*palliative* care when someone is *\*dying*.

**withdrawal symptoms** *see* **DEPENDENCE**.

**Wohlfahrtia** *n.* a genus of non-bloodsucking flies. Females of the species *W. magnifica* and *W. vigil* deposit their parasitic maggots in wounds and the openings of the body. This causes *\*myiasis*, particularly in children.

**Wolff–Chaikoff effect** the inhibition of thyroid hormone production by administration of large doses of iodide. This occurs at a critical dosage level below which the addition of iodide to an iodine-deficient individual results in increased production of thyroid hormone. The effect is transient in individuals with normal thyroids but may persist in thyroiditis; it can be utilized medically to induce a hypothyroid state, for example in patients with *\*thyroid crisis* (*see* **LUGOL'S SOLUTION**). [L. Wolff (1898–1972), US cardiologist; I. L. Chaikoff (20th century), US physiologist]

**Wolffian body** *see* **MESONEPHROS**. [K. F. Wolff (1733–94), German anatomist]

**Wolffian duct** *see* **MESONEPHROS**.

**Wolff–Parkinson–White syndrome** a congenital abnormality of heart conduction caused by the presence of an *\*accessory pathway* of conduction between the atria and ventricles. It results in premature excitation of one ventricle and is characterized by an abnormal wave (**delta wave**) at the start of the QRS complex on the electrocardiogram. The accessory pathway

predisposes the patient to episodes of fast heart rate due to the rapid self-sustaining circulation of an electrical impulse from the atria to the ventricles and back again (*\*atrioventricular reciprocating tachycardia*). Emergency treatment is in the form of drugs that temporarily block the re-entry circuit. Permanent destruction of the accessory pathway by *\*radiofrequency ablation* is usually curative. [L. Wolff; Sir J. Parkinson (1885–1976), British physician; P. D. White (1886–1973), US cardiologist]

**Wolfram syndrome (DIDMOAD syndrome)** a rare syndrome consisting of a combination of *\*diabetes insipidus*, *\*diabetes mellitus*, *\*optic atrophy*, and *\*deafness*.

**womb** *n.* *see* UTERUS.

**Wood's light** ultraviolet light filtered through a nickel oxide prism, which causes fluorescence in skin and hair affected by some fungal and bacterial infections and is therefore useful in diagnosis. For example, *\*erythrasma* fluoresces coral pink, while scalp ringworm caused by *Microsporum* species fluoresces green. [R. W. Wood (1868–1955), US physician]

**Woods' screw manoeuvre** an internal rotational manoeuvre to facilitate delivery in cases of *\*shoulder dystocia* that have not responded to other measures. Using the fingertips of both hands, pressure is applied from behind the anterior shoulder and in front of the posterior shoulder. [C. E. Woods (20th century), US obstetrician]

**woolsorter's disease** *see* ANTHRAX.

**word blindness** *see* ALEXIA.

**working tax credit** a benefit payable to working people with a low income. There are four categories of eligibility: a person responsible for a child; a disabled person; a person who is aged over 50, has recently started work, and was receiving certain benefits before starting work; and a person aged over 25 and working more than 30 hours per week. Working tax credit is in the process of being replaced by *\*universal credit*.

**World Health Organization (WHO)** an international organization working to improve global public health. Membership is open to all countries, and the member states are divided into six regions; the United Kingdom is part of the

WHO European Region. Health issues are discussed and policies evolved mainly through topic-specific working groups. WHO staff are seconded by invitation to advise countries on solving public health problems (especially infectious disease control). WHO handles information on the internationally **\*notifiable diseases**, publishes the **\*International Classification of Diseases**, and awards fellowships to enable health staff from poorer countries to obtain further training.

<https://www.who.int/en/>

- WHO website

**worm** *n.* any member of several groups of soft-bodied legless animals, including flatworms, nematode worms, earthworms, and leeches, that were formerly thought to be closely related and classified as a single group – Vermes.

**wormian bone** one of a number of small bones that occur in the cranial sutures.

**wound** *n.* a break in the structure of an organ or tissue caused by an external agent. Bruises, grazes, tears, cuts, punctures, and burns are all examples of wounds.

**wound colonization** the presence of multiplying bacteria within a wound that do not cause inflammation or clinical symptoms. This may be due to the presence of natural flora or to environmental or endogenous factors. Healing is not delayed.

**woven bone** immature bone, in which the collagen fibres are arranged haphazardly and the cells have no specific orientation. It is typically found in the early stages of fracture healing, eventually being replaced by mature **\*lamellar bone**.

**wrist** *n.* **1.** the joint between the forearm and hand. It consists of the proximal bones of the **\*carpus**, which articulate with the radius and ulna. **2.** the whole region of the wrist joint, including the carpus and lower parts of the radius and ulna.

**wrist drop** paralysis of the muscles that raise the wrist, which is caused by damage to the **\*radial nerve**. This may result from compression of the nerve against the humerus in the upper arm or from selective damage to the nerve, which is a feature of **\*lead** poisoning.

**wryneck** *n.* *see* TORTICOLLIS.

**Wuchereria** *n.* a genus of white threadlike parasitic worms (*see* FILARIA) that live in the lymphatic vessels. *W. bancrofti* is a tropical and subtropical species that causes **\*elephantiasis**, lymphangitis, and chyluria. The immature forms concentrate in the lungs during the day. At night they become more numerous in the blood vessels of the skin, from which they are taken up by blood-sucking mosquitoes, acting as carriers of the diseases they cause.

**xanthaemia (carotenaemia)** *n.* the presence in the blood of the yellow pigment **\*carotene**, from excessive intake of carrots, tomatoes, or other vegetables containing the pigment.

**xanthelasma** *n.* yellow **\*plaques** occurring symmetrically around the eyelids. It is quite common in elderly people and of no more than cosmetic importance, but in some cases it may be a manifestation of disorders of fat metabolism (hyperlipidaemia). The plaques may be removed surgically or by careful use of saturated trichloroacetic acid.

**xanthine** *n.* a nitrogenous breakdown product of the purines adenosine and guanine. Xanthine is an intermediate product of the breakdown of nucleic acids to uric acid.

**xanthinuria** *n.* excess of the purine derivative **\*xanthine** in the urine, usually the result of an inborn defect of metabolism. It is both rare and symptomless.

**xantho-** *combining form denoting yellow colour.*

**xanthochromia** *n.* yellow discoloration, such as may affect the skin (for example, in jaundice) or the cerebrospinal fluid (when it contains the breakdown products of haemoglobin from red blood cells that have entered it).

**xanthoma** *n.* (*pl.* **xanthomata**) a yellowish skin lesion associated with any of various disorders of lipid metabolism. There are several types of xanthomata. **Tuberous xanthomata** are found on the knees and elbows; **tendon xanthomata** involve the extensor tendons of the hands and feet and the Achilles tendon. Crops of small yellow papules at any site are known as

**eruptive xanthomata**, while larger flat lesions are called **plane xanthomata**.

**xanthomatosis** *n.* the presence of multiple xanthomata in the skin. *See* **XANTHOMA**.

**xanthophyll** *n.* a member of a class of yellow carotenoid pigments found in green leaves. Examples of xanthophylls are **\*lutein**, zeaxanthin, and **\*mesozeaxanthin**.

**xanthopsia** *n.* yellow vision: the condition in which all objects appear to have a yellowish tinge. It is sometimes experienced in digitalis poisoning.

**X chromosome** the sex chromosome present in both sexes. Women have two X chromosomes and men one. Genes for some important genetic disorders, including **\*haemophilia**, are carried on the X chromosomes; these genes are described as **\*sex-linked**. *Compare* **Y CHROMOSOME**.

**Xeloda** *n.* *see* **CAPECITABINE**.

**xeno-** *combining form denoting* different; foreign; alien.

**xenodiagnosis** *n.* a procedure for diagnosing infections transmitted by insect carriers. Uninfected insects of the species known to carry the disease in question are allowed to suck the blood of a patient suspected of having the disease. A positive diagnosis is made if the disease parasites appear in the insects. This method has proved invaluable for diagnosing Chagas' disease, using reduviid bugs (the carriers), since the parasites are not always easily detected in blood smears.

**xenogeneic** *adj.* describing grafted tissue derived from a donor of a different species.

**xenograft (heterograft)** *n.* a living tissue graft that is made from an animal of one species to another of a different species. For example, attempts have been made to graft animal organs into humans. **\*Bioengineering** techniques are now available to produce animals whose **\*MHC** is compatible with that of another species. Xenografts currently used include porcine heart valves and porcine skin for specific types of hernia repair. *See also* **XENOTRANSPLANTATION**.

**xenon-133** *n.* a radioactive isotope that has a half-life of about five days and is used in ventilation scanning of the lungs in nuclear medicine (*see* **VENTILATION-PERFUSION SCANNING**). It gives off beta particles, which are responsible for the relatively high radiation dose compared to **\*krypton-81m**. Symbol: Xe-133.

**xenophobia** *n.* excessive fear of strangers and foreigners. *See* **PHOBIA**.

**Xenopsylla** *n.* a genus of tropical and subtropical fleas, with some 40 species. The rat flea, *X. cheopis*, occasionally attacks humans and can transmit plague from an infected rat population; it also transmits murine typhus and two tapeworms, **\*Hymenolepis nana** and *H. diminuta*.

**xenotransplantation** *n.* the **\*transplantation** of organs from one species into another. Experimental work into the feasibility of transplanting pig organs into human beings is under way. It includes the genetic manipulation of pig embryos to produce animals whose organs produce a human cell-surface protein and would therefore not be rejected at transplantation.

**xero-** *combining form denoting a dry condition.*

**xeroderma** *n.* a mild form of the hereditary disorder **\*ichthyosis**, in which the skin develops slight dryness and forms branlike scales. It is common in the elderly. **Xeroderma pigmentosum** is a rare genetically determined disorder (*see* **GENODERMATOSIS**) in which there is an inherited defect in the **\*DNA repair** mechanism in the skin, which corrects ultraviolet radiation damage; this leads to multiple skin cancers. Affected individuals must avoid exposure to sunlight.

**xerophthalmia** *n.* a progressive nutritional disease of the eye due to deficiency of **\*vitamin A**. The cornea and conjunctiva become dry, thickened, and wrinkled. This may progress to **\*keratomalacia** and eventual blindness.

**xeroradiography** *n.* a type of X-ray imaging in which a picture of the body is recorded on paper rather than on film. A plate of selenium, which rests on a thin layer of aluminium oxide, is charged uniformly by passing it in front of a scorotron. As X-ray photons impinge on this, charges diffuse out in proportion to the energy content of the X-ray. An imprint is formed by the charge distribution on the plate, which attracts toner particles and is transferred to reusable paper plates. Unlike conventional X-ray imaging,

xeroradiography does not require photographic developers. The technique does, however, require more radiation exposure. It was widely used in mammography prior to the advent of digital mammography.

**xerosis** *n.* abnormal dryness of the conjunctiva, the skin, or the mucous membranes. Xerosis affecting the conjunctiva is due to changes in the membrane itself, which becomes thickened and grey in the area exposed when the eyelids are open.

**xerostomia** *n.* *see* **DRY MOUTH**. Compare **PTYALISM**.

**xiphi- (xipho-)** *combining form denoting the xiphoid process of the sternum.* Example: **xiphocostal** (relating to the xiphoid process and ribs).

**xiphisternum** *n.* *see* **XIPHOID PROCESS**.

**xiphoid process (xiphoid cartilage)** the lowermost section of the breastbone (*see* **STERNUM**): a flat pointed cartilage that gradually ossifies until it is completely replaced by bone, a process not completed until after middle age. It does not articulate with any ribs. Also called: **ensiform process** or **cartilage, xiphisternum**.

**X-linked disease** *see* **SEX-LINKED**.

**X-linked lymphoproliferative syndrome (XLP syndrome, Duncan's disease)** a hereditary disorder of the immune system caused by a defective **\*sex-linked** gene carried on an **\*X chromosome**. There is uncontrolled proliferation of B-**\*lymphocytes** in response to infection by the Epstein-Barr virus, which can lead to fulminating hepatitis or lymphoma. This condition is due to a defect in a gene, *SAP*, which encodes a signalling molecule found in the cytoplasm of cells.

**XLP syndrome** *see* **X-LINKED LYMPHOPROLIFERATIVE SYNDROME**.

**Xolair** *n.* *see* **OMALIZUMAB**.

**X-rays** *pl. n.* electromagnetic radiation of extremely short wavelength (beyond the ultraviolet), which pass through matter to varying degrees depending on its density. X-rays are produced when high-energy beams of electrons strike matter. They are physically indistinguishable from gamma

rays, produced during radioactive decay. Both are used in diagnostic *\*radiology* (see RADIOGRAPHY; NUCLEAR MEDICINE) and in *\*radiotherapy*. Great care is needed to avoid unnecessary exposure, because the radiation is harmful to all living things (see IONIZATION; RADIATION SICKNESS). Heavy elements, such as lead and barium, tend to stop X-rays and can be used to shield people from unwanted exposure to ionizing radiation.

**X-ray screening** the use of an image intensifier to produce *\*real-time imaging* during an X-ray examination on a TV monitor. It is widely used in angiography and *\*interventional radiology* to guide procedures. See VIDEOFLUOROSCOPY.

**xylene (dimethylbenzene)** *n.* a liquid used for increasing the transparency of tissues prepared for microscopic examination after dehydration. See CLEARING.

**xylometazoline** *n.* a *\*sympathomimetic* drug that constricts blood vessels (see VASOCONSTRICTOR). It is applied topically as a nasal decongestant for the relief of the common cold and sinusitis. Toxic effects are rare, but the congestion may worsen transiently when treatment stops.

**xylose** *n.* a pentose sugar (i.e. one with five carbon atoms) that is involved in carbohydrate interconversions within cells. It is used as a diagnostic aid for intestinal function.

**YAG laser** a type of **\*laser** whose active medium is a crystal of yttrium, aluminium, and garnet. It is used for cutting tissue, for example in lens **\*capsulotomy** or **\*iridotomy**. Specialized types (e.g. the **\*holmium:YAG laser**) are used for various specific purposes.

**yawning** *n.* a reflex action in which the mouth is opened wide and air is drawn into the lungs then slowly released. It is triggered by drowsiness, fatigue, or boredom.

**yaws (pian, framboesia)** *n.* a tropical infectious disease caused by the spirochaete *Treponema pertenue* in the skin and its underlying tissues. Yaws occurs chiefly in conditions of poor hygiene. It is transmitted by direct contact with infected persons and their clothing and possibly also by flies of the genus *Hippelates*. The spirochaetes enter through abrasions on the skin. Initial symptoms include fever, pains, and itching, followed by the appearance of small tumours, each covered by a yellow crust of dried serum, on the hands, face, legs, and feet. These tumours may deteriorate into deep ulcers. The final stage of yaws, which may appear after an interval of several years, involves destructive and deforming lesions of the skin, bones, and periosteum (*see also* **GANGOSA**; **GOUNDOU**). Yaws, which commonly affects children, is prevalent in hot humid lowlands of equatorial Africa, tropical America, the Far East, and the West Indies. It responds well to antibiotics.

**Y chromosome** a sex chromosome that is present in men but not in women. It carries the SRY (sex reversal on Y) gene, which encodes a protein (**testis-determining factor**, or **SRY protein**) that switches the default female pathway of embryonic development to the male pathway by initiating testis formation. *Compare* **X CHROMOSOME**.

**years of life lost (YLL, years of potential life lost, YPLL, potential years of life lost, PYLL)** a measure of premature mortality that calculates the number of additional years a person could have expected to live, on average, had they not died prematurely. A reference age intended to represent the total number of years a person can expect to live, on average, is required for the calculation: this is often given in square brackets after YLL. Negative values for YLL are not used: if somebody survives longer than the reference age, their YLL is calculated as 0. YLLs for different diseases can be compared across populations to give an indication of which diseases carry the greatest burden of premature mortality.

**yeast** *n.* any of a group of fungi in which the body (mycelium) consists of individual cells, which may occur singly, in groups of two or three, or in chains. Yeasts reproduce by budding and by the formation of sexual spores (in the case of the perfect yeasts) or asexual spores (in the case of the imperfect yeasts). Baker's yeast (*Saccharomyces*) ferments carbohydrates to produce alcohol and carbon dioxide and is important in brewing and breadmaking. Some yeasts are a commercial source of proteins and of vitamins of the B complex. Yeasts that cause disease in humans include *\*Candida*, *\*Cryptococcus*, and *\*Malassezia*.

**yellow fever** an infectious disease, caused by an *\*arbovirus*, occurring in tropical Africa and the northern regions of South America. It is transmitted by mosquitoes, principally *Aedes aegypti*. The virus causes degeneration of the tissues of the liver and kidneys. Symptoms, depending on severity of infection, include chill, headache, pains in the back and limbs, fever, vomiting, constipation, a reduced flow of urine (which contains high levels of albumin), and *\*jaundice*. The more serious cases may prove fatal, but recovery from a first attack confers subsequent immunity. The disease is treated by fluid replacement and can be prevented by vaccination.

**yellow spot** *see* *MACULA*.

**Yersinia** *n.* a genus of aerobic or facultatively anaerobic Gram-negative bacteria that are parasites of animals and humans. *Y. pestis* causes bubonic *\*plague*; *Y. enterocolitica* causes intestinal infections.

**YLL** *see* *years of life lost*.

**yolk (deutoplasm)** *n.* a substance, rich in protein and fat, that is laid down within the egg cell as nourishment for the embryo. It is absent (or nearly so) from the eggs of mammals (including humans) whose embryos absorb nutrients from their mother.

**yolk sac (vitelline sac)** the membranous sac, composed of mesoderm lined with endoderm, that lies ventral to the embryo. It is one of the *\*extraembryonic membranes*. Its initially wide communication with the future gut is later reduced to a narrow duct passing through the *\*umbilicus*. It probably assists in transporting nutrients to the early embryo and is one of the first sites where blood cells are formed.

**YPLL** *see* *years of life lost*.

**yttrium-90** *n.* an artificial radioactive isotope of the element yttrium used in *\*radiotherapy*.

# Z

**zafirlukast** *n.* *see* LEUKOTRIENE RECEPTOR ANTAGONIST.

**zaleplon** *n.* *see* HYPNOTIC.

**zanamivir** *n.* an antiviral drug that acts by inhibiting the action of neuraminidase in viruses. This enzyme destroys the receptor sites on the surface of the host cells. Zanamivir is used for the treatment and prevention of influenza A and B. To be effective, the drug must be taken within 48 hours of the onset of symptoms (for treatment) or within 36 hours of exposure (for prevention). It is liable to cause tightening of the bronchial tubes and this may be dangerous in people with asthma.

**Zantac** *n.* *see* RANITIDINE.

**zeaxanthin** *n.* *see* LUTEIN.

**zein** *n.* a protein found in maize.

**zidovudine (AZT)** *n.* a \*reverse transcriptase inhibitor used in the treatment of AIDS and HIV infection. The drug slows the growth of HIV infection in the body, but is not curative. It is administered in combination with other \*antiretroviral drugs; the most common side-effects are nausea, headache, and insomnia, and it may damage the blood-forming tissues of the bone marrow.

**Ziehl–Neelsen stain** an acid-fast \*carbol fuchsin stain used specifically for identifying the tubercle bacillus. [F. Ziehl (1857–1926), German bacteriologist; F. K. A. Neelsen (1854–94), German pathologist]

**Zieve's syndrome** a combination of severe \*hyperlipidaemia, haemolytic \*anaemia, and \*jaundice seen in susceptible individuals drinking alcohol to

excess. [L. Zieve (1915–2000), US physician]

**Zika virus** a mosquito-borne virus that usually causes mild symptoms in humans, including fever, skin rashes, muscle and joint pain, and headache. However, infection during pregnancy can result in brain abnormalities of the fetus, notably *\*microcephaly*. Zika virus can also trigger *\*Guillain–Barré syndrome*. Infection is usually from a mosquito bite, although the virus may also be transmitted by sexual intercourse.

**zinc** *n.* a *\*trace element* that is a cofactor of many enzymes: it is important in the immune response and has structural properties in some proteins. Deficiency is rare with a balanced diet but may occur in alcoholics and those with kidney disease; symptoms include lesions of the skin, oesophagus, and cornea, alopecia, and (in children) retarded growth. The adult RNI (*see DIETARY REFERENCE VALUES*) is 9.5 µg/day for men and 7.0 µg/day for women (an additional 6 µg is needed during lactation). Symbol: Zn.

**zinc oxide** a mild *\*astringent* used in various skin conditions, usually mixed with other substances.

**zinc sulphate** a preparation used in the treatment of proven zinc deficiency.

**zinc undecenoate (zinc undecylenate)** an antifungal agent with uses similar to those of *\*undecenoic acid*.

**zoledronic acid (zolendronate)** a *\*bisphosphonate* drug that is used to treat Paget's disease and malignant *\*hypercalcaemia* and is also establishing a role in treating bone metastases, both in terms of symptom relief and preventing bone fractures.

**Zollinger–Ellison syndrome** a rare disorder in which there is excessive secretion of gastric juice due to high levels of circulating *\*gastrin*, which is produced by a pancreatic tumour (*see GASTRINOMA*) or an enlarged pancreas. The high levels of stomach acid cause diarrhoea and peptic ulcers, which may be multiple, in unusual sites (e.g. jejunum), or which may quickly recur after *\*vagotomy* or partial *\*gastrectomy*. Treatment with proton-pump inhibitors, by removal of the tumour (if benign), or by total gastrectomy is usually effective. [R. M. Zollinger (1903–92) and E. H. Ellison (1918–70), US physicians]

**zolmitriptan** *n.* *see* 5HT<sub>1</sub> AGONIST.

**zolpidem** *n.* *see* HYPNOTIC.

**zona pellucida** the thick membrane that develops around the mammalian oocyte within the ovarian follicle. It is penetrated by at least one spermatozoon at fertilization and persists around the \*blastocyst until it reaches the uterus. *See* OVUM.

**zonula** *n.* *see* ZONULE.

**zonule (zonula)** *n.* (in anatomy) a small band or zone; for example the **zonule of Zinn (zonula ciliaris)** is the suspensory ligament of the eye. — **zonular** *adj.*

**zonulolysis** *n.* dissolution of the suspensory ligament (**zonule of Zinn**) of the lens of the eye by means of an enzyme solution, which facilitates intracapsular removal of a lens affected by cataract. This technique is not used for modern cataract surgery.

**zoo-** *combining form denoting* animals.

**zoonosis** *n.* an infectious disease of animals that can be transmitted to humans. *See* ANTHRAX; AVIAN INFLUENZA; BRUCELLOSIS; CAT-SCRATCH DISEASE; COWPOX; GLANDERS; Q FEVER; RIFT VALLEY FEVER; RABIES; RAT-BITE FEVER; TOXOPLASMOSIS; TULARAEMIA; TYPHUS.

**zoophobia** *n.* excessively strong fear of animals. *See* PHOBIA.

**zopiclone** *n.* *see* HYPNOTIC.

**zwitterion** *n.* an ion that bears a positive and a negative charge. Amino acids can yield zwitterions.

**Zyban** *n.* *see* BUPROPION.

**zygoma** *n.* *see* ZYGOMATIC ARCH; ZYGOMATIC BONE.

**zygomatic arch (zygoma)** the horizontal arch of bone on either side of the face, just below the eyes, formed by connected processes of the zygomatic and temporal bones. *See* SKULL.

**zygomatic bone** (**zygoma**, **malar bone**) either of a pair of bones that form the prominent part of the cheeks and contribute to the orbits. See **SKULL**.

**zygote** *n.* the fertilized ovum before **\*cleavage** begins. It contains both male and female pronuclei.

**zygotene** *n.* the second stage of the first prophase of **\*meiosis**, in which the homologous chromosomes form pairs (bivalents).

**zym-** (**zymo-**) *combining form denoting* **1.** an enzyme. **2.** fermentation.

**zymogen** *n.* see **PROENZYME**.

**zymology** *n.* the science of the study of yeasts and fermentation.

**zymolysis** *n.* the process of **\*fermentation** or digestion by an enzyme.

**zymosis** *n.* **1.** the process of **\*fermentation**, brought about by yeast organisms. **2.** the changes in the body that occur in certain infectious diseases, once thought to be the result of a process similar to fermentation. —**zymotic** *adj.*

**zymotic disease** an old name for a contagious disease, which was formerly thought to develop within the body following infection in a process similar to the fermentation and growth of yeast.

## **2. Biochemical reference values for blood**

(B = whole blood; P = plasma; S = serum)

**Table 2.1 Everyday tests**

Determination	Sample	Reference range
Alcohol legal limit (UK)	B or P	<17.4 mmol/l
Albumin	P	35–50 g/l
in pregnancy	P	25–38 g/l
Ammonia	B	<40 $\mu\text{mol/l}$
$\alpha$ -Amylase	P	25–180 somogyi units/dl
Anion gap ( $\text{Na}^+ + \text{K}^+ - (\text{HCO}_3^- + \text{Cl}^-)$ )	P	12–16 mmol/l
Bilirubin	P	3–17 $\mu\text{mol/l}$
Bicarbonate (see also Table 2.2)	P	22–28 mmol/l
Calcium		
ionized	P	1.0–1.25 mmol/l
total	P	2.12–2.65 mmol/l
total in pregnancy	P	1.95–2.35 mmol/l
Chloride	P	95–105 mmol/l
Cholesterol (see also Table 2.6)	P	3.9–7.8 mmol/l
Copper	P	12–26 $\mu\text{mol/l}$
Creatinine	P	70–150 $\mu\text{mol/l}$
in pregnancy	P	24–68 $\mu\text{mol/l}$
Digoxin		
children	P	2.0–3.0 nmol/l
adults	P	1.0–2.0 nmol/l
Glucose (fasting)	P	3.0–5.0 mmol/l
Glycated haemoglobin ( $\text{HbA}_{1\text{C}}$ )	B	5–8%
Iron		
male	S	14–31 $\mu\text{mol/l}$
female	S	11–30 $\mu\text{mol/l}$
total iron-binding capacity (TIBC)	S	45–75 $\mu\text{mol/l}$
Lactate		
venous	B	0.5–2.2 mmol/l
arterial	B	0.5–1.6 mmol/l
Magnesium	P	0.75–1.05 mmol/l
Osmolality	P	278–305 mosm/kg
Phosphate (inorganic)	P	0.8–1.45 mmol/l
Potassium	P	3.5–5.0 mmol/l
Protein (total)	P	60–80 g/l
Sodium	P	135–145 mmol/l
Troponin I	P	<0.2 ng/ml
Troponin T	P	<0.1 ng/ml
Urea	P	2.5–6.7 mmol/l
in pregnancy	P	2.0–2 mmol/l
Urea nitrogen (BUN)	P	1.16–3.12 mmol/l
Uric acid		
male	P	210–480 $\mu\text{mol/l}$
female	P	150–390 $\mu\text{mol/l}$

**Table 2.3 Diagnostic enzymes**

Enzyme	Sample	Reference range
Acid phosphatase		
total	S	1–5 U/l
prostatic	S	0–1 U/l
Alkaline phosphatase	P	80–250 U/l
Alanine aminotransferase (ALT)	P	5–35 U/l
$\alpha$ -Amylase	P	25–180 somogyi units/dl
Angiotensin-converting enzyme (ACE)	S	21–54 U/l
Aspartate aminotransferase (AST)	P	15–42 U/l
Creatine kinase (CK)		
male	P	24–195 U/l
female	P	24–70 U/l
Gamma-glutamyl transferase (GGT)		
male	P	11–51 U/l
female	P	7–35 U/l
Lactate dehydrogenase (total)	P	240–525 U/l

**Table 2.4 Hormones**

<b>Hormone</b>	<b>Sample</b>	<b>Reference range</b>
Adrenaline (epinephrine)	P	0.03–1.31 nmol/l
ACTH	P	3.3–15.4 pmol/l
Aldosterone		
recumbent	P	100–450 pmol/l
midday	P	2-fold increase of recumbent level
Angiotensin II	P	5–35 pmol/l
Antidiuretic hormone (ADH)	P	0.9–4.6 pmol/l
Calcitonin		
male	P	<100 nmol/l
female	P	<30 nmol/l
Cortisol		
00.00 h	P	80–280 nmol/l
09.00 h	P	280–700 nmol/l
Follicle-stimulating hormone (FSH)		
follicular phase	P or S	0.5–5.0 U/l
ovulatory peak	P or S	8–15 U/l
luteal phase	P or S	2–8 U/l
postmenopause	P or S	> 30 U/l
male	P or S	0.5–5.0 U/l
Gastrin		
male + female (>60 yr)	P	<50 pmol/l
female (16–60 yr)	P	<38 pmol/l
Glucagon	P	<50 pmol/l
Growth hormone	P	<20 mU/l
Human chorionic gonadotrophin	S	<5U/l
Insulin (fasting)	P	<15mU/l
Insulin C-peptide (fasting)	P	<0.4 nmol/l (undetectable in hypoglycaemia)
Insulin-like growth factor-1 (IFG-1)	P	0.52–3.4 kU/l
Luteinizing hormone		
premenopausal	P or S	6–13 U/l
follicular phase	P or S	3–12 U/l
ovulatory peak	P or S	20–80 U/l
luteal phase	P or S	3–16 U/l
postmenopause	P or S	>30 U/l
male	P or S	3–8 U/l
Noradrenaline	P	0.47–4.14 mmol/l
17- $\beta$ -oestradiol		
follicular phase	P	75–260 pmol/l
mid-cycle	P	370–1470 pmol/l
luteal phase	P	180–1100 pmol/l
male	P	<220 pmol/l
Parathyroid hormone (intact)	P	0.9–5.4 pmol/l
Pancreatic polypeptide	P	<200 pmol/l

<b>Hormone</b>	<b>Sample</b>	<b>Reference range</b>
Progesterone		
male	P	<5 nmol/l
female postovulation	P	15–77nmol/l
follicular (newborn)	P	<3 nmol/l
17-Hydroxyprogesterone	P	7–16 nmol/l
Prolactin		
male	P	<450 U/l
female	P	<600 U/l
Renin activity	P	
recumbent		1.1–2.7 pmol/ml per hr
erect after 30 min		3.0–4.3 pmol/ml per hr
Somatostatin	P	30–166 pmol/l
Testosterone		
male	P or S	9–42 nmol/l
female	P or S	1–2.5 nmol/l
Thyroid-stimulating hormone	P	0.5–5.5 mU/l
Thyroid-binding globulin	P	13–28 mg/l
Triiodothyronine (T <sub>3</sub> )	P	1–3 nmol/l
Free T <sub>3</sub>	P	3.3–8.2 pmol/l
Thyroxine (T <sub>4</sub> )	P	70–140 nmol/l
Free T <sub>4</sub>	P	9–25 pmol/l
Vasoactive intestinal peptide (VIP)	P	<30 pmol/l

**Table 2.5 Proteins and immunoproteins**

<b>Protein/immunoprotein</b>	<b>Sample</b>	<b>Reference range</b>
Albumin	P	35–50 g/l
$\alpha_1$ -Antitrypsin	S	107–209 mg/l
Complement		
C3		65–190 mg/dl
C4		15–50 mg/dl
Caeruloplasmin	S	16–0 mg/dl
C1 esterase inhibitor	S	15–5 mg/dl
C-reactive protein (CRP)	S	<10 mg/l
Ferritin	S	14–200 ug/l
Fibrinogen	P	2–4 g/l
D-dimer	S	<500 ug/l
Haptoglobins	S	0.6–2.6 g/l
Immunoglobulins		
IgG	S	6.0–13.0 g/l
IgA	S	0.8–3.0 g/l
IgM	S	0.4–2.5 g/l
IgE	S	<120 kU/l
$\beta_2$ -Microglobulin	S	<3 mg/l
Thyroid microsomal antibodies		
male	S	<1/400
female (<44 yr)	S	<1/400
female (>44 yr)	S	<1/6400
Total protein	P	60–0 g/l
$\beta_1$ -Transferrin	S	1.2–2.0 g/l

**Table 2.6 Lipids and lipoproteins**

<b>Lipid/lipoprotein</b>	<b>Sample</b>	<b>Reference range</b>
Cholesterol	P	3.9–7.8 mmol/l
ideal upper limit		5.2 mmol/l
acceptable upper limit		6.5 mmol/l
Triglyceride (fasting)	P	0.55–1.90 mmol/l
Nonesterified (free)	S	
fatty acids (NEFA)		
male		0.19–0.78 mmol/l
female		0.06–0.9 mmol/l
Lipoproteins (as cholesterol)		
low-density (LDL)	S	1.55–4.4 mmol/l
ideal upper limit		3.4 mmol/l
acceptable upper limit		4.2 mmol/l
high density (HDL)	S	0.8–2.0 mmol/l
ideal (male)		>0.9 mmol/l
ideal (female)		>1.2 mmol/l
Total cholesterol/HDL ideal	S	<5 ratio

**Table 2.7 Vitamins**

<b>Vitamin</b>	<b>Sample</b>	<b>Reference range</b>
Vitamin A		
(retinol)	S	
male		1.06–3.35 $\mu\text{mol/l}$
female		0.84–2.95 $\mu\text{mol/l}$
$\beta$ -carotene	S	
male		0.01–6.52 $\mu\text{mol/l}$
female		0.019–2.93 $\mu\text{mol/l}$
Vitamin B		
Thiamine (B <sub>1</sub> )	P	>40 nmol/l
Riboflavin (B <sub>2</sub> )	S	100–630 nmol/l
Pyridoxine (B <sub>6</sub> )	P (EDTA)	20–120 nmol/l
Vitamin B <sub>12</sub>	S	138–780 nmol/l
Folate	S	12–33 $\mu\text{mol/l}$
red blood cell folate	B	500–1300 $\mu\text{mol/l}$
Vitamin D metabolites		
25-(OH) D	S	17–125 nmol/l
1,25-(OH) <sub>2</sub> D <sub>3</sub>	S	50–120 pmol/l
Vitamin E ( $\alpha$ -tocopherol)	S	11.5–35 $\mu\text{mol/l}$

**Table 2.8 Tumour markers**

<b>Tumour marker</b>	<b>Sample</b>	<b>Reference range</b>
Alpha-fetoprotein (AFP)	S	<10 kU/l
Carcino-embryonic antigen (CEA)	S	<10 ug/l
Neuron-specific enolase (NSE)	S	<12 ug/l
Prostate-specific antigen (PSA)	S	<4 ug/l
Human chorionic gonadotrophin (hCG)	S	<5 IU/l
CA125	S	<35 U/ml
CA19-9	S	<33 U/ml

---

### **3. Biochemical reference values for urine**

Determination	Reference range
Aldosterone	10–50 nmol/24 h
Albumin	<80 mg/24 h
$\alpha$ -Aminolaevulinic acid	9.9–53.4 $\mu$ mol/24 h
Amylase	
secretion rate	1–17 somogyi U/h
clearance	0.01–0.04 of creatinine clearance value
Arginine	1.3–6.5 $\mu$ mol/mol creat
Ascorbic acid	34–68 $\mu$ mol/l
Calcium	2.5–7.5 mmol/24 h
Catecholamines	<2.6 $\mu$ mol/24 h
Chloride	110–250 mmol/24 h
Copper	0.47–0.55 $\mu$ mol/l
Cortisol	60–1500 nmol/l
	<280 nmol/24 h
Creatinine	
male	9.0–17.0 mmol/24 h
female	7.5–12.5 mmol/24 h
pregnancy	8.0–13.5 mmol/24 h
Glucose	0.06–0.84 mmol/l
Homovanillic acid (HVA) - adults	<43 $\mu$ mol/24 h
Hydroxyindoleacetic acid (5-HIAA)	16–73 $\mu$ mol/24 h
Hydroxymethylmandelic acid (HMMA)	16–48 $\mu$ mol/24 h
Iron	<1.8 $\mu$ mol/24 h
Lead	<0.4 $\mu$ mol/l
$\beta_2$ -Microglobulin	4–370 $\mu$ g/l
Magnesium	3.3–4.9 mmol/24 h
Osmolality	350–1000 mosm/kg
Oxalate	<450 $\mu$ mol/24 h
Phosphate (inorganic)	15–50 mmol/24 h
Porphyrins	
coproporphyrin	50–350 nmol/24 h
porphobilinogen	0.9–8.8 $\mu$ mol/24 h
uroporphyrin	0–49 nmol/24 h
Potassium	20–60 mmol/l
	40–120 mmol/24 h
Protein	<120 mg/24h
pregnancy	<300 mg/24 h
Sodium	50–125 mmol/l
	100–250 mmol/24 h
Urea	250–500 mmol/24 h
Uric acid	<5.0 mmol/24 h
pregnancy (except late)	<7.0 mmol/24 h
Urobilinogen	<6.7 $\mu$ mol/24 h
Vanillylmandelic acid (VMA)	<35 $\mu$ mol/24 h
Zinc	2.1–11.0 $\mu$ mol/24 h

---

## 4. Biochemical reference values for faeces

Determination	Reference range
Fat (on normal diet)	<7 g/24 h
Nitrogen	70–140 mmol/24 h
Urobilinogen	67–473 $\mu$ mol/24 h
Coproporphyrin	<0.46 nmol/g dry weight
Protoporphyrin	<2.67 $\mu$ mol/24 h
Protoporphyrin	<0.11 nmol/kg dry weight
Total porphyrin	
(ether soluble)	10–200 nmol/g dry weight
(ether insoluble)	0–24 nmol/g dry weight

## 5. Biochemical reference values for cerebrospinal fluid

Determination	Reference range
Glucose	3.3–4.4 mmol/24 h
Protein	0.15–0.40 g/l
Chloride	122–128 mmol/l
Lactate	<2.8 mmol/l

---

## **6. Haematological reference values**

**Measurement****Reference range**

haemoglobin

(male) 13.5–18.0 g/dl  
(female) 11.5–16.0 g/dl

packed cell volume or haematocrit (PCV)

(male) 0.40–0.54 l/l  
(female) 0.37–0.47 l/l

red cell count

(male)  $4.5\text{--}6.5 \times 10^{12}/\text{l}$   
(female)  $3.9\text{--}5.6 \times 10^{12}/\text{l}$   
81–100 fl

mean cell volume (MCV)

mean cell haemoglobin (MCH)

27–32 pg

mean cell haemoglobin concentration (MCHC)

32–36 g/dl

reticulocyte count

0.8–2.0 per cent

absolute count

 $25\text{--}100 \times 10^9/\text{l}$ 

total blood volume

 $70 \pm 10 \text{ ml/kg}$ 

plasma volume

 $45 \pm 5 \text{ ml/kg}$ 

red cell volume

(male)  $30 \pm 5 \text{ ml/kg}$   
(female)  $25 \pm 5 \text{ ml/kg}$ 

white cell count

 $4.0\text{--}11.0 \times 10^9/\text{l}$ 

neutrophils

 $2.0\text{--}7.5 \times 10^9/\text{l}$ 

lymphocytes

 $1.3\text{--}3.5 \times 10^9/\text{l}$ 

eosinophils

 $0\text{--}0.44 \times 10^9/\text{l}$ 

basophils

 $0\text{--}0.10 \times 10^9/\text{l}$ 

monocytes

 $0.2\text{--}0.8 \times 10^9/\text{l}$ 

platelet count

 $150\text{--}400 \times 10^9/\text{l}$ 

bleeding time

1–9 min

coagulation time

5–11 min

thrombin time

10–15 s

prothrombin time

10–14 s

activated partial thromboplastin time

35–45 s

fibrinogen concentration

1.6–4.2 g/l

fibrinogen titre

normal – up to 1/128

erythrocyte sedimentation rate

(male) 0–10 mm

(female) 0–15 mm

cold agglutinin titre at 4°C

less than 64

---

## **7. Paediatric reference values**

Determination	Sample	Reference range
Alkaline phosphatase	P	
<1 year		30–250 IU/l
1–14 years		150–570 IU/l
>14 years		80–250 IU/l
Ammonia	P	
newborn		64–107 µmol/l
0–2 weeks		56–92 µmol/l
>1 month		21–50 µmol/l
Aspartate aminotransferase	P	
1–3 years		20–60 IU/l
4–6 years		15–50 IU/l
Bicarbonate	P	
infants		18–22 mmol/l
older children		20–26 mmol/l
Bilirubin	P	
first week of life		100–200 µmol/l (total)
after first week of life		2–14 µmol/l (total)
and throughout childhood		0–0.4 µmol/l (direct)
Calcium	P	
1–3 weeks		1.9–2.85 mmol/l
3 weeks and above		2.12–2.65 mmol/l
β-Carotene	S	
<1 year (upper limit falls with age up to 3½ years)		1.3–6.3 µmol/l
3½ years onwards		1.9–2.8 µmol/l
Creatinine	P	
cord blood		57–100 µmol/l
2 weeks–6 years		33–61 µmol/l
6 years–10 years		39–70 µmol/l
>12 years		49–81 µmol/l
Creatinine clearance	P	
3–13 years		94–142 ml/min per 1.73m <sup>2</sup>
Creatine kinase (CK)	P	
neonates		75–400 U/l
infants 3–12 months		10–145 U/l
children 1–15 years		15–130 U/l
Gamma-glutamyl transferase (GGT)	P	
0–1 month		12–271 U/l
1–2 months		9–159 U/l
2–4 months		7–98 U/l
4–7 months		5–45 U/l
7–12 months		4–27 U/l
1–15 years		3–30 U/l
Glucose (fasting)	S	
cord		2.5–5.3 mmol/l
premature/low birth wt		1.1–3.3 mmol/l

Determination	Sample	Reference range
neonates		1.67–3.3 mmol/l
1 day		2.2–3.3 mmol/l
1–7 days		2.8–4.6 mmol/l
>7 days		3.3–5.5 mmol/l
Total protein	P	
1st month		51 g/l (mean)
1st year		61 g/l (mean)
1–6 years		61–78 g/l
7–16 years		66–82 g/l
Immunoglobulins		
IgG	S	
cord		5.2–18.0 g/l
0–2 weeks		5.0–17.0 g/l
2–6 weeks		3.9–13.0 g/l
6–12 weeks		2.1–7.7 g/l
3–6 months		2.4–8.8 g/l
6–9 months		3.0–9.0 g/l
9–12 months		3.0–10.9 g/l
1–2 years		3.1–13.8 g/l
2–3 years		3.7–15.8 g/l
3–6 years		4.9–16.1 g/l
6–9 years		5.4–16.1 g/l
9–12 years		5.4–16.1 g/l
12–15 years		5.4–16.1 g/l
IgA	S	
cord		0.00–0.02 g/l
0–2 weeks		0.01–0.08 g/l
2–6 weeks		0.02–0.15 g/l
6–12 weeks		0.05–0.4 g/l
3–6 months		0.1–0.5 g/l
6–9 months		0.15–0.7 g/l
9–12 months		0.20–0.7 g/l
1–2 years		0.3–1.2 g/l
2–3 years		0.3–1.3 g/l
3–6 years		0.4–2.0 g/l
6–9 years		0.5–2.4 g/l
9–12 years		0.8–2.8 g/l
12–15 years		0.8–2.8 g/l
IgM	S	
cord		0.02–0.2 g/l
0–2 weeks		0.05–0.2 g/l
2–6 weeks		0.08–0.4 g/l
6–12 weeks		0.15–0.7 g/l
3–6 months		0.20–1.0 g/l
6–9 months		0.40–1.6 g/l
9–12 months		0.60–2.1 g/l

Determination	Sample	Reference range
1–2 years		0.50–2.2 g/l
2–3 years		0.50–2.2 g/l
3–6 years		0.50–2.0 g/l
6–9 years		0.50–1.8 g/l
9–12 years		0.50–1.9 g/l
12–15 years		0.50–1.9 g/l
Lactate	P (venous)	0.5–2.2 mmol/l
	P (arterial)	0.5–1.6 mmol/l
	B	0.5–1.7 mmol/l
Phosphate (inorganic)	P	
newborn		1.20–2.78 mmol/l
young children		1.29–1.78 mmol/l
girls 15 years		0.9–1.38 mmol/l
boys 17 years		0.83–1.49 mmol/l
(from 7 years levels fall steadily to reach adult levels at 15–17 years)		
Potassium	P	
newborn		up to 6.6 mmol/l
>1 month–6 years		4.1–5.6 mmol/l
boys 7–16 years		3.3–4.7 mmol/l
girls 7–16 years		3.4–4.5 mmol/l
Sweat sodium		10–40 mmol/l
Sweat chloride		0–50 mmol/l
Thyroid-stimulating hormone (TSH) (outside neonatal period)	S	0.5–5.0 mU/l
Uric acid	P	
childhood		0.06–0.24 mmol/l
boys 16 years		0.23–0.46 mmol/l
girls 16 years		0.19–0.36 mmol/l

---

## 8. Medical certificates

(commonly used forms)

### **SC2**

Self-certification form used by an employee to provide their employer with details of sick absences of four or more consecutive days (**SC1** for unemployed or self-employed).

### **Statement of fitness for work ('fit note')**

Issued when the patient has been off work for more than seven days. It allows the doctor to advise one of two options:

- Not fit for work: the patient is unfit for work and is advised to refrain from work for a stated period of time.
- May be fit for work: the patient may not be able to complete all his or her normal duties or hours, or they may need some support to undertake these.

### **DS 1500**

Issued to a person suffering from a potentially terminal illness (defined by Social Security legislation) where death as a consequence of the illness "can reasonably be expected within six months". This allows rapid access to claiming personal independence payment (PIP) or disability living allowance (DLA) and attendance allowance (AA) under "special rules".

---

## 9. Doctors' training grades

### Foundation training

Doctors in the UK who have completed medical school undertake the Foundation Programme. This is a two-year postgraduate general medical training programme, and junior doctors undertaking this training are referred to as:

- **FY1 or F1** (Foundation training year 1)
- **FY2 or F2** (Foundation training year 2)

FY1 doctors rotate through three or four jobs in different hospital specialties. In year two, there is often training in general practice or academic medicine as well as hospital specialties.

### Specialty training

Until August 2019, doctors who completed the Foundation Programme either directly entered specialty training or undertook core training (core medical training or core surgical training). This phase of training is typically for two years, and doctors are referred to as:

- **CT1** (core training year 1)
- **CT2** (core training year 2)

or

- **ST1** (specialty training year 1)
- **ST2** (specialty training year 2)

ST2 doctors progress automatically to year 3 specialty training, while CT2 doctors apply for specialty training at this level. The training grade is:

- **ST3** (specialty training year 3)

ST3 doctors then undertake a further 4–6 years of training according to their chosen specialty (**ST4**, **ST5**, etc.).

On successful completion of the specialist training, the doctor receives a certificate of completion of training (CCT), which will make them eligible for entry to the GMC's Specialist Register or GP Register.

From August 2019 no new entrants will be admitted to CT1-2 or ST1-2. These pathways are replaced by a new programme of **Internal Medicine Training (IMT)**, under which all entrants spend two years training in general adult medicine with a focus on acute and long-term conditions (**IMT1–2**).

For their third year trainees may either (1) continue their study of general medicine while also beginning to train in an acute specialism, or (2) concentrate on a non-acute specialism.

Doctors who complete this programme will then be able to practise as GPs or pursue further specialist training as at present.

---

## 10. Inherited medical conditions

These are grouped according to their mode of inheritance.

### **Autosomal dominant**

achondroplasia  
acute intermittent porphyria  
Alexander disease  
antithrombin III deficiency  
autosomal dominant polycystic kidney disease  
Brugada syndrome  
Charcot-Marie-Tooth disease  
dystrophia myotonica (myotonic dystrophy)  
Ehlers-Danlos syndrome  
facioscapulohumeral muscular dystrophy  
familial adenomatous polyposis  
familial hypercholesterolaemia  
fatal familial insomnia  
fibrodysplasia ossificans progressiva  
Gilbert's syndrome (some forms are autosomal recessive)  
hereditary elliptocytosis  
hereditary multiple exostoses  
hereditary spherocytosis  
Huntington's disease  
hypertrophic obstructive cardiomyopathy  
hypokalaemic periodic paralysis  
ichthyosis vulgaris  
idiopathic hypoparathyroidism  
malignant hyperthermia  
Marfan's syndrome  
maturity-onset diabetes of the young (MODY)  
Mowat-Wilson syndrome  
multiple endocrine neoplasia (MEN) types 1 and 2

neurofibromatosis  
Noonan's syndrome  
Osler-Rendu-Weber syndrome  
osteogenesis imperfecta (types I–VI)  
osteopetrosis (mild form)  
otosclerosis (some forms)  
Peutz-Jeghers syndrome  
Pfeiffer syndrome  
protein C deficiency  
retinitis pigmentosa (some mild forms)  
retinoblastoma (some forms)  
Treacher Collins syndrome  
tuberous sclerosis  
von Hippel-Lindau disease  
von Willebrand's disease  
Waardenburg's syndrome

### **Autosomal recessive**

albinism  
alcaptonuria  
autosomal recessive polycystic kidney disease  
Bartter syndrome  
congenital adrenal hyperplasia  
cystic fibrosis  
Friedreich's ataxia  
galactosaemia  
Gaucher's disease  
Gilbert's syndrome (some forms are autosomal dominant)  
glycogen storage disease  
haemochromatosis  
Hurler's syndrome (MPS I)  
osteogenesis imperfecta (type VII)  
osteopetrosis (severe form)  
phenylketonuria  
retinitis pigmentosa (some mild forms)  
sickle-cell disease  
Tay-Sachs disease  
thalassaemia  
Werdnig-Hoffmann disease  
Wilson's disease  
xeroderma pigmentosa

### **X-linked recessive**

agammaglobulinaemia  
androgen insensitivity syndrome  
Becker muscular dystrophy  
Duchenne's muscular dystrophy  
Fabry disease  
glucose-6-phosphate dehydrogenase (G6PD) deficiency  
haemophilia A  
haemophilia B  
Hunter's syndrome  
Lesch-Nyhan disease  
Menkes (kinky-hair) disease  
red-green colour blindness  
retinitis pigmentosa (some severe forms)  
Wiskott-Aldrich syndrome  
X-linked ichthyosis

**X-linked dominant**

fragile-X syndrome  
Rett's syndrome  
X-linked hypophosphataemia (vitamin D-resistant rickets)

---

## 11. Units of alcohol

### Units and ABV

1 unit is 10 ml (8 g) of pure alcohol.

It is difficult to tell how many units are in different drinks as this is dependent on the size of the measure and its strength. The strength of alcoholic drink is expressed as % of alcohol by volume (ABV), and this is printed on the label of a bottle (or on the container): for example, 13.5% ABV (or vol).

The relationship between units and ABV is given by a simple formula:

$$\frac{\text{strength (\%ABV)} \times \text{volume of the measure (in ml)}}{1000} = \text{no. of units}$$

For example:

one glass of 12% wine (125 ml) would contain:

$$\frac{12 \times 125}{1000} = 1.5 \text{ units}$$

one pint of 5.3% beer (just over 500 ml) would contain:

$$\frac{5.3 \times 500}{1000} = 3 \text{ units (approx.)}$$

### Recommended intake

The Department of Health and Social Care recommends a maximum weekly intake of no more than 14 units for both men and women and suggests that this should be spread across 3 or more days with 'several' drink-free days each week. Current guidelines recommend that alcohol should be avoided during pregnancy to reduce the risks of low birth weight and organ defects. Women who find that they are pregnant having drunk alcohol during the early part of their pregnancy should avoid further drinking but should also be aware that the risk of harm to their babies is likely to be low. However, women who

consistently drink above the recommended alcohol intake risk their child being born with fetal alcohol syndrome.

Type of drink	Strength (ABV)	Measure	Units
Beer, lager, cider	2% (low alcohol)	Bottle (330 ml)	0.7
		Can (440 ml)	0.9
		Pint (568 ml)	1.1
		Litre	2
	4%	Bottle (330 ml)	1.3
		Can (440 ml)	1.8
		Pint (568 ml)	2.3
		Litre	4
	5%	Bottle (330 ml)	1.7
		Can (440 ml)	2.2
		Pint (568 ml)	2.8
		Litre	5
	6%	Bottle (330 ml)	2
		Can (440 ml)	2.6
		Pint (568 ml)	3.4
		Litre	6
	9% (super strength)	Bottle (330 ml)	3
		Can (440 ml)	4
		Pint (568 ml)	5.1
		Litre	9
Wine, champagne, sparkling wine	10%	Small glass (125 ml)	1.25
		Standard glass (175 ml)	1.75
		Large glass (250 ml)	2.5
		Bottle (750 ml)	7.5
	11%	Small glass (125 ml)	1.4
		Standard glass (175 ml)	1.9
		Large glass (250 ml)	2.8
		Bottle (750 ml)	8.3
	12%	Small glass (125 ml)	1.5
		Standard glass (175 ml)	2.1
		Large glass (250 ml)	3
		Bottle (750 ml)	9
	13%	Small glass (125 ml)	1.6
		Standard glass (175 ml)	2.3
		Large glass (250 ml)	3.3
		Bottle (750 ml)	9.8
	14%	Small glass (125 ml)	1.75
		Standard glass (175 ml)	2.5
		Large glass (250 ml)	3.5
		Bottle (750 ml)	10.5
Shots: tequila, sambuca	40%	Small shot (25 ml)	1
		Large shot (35 ml)	1.3
Alcopops	Normal (5%)	Bottle (275 ml)	1.4
Fortified wine: port, sherry	20%	Standard (50 ml)	1
Spirits: gin, rum, vodka, whisky	40%	Small (25 ml)	1
		Large single (35 ml)	1.4
		Double (50 ml)	2
		Large double (70 ml)	2.8

---

## 12. Street names for illicit drugs

[www.talktofrank.com](http://www.talktofrank.com)

## **Illicit drug**

amphetamines:

alkyl nitrites:

cannabis:

cocaine and crack

Ecstasy:

gases, glues, and aerosols:

GHB (gamma-hydroxybutyrate):

heroin:

ketamine:

khat:

magic mushrooms:

LSD (lysergic acid diethylamide):

Tranquillizers:

## **slang/street names**

(can vary around the country and with differing forms of the drug)

speed, phet, Billy, whizz, sulph, base, paste, dexies, bennies, black beauties, uppers

poppers, ram, thrust, rock hard, kix, TNT, liquid gold

bhang, black, blast, blow, blunts, Bob Hope, bush, bud, dope, draw, ganja, grass, hash, hashish, hemp, herb, marijuana, pot, puff, Northern Lights, resin, sensi, sinsemilla, shit, skunk, smoke, soap, spliff, wacky backy, weed, zero.

Some names are based on where it comes from: Afghan, homegrown, Moroccan, etc.

powder cocaine: coke, Charlie, C, white, Percy, snow, toot.

crack (a smokeable form of cocaine): rocks, wash, stones, pebbles, base, freebase

E, pills, brownies, Mitsubishi's, Rolex's, Dolphins, XTC, crystal, cowies, mandy

thinners, volatile substances, whippets, tooting, solvents, petrol, inhalants, huffing, glues, gas, dusting, chroming, butane, aerosols

GHB, GBH, liquid Ecstasy, geebs, GBL, 4-BD

brown, skag, H, horse, gear, smack

green, K, special K, super K, vitamin K, donkey dust

quat, qat, qaadka, chat

liberties, magics, mushies, liberty cap, shrooms, Amani, agaric, philosopher's stone

acid, blotter, cheer, dots, drop, flash, hawk, L, lightening flash, liquid acid, Lucy, microdot, paper mushrooms, rainbows, smilies, stars, tab, trips, tripper, window

Sometimes LSD is known by the pictures on it, e.g. strawberries

jellies, benzos, eggs, norries, rugby balls, vallies, moggies, mazzies, roofies, downers, blues

---

## 13. Online medical resources

Recent decades have seen a proliferation of online medical resources, ranging from specialist databases to sites offering advice and information to patients and their families. The following is a selection of authoritative, quality-controlled sites that provide information on essential topics. These resources are widely used by health-care professionals but in most cases are freely accessible to the general public. To access any of these websites, go to **Web links: Appendix**, and then click through to the relevant site.

<https://www.oxfordreference.com/page/med>

- Anatomy Atlases: annotated images of human anatomy, including cross-sections and microscope plates.
- Bandolier: evidence-based health-care information for professionals and consumers. Includes lifestyle advice.
- BMJ Best Practice: practical, evidence-based guidance for professionals from the British Medical Journal. Includes diagnostic and treatment guidelines, medical calculators, and recent research. (Registration required.)
- British Dental Association: includes advice on patient care and practice management.
- British Dietetic Association: provides information and other resources for professionals, as well as dietary advice for the public (including downloadable food fact sheets).
- British Medical Journal: full text of all articles from January 1997 is now available free online.
- British National Formulary: free access to the BNF and BNF for Children via NICE. Authoritative, practical information on the selection and use of medicines.
- British Nutrition Foundation: independent evidence-based advice on healthy eating. Includes recipes.
- Cancersource: a US site providing a range of resources for oncology professionals and advice and support for patients.
- Cinahl (Cumulative Index to Nursing and Allied Health Literature): a bibliographic database for nursing and allied health care. (Subscription required.)
- ClinicalTrials: an online registry of research trials organized by the US National Institutes of Health. Many health-care journals demand that trials of therapeutic interventions are registered at ClinicalTrials as a prerequisite for publication.
- Cochrane: a set of databases collecting high-quality evidence relating to health-care issues. Includes the Cochrane Database of Systematic Reviews and the Cochrane Central Register of Controlled

Trials.

- Dr Foster: information on the availability and quality of UK health care: includes guides to hospitals, consultants, and birth units.
- eMedicine Health: comprehensive health advice for laypeople.
- ENT-UK: provides comprehensive information on conditions of the ears, nose, and throat as well as material for professionals in the field.
- General Dental Council: includes sections for patients and professionals.
- GPnotebook: a concise synopsis of the entire field of clinical medicine focused on the needs of the general practitioner.
- Healthtalkonline: award-winning charity website providing information on conditions and treatment choices, together with patients' accounts of their experiences.
- KidsHealth: an award-winning site providing parents with information about children's health issues from before birth to adolescence. Provided by the Nemours Foundation.
- Medicines.org: reliable up-to-date information on medicines currently licensed for use in the UK.
- Medscape: a clinical knowledge database for professionals.
- Mind website: information on the different types of mental illness, treatment, support services, and self-help
- NaTHNaC: the National Travel Health Network and Centre promotes standards in travel medicine, providing travel-health information for health professionals and the public.
- National Drugs Helpline: online resources include an A–Z of the most common drugs with their appearance, effects, health risks, and legal status. Also offers help and support, including a 24-hour confidential advice service.
- NetDoctor: a comprehensive resource for health-care consumers, featuring information on conditions, medicines, and healthy living.
- NHS: information on common conditions and treatments together with details of local hospitals, doctors, pharmacies, etc.
- NICE Evidence Services: a gateway to a wide range of online resources, including specialist libraries and journals; mainly for professionals, but with many areas accessible to the public.
- Parenteral and Enteral Nutrition Group: specialist information for dietitians working in oral, enteral, and parenteral nutrition.
- Patient info: comprehensive information on conditions and treatments, healthy living, and patient support groups. Includes resources for professionals.
- Psycinfo: a database of psychological literature provided by the American Psychological Association.
- PubMed: a freely accessible search engine run by the US National Institutes of Health that accesses citations from MEDLINE, the US National Library of Health's bibliographic database.
- StudentBMJ: an online journal for medical students provided by the BMJ.
- Teenage Health Freak: advice and information for teenagers, including Dr Ann's Virtual Surgery.
- TOXBASE: the primary clinical toxicology database of the National Poisons Information Service. It is the first-line resource for UK health-care professionals. (Registration required.)
- UK Foundation of Nursing Studies: the FONS Centre for Nursing Innovation provides numerous resources for nurses.
- Women's Health Information: covers pregnancy, infertility, sexual health, menopause, and other issues in women's health.

---

## 14. Abbreviations and symbols

### Abbreviations

AAA	abdominal aortic aneurysm
A&E	accident and emergency department
ABG	arterial blood gas
ABI	acquired brain injury
ABPI	ankle-brachial pressure index
ABx	antibiotics
AC	(in prescribing) ante cibum (before food)
ACEi	angiotensin-converting enzyme inhibitor
ACLS	advanced cardiac life support
ACPA	anticitrullinated protein antibodies
ACR	acute renal failure
ACS	*acute coronary syndrome
AD	*Alzheimer's disease
ADH	antidiuretic hormone
ADHD	*attention-deficit/hyperactivity disorder
ADLs	*activities of daily living
ADR	adverse drug reaction
AE	adverse event; air entry
AED	antiepilepsy drugs
AF	atrial fibrillation
AFB	acid-fast bacilli
AGA	appropriate for gestational age
AIDS	acquired immune deficiency syndrome
AIH	autoimmune hepatitis; artificial insemination by husband
AKA	above knee amputation
AKI	acute kidney injury
ALD	alcoholic liver disease
ALL	acute lymphoblastic leukaemia

<b>ALS</b>	amyotrophic lateral sclerosis; advanced life support
<b>AML</b>	acute myeloid leukaemia
<b>AMT</b>	abbreviated mental test
<b>ANP</b>	advanced nurse practitioner
<b>AP</b>	*anteroposterior
<b>APC</b>	*argon plasma coagulation
<b>AR</b>	*aortic regurgitation
<b>ARC</b>	AIDS-related complex
<b>ARDS</b>	acute respiratory distress syndrome
<b>ARF</b>	acute renal failure; *acute respiratory failure
<b>ARM D</b>	age-related macular degeneration
<b>AS</b>	ankylosing spondylitis; *aortic stenosis
<b>ASD</b>	*atrial septal defect
<b>ATLS</b>	advanced trauma life support
<b>ATN</b>	*acute tubular necrosis
<b>ATSP</b>	asked to see patient
<b>AUR</b>	acute urinary retention
<b>AVM</b>	arteriovenous malformation
<b>AVPU</b>	alert, verbal (responses present), pain (responses present), unresponsive
<b>A/W</b>	admitted with
<b>AWS</b>	alcohol withdrawal syndrome
<b>AXR</b>	abdominal X-ray
<b>BAL</b>	blood alcohol level; *bronchoalveolar lavage
<b>BBB</b>	*blood-brain barrier
<b>BBV</b>	blood-borne virus
<b>BD</b>	bis die (twice daily)
<b>BIBA</b>	brought in by ambulance
<b>BiPAP</b>	bilevel positive airways pressure
<b>BI-RADS</b>	Breast Imaging Reporting and Data System
<b>BKA</b>	below knee amputation
<b>BLS</b>	*basic life support
<b>BM</b>	blood (glucose) monitoring
<b>BMD</b>	bone mineral density
<b>BMI</b>	*body mass index
<b>BMR</b>	basal metabolic rate
<b>BMT</b>	bone marrow transplant
<b>BNF</b>	*British National Formulary

<b>BNO</b>	bowels not opened
<b>BO</b>	*bowels opened
<b>BOO</b>	bladder outlet obstruction
<b>BP</b>	blood pressure
<b>BPAD</b>	*bipolar affective disorder
<b>BPH</b>	benign prostatic hypertrophy
<b>BRUE</b>	*Brief Resolved Unexplained Episode (in infants)
<b>BS</b>	*blood sugar; bowel sounds; *breath sounds
<b>BSE</b>	bovine spongiform encephalopathy
<b>BW</b>	body weight
<b>Bx</b>	biopsies
<b>c̄</b>	with
<b>CA</b>	*cancer
<b>CABG</b>	*coronary artery bypass graft
<b>CAH</b>	*congenital adrenal hyperplasia
<b>CAP</b>	*community-acquired pneumonia
<b>CAPD</b>	continuous ambulatory peritoneal dialysis
<b>CAT</b>	computerized (axial) tomography
<b>CBD</b>	common bile duct
<b>CBF</b>	cerebral blood flow
<b>CBT</b>	*cognitive behavioural therapy
<b>CCF</b>	congestive cardiac failure
<b>CCG</b>	clinical commissioning group
<b>CCP</b>	cyclic citrullinated peptide
<b>CCU</b>	*coronary care unit
<b>CF</b>	*cystic fibrosis
<b>CFA/UIP</b>	cryptogenic fibrosing alveolitis/usual interstitial pneumonia
<b>CFS/ME/PVF</b>	chronic fatigue syndrome/myalgic encephalomyelitis (or encephalopathy)/postviral fatigue syndrome
<b>CFU</b>	colony-forming units
<b>CHD</b>	coronary heart disease
<b>CHF</b>	congestive heart failure
<b>CI</b>	*contraindication
<b>CICU</b>	cardiac intensive care unit
<b>CIN</b>	*cervical intraepithelial neoplasia
<b>CJD</b>	*Creutzfeldt–Jakob disease
<b>CKD</b>	chronic kidney disease chronic liver disease

<b>CLD</b>	chronic lymphocytic leukaemia
<b>CLS</b>	*Coffin–Lowry syndrome
<b>CME</b>	continuing medical education
<b>CML</b>	chronic myeloid leukaemia
<b>CMV</b>	*cytomegalovirus
<b>CN</b>	*cranial nerves
<b>CNS</b>	*central nervous system
<b>C/O</b>	complaining of
<b>COC(P)</b>	combined oral contraceptive (pill)
<b>COPD</b>	*chronic obstructive pulmonary disease
<b>CP</b>	*cerebral palsy; chest pain
<b>CPAP</b>	*continuous positive airways pressure
<b>CPD</b>	*continuous professional development
<b>CPR</b>	*cardiopulmonary resuscitation
<b>CQC</b>	*Care Quality Commission
<b>CRF</b>	chronic renal failure
<b>CRT</b>	*cardiac resynchronization therapy
<b>CSF</b>	*cerebrospinal fluid
<b>CSU</b>	catheter specimen of urine
<b>CT</b>	*computerized tomography
<b>CT1/CT2</b>	core trainee year 1/core trainee year 2
<b>CTD</b>	connective tissue disease
<b>CTPA</b>	computerized tomographic pulmonary angiography
<b>CVA</b>	*cerebrovascular accident
<b>CVD</b>	cardiovascular disease
<b>CVS</b>	*cardiovascular system
<b>CVVH</b>	continuous venovenous haemofiltration
<b>CXR</b>	chest X-ray
<b>D&amp;C</b>	*dilatation and curettage
<b>D&amp;V</b>	diarrhoea and vomiting
<b>DBE</b>	double-balloon enteroscopy
<b>DCBE</b>	double-contrast barium enema
<b>DCP</b>	*dental care professional
<b>DDx</b>	*differential diagnosis
<b>DES</b>	drug-eluting stent
<b>DH</b>	drug history
<b>DI</b>	*diabetes insipidus; donor insemination

<b>DIB</b>	difficulty in breathing
<b>DIC</b>	*disseminated intravascular coagulation
<b>DIPJ</b>	distal interphalangeal joint
<b>DKA</b>	*diabetic ketoacidosis
<b>DM</b>	*diabetes mellitus
<b>DMARDs</b>	disease-modifying antirheumatic drugs
<b>DMD</b>	Duchenne muscular dystrophy
<b>DN</b>	*district nurse
<b>DNA</b>	did not attend
<b>DNAR</b>	do not attempt resuscitation
<b>DNR</b>	do not resuscitate
<b>DOA</b>	dead on arrival
<b>DOAC</b>	*direct oral anticoagulant
<b>DOB</b>	date of birth
<b>DOT</b>	directly-observed therapy
<b>DR</b>	*digital radiography
<b>DRE</b>	digital rectal examination
<b>DRVs</b>	*Dietary Reference Values
<b>DSH</b>	*deliberate self-harm
<b>DSM</b>	Diagnostic and Statistical Manual (of Mental Disorders)
<b>DTs</b>	delerium tremens
<b>DU</b>	*duodenal ulcer
<b>DUI</b>	driving under influence
<b>DVT</b>	*deep vein thrombosis
<b>D/W</b>	discuss with
<b>Dx</b>	*diagnosis
<b>EAA</b>	extrinsic allergic alveolitis
<b>E&amp;D</b>	eating and drinking
<b>EBM</b>	*evidence-based medicine
<b>EBV</b>	*Epstein-Barr virus
<b>EC</b>	*enteric-coated
<b>ECG</b>	*electrocardiogram
<b>ECHO</b>	echocardiogram
<b>ECT</b>	*electroconvulsive therapy
<b>ED</b>	emergency department; *erectile dysfunction
<b>EDD</b>	estimated date of delivery
<b>EEG</b>	*electroencephalogram

<b>EF</b>	<a href="#">*ejection fraction</a>
<b>eGFR</b>	estimated glomerular filtration rate
<b>ELISA</b>	<a href="#">*enzyme-linked immunosorbent assay</a>
<b>ENT</b>	ear, nose, and throat
<b>EOL</b>	end of life
<b>EOLCP</b>	end of life care pathway
<b>EPAP</b>	expiratory positive airway pressure
<b>EPAU</b>	early pregnancy assessment unit
<b>EPO</b>	<a href="#">*erythropoietin</a>
<b>EPS</b>	<a href="#">*electrophysiological study</a>
<b>ER</b>	emergency room
<b>ERCP</b>	endoscopic retrograde cholangiopancreatography
<b>ERG</b>	<a href="#">*electroretinography</a>
<b>ESM</b>	ejection systolic murmur
<b>ESRF</b>	<a href="#">*end-stage renal failure</a>
<b>ET</b>	endotracheal
<b>ETOH</b>	ethanol/alcohol
<b>ETT</b>	endotracheal tube; exercise tolerance test
<b>EUA</b>	examination under anaesthesia
<b>EUM</b>	examination under microscope
<b>FAS</b>	fetal alcohol syndrome
<b>FB</b>	foreign body
<b>FBS</b>	fasting blood sugar
<b>FH</b>	<a href="#">familial hypercholesterolaemia</a> ; <a href="#">*fundal height</a>
<b>FHH</b>	fetal heart heard
<b>FHx</b>	family history
<b>FM</b>	fetal movements
<b>FNA</b>	fine-needle aspiration
<b>FOB</b>	faecal occult blood
<b>FOBT</b>	<a href="#">*faecal occult blood test</a>
<b>FROEM</b>	full range of eye movements
<b>FROM</b>	full range of movement (see Symbols, numbers, and diagrams below)
<b>FTT</b>	<a href="#">*failure to thrive</a>
<b>FY1/FY2</b>	Foundation year 1/Foundation year 2
<b>GA</b>	general anaesthetic
<b>GAHS</b>	Glasgow alcoholic hepatitis score
<b>GB</b>	<a href="#">*gall bladder</a>

<b>GBS</b>	*Guillain-Barré syndrome
<b>GCP</b>	good clinical practice
<b>GCS</b>	*Glasgow Coma Scale
<b>GDA</b>	guideline daily amount
<b>GDS</b>	geriatric depression score
<b>GFR</b>	*glomerular filtration rate
<b>GH</b>	*growth hormone
<b>GI</b>	gastrointestinal
<b>GN</b>	*glomerulonephritis
<b>GOR</b>	*gastro-oesophageal reflux
<b>GORD</b>	*gastro-oesophageal reflux disease
<b>GU</b>	*gastric ulcer; genitourinary
<b>GVHD</b>	*graft-versus-host disease
<b>HAI</b>	hospital-acquired infection
<b>HAP</b>	hospital-acquired pneumonia
<b>Hb</b>	*haemoglobin
<b>HDL</b>	*high-density lipoprotein
<b>HDU</b>	*high-dependency unit
<b>HFEA</b>	Human Fertilization and Embryology Authority
<b>HH</b>	hiatus hernia
<b>HIV</b>	human immunodeficiency virus
<b>HOH</b>	hard of hearing
<b>HPC</b>	history of presenting complaint
<b>HPV</b>	*human papillomavirus
<b>HR</b>	heart rate
<b>HRT</b>	*hormone replacement therapy
<b>HS</b>	heart sounds
<b>HSP</b>	*Henoch-Schönlein purpura
<b>HSV</b>	herpes simplex virus
<b>HTN</b>	*hypertension
<b>HVS</b>	high vaginal swab
<b>Hx</b>	history
<b>IBD</b>	*inflammatory bowel disease
<b>IBS</b>	*irritable bowel syndrome
<b>I&amp;D</b>	incision and drainage
<b>ICD</b>	implantable cardioverter/defibrillator
<b>ICU</b>	intensive care unit

<b>IDA</b>	iron-deficiency anaemia
<b>IDDM</b>	insulin-dependent diabetes mellitus
<b>IE</b>	infective endocarditis
<b>IGT</b>	impaired glucose tolerance
<b>IHD</b>	ischaemic heart disease
<b>ILD</b>	interstitial lung disease
<b>ILR</b>	*implantable loop recorder
<b>IM</b>	*intramuscular
<b>INR</b>	international normalized ratio
<b>IP</b>	in-patient
<b>IPAA</b>	ileal pouch anal anastomosis
<b>IPF</b>	*idiopathic pulmonary fibrosis
<b>ISQ</b>	in status quo (unchanged)
<b>ITP</b>	*idiopathic thrombocytopenic purpura
<b>ITU</b>	*intensive therapy unit
<b>IU</b>	international units
<b>IUCD</b>	intrauterine contraceptive device
<b>IUD</b>	intrauterine device
<b>IUGR</b>	intrauterine growth restriction (or retardation)
<b>IV</b>	*intravenous
<b>IVDU</b>	intravenous drug user
<b>IVI</b>	intravenous infusion
<b>IVT</b>	intracranial venous thrombosis
<b>IVU</b>	*intravenous urography
<b>IVUS</b>	*intravascular ultrasound
<b>Ix</b>	investigations
<b>J.A.C.C.O.L.</b>	jaundice, anaemia, clubbing, cyanosis, oedema, lymphadenopathy
<b>JCA</b>	juvenile chronic arthritis
<b>JVP</b>	*jugular venous pressure
<b>K 6/28</b>	menstrual cycle (e.g. menstruation lasting 6 days, occurring every 28 days)
<b>KS</b>	*Kaposi's sarcoma
<b>KUB</b>	kidneys, ureters, and bladder
<b>LA</b>	local anaesthetic
<b>LAD</b>	left anterior descending artery
<b>LBBB</b>	left bundle branch block
<b>LBO</b>	large bowel obstruction
<b>LBW</b>	low birth weight

<b>LDL</b>	*low-density lipoprotein
<b>LE</b>	*lupus erythematosus
<b>LEMS</b>	Lambert-Eaton myasthenic syndrome
<b>LIF</b>	left iliac fossa
<b>LKKS/LKS</b>	liver, kidney, kidney, spleen/liver, kidney, spleen
<b>LLL</b>	left lower lobe (of lung)
<b>LLQ</b>	left lower quadrant (of abdomen)
<b>LMP</b>	last menstrual period
<b>LN</b>	*lymph node
<b>LOC</b>	loss of consciousness
<b>LOS</b>	lower oesophageal sphincter
<b>LP</b>	*lumbar puncture
<b>LRTI</b>	lower respiratory tract infection
<b>LTOT</b>	long-term oxygen therapy
<b>LUQ</b>	left upper quadrant (of abdomen)
<b>L(U)SCS</b>	lower (uterine) segment Caesarean section
<b>LUTS</b>	lower urinary tract symptoms
<b>LVF</b>	left ventricular failure
<b>LVH</b>	left ventricular hypertrophy
<b>LVSD</b>	left ventricular systolic dysfunction
<b>Mane</b>	(in prescribing) in the morning
<b>MAOI</b>	monoamine oxidase inhibitor
<b>MAP</b>	mean arterial pressure
<b>MC&amp;S</b>	microscopy, culture, and sensitivity
<b>MCPJ</b>	metacarpal phalangeal joint
<b>MDR</b>	multidrug resistance
<b>MDS</b>	*myelodysplastic syndrome
<b>MDT</b>	*multidisciplinary team
<b>ME</b>	myalgic encephalomyelitis (or encephalopathy)
<b>MELD</b>	model for end-stage liver disease
<b>Mets</b>	metastases
<b>MG</b>	*myasthenia gravis
<b>MI</b>	*myocardial infarction
<b>Mict.</b>	micturition
<b>MLD</b>	minimal lethal dose
<b>MMR</b>	measles, mumps, rubella (vaccine)
<b>MMSE</b>	*Mini-Mental State Examination

<b>MND</b>	*motor neuron disease
<b>MOF</b>	multi-organ failure
<b>MR</b>	*mitral regurgitation
<b>MRA</b>	magnetic resonance angiography
<b>MRI</b>	*magnetic resonance imaging
<b>MRSA</b>	methicillin- (or multiple-) resistant <i>Staphylococcus aureus</i>
<b>MRV</b>	magnetic resonance venography
<b>MS</b>	*multiple sclerosis
<b>MSE</b>	*mental state examination
<b>MSM</b>	men who have sex with men
<b>MSU</b>	*midstream specimen of urine
<b>MTPJ</b>	metatarsal phalangeal joint
<b>MUA</b>	manipulation under anaesthesia
<b>MVP</b>	mitral valve prolapse
<b>Mx</b>	management
<b>N</b>	normal
<b>NAD</b>	no active (or apparent) disease; nothing abnormal detected
<b>NAI</b>	*nonaccidental injury
<b>N&amp;V</b>	nausea and vomiting
<b>NBM</b>	nil by mouth
<b>NET</b>	neuroendocrine tumour
<b>NG</b>	nasogastric
<b>NHL</b>	non-Hodgkin's lymphoma
<b>NICU</b>	neonatal intensive care unit
<b>NIPPV</b>	noninvasive (or nasal) intermittent positive-pressure ventilation
<b>NKA</b>	no known allergies
<b>NKDA</b>	no known drug allergies
<b>NMR</b>	*nuclear magnetic resonance
<b>NNT</b>	*number needed to treat
<b>Noct.</b>	*nocturia
<b>Nocte</b>	(in prescribing) at night
<b>(#) NOF</b>	(fractured) neck of femur
<b>NS</b>	normal saline
<b>NSAIDs</b>	nonsteroidal anti-inflammatory drugs
<b>NSCLC</b>	*non-small-cell lung cancer
<b>NSR</b>	normal sinus rhythm (on an ECG)
<b>NSTEMI</b>	non-S–T elevation myocardial infarction

<b>NTDs</b>	*neglected tropical diseases
<b>NVD</b>	normal vaginal delivery
<b>NYHA</b>	New York Heart Association (classification)
<b>OA</b>	*osteoarthritis
<b>OC&amp;P</b>	oocytes, cysts, and parasites
<b>OCD</b>	*obsessive–compulsive disorder
<b>OD</b>	overdose; (in prescribing) omni die (daily)
<b>O/E or OE</b>	on examination
<b>OGD</b>	*oesophagogastroduodenoscopy
<b>OGTT</b>	oral glucose tolerance test
<b>OHT</b>	*ocular hypertension
<b>OM</b>	(in prescribing) omni mane (in the morning)
<b>ON</b>	(in prescribing) omni nocte (at night)
<b>OP</b>	*out-patient
<b>OPA</b>	out-patient appointment
<b>OPD</b>	out-patient department
<b>ORIF</b>	open reduction, internal fixation
<b>ORT</b>	*oral rehydration therapy
<b>OSA</b>	*obstructive sleep apnoea
<b>OT</b>	*occupational therapy
<b>OTC</b>	over-the-counter (drug)
<b>P</b>	*pulse
<b>PA</b>	*posteroanterior
<b>PALS</b>	paediatric advanced life support
<b>PBC</b>	primary biliary cirrhosis
<b>PC</b>	presenting complaint; (in prescribing) post cibum (after food)
<b>PCA</b>	patient-controlled analgesia; percutaneous coronary angioplasty
<b>PCI</b>	*percutaneous coronary intervention
<b>PCOS</b>	*polycystic ovary syndrome
<b>PCP</b>	<i>Pneumocystis carinii</i> ( <i>P. jiroveci</i> ) pneumonia
<b>PCR</b>	*polymerase chain reaction
<b>PD</b>	Parkinson's disease
<b>PDA</b>	patent ductus arteriosus
<b>PE</b>	*pulmonary embolism
<b>PEEP</b>	positive end-expiratory pressure
<b>PEFR</b>	*peak expiratory flow rate
<b>PEG</b>	percutaneous endoscopic gastrostomy

<b>PEJ</b>	percutaneous endoscopic jejunostomy
<b>PERL</b>	pupils equal and reactive to light
<b>PERLA</b>	pupils equal and reactive to light and accommodation
<b>PERT</b>	*pancreatic enzyme replacement therapy
<b>PET</b>	*positron emission tomography
<b>PFTs</b>	pulmonary function tests
<b>PICC</b>	peripherally inserted central catheter
<b>PICU</b>	paediatric intensive care unit; psychiatric intensive care unit
<b>PID</b>	*pelvic inflammatory disease
<b>PIH</b>	*pregnancy-induced hypertension
<b>PIPJ</b>	proximal interphalangeal joint
<b>PMH</b>	past medical history
<b>PMR</b>	*polymyalgia rheumatica
<b>PN</b>	parenteral nutrition; percussion note
<b>PND</b>	paroxysmal nocturnal dyspnoea; postnasal drip
<b>PNS</b>	*peripheral nervous system; postnasal space (nasopharynx)
<b>PO</b>	per os (by mouth)
<b>POM</b>	prescription only medicine
<b>POP</b>	*plaster of Paris
<b>PP</b>	peripheral pulses; private patient
<b>PPCI</b>	primary percutaneous coronary intervention
<b>PPI</b>	*proton-pump inhibitor
<b>PPM</b>	permanent pacemaker
<b>PR</b>	per rectum
<b>PRN</b>	(in prescribing) pro re nata (as required)
<b>PRRT</b>	*peptide receptor radionuclide therapy
<b>PsA</b>	*psoriatic arthritis
<b>PSC</b>	primary sclerosing cholangitis
<b>PSH</b>	past surgical history
<b>PSM</b>	pansystolic murmur
<b>Pt</b>	patient
<b>PTSD</b>	*post-traumatic stress disorder
<b>PU</b>	passing urine
<b>PUD</b>	peptic ulcer disease
<b>PUO</b>	pyrexia of unknown origin
<b>PV</b>	per vaginam
<b>PVC</b>	premature ventricular contraction

<b>PVD</b>	peripheral vascular disease
<b>PVS</b>	*persistent vegetative state
<b>QALYs</b>	quality-adjusted life years
<b>QDS</b>	quarter die sumendus ([to be taken] four times a day)
<b>QOL</b>	*quality of life
<b>RA</b>	*rheumatoid arthritis
<b>RBBB</b>	right bundle branch block
<b>RBC</b>	red blood cell
<b>RCA</b>	right coronary artery
<b>RCT</b>	randomized control trial
<b>RDA</b>	recommended daily amount (of a nutrient)
<b>RDS</b>	*respiratory distress syndrome
<b>RF</b>	*rheumatic fever
<b>RFA</b>	*radiofrequency ablation
<b>RIF</b>	right iliac fossa
<b>RIG</b>	radiologically inserted gastrostomy
<b>RLL</b>	right lower lobe (of lung)
<b>RLQ</b>	right lower quadrant (of abdomen)
<b>RNI</b>	reference nutrient intake
<b>R/O</b>	rule out
<b>ROM</b>	range of movement
<b>ROS</b>	review of systems
<b>RR</b>	*respiratory rate
<b>RS</b>	*respiratory system
<b>RT</b>	*radiotherapy
<b>RTA</b>	road traffic accident
<b>RUL</b>	right upper lobe (of lung)
<b>RUQ</b>	right upper quadrant (of abdomen)
<b>RVH</b>	right ventricular hypertrophy
<b>Rx</b>	therapy (or treatment)
<b>S1/S2/S3/S4</b>	1st/2nd/3rd/4th heart sound
<b>SAAG</b>	serum ascites to albumin gradient
<b>SAH</b>	*subarachnoid haemorrhage
<b>SALT</b>	speech and language therapist
<b>SARS</b>	severe acute respiratory syndrome
<b>S/B</b>	seen by
<b>SBE</b>	subacute bacterial endocarditis

<b>SBO</b>	small bowel obstruction
<b>SBS</b>	*short bowel syndrome
<b>SC</b>	*subcutaneous
<b>SCBU</b>	special care baby unit
<b>S/E</b>	*side-effect
<b>SEMS</b>	self-expanding metal stent
<b>SGA</b>	*small for gestational age
<b>SH</b>	social history
<b>SIDS</b>	*sudden infant death syndrome
<b>SIRT</b>	selective internal radiation therapy
<b>SL</b>	*sublingual
<b>SLE</b>	systemic lupus erythematosus
<b>SLR</b>	straight leg raise
<b>SNRI</b>	selective serotonin and noradrenaline reuptake inhibitor
<b>SNT</b>	soft, non-tender
<b>SOA</b>	swelling of ankles
<b>SOB</b>	shortness of breath
<b>SOBOE</b>	shortness of breath on exertion
<b>SOL</b>	space-occupying lesion
<b>SPECT</b>	single photon emission computed tomography
<b>SR</b>	*sinus rhythm; systems review
<b>ST</b>	sinus tachycardia
<b>ST1/ST2/ST3+</b>	specialty training year 1/specialty training year 2/specialty training year 3, etc.
<b>Stat</b>	(in prescribing) statim (immediately)
<b>STD</b>	*sexually transmitted disease
<b>STEMI</b>	S–T elevation myocardial infarction
<b>STI</b>	sexually transmitted infection
<b>SUDEP</b>	*sudden unexpected death in epilepsy
<b>SVT</b>	*supraventricular tachycardia
<b>T</b>	temperature
<b>TAH</b>	total abdominal hysterectomy
<b>TB</b>	*tuberculosis
<b>TCI</b>	to come in (to hospital)
<b>T2DM</b>	type 2 diabetes mellitus
<b>TDS</b>	ter die sumendus ([to be taken] three times a day)
<b>TEMS</b>	*transanal endoscopic microsurgery
<b>TENS</b>	*transcutaneous electrical nerve stimulation

<b>THR</b>	total hip replacement
<b>Ti</b>	*tinnitus
<b>TIA</b>	*transient ischaemic attack
<b>TKR</b>	total knee replacement
<b>TLC</b>	tender loving care; total lung capacity
<b>TLOC</b>	transient loss of consciousness
<b>TM</b>	*tympanic membrane
<b>TNM</b>	tumour, nodes, metastasis (classification of malignant tumours)
<b>TOE</b>	transoesophageal echocardiography
<b>TOP</b>	termination of pregnancy
<b>TPN</b>	*total parenteral nutrition
<b>TPP</b>	time, place, person
<b>TPRS</b>	tone, power, reflexes, sensation
<b>TRH</b>	*thyrotrophin-releasing hormone
<b>Ts&amp;As</b>	tonsillectomy and adenoidectomy
<b>TSH</b>	*thyroid-stimulating hormone
<b>TSS</b>	*toxic shock syndrome
<b>TTA</b>	to take away (drugs)
<b>TTE</b>	transthoracic echocardiography
<b>TTO</b>	to take out (drugs)
<b>TTP</b>	thrombotic thrombocytopenia purpura
<b>TURP</b>	transurethral resection of the prostate
<b>TVF</b>	tactile vocal fremitus
<b>TWOC</b>	trial without catheter
<b>UC</b>	*ulcerative colitis
<b>UGIB</b>	upper gastrointestinal bleed
<b>UIP</b>	usual interstitial pneumonia
<b>UO</b>	urine output
<b>URTI</b>	upper respiratory tract infection
<b>USS</b>	ultrasound scan
<b>UTI</b>	urinary tract infection
<b>VAD</b>	*ventricular assist device
<b>VATS</b>	video-assisted thoracoscopic surgery
<b>VBL</b>	variceal band ligation
<b>VF</b>	ventricular fibrillation; vocal fremitus
<b>VLCD</b>	very low-calorie diet
<b>V/Q scan</b>	ventilation-perfusion scan

<b>VR</b>	*vocal resonance
<b>VSD</b>	*ventricular septal defect
<b>VT</b>	*ventricular tachycardia
<b>VTE</b>	*venous thromboembolism
<b>VVs</b>	*varicose veins
<b>vWD</b>	von Willebrand disease
<b>WBC</b>	white blood cell
<b>WNL</b>	within normal limits
<b>XR</b>	X-ray
<b>YLL</b>	years of life lost

## Abbreviations for blood tests

### Blood test requests

<b>FBC</b>	full blood count
<b>U+E</b>	urea and electrolytes
<b>LFTs</b>	liver function tests
<b>TFTs</b>	thyroid function tests
<b>TNF</b>	*tumour necrosis factor
<b>ESR</b>	erythrocyte sedimentation rate
<b>CRP</b>	*C-reactive protein
<b>HbA<sub>1c</sub></b>	*glycated haemoglobin
<b>OGTT</b>	oral glucose tolerance test
<b>PSA</b>	prostate-specific antigen

### Blood test results

#### FBC:

<b>Hb</b>	*haemoglobin
<b>MCV</b>	mean corpuscular volume
<b>WBC</b>	white blood cell count
<b>PLTS</b>	platelets

#### U+E:

<b>Na<sup>+</sup></b>	sodium
<b>K<sup>+</sup></b>	potassium
<b>Urea</b>	urea
<b>Cr</b>	creatinine
<b>eGFR</b>	estimated glomerular filtration rate

#### LFTs:

<b>ALP</b>	alkaline phosphatase
<b>ALT</b>	*alanine aminotransferase
<b>AST</b>	*aspartate aminotransferase
<b>Bili</b>	bilirubin
<b>GGT</b>	gamma-glutamyl transferase

#### **TFTs:**

<b>T3</b>	*triiodothyronine
<b>T4</b>	*thyroxine (tetraiodothyronine)
<b>TSH</b>	*thyroid-stimulating hormone

#### **Symbols and numbers**

(commonly used in medical notes and records)

<b>1°</b>	primary
<b>2°</b>	secondary
<b>Δ or Δx</b>	diagnosis
<b>ΔΔ or ΔΔx</b>	differential diagnosis
<b>N</b>	normal
♂	male
♀	female
<b>-ve</b>	negative
<b>+ve</b>	positive
↑	increase
↓	decrease
Ⓡ	right
Ⓛ	left
Ⓜ	home
<b>I + II + 0</b>	normal heart sounds (i.e. heart sounds 1 and 2 present with no additional heart sounds)
<b>#</b>	fracture(d)
<b>x/7</b>	x days (e.g. 3/7 = 3 days)
<b>x/52</b>	x weeks (e.g. 2/52 = 2 weeks)
<b>x/12</b>	x months (e.g. 1/12 = 1 month)
<b>X/40</b>	X weeks gestation (e.g. 12/40 = 12 weeks pregnant)
<b>X+y/40</b>	X weeks y days (e.g. 6+3/40 = 6 weeks 3 days pregnant)
<b>Gx Paray+z</b>	
<b>G</b>	gravida
<b>x</b>	total number of pregnancies (including current pregnancy) regardless of outcome

**y**

number of deliveries exceeding 24 weeks (including stillbirths)

**z**

number of pregnancies less than 24 weeks (including ectopic pregnancies, miscarriages, and terminations)

For example:

**G5 Para 2+2**

five pregnancies, including the current one, one stillbirth at 29 weeks, one child delivered at 38 weeks, one termination, and one miscarriage

# Oxford Quick Reference
